After the first day my chickens have whole groats as a staple food varied with a little hard-boiled egg chopped fine, and ground oats mixed very dry. In a week or ten days they will relish small wheat, and occasionally a little chopped meat may be given them as the egg is discontinued. The great point will be neither to let them eat too much at a time nor leave any, so that, if possible, they may always have an appetite at feeding time. If, in the hot weather their appetite seems to leave them, a little gentian bark grated into the meal will be beneficial; but as chickens get older they do not require to be fed so often, and the interval between meals may be gradually extended till, at about four months old, they are fed about three times a day. If new milk can be obtained they will much enjoy a drink of it the first thing in the morning; but too much coddling will only tend to make them delicate.

It will be a very wise course to weed out the chickens as early as possible, as the fewer there are the better they will thrive. Two or three in every brood may generally be selected for the spit without much trouble, as defective and crooked toes and sooty feet will never get any better. No rules can be laid down for certain, but a little experience will soon teach which chickens to keep.

The chickens should not be allowed to perch at night on narrow or crooked sticks, or they will most certainly become crooked-breasted. Some breeders keep their chickens hedged down on straw or sawdust till their breast-bones are fully formed, but this entails much trouble, and I have not found it essential; besides, some chickens have crooked breasts from the day of their birth, and nothing that we can do will then set them right. Till recently I was of opinion that crooked breast-bones could be entirely prevented, but from conversations with some of the most careful breeders, and from my own experience, I am convinced that some

are hereditary, and, like rickets in children, as long as we breed from such we shall never get rid of it. Undoubtedly birds occasionally receive prizes in spite of crooked breasts, but in my opinion a crooked breast in a Dorking, the table fowl *par excellence*, is quite as bad as or worse than a crooked leg or wry tail. A slight bend in the bone I would pass over, but a bird which has a large hollow in his breast-bone I would not have for a gift, and in my opinion he should never receive a prize. If the chickens are given a flat plank of wood to perch on about 6 inches wide, with the sharp edges just planed off so that they cannot perch upon them, they will be obliged to roost on the centre of the board, and if this is not placed too high up we shall see very little of crooked breasts if the parent birds are not defective in this respect.

At ten weeks old the cockerels and pullets should be separated from one another, as by this means a good deal of trouble will be avoided, and the cockerels will not fight, especially if any old cock be left in charge of them. If a cockerel be taken away for three or four days for an exhibition or other purpose he should always be returned to his comrades at night, or a free fight will very likely be the result; but if the bird on awaking finds himself on his old perching place he will forget all about his absence, and will in all probability in the morning run out with the others as usual. This is very important, as with fifteen or twenty cockerels it would be quite impossible to find separate runs for them all.

I have before mentioned how necessary it is to train birds to a pen before sending them to a show, and this is especially the case with hens and pullets. If two hens are caught and placed in a small pen together they will be nearly sure to disagree, and one will peck the other almost to pieces, even though they have been bosom friends before. A good plan will be to first let them run in a small yard together where there are no other birds, and afterwards to put them in a small place and thus to accustom them to one another by degrees. If after this, one bird still remains obdurate, and insists on pecking the other, the only way will be to tie the offender by one leg to the side of the pen; but even this will sometimes not effect a cure, and the only way then to proceed will be to make up another pair. The plan of showing two hens in a pen together is now generally given up, though in my opinion it is a far better criterion of who has the best yard of fowls, and I think the yard which exhibits the largest number of noticed birds is more deserving of credit than that which exhibits one, even though this be the first-prize bird.

(For Fanciers' Journal.)

AWARDING PRIZES.

No. 1.

FRIEND WADE:

Your article in No. 21 of *THE FANCIERS' JOURNAL*, on "Prize Awards at our Shows," is the "right thing in the right time," and will, I think, meet with approval by almost everyone. But I would "tack" a little more to the end of it. You suggest that but three prizes be awarded in each variety, old and young. Now I would like to again suggest, in this connection, what I suggested last fall in your *JOURNAL* in an article on "Judging by the Standard." In that article I suggested that a minimum point be fixed by which premiums should be awarded, viz.: Award no first premium when a specimen did not score ninety (90) points, no second premium to any specimen that did not score eighty-five (85) points, and no third premium unless a specimen scored eighty (80) points. Of course I would much rather see the first premium bird scoring ninety-five (95), the second eighty-nine (89) and the third eighty-four (84), but this I would place as a minor point—not a maximum, as a writer interpreted me afterward in your "Journal." This plan would, of course, necessitate the judging of all shows by the "American Standard of Excellence," and sealing every bird. But this is just what

should be done, and until it is done entire justice cannot be done. No man—judge—can walk along in front of twenty coops of Light Brahmas and by comparison tell the best coop and be sure he is right. Because it frequently happens that a bird is quite attractive at first sight but come to scale him and figure up his excellencies, you find him falling far below a less attractive neighbor. And especially is this true if a judge is partial to a dark hackle, fine comb, heavy leg-feathering, or some other prominent feature.

Then, again, if the birds are all scaled and the score card placed on the coop, criticism is made plain and there is less opportunity to award premiums to *friends* rather than birds—a subject which I shall discuss in your next issue. Again I say give us three premiums, and give them to by the use of the “New American Standard of Excellence,” letting first premium mean 90 points or more, and so on, as I have suggested, and thus we will know what is meant when we see stock advertised as first or second or third premium stock.

JAMES M. LAMBING.

PARKER'S LANDING, PA., June 6, 1876.

(For *Fanciers' Journal*.)

A VALUABLE DISCOVERY.

Editor of Fanciers' Journal:

DEAR SIR:—I think I have (accidentally) made rather a valuable discovery; which, though it relates more directly to benefiting the agricultural rather than the poultry interests of this country, I send you the first account of—because it pertains particularly to the specialty for which your poultry paper caters. And I am very confident—if further experiments with this article (now being tried) shall prove as wonderfully effective as those I have already made have resulted, that we have upon the premises of every poultry-breeder in America, a certain and simple remedy against the *depredations of destructive garden and flower insects*, that we have as yet never appreciated!

As you are aware, gardeners who raise early market vegetables—such as squashes, cucumbers, melons, etc., as well as small fruits, currants, raspberries, and even grapes, have always been put to their wits' ends to devise ways and means to preserve their vines and bushes from the ravages of spring bugs and worms that assail the tender plants, as soon as they get fairly growing. And various applications of plaster, gypsum, ashes, lime, hellebore, Paris green, and other poisons have been used freely, to kill or drive away these pests; often without avail, until half or two-thirds of their plants have been killed, or eaten up by these numerous varieties of marauders.

I had tried these “cures” for currant worms, tomato-flies, cucumber and squash vines, etc., as well as for the dispersion of rose-bugs, often without success. And two years ago I made use of a preparation of liquid raw hen-manure upon a few cucumber hills—when the bugs had fairly taken possession of the vines. I applied this, morning and evening for a week, and saved every one of my vines. Then I saved my squashes similarly, with entire success. I then washed our rose-bushes with it daily, for four or five days, and “cleaned out” every bug on them effectually! The currant bushes came next, and not a currant-worm have I seen this season, in my garden. I have used it this spring, and my cucumbers, squashes, currants, etc., (as they were last year) are entirely free from the pests that have quite destroyed the first plantings of my neighbors.

I believe the pungent, peculiar odor of this preparation is a complete protection against the attacks of these insects. They will not approach the vines or leaves saturated with it. And at the same time, I find this a most admirable fertilizer to the plants. I have no doubt it will destroy or keep at a distance the villainous “potato-bug,” too. Why not? At all events, I shall try it the present season, as I notice

in the papers that this depredator is about, this year, in New England.

I throw into a common bucket-full of water, a heaped spadeful of fresh manure, taken from beneath the hen house roosts. Mix well, and apply from a watering-pot. A little goes a great way. It is thus sufficiently strong, and the effect will be discovered immediately. On rose-bushes and currants, it should be thrown under the leaves with a large syringe. Upon ground vines it may be applied, easily.

I have found this so singularly beneficial, that I now make the fact known, in the interest of poultry-keepers, that they may save the hen manure carefully. If they don't wish to use it on their own premises, there will be a market for it as soon as their neighbors try it, if they succeed with it as I have. And if it will destroy the potato bug, (as I sincerely believe it will) there must surely be a lively demand for this often wasted article, should the “Colorado beetle” really show itself in this region.

If you think this “discovery” worth recording in your columns, I have no doubt it will meet the eye of some poultry men or gardeners who are more or less annoyed as I have been, who will thank you and me for this hint. It is a simple method, practical, certain, not poisonous, and worthy a trial.

Yours &c.,

HELPER.

P. S.—I suggest that this liquid be used *not too strong*. The proportions I give above are sufficiently powerful. If applied too strong it will burn the vines and leaves, or even the stalks of tender plants.

MORE ABOUT PRIZE AWARDS.

Having read the interesting article on prize awards at our shows, in your issue of the 5th inst., it has occurred to me that a few remarks on the system of awards now in vogue in England, might be of service to some of your readers. As I have only been in this country a few weeks, I have no practical knowledge of the working of the American poultry shows, but having been a breeder and exhibitor for many years in the old country, and never missing an opportunity to advance poultry interests, I hope the breeders here will take my remarks in the spirit in which they are written. Your proposal to limit the awards to three in each class will, I feel sure, benefit both exhibitors and managers of shows, but I do not think the abolition of “honorable mentions,” (which I presume means something akin to our “highly commended,” in England) would work well. At the English shows, except such as the Crystal Palace, Birmingham, and Alexandra Palace, the prizes are almost universally three for each class, and in some cases only two prizes are given. The judges are, however, empowered to give extra prizes where the fowls are sufficiently numerous in a class, and this extra prize is not called fourth or fifth, but “extra first,” “extra second,” or “extra third, as the case may be. In addition to this “highly commended,” cards are also fixed to pens which are considered of sufficient merit. It would manifestly be unfair to exhibitors, in a class containing, say twenty to thirty entries, to debar all pens except two or three from receiving notice, which would be the case were all the supplemental means abolished. The remedy of the evil complained of in your article is, in my humble opinion, as follows: viz. Limit the prizes to three in number in each class, except where the judges are unanimously of opinion that one or two extra prizes ought to be given, and let no “honorable mentions” be given, unless the birds are *good average specimens*. Of course mistakes would occasionally occur, but then we must remember that poultry judges are only “mortal,” and we are all liable to err, and it is an undoubted fact that the rule has worked well in the old country, and would give satisfaction here if fairly carried out.

Another point which is always insisted upon by English exhibitors is, that managers of poultry shows shall forward clean prize cards with the birds when returning them from the shows. These are highly prized, and fixed up in some conspicuous part of their poultry house, and are a source of gratification to their possessors, if nothing more. The writer had over four hundred of them posted on the walls of his corn-chamber before leaving home, and it must be borne in mind, that to visitors they are a very good criterion of the quality of the stock kept by the owner of them.

GOLDEN POLAND.

EFFUSION NO. 3 ON INFANTS: i. e., YOUNG BREEDERS.

Y. B. amply confirms the opinion expressed in third paragraph of "Effusion No. 2." I shall only say here, that the expression "shanks not feathered down the outer sides, and to the extremities of the outer toes," is a wrongly constructed sentence. To have been grammatically correct, and to mean what it was intended to, it should have read, "shanks not feathered down the outer sides, and the outer toes not feathered to the extremities."

As to the twisted wing question—*twisted feathers in wing*," and a "twisted wing" (or wings) are two very different things. I am extremely sorry that Y. B. has not yet found that out.

The whole trouble with the Standard—all these defects, oversights, omissions and errors may be laid to just this class of men—*young breeders*—who, as Josh Billings says "has found out his sum process that 2 and two allways make 4, and then spends his time trying to prove it to the rest ov mankind."

In conclusion, I will quote the words of Hon. Edward Everett, in his reply to the British minister, some years since. "Sarcasm is not argument; if it were, we might use it as effectively as your lordship."

Yours,

Editor P. B.

(For *Fanciers' Journal*.)

THE LAW OF TRUTH, RIGHT, AND BEAUTY.

A few days ago the following sentence in the editorial department of the "JOURNAL" caught my eye. "The old prejudice of one hundred years ago, covering a man like a mantle, with a degree of disgrace, who was known to be a fancier of birds and agile pets generally, is fast being dissipated" etc. As I read this, my mind went back to the time of my childhood—not a hundred years ago, nor one third of that—when the fancier of thorough-bred poultry, pigeons or rabbits, was supposed at least, not to be quite such a common-sense, practical man as his less enthusiastic neighbor, even if not really having "a bee in the bonnet" or "a maggot in the brain."

But my recollections left me not with these reflections; they led to a brighter side of that picture, and I fell to thinking of the true condition of mind necessary to the successful breeding of any pet stock, and the habits of patient study and observation cultivated by it. Something like this was the course of thought which almost involuntarily my mind followed. Law is the great fact of all facts in this universe with which we have to deal, and the important thing to be known. This being true, that thing is valuable to man which leads him directly to a knowledge of law. The breeding of thorough-bred stock leads directly to this knowledge; therefore the breeding of fancy, or thorough-bred stock is a valuable employment of man's time. But if this is too syllogistic, let us look at the matter more in detail, and in speaking of fancy breeding as a valuable use of time, I shall refer more to its value to youth than to adults.

The need of a knowledge of law is seen in every department of life. In science, the student or experimenter finds himself at once face to face with the unchanging laws of nature, and the first les-

son he learns is that if he would find the truth of what he examines he must work in accordance with law, and not against it. In fact, all the truth that he finds is law, law as seen in the established relations of elements and things. Science is the sphere of exact truth, and in so far as the scientist is trained in perceiving law, so far is he a successful worker in his sphere of labor.

Nor is this less true of the man who works in the sphere of morals or right. All our experience teaches us that true society is that in which a law of order prevails. Just as the elements of nature harmoniously exist by law to make some organic whole, just as the words of the poem, or the colors of the picture are grouped by a law of order to represent some central idea of beauty, so is it with the organic whole of society, so is it with the true "poetry of life," and that picture of humanity, whose blending tints and colorings gladden the eye.

The same thing is also true in the sphere of beauty. The artist finds that his inspection serves him in so far as it prompts him to discern the law of beauty. The very idea which leads him on is that vision of the higher relations which in itself is the divine revealing of true nature. His genius originates and works by law, that law of habit which transmitted becomes instinct.

Law is then the great fact we find in life, and one of the most important questions of education is, how shall we best learn of this secret order or law of nature? Can we learn it in any other way than by dealing with it through experience; by becoming acquainted with it at first hand? Is even the moral law best taught us by wordy precepts and homilies? He learns it most truly and effectively who learns most truly how to observe the life about him. Good-boy stories, rewards of merit, and sugared rules never take the child into the depths of that sublime order and harmony of law which will encompass him all his life, aiding him if he works with it, crushing him if he works against it. Into the secret counsels of all-wise and loving nature, he only is admitted who lays off the earthly sandals of conceit and sees that even the bush beside him grows out of holy ground. If a child can see what there really is in bird and bush, in flower, pebble and stone, he sees all depths of life and being, he reads the law of relations in this all-pervading harmony of the universe, and in it—not outside of it—catches glimpses of that Eternal Spirit whose life throbs in his own.

But what has this to do with the breeding of fancy stock? Why, simply this: Fancy stock, or more properly thorough-bred stock, is only successfully bred by the closest study of law, and the closest adherence to it in every step of the pursuit. Moreover, fancy stock has a charm and power over the minds of all lovers of the beautiful in living forms, which holds both child and adult to his work with strong attracting power. It offers no dull test to which some penalty must be appended in case of neglect, but it charms the observer, and draws rather than drives him into essential knowledge. It works by the power of love rather than fear, yet this very love outside him is the mother of fear within his own breast, and reveals penalties that cut deeper than the lash. What more awful to the young breeder than the sickness, death, or careless loss of a pet pigeon, or rabbit. What more mortifying than vermin in his chicken coop, or foul air in his rabbit hutch! His conscience reproves him of neglect, and amidst those experiences a true conscience is every day cultivated. Yes, and that true knowledge of the conditions of success in any enterprise is daily acquired. Does he not know how to breed his pigeons true to a feather; and does he not learn patience, perseverance, and carefulness in this? Why that disqualifying color in these young birds? He will find out. I find that "blood tells," even down to the third and fourth generation. I confess that, when a boy, the Scripture passage, "the sins of the fathers shall be visited upon the children, to the third and fourth generation" was always misunderstood by me until I bred pigeons. They furnished me with a better commentary than the big books I handled.

Now the wee word that I have to say to parents is this. Don't leave the education of your children wholly to the common school, nor yet to the Sunday-school, or the learning of moral precepts.

Let them go to work on the problems of life themselves, and find out the laws of nature by experience and observation. Every boy loves animals, and this love is often a sanctifying influence in his life. It will not only draw out the tender side of his nature, but the stern also; for it will teach him to bravely meet difficulties and discouragements, and to win success over them by conformity to law. Aid him too, yourself, so that he shall have clearly before him a good type to breed towards, and so that his attention may be called to the little prosy details of care which his enthusiasm may be tempted to overlook. When he can successfully and profitably breed poultry and pigeons, he has learned something that will serve him all his life, and which he cannot learn except by experience. It will teach him also, lessons in morality. There is a direct connection between the laws which govern the successful raising of pigeons or rabbits, and the eternal law of right. It will keep him also out of bad company, and furnish employment for those heavy hours of idleness, when temptation most powerfully assails him. I well remember the interest which I took in such employment, and the part it played in my true education. Let parents then give their boys a chance to keep some sort of pet stock, and they will find it pays. It is a profitable investment for themselves, and if the youngsters get as much pleasure out of the occupation as did the writer it will be profitable to them.

W. G. TODD.

FRIZZLED FOWLS.

"Friesland" fowls is a name often applied to this breed of fowls, although on what foundation has never been satisfactorily accounted for, as this breed is not confined to one particular country, it being found in nearly every part of the world. Close observers of all the Asiatic breeds, but more especially the Cochins and Brahmans, have not failed to notice that feathers in the neck hackles have a tendency to twist, and this defect has been called by fanciers "twisted hackles." Several causes are assigned for this defect, which it is unnecessary here to enumerate, but of this we are quite certain, that twisted hackles have a strong tendency to become hereditary, so much so that experienced breeders do not hesitate to say that by mating together such defective hackled birds, partly frizzled fowls would be sure to be produced. Hence the breed of frizzled fowls is not indigenous to any country. Apart from these, however, there is now a distinct breed of frizzled fowls which breed true to feather and markings, and are of different colors of plumage, some white, others brown or partridge colored, and some black. White is the most usual color shown in England, but black is by some breeders considered the handsomest bird.

Nearly all frizzled fowls have neat rose combs and short dark legs. The chief peculiarity is, however, in the plumage, every feather being curled back in the wrong direction, as if the bird had been roughly stroked the wrong way, and presents a most grotesque appearance. The tail feathers are not recurved like those on the body, but the webs are loose and disconnected. From the loose and unprotected character of the plumage they are said to be rather susceptible to cold or wet, and therefore have the reputation of being delicate, and this would seem reasonable, although breeders who have kept them for years, do not endorse that statement. Mrs. Taylor, of Ardgillan Castle, Balbriggan, Ireland, writing in the "Illustrated Book of Poultry" says:

"I have kept White Frizzled fowls now for seven or eight years, and think them a most useful and profitable variety. They are always first to lay in the autumn, which I attribute to their early moulting—my poultry woman writes me from home that they are all featherless already (June 10th). They are also excel-

lent mothers, and from their feathers being nothing but fluff, they always seem to keep their eggs warmer than other hens when sitting. They have a very marked power to reproduce their peculiarities—the turned back feather and rose comb—even when several times crossed with other breeds. I have also remarked that although the parent birds in my pure bred runs are all white, a jet black chicken has often been produced; which fact and the observations of Captain Tollenmache in the Mauritius, led me to believe that the black is not an original variety. The first I ever possessed came from a farmer in Westmeath, and at that time they were common both in that county and in Cavan. I have since tried to obtain some from that locality, but they are nearly extinct, and I could not meet with any true bred specimens. My first birds were not pure white, but each feather had very delicate penciling of gray, which Captain Tollenmache states is the general color of the Mozambique fowl in the Mauritius. By always selecting the whitest birds, my stock is now pure white, but a black chick still occasionally appears. I consider them the most valuable fowls I possess. They are excellent for the table, and even a hen two years old gives very white meat, and much more tender than that of any other variety. The smallness of their bones also makes them desirable for the table. They seldom or never want to sit, and are, to my taste, very ornamental. They are very hardy, and the chicks easily reared. They are also slow in feathering; and therefore require to run long with the hen, but on the other hand there is no harbor for vermin."

Captain Tollenmache, to whom reference is made by Mrs. Taylor, in the same publication writes "The Hurricane Fowls," as they are there (Mauritius) called, are very common, especially in the best camps of the Malibars. The name arose from the happy idea of their progenitor being caught in a hurricane, and so having their feathers all blown the wrong way. They are natives of that part of the African coast opposite Madagascar, hence I should say the proper name would be the Madagascar fowl. Their color is generally brown, but I have seen them in much brighter colors, each feather being barred with brown and yellow, giving the appearance of shot silk. I never saw them white. I have bred them myself, but am sorry to say that I did not then observe their habits and peculiarities very closely. I can, however, say that they were very good layers, laying a nice egg, and also very good eating. They are also very careful and excellent bringers-up of a young family."

Naturalists state that the Frizzled Fowl is to be found throughout Southern Asia, Java, Sumatra, and the Philippines. It is also to be found in Ceylon, but is said not to be a native of that place, having been brought there from Batavia. It is also stated to be found in the West Indies. The chief point to be observed in breeding these fowls is neatness in the frizzled plumage, and in choosing stock birds this point should not be lost sight of.—*Canada Farmer.*

Mr. Henn was promoted at a recent political convention in Illinois, and greatly assisted in laying resolutions on the table.

The *Alabama Planter* complains that its little garden-patch was unprofitable last season: "The snails ate up the cucumbers; the chickens ate up the snails; the neighbors' cats ate up the chickens, and we are now in search of something that will eat up the cats!"

BUGS, WORMS AND CHICKEN CHOLERA.—A correspondent of the *Prairie Farmer* says: "We have noticed that whenever the chickens follow the plow, and gorge themselves with bugs and worms, soon cholera breaks out among them. Our remedy is:—To one gallon of sour milk, add a tablespoonful of powdered alum, set it in shallow vessels, where the chickens can drink as often as they choose. We have used this remedy for the last three years, and none of our chickens die with cholera, when we attend to it in time."

PIGEON DEPARTMENT.

(For *Fanciers' Journal*.)

"PIGEON RACES."

NEW YORK, JUNE 6th, 1876.

EDITOR FANCIERS' JOURNAL:

In your *JOURNAL* of June the 1st I see an account of three pigeon races. One from Wilmington to Philadelphia, the other from Newark to Philadelphia, and the third race was between three of my birds, and five of the Philadelphia fanciers', their birds flying from North East 52 miles on the Baltimore road, and mine flying from Trenton, 56 miles on the Philadelphia road.

In regard of the first race, I don't know anything about it. The second race from Newark to Philadelphia, in which race Mr. James Grist won the 1st prize in 1 hour 90 seconds. Mr. Buckley the 2d prize in 1 hour 16 minutes, and Mr. Woods the 3d prize in 1 hour 22 minutes. There must certainly have occurred a mistake either in Mr. Thomas Grist's letter, or in the time keeping when the birds arrived, as there is not, or never was a pigeon in Philadelphia, who can fly the distance from Newark to Philadelphia in one hour 90 seconds. Newark is about 80 miles from Philadelphia instead of 40 miles, as Mr. Grist says in his letter.

Now in regard to the third race, in which three of my birds flew, and five of the Philadelphia fanciers'. This race did not come off in a fair way at all, although not with any bad intention on the part of the Philadelphia fanciers' I think. I will explain, Mr. Editor, the bad management of the race, and you will see as well as your numerous readers, that my birds flew under the greatest disadvantages.

The 6th of May, the day of the race, the weather was very cloudy, and as is often or generally the case, it grew gradually clearer coming towards noontime, in fact at 12 o'clock the atmosphere was clear and free from all haziness. Our conditions were that my birds should fly at the same hour that those of Philadelphia should fly, and with an intermission of fifteen minutes between each bird. My first bird was tossed at 9:30, my second at 9:45, and my third at 10 o'clock, while Mr. James Grist's birds were tossed, the first at 10:15, the second at 10:30, and the third at 10:45, or each bird three quarters of an hour later than mine. Now, sir, my first tossed bird was my good Silver Dun Cock, Jupiter, who won the gold medal and the silver cup last year, my second tossed was a blue hen, also always one of my swiftest birds to come home from any voyage, and who won first last year from Monmouth Junction, and my third tossed one was a blue cock who flew from Philadelphia last year. My two first tossed birds came home together at 11:54, and my third tossed bird came home at 11:54½. Trenton being 56 miles from New York, and a bird being able to fly a mile in 1 minute, that is with clear weather and favorable wind, my birds ought to have arrived in about one hour, had the weather not been cloudy. The arrival of my birds, all three coming home so to say together,

proves that they all three had to fly until after 11 o'clock before the weather was sufficiently cleared up to find their destination, as my two first tossed birds, who flew from Trenton two days before in 1 hour and 5 minutes, needed now the 1st, 2 hours 24 minutes, the 2d, 2 hours and nine minutes, and my 3d 1 hour and 54 minutes. Is this not conclusive enough to show, and plainly too, that if Mr. Grist's birds had flown at the same time, and in the same atmosphere, the result of the race would have been different altogether?

I have protested against the management of the race, and have requested to have it flown over again; but as I was persuaded by my friend T. Grist, that it was not of the Philadelphia fanciers' fault, that their birds flew three-quarters of an hour later than mine, but that it was on account of the train being behind time; and as I had won from the Philadelphia fanciers in three consecutive races last year, I have dropped the matter, and we have now made an arrangement to fly another match on the 27th of this month, from Easton, Pennsylvania, which is about 85 miles from New York, and also about the same distance from Philadelphia. Which will make this race a fair one in every respect, is that Easton lays in about the same direction from New York as from Philadelphia, and as the birds will all be tossed in the same time, with nearly the same wind and in the same atmosphere there will be no advantage for the one bird against the other. This is after the Belgian style, and their long year's experience the Belgians have in training and racing pigeons, should be taken in consideration, and followed here. I have spoken with several American and English fanciers of homing birds, and all concur in the letting loose of all the birds together in a prize race. Mr. Waefelaer of Hoboken, N. J., will make the entry fee from currency in gold, that is to say that if twenty birds are entered at \$5 per bird, there will be one hundred dollars prizes, which amount Mr. Waefelaer will change from currency in gold.

Mr. Thomas Grist, in the name of the Philadelphia fanciers proposed that we should fly our birds from Easton and their's from about the same distance on the Baltimore road. I wrote Mr. Waefelaer about it, and see here his answer; he says: "The Philadelphia fanciers are unjust; I think it very reasonable that in a concourse or race the pigeons should be let loose all together at once, just as it is done in Europe; and the South East route, in which direction Easton lays, I believe, both from New York and Philadelphia, has its advantages just as well as his disadvantages for one party as for another."

Any fancier acquainted with the racing and flying of the homing Antwerps, must see the correctness of Mr. Waefelaer's remarks, and I request some of the fanciers to express their views in this *Journal*.

Besides the premium, Mr. Waefelaer offers to make the prizes gold instead of currency. I will give the Philadelphia fanciers a chance to win back the silver cup which I won from them last year, and I will also give them a chance to win back the \$25 which I won from them last fall by forfeit in the intended Philadelphia and Baltimore race, challenging any Philadelphia fancier for this amount in the Easton race of the 27th.

I trust then that this race will come off in a straight and forward way, and certainly Mr. Waefelaer and myself will do all what lays in our power to arrange things that no reason of complaint will be left to any one, and that the quickest bird will win the prize of honor, as also the first money prize, and the other swiftest birds the other prizes.

Trusting Mr. Editor that you will give the above a place in the next issue of your going ahead paper, I remain yours respectfully,

JOHN VAN OPSTAL,
4 Lewis St., N. Y.

What sort of fish does the hen like? Answer—The perch.

CORRECTION.

In No. 20 of our paper, in the article "The Bulletin and our Standard," the quotation "the outer toes being well feathered thereof," should read "being well feathered to the ends thereof."

THIRD AND LAST CALL.

Will the few members of the A. P. A., who have not favored me with their card photographs, (especially those who have written they desired to be represented in the group, and would soon send &c.) please do so? I am very anxious all should be in.

Address, G. O. BROWN,

BROOKLANDVILLE, MD.

IMPORTATION.

Arrived by steamer Adriatic, June 6th, a trio of White Crested Black Polands, for Andrew Sugden of this city, from Mr. Henry Belden, England, price paid, fifteen guineas or about \$90. Think of that, ye that think \$25 a large sum for a good pair. Mr. Belden says that it would be very difficult to get another trio in England equally as good in every respect. He recommends covered runs for this breed, in which advice we coincide, as nothing injures their health more than being exposed in damp, wet places.

ISHMAEL; OR, IN THE DEPTHS.—Is the name of Mrs. Emma D. E. N. Southworth's best work, just published in book form, for the first time, by T. B. Peterson & Brothers, Philadelphia, Pa. It is said to be the best work ever written by Mrs. Southworth, and has never before been published except in the "New York Ledger," in which paper it was issued many years since, under the name of "Self-Made; or, Out of the Depths." Mrs. Southworth, in the preface to "Ishmael," says: "This story, in book form, has been called for by thousands, during several years past, but the author has reserved it until 1876, as her contribution to the Centennial; not only because she considers it to be her very best work, but because it is peculiarly a National Novel, being founded on the life and career of one of the noblest of our countrymen, who really lived, suffered, toiled, and triumphed in this land; one whose inspirations of wisdom and goodness were drawn from the examples of the heroic warriors and statesmen of the Revolution, and who, having by his own energy, risen from

the deepest obscurity to the highest fame, became in himself an illustration of the elevating influences of our Republican Institutions. "In the Depths," he was born indeed—in the very depths of poverty, misery, and humiliation. But through Heaven's blessing on his aspirations and endeavors, he raised himself to the summit of fame. He was good as well as great. His goodness won the love of all who knew him intimately. His greatness gained the homage of the world. He became, in a word, one of the brightest stars in Columbia's diadem of light. His identity will be recognized by those who were familiar with his early personal history; but for obvious reasons, his real name must be veiled under a fictitious one here. His life is a guiding star to the youth of every land, to show them that there is no depth of human misery from which they may not, by virtue, energy, and perseverance, rise to earthly honors, as well as to eternal glory." It is published in a large duodecimo volume of over seven hundred pages, bound in morocco cloth, gilt back price \$1.75, and is for sale by all Booksellers, or copies of it will be sent to any one, at once, on their remitting the price of it in a letter, to the Publishers, T. B. Peterson & Brothers, Philadelphia, Pa.

CORRESPONDENCE.

INFORMATION WANTED.

EDITOR FANCIERS' JOURNAL:

If it is not asking too much, would some one who knows, tell how to make a food suitable for soft-billed birds?

Yours respectfully,

R. I. W.

INCUBATOR.

MR. JOS. M. WADE:

DEAR SIR,—In No. 16, of the JOURNAL, I gave an account of an incubator that I have been trying; invented by Chas. B. Jaques. Have given it two trials. At the first I found chicks in all the eggs but four, which were not impregnated. Some of the chicks picked the shell, then died. Others came out themselves, but more I picked out. Have good healthy chicks from first experiment. I filled it again with very large eggs procured from another party, (my ideas were large) and also put in one Brown Leghorn egg. Kept heat better than at first trial—hatched but one chick, and that my Brown Leghorn. I told the party, from whom I received the eggs, of my success, and by way he laughed, think it was a "put up job" on me. Shall try the incubator again, using my own eggs.

Yours,

JOHN H. BISHOP.

NORTH ATTLEBORO, MASS., May 18, 1876.

"YOUNG BREEDER."

DEAR JOURNAL:

I have been amused, if not edified by the learned articles that have appeared from time to time from the pens of Young Breeder and his opponents. But my dear Journal will your many readers call me thick-headed if I say I cannot see where the benefit to the poultry fraternity comes in? Would not your readers be the better pleased if those communications were thoroughly pruned? And would it not be an exemplification of a part of your motto, "For all?" It seems to me that writers in the poultry journals are too prone to rush madly into print without due consideration. Their effusions are replied to and the controversy frequently ends in "You did," "I didn't." I am happy to say that you, dear Journal, are not much inclined to contumacy that class of writers. And now in all candor, with malice to none, I ask if this tends to the upbuilding of the poultry interests, and the elevation

and moralizing of the fraternity? If so, then should this be replied to, and I be termed thick-headed, the appellation will be received in all meekness and humility.

Yours &c.

PRO BONO PUBLICO.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

GREAT AND SMALL.

A sparrow, twittering by a door,
Seemed to a lark up-soaring high,
His anthem at heaven's gate to pour,
In rich rejoicing melody,
A poor dull thing, unworthy birth,
A voiceless cumberer of the earth.
But by the cottage window lay
A little sickly, pining child;
The lark was too far away,
She could not hear his rapture wild;
But loved to listen all day long
The sparrow's little twittering song.
Thus lark and sparrow equally
Had fitting service duly given—
The one to pour, in rapture high,
His soul in music meet for heaven;
The other by its twittering,
To soothe a lone child's suffering.
And, knowing this, I will not fear
My song, however faint, to sing;
It may be to some suffering ear
Some note of mine may comfort bring;
In God's great world there's room for all—
For lark and sparrow, great and small.
—S. S. in *Sunday at Home*.

ANNUALS, BIENNIALS, AND PERENNIALS.

—The term "annual" is given to those plants which grow, flower, seed, and die within the same year.
—"Biennials" are those plants that do not flower until the second season, and, after blooming, die.
—"Perennials" are those that do not generally bloom until the second year, but continue to bloom for years, and may be propagated by a division of the roots.

—A SEIGE RAISED BY A PIG.—During the siege of Edessa by the Persians, an immense elephant bearing on his back a lofty tower filled with archers, advanced like a terrible machine, from the top of which poured a continuous shower of darts and arrows. There was great danger of the wall being escaladed at this spot, when a Roman soldier took it into his head to suspend a pig by a cord, and angle it before the elephant. This animal appeared amazed at the horrible noise made by the suspended pig, and retreated in such haste as to place his masters' troops in danger. The citizens sallied forth, the Persians were routed and the siege was over.

J. M. McCann.

—MANX CATS.—Your correspondent, P. Welch, asks for some information as to the native place and origin of the Manx or no-tailed Cats, and speaks of a race or family of them in Japan; a statement which, while I do not dispute it, I have never heard or read of before; neither wild or domestic animals, except the dog, are numerous in that strange land.

How the singular variety of the domestic cat without a tail came about, is extremely doubtful, or where it first appeared. Both are enigmas which have yet to be solved, and a correct answer given. The Manx Cat is not blessed with the "fatal gift of beauty" by any means. A black one with glaring eyes, red eyelids, and stump tail, is a most uncouthly looking beast which would seem to have been made especially to be the familiar of the ancient sorcerers, and I should not be surprised to learn that the Witch of Endor had one of the no-tailers to accompany her upon her nocturnal excursions. There's no trusting to appearances, however, as your correspondent gives his family of tail-less felines, a very good character. As I write I glance my eye upon a most savage rascal with a miserable apology for a tail, and feel thankful that he is—a painted one, closely confined in a walnut frame, and suspended over my hook-case. Were he alive, I should not want him quite so near me, notwithstanding the "love and confidence" Mr. Welch says his race may be made to possess.

Huon.

—The second week in April was very cold and stormy throughout Great Britain, with much snow. Many of the migratory birds had arrived, and they suffered greatly. The swallow and martins were so exhausted by cold and lack of food that they could hardly fly, and might have been killed by the dozen. Several were seen floating upon ponds in the morning at one place, which indicates that a great number must have succumbed to the inclemency of the weather. Gulls have been seen in great numbers many miles from the sea. Wall fruit and pear trees suffered much, and raspberries, and in some places potatoes, were completely cut up.—*Forest & Stream*.

—The power of serpents to charm birds and small animals is now admitted by eminent naturalists; I don't believe that all snakes possess this power. Have never heard of any species of water-snake attempting to exert it. As their food consists principally of frogs and fish, the gift would be a useless one to them. I have often seen birds pursuing snakes, darting down almost upon their very heads and yet they made no effort to use their power of charming. May it not be true that serpents possessed of this power only attempt to exercise it when all other means of obtaining food have failed?

A gentleman once told me that he saw a squirrel jumping from tree to tree in a singular manner all the time uttering pitiful and peculiar cries; he soon perceived the head of a large Black Snake (*Coluber Constrictor*) protruding from a hole in the tree, and this it was that seemed to cause the squirrel its uneasiness. He watched them attentively—sometimes the squirrel would leap from tree to tree, a distance of twenty or thirty yards from the serpent, but would always return again and finally passed directly over its head into the hollow of the tree. That the act of the squirrel was involuntary, and that it was drawn to its death by some irresistible power is certain. I once saw a snake of the same species charm a ground squirrel (*Tamias*) and I am convinced that it was not the deadly power of the serpent's eyes alone that enabled it thus to secure its victim. In this instance the squirrel would often retreat to a considerable distance, and could not see the snake, but it returned again and again from seeming safety to certain danger, approaching nearer and nearer having no power to resist until it was seized by the charmer.

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending June 11th, 1876.

- 13 Horned Toads (*Rhynchosoma cornuta*). Presented by Chas. Noble, Phila.
- 11 Prairie Dogs (*Cynomys ludovicianus*). Born in the garden.
- 1 Gold-naped Amazon (*Chrysotis auripalliat*). Presented by Willie W. Walker, Phila.
- 1 Wild Cat (*Lynx rufus*). Purchased.
- 1 Loggerhead Turtle (*Chelonia caretta*). Presented by Jerry Nolan, Phila.
- 3 Loggerhead Turtles (*C. caretta*). Presented by John Fletcher, Phila.
- 2 Screech Owls (*Scops asio*). Presented by M. C. Taylor, Toughkenamon, Pa.

NATIONAL SOCIETY OF RABBIT FANCIERS.

MANCHESTER, ENGLAND, May 12th, 1876.

MY DEAR MR. WADE:—

The "National Society of Rabbit Fanciers" is now holding its first grand exhibition, open to general competition, in the bottom Waste Brokers' exchange, in this City.

About two hundred and eighty entries are exhibited from all parts of the country. It is probably the finest exhibition of rabbits ever held. Many great winners at London, and other shows have in consequence to receive second, third or fourth honors, or even less. There are ten regular classes, besides which, a class is provided for litters under ten weeks old, any other variety than the ten named classes, common rabbit, selling class, and a selling class for lops only, making fourteen classes in all. Except in the

class for litters, single specimens only (buck or doe) are exhibited. Perhaps it would be more satisfactory if the funds would allow of it, to have a separate class for each sex. Six classes of the four-teen are for lop-eared rabbits.

CLASS 1, Lop-eared, self colored, ten entries. The first prize, and gold medal for best rabbit in the show, was taken by one of the best black lops ever seen, a doe whose ears measured twenty-three and seven-eighths inches in length, by five and five eighths inches in width—she has large size, good dowlap, and is very fine in carriage, and her catalogue price is £50 sterling. Second is a fawn buck, eight months old, a good all-property rabbit, with ears twenty-three and five-eighths inches by five inches and one-eighth. Third, the largest lop-eared rabbit in the show, a strong, robust, black buck, with gray hairs scattered through his coat—he is excellent in head, eye and carriage, with ears twenty-three and one eighth inches, by five and seven eighths inches. Amongst the rabbits which did not win in this class, was a famous London lop, with ears over twenty-four inches in length—but it has no other quality to recommend it, its width of ears not being in good proportion to the length, whilst its head, body, style and carriage are inferior to many under-sized, common rabbits.

Lop eared, tortoise shell—Fourteen entries. The prize rabbits in this class were very good throughout in head, eye, and carriage, the does having good dewlaps, a property seldom possessed by a buck rabbit, which often makes it difficult to judge when both sexes compete together. First, a buck, twenty-three and one-fourth inches by five and one-fourth in earage; second, a doe, ears twenty-three by five inches; third, also a doe with ears twenty-two and three-fourths inches by five and one-eighth inches. Fourth, a buck, ears twenty-two and a half by five and one-eighth inches.

Lop-eared, black and white—Eleven entries.—An extraordinary class. First and second were very beautiful does, third and fourth, bucks; earage, first, twenty-three by five and one-half inches; second, twenty-three by five and one-fourth inches; third, twenty-three by five and one-fourth inches; fourth, twenty-two and three-fourths by four and three-fourths inches.

Lop-eared, yellow and white.—Twelve entries.—First, a very grand doe, as superior in head, eye and dewlap as in earage; ears twenty-three by five and one-fourth inches; second, a buck, ears twenty-two and one-fourth by five and one-eighth inches; third, in this class is one of the finest does in the show, although her ears are only twenty-two by five inches. She has about the finest eye and head, with good dewlap, and beautiful carriage, and shows by her robust, healthy appearance that she has not been forced, by being kept in an unnaturally hot room; fourth, a buck, twenty-one and three-fourths by four and three-fourths inches in ears.

Lop-eared, any other color, were principally gray and white, not a fashionable color. First, gray and white, buck, a large rabbit, ears twenty-two and three-fourths inches, by five and one eighth; second, twenty-two and one-eighth by five and one-eighth inches; third, the same in length of ear, but one-eighth less in width.

I have been particular in getting the earage of the winners, but the longest eared rabbits did not invariably win, and where they did not win they were invariably either not mentioned, or did not get higher than a high commendation.

The prize list would also differ very much if the sexes were separated for the reason given above.

Besides the lop-eared classes, are Himalayan, Silver Gray, Belgian Hare, Dutch and Angora.

Himalayan—21 entries, were a hard class to judge, the points of ears, feet and noses of some of the specimens being so black as to cause a suspicion of their being dyed. This class of rabbits (and a beautiful one it is) is probably bred as near perfect as it ever

will be. It is a most popular variety, pure white in body color, with black feet and black tips of ears and nose—or usually a burnt sienna color terminating in a nearly black point.—The difficulty in breeding being to get the points a jet black is a great temptation to some breeders to use a little dye for that purpose.

Silver Grays, 22 entries, a difficult variety to breed perfect; the fur should be dark in color evenly tipped throughout (every hair) with silver. Winter is probably the time for this variety to show to advantage, although great numbers are bred. Where a specimen of this variety wins at one good show, its victory is very likely to be often repeated, which proves the difficulty of breeding them to a high standard.

Belgian Hares, 15 entries. This is a true rabbit, but has a great deal of the appearance of a hare. They are not so large as the Patagonian rabbits, but are next to them in size. The show in this class is nothing extra as an exhibition of large rabbits.

Dutch, 21 entries. This charming variety of rabbit does not show any advance in quality. The specimens that are not too wide in collar or imperfect in blaze, are too large. The society has a good work before it in improving this variety, or in bringing it back small size and good markings. In one of the litters of this variety is the first approach to tortoise-shell Dutch, probably ever seen—not a perfect specimen but a beautiful combination of black, yellow and white.

Angora, 19 entries. The best class outside of the lops. Eight of the nineteen entries were mentioned by the judges. The form of the rabbits, carriage, length, and color of fleece leave little room for improvement.

The largest rabbit in the show was a Patagonian doe in the variety class.

Yours truly,
JOHN. H. CRYER.

(For Fanciers' Journal.)

ZOO NOTES, NO. 23.

BEARS.

(Ursidae, Major and Minor.)

In a former paper we have had some talk about the playful little "sun bears," which have a pleasant home in the carnivora house, but we have not as yet tackled a grizzly, black, brown, or even a cinnamon bear, and we now propose to pay a visit to the home of the above bruins, which is in the substantial bear pits in the south-eastern part of the grounds of the Zoological gardens.

These bear pits are three in number, built of stone, in a tasteful and substantial manner, well adapted for the comfort and convenience of the captives therein, and have cost the society about five thousand dollars. They are located in a pleasant position, facing the river walk, where, in the heat of summer, a dense shade from the fine old trees will fall upon the captive animals, sheltering them from the noonday sun.

Not only have the necessities of the bear's life been cared for, but his amusements have also been looked to, and from the centre of the pits rise good solid tree trunks, with plenty of limbs up which bruin may climb, and to the top of which he will quickly mount if you place thereon a piece of honey, or a good big apple. All the bears are great climbers, even grizzly, who has been supposed to be too heavy and clumsy for that kind of work. This is a mistake, as any visitor can see who will enter the garden with some sweet morsel, to tempt grizzly to play—

"Little bye baby, on the tree top."

Allow me, Halchen mio, to introduce to you, Rose Grizzly. She is well worth your notice; there are few animals so widely and deservedly dreaded as the grizzly bear, as it is acknowledged the superior in power to all the animals ranging over North America. The other members of the Ursine family are not given to attacking human beings, unless wounded, or their presence

invaded, but the grizzly is a perfect Ishmael; his "hand is against every man" as soon as he sees him, be he mounted or on foot, armed or unarmed; while his capacity and courage as a "fightist" are so great, that to slaughter one in fair combat, is rather a wonderful achievement on the part of the hunter, and which entitles him to much honor among his fellows.

And yet grizzly is not without his innate fear of man. Though he will attack one without hesitation, yet he seems not bold enough to follow up his track, and if he even comes into a current of air tainted by man's presence, he will escape as fast as his clumsy looking legs will let him, and to the natural instinctive fear of man, more than one hundred has owed his precious life.

In the earlier years of the grizzly (in cubhood, we might say) he can boast of a beautiful fur coat, brown in color, with a dark stripe all down his spine; so thick, long, and shaggy is his fur that it shakes up and down at every step he takes in his ungainly walk or shuffle. As he gets older, however, you cannot depend upon recognizing him by color alone, for it becomes very variable. In some of his race it will be a dullish brown flecked with white hairs; in others the entire fur is of a beautiful steel gray—in every case, however, the grizzled hairs (which give the animal its peculiar name) are very conspicuous, and cause a tendency to whiteness.

All the animals inhabiting the land over which the grizzly ranges stand in fear of him, and his skin even—flesh and bones out of it—will by its sight or scent, frighten some of them "into fits," while the bolder predaceous brutes hold him in such respect that they will not touch anything he has killed, for fear of punishment; the mere imprint of Rose's delicate feet on one of the slopes of her native Rocky Mountains would be a warning a hungry wolf would not be foolish enough to disregard.

The grizzly can be but partially tamed at the best. When quite young he is playful and somewhat amusing in his antics, but he loses his playfulness as he gets older, and being by nature rough in his manners, he is rather a dangerous playfellow, especially when he has grown to his full size, which is about eight feet six inches in length, and nearly the same in girth round his body—as broad as he is long you see—and his weight then should be about eight hundred pounds. Grizzlies have been found west of the Rocky Mountains, larger than this, however.

The "gentle savage" of the Rocky Mountain regions is not much given to fear, or the playing of practical jokes, but there is one joke he is sure to play on the green horn, who comes for the first time into the presence of a dead grizzly. Now, if you will take another look at Rose, you will see that she has an enormous head and a very short tail, and what there is of that caudal appendage, is nearly lost in the thick fur which covers her. Well, when "Red Modoc" wishes to be funny he persuades the "green horn" that he can easily lift the ponderous beast if he will seize it by the tail. Yes, just as the little bird is caught by putting some *fresh salt on its tail*.

Now, allow me to introduce you, Halchen mio, to "Reuben" and his wife, who inhabit the next compartment. "Reub" and his wife are black, (*Ursus Americanus*) and therefore entitled to "civil rights" just now. "Reub" was presented to the garden by his "holiness" the much-married Brigham Young, prophet and ruler of a "peculiar people." "Reub's tribe it is which furnishes "bear steak and grease." "Bear steak" is toothsome to those who love pork, which "abomination" it much resembles in taste, so much so that the dealers out West, when they find the bear market overstocked, sell it for hog, but are not always able to keep the new "Plymouth commandment"—"Thou shalt not be found out!"

The black bear is much more easily tamed than the grizzly, and not near so dangerous, though he will commit murder if he gets a chance. Indeed I fear "Reub" has done something worse

—murder I know he has committed. Did not an unfortunate young cub of his own tribe, offend him by seizing an apple to which "Reub" thought he had no right or claim? Not the first apple which has caused trouble. (Woe's me! that so delicious, useful and innocent fruit should cause moral as well as physical death!) Well, did not Reub with one dash and crunch break the poor fellow's neck? Aye, did he—and then—(O! horrible to relate) were not twins born unto him, and did they not disappear—vanish away, leaving not a trace behind, not a feather nor bone? Now, bears will eat their children, but who did this deed of infanticide—whether one or both of these cruel "parents"—can never be known, but well might one exclaim with the sublime poet—

"If so soon they were thus done for,
We wonder what they were begun for."

It is certain that bears are not particular as to their diet; being omnivorous, everything is "fish which comes to their net," but there are two things the bear dearly loves, and which he will risk much to get—namely, honey and young pig!—separately, he takes them, however, and his love for the honey has cost him many a bugged eye and swollen lip by bee stings, while for the love of the pig, more than one bear has yielded up his life. A sucking pig, when seized by a bear, is very apt to let the fact be known in a succession of very loud, if not musical squeals, which squeals are very likely to fall upon the ears of piggy's owner. Then "fire irons" are taken down—dogs are let loose—their furious baying soon sends bear to tree, when rifles very quickly settle the account of poor bruin.

The brown bear and the cinnamons, which occupy apartments in the pits, are but varieties of the black bear. The cinnamons are the most playful of the "pitites," and not being so heavy as their neighbors, are much more expert in climbing their trees. A few years ago, "cinnamon" had no particular reason to love the ladies very much, for many a one "bit the dust" that its rich brown fur might trim their pelisses, mantles, jackets and other feminine fixin's." Then, a first-class cinnamon's skin was cheap at two hundred dollars, but one day Dame Fashion said, "take the skin of another animal to beautify yourselves with, ladies," and she pointed to the "white thighed" monkey; poor Jocko had a hard time after, though the "cinnamons" lived longer, and the best skin at this day is not worth more than twenty dollars, instead of two hundred.

Bruin seems a toper by nature! I never knew a tame bear that would not drink whiskey—if he could get it! The proprietor of the "Old Log Cabin" on the Wissahickon, (years ago, before any one ever dreamed of a park) had, among quite a collection of various animals, a large black bear, which loved whiskey so well, that without his "tap," he was very troublesome and quite unbearable, and his visitors, to watch his antics, used to stand treat to him very often. When "half seas over," bruin would leer, smile, grunt, roll about from side to side, and by turns be loving or savage. One day, the unfortunate brute came to a sudden and unnatural death. He was decidedly tipsy, when some fellow, (more of a brute than he) gave him a porter bottle containing a considerable quantity of whiskey, well corked up, as part of the fun was to see the bear extract the cork, a business which he seemed to thoroughly understand. Now whether the bear was too tight, or whether the cork was too tight, cannot be told, but by some means the bottle slipped down the poor bear's throat; there it stuck, and before relief could be obtained, bruin had choked to death—a warning to all bears to abstain from whiskey and whiskey bottles, unless the cork is first extracted.

HUON.

The word honey is undoubtedly derived from the Hebrew *ghoney*, which means delight; an appropriate name.

A CUNNING COON.

"Once a week" tells the following entertaining story of a shrewd coon the author met with some years ago, in America. He says: "I was down South, and had dealings in cotton and sugar, doing a little bit of duck shooting for a change, in the lagoons, where I also fished (?) for hideous little alligators, abominations for which I had a most wholesome hatred.

One day Pete, a gentleman of ebony countenance, opal eyeballs and ivory teeth, a thoroughly merry darkey who was my companion in many a fishing trip, came grinning up to me with some thing tied up in a pocket handkerchief, and on opening it there rolled out a furry-looking little animal, which proved to be a half-grown raccoon, one which, on arriving at maturity, was as tame and companionable as a dog. He was a handsome little fellow, in his dusky gray coat, white ringed tail and a patch here and there of white. But it is not of his personal appearance that I wish to tell, but his antics and tricks. In the former he resembled a kitten in the way in which he would roll over, curve his tail, or seize my hand to pretend to bite it; in the latter he was A 1 in the cunning he displayed. Peter used to say it came natural to him, but I have my suspicions that it was my black friend who taught "Dick," as I called him, to drink rum and water and get hopelessly intoxicated thereon; to find oysters on the shore with their shells open, and with one rapid dash of the paw, scoop out the mollusk without getting caught.

Another of "Dick's" games was land crab hunting, and he would chase the crawling objects to their holes, or hunt out the said holes, and then inserting his paw, he would fish the crab out, seize him in his mouth, avoiding the nippers, and then—scrunch!—it was all over with the crab, while "Dick" sat blinking with his bright eyes in thorough enjoyment.

There was not much to be done with "Dick" during the day, when he would tuck his nose in the warm fur between his legs, curl up and sleep like a top; and it was not until evening, that he would become lively.

Take him down to a lagoon on a moonlight night, and "Dick" would be in his glory. He would scuffle out on an overhanging bough, then thoroughly assimilate himself with it by crouching so close that you could hardly make him out; and then he would allow his busy tail to drop into the water, moving it very softly about, and waiting for a bite.

He would not wait long as a rule, for over and over again I have stood and watched him, till I have become aware of a slight movement in the water, when, with a spring that was like lightning, "Dick" would throw himself ashore and in nine cases out of ten with a crab tight hold of his bushy tail.

Then there would be a slight scuffle, "Dick" would sit up on his hind legs, with the captive that had tried hard to regain the water, hold his prey in his fore paws, and crunch him up with the greatest of zest, before going to fish for another.

But they were not crabs which always came to "Dick's" fishing tackle. Before now a little alligator of some eighteen inches long has seized it, and been shaken off by "Dick," who evidently did not wish for a nearer acquaintance. The other creatures attracted were a kind of turtle—alligator turtles we called them—hideous little creatures, and with a very small carapace, and a long snake-looking head and neck, armed with a bird-like, nipping mouth; I detested the things, placing them next to alligators; but "Dick" liked them, for there seemed to be a good deal of succulent food contained between their shells. These fellows were very easily attracted to "Dick's" tail upon his fishing expeditions; they bit readily, but the result was not all that could be desired.

"Dick" would be crouching on a tree trunk, close over one of the silent, oily-looking reed-fringed pools, when suddenly, as I watched, a snake-like head would rise out of the water, followed by a lumpy shell. Then another and another would be thrust up,

and the owners would silently paddle to the moving fur, look at it intently for a few moments, and then one would make a grab.

Evidently knowing his customers, "Dick" would wait patiently to let him get hold fast before making his spring. Then off he would go for the shore or the shallows, with as big a bounce as his muscles would sustain; but as a rule the result was only a loud splash, the turtle fell back into the water, and "Dick" had to resume his tactics, and generally without success till a crab came, when, with a short bark of delight, the clever little animal would set to and feast.

When however, by chance "Dick" did succeed in getting his prey ashore, there was no fight shown beyond one sharp snap made by the turtle, one easily avoided by "Dick," who would seize the reptile by the back of the neck, and drag the soft part piecemeal from between the shells; for if he were not sharp over his work a task was in store for him, the turtle giving up all hope of reaching the water, and retiring within his hard leathery carapace.

"Dick" afforded me many an hour's amusement; but one evening, when I had him out, he must have been seized with a desire for freedom. He darted off into the undergrowth—as I thought in pursuit of something, and he never came back. Domesticity was all very well; but "Dick's" motto was evidently, "A life in the woods for me."

♦♦♦

A New Hampshire cat has distinguished herself. A canary-bird belonging to her mistress recently escaped and flew out of doors. All attempts to recapture it proved useless, and it soon flew out of sight. Three days afterward the cat brought the bird into the house and laid it, safe and sound, at the feet of its owner.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

For "EXCHANGES FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the **Exchange** or **Want** column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

GEO. M. WONSON, East Gloucester, Mass., has several trios of Aylesbury Ducks to exchange for Silver-Spangled Hamburgs, White-crested White Polands, and Golden Sebright Bantams. My Ducks are very fine, and laying nicely.

JOSEPH REBMISTER, Batavia, N. Y., will exchange one pair Red Tumblers, also one Crested Male Fan Tail, one White female Jacobin, for one pair of Turbils. I want good birds.

C. M. BOYNTON, Concord, N. H., will exchange Buff Cochins and White Leghorns, in "trios or singly," for a Lawn Mower, or for Gas Fixtures, ornamental ones. Stock first-class. Address as above.

C. H. WILCOX, Earlville, Madison Co., N. Y., wants to exchange some of the following fowls for a pair of Ferrets, one year old, or Berkshire Pigs, (pedigree stock), one trio B. B. Red Game, one trio Derby Games, one pair of Duckwing Games, one pair of Himalayas Cochins, one pair Silver-spangled Hamburgs, four Duckwing Game Bantam cocks. Fowls one and two years old. Health, true to name, and well marked.

PHILIP ROGERS, Baltimore, Md., will exchange six or eight Light Brahma cockerels, last June's hatch, first-class birds, for pullets of same variety.

Wm. P. SEAL, 622 Arch St., Philadelphia, wants to exchange fine specimens of Selenite from Nova Scotia, and of Cryolite, containing specimens of Galena; Siderite, and Sulphuret of Iron, from Greenland, for specimens of ores or other minerals. What offers?

GEO. W. DIXON, Worcester, Mass., will exchange imported Lops, Buck, 21x5, value \$25.00; Buck, 20x4½, value \$20.00; Doe, 21x4½, value \$20.00; Doe, 15 x4½, value \$12.00. Pair of Himalayas, valued \$10.00—6 in all, for \$40.00 cash, or merchandise at full value of each animal. White and Colored Guinea Figs, and 2 pair young Lops, for most anything excepting live stock.

A. C. HELTZEL, 807 North 2d St., St. Louis, Mo., will exchange Gray Foxes, single or in pairs, not akin, and two to four months old, for B. H. R. Games, or a Male Black and Tan Terrier pup, or offers. All letters promptly answered.

GEO. W. SCHEFFER, No. 21 South 2d St., Harrisburg, Pa., will exchange a young Coach Silt, 4 months old—she is a beauty; also 3 Light Brahma hens, pair of fine Peacocks, 1 pair of pure white Muscovy Ducks, they are large and of good stock; also small printing press, for Fancy Pigeons. Make me an offer. Speak quick.

BOX 489, Middletown, Ct., will exchange a Liver and White Pointer, 16 months old, fairly trained—a staunch dog; for an English Setter, well broke.

JOHN D. WHITE, Chicopee, Mass., will exchange a fine cockerel and one or two pullets Partridge Cochins, for a pair or trio of Golden-penciled Hamburg pullets. First-class birds wanted.

HERBERT LODEL, Box 638, Stamford, Conn., would like to exchange a few good White Leghorn hens, for Plymouth Rock hens of same quality.

JOHN KNOX, No. 9, Piensant St., Hartford, Conn., would like to exchange choice White Leghorn Eggs, for Eggs of some well-known reliable strain of Brown Leghorns.

J. F. FERRIS, Hartford, Conn., would like to exchange a policy of Life Insurance in one of the best companies in the country, for a good horse and buggy. Write for particulars.

ROOM 7, P. O. Building, Hartford, Conn., would like some fine American Song Birds, or Canaries, with cages, in exchange for choice selected eggs of most any variety. Write on Postal Cards, or any other cards. Double quick.

JOHN D. WHITE, Chicopee, Mass., will give fine young pair of Yellow Barbs, with pearl eyes and short face, for a pair of choice young Duns of same breed and same qualifications, or pair of Dun Carriers.

J. B. TUCKERMAN, Eaton, Madison Co., N. Y., will exchange one pair Pouters for pair Tumblers, one trio Golden Polish and one pair Silkies for Scotch Terrier or Newfoundland dog pup, or others in anything else but live stock. All correspondence answered.

SMITH & BRO., Stony Brook, N. Y., will exchange one pair of Blue Wing Turbids, one pair of Gold Sebrights, Silver Duckwing Bantams, for American Dominique, Polands, Hamburgs.

J. H. PHILLIPS, Coventry, N. Y., will exchange one Red Jacobin cock, 1st premium bird, for pair of Black or White Fantails. Must be good birds.

G. W. SEYBOLD, 23 Rowland St., Newark, N. J., will exchange a Red Setter Dog (broken); also a Cocker Spaniel, and a White Spitz bitch, for White Leghorns or Fancy Pigeons. What offers?

G. A. WIDMER, Rochester, N. Y., will exchange Himalayan and Angora Rabbits, Guinea Pigs, Prairie Dogs, Prairie Squirrels, Ferrets, White Game Bantams, and Ring-Neck Doves, for Flour, Screenings, Peterson's Coin Book, pure Black Lop-eared Dove, Standard of Excellence, Webster's Unabridged Dictionary, or a Modern Atlas. Don't be afraid if it is from Rochester.

ALFARD, 17 Clinton Place, New York, exchanges splendid Ferrets, imported Brass Back and Pile Game cocks, pair of Pea fowls, fine red Jacobin cocks, imported glass case Watches, new and warranted, for Berkshire, Yorkshire, Poland China Pigs, eight weeks old, heavy Asiatic fowls, or any variety of Fancy Pigeons.

FANCER, Room 7, P. O. Building, Hartford, Conn., would like a nice sitting of Duckwing Game Bantam eggs, in exchange for other eggs of Leghorns, Cochins or Brahmas.

ABRAHAM PERRY, Mourne, N. Y., will exchange his two fine female Beagle Hound pups, three months old, sire is Snider, grand sire imported; some best deer dogs in the country, and handsome in every respect; pups very nice, one black and white; other yellow and white, long slim tails.

HARVEY LAMBERT, P. O. Box 25, Emmitsburg, Frederick Co., Md., will exchange 3 hens and 1 cock, White Leghorns, for either caponizing instruments, P. Rock, L. or D. Brahma hens or pullets, Game Bantams, Maltese kittens, Doyle's Poultry Book, Pigeons, Pouters, Magpies, Turbids, Archangels, Antwerps, Runts, or Mocking Bird.

DR. J. THOS. BUSSEY, Emmitsburg, Md., wishes to exchange Partridge Coochin cock, 2 pullets, and 2 chicks, Henry & Hestier strain, for Houdan pullets, or W. C. B. Poland cock and pullets. Must be No. 1.

A. BERNIS, Box 833, East Saginaw, Mich., will give a fine Meerscham cigar holder, warranted good, very richly colored, for one good Brown Leghorn cockerel, Kinner's strain preferred.

BOX 27, Centerville, Md., will exchange a pair of genuine Rabbit Beagle pups (male and female), 3 months old, small size when grown, for No. 1 Fancy Pigeons, Turbids, Pouters, or short face Bulls preferred.

W. L. HOLTON, Centerville, Md., will exchange a splendid singing Mocking Bird, one year old, for pair first-class Pied Pouters. None other wanted.

FANCER, Delaware City, Del., has to exchange one White Ruffie hen, for a White Ruffie cock, or Red Fans. Must have pearl eyes, as mine has.

H. B. & E. T. BLAKE, Sidney, Ohio, will exchange eggs from any of the following varieties: L. Brahma, P. & Buff Cochins, for rare coins, shot gun, revolver, or anything that don't eat.

WM. B. MARTIN, Box 233, Thompsonville, Conn., wants Black Bad-head Turkey Pigeons good birds, mated, in exchange for Partridge Cochins, or Black Braasted Red Game fowls.

W. I. ROW, Greensburg, Pa., would exchange a pair of thoroughbred Berkshire pigs, eight weeks old, not akin, for a pair of thoroughbred Suffolk pigs, not akin. Nothing inferior given or taken. Write.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

ALBERT REMENERS, 1023, 1025, and 1027, Passyunk Ave., Philadelphia, Pa., wants Common Pigeons, at 25 cents per pair, in small and large lots.

J. H. D. SMOOT, Alexandria, Va., wants one pair of White Fowl Black Pigeons.

THIRD AND LAST CALL, Every member of A. P. A. wanted to see.

W. I. ROW, Greensburg, Pa., wants one or two pairs Virginia Nightingales. Address, with lowest cash price per pair.

C. G. WILSON, Millbury, Mass., wants a Silver Duckwing Game Bantam cock, not over two years old; must have a clear hackle, be long in the leg, and in every respect a good bird to breed from. Write immediately.

J. S. HOEFMAN, Williamsport, Pa., wants Golden Sebright Bantam hens or pullets; Blue Pied, Solid Black or Solid White Pouters, and Pekin Ducks, in exchange for Tegetmeier's Poultry Book; 18 Nos. of History and Biography of Eminent Men and Women of Europe and America, (a splendid work); Books to learn German without a teacher; a good Musket; and Light Brahms eggs from first-class stock. No culis or rubbish wanted. Describe what you have particularly.

S. K. FERRIS, Stamford, Conn., wants nice fresh-laid eggs of Brown Leghorns or Game Bantams, in exchange for White Leghorn eggs from a nicely mated pen of choice birds.

PIGEON FANCER, Box 486, Hartford, Conn., wants Common Pigeons, good healthy birds, in lots of 10 pairs and upwards, at 25 cents per pair, or will exchange good thoroughbred fowls for same.

H. J. HALL & CO., Box 496, Hartford, Conn., wants some good serviceable Water Fountains for Poultry, different sizes, in exchange for eggs from a magnificent pen of prize-winning Dark Brahmas.

J. F. FERRIS, 216 Main St., Hartford, Conn., wants Ground Bone, Crushed Oyster Shell, Beef Scrap, or Poultry Pictures of any kind, for which I will send choice selected White Leghorn eggs of my well-known laying strain, at rate of \$1.50 per dozen.

BLACK ROSE-COMB BANTAMS, MY SPECIALTY.

Black African Bantams.

Fine Light Brahmas.

During the show season of 1876 my stock won ten first premiums. Having exhibited them myself at four exhibitions, winning six first premiums on old and young, some figuring as high as 97 points, this fact alone should be a sufficient guarantee of the purity of stock and perfections of markings. No birds to dispose of at present. C. B. ELBEN, Pittsburg, Pa.

J. H. SCHOCK, S. W. corner Tenth and Buttonwood Streets, Philadelphia, Pa., dealer in Segars, Weekly Papers, Stationery, etc.; will also supply Fanciers' Journal promptly by mail or at the store.

PEDIGREE A NO. 1.

I have shown L. and D. Brahmas, and Pea-Comb Partridge Cochins 17 times, and have won 16 first, "1" second, and two special premiums; stock from Pelch, Williams, Herstins, and Edmonds noted strains. Eggs \$3.00 per 12. H. PARHAM, Lima, O.

KINGDOM OF HOME.

Flashes the firelight upon the dear faces,
Dearer and dearer as onward we go,
Forces the shadow behind us, and places
Brightness around us with warmth in the glow.

*King, King, crown me the King:
Home is the Kingdom and Love is the King!*

Flashes the lovelight, increasing their glory,
Beaming from bright eyes with warmth of the soul,
Telling of content and trust the sweet story,
Lifting the shadows that over us roll.

*King, King, crown me the King:
Home is the Kingdom and Love is the King!*

THE COMMON PEOPLE OF EGYPT.

A correspondent of *The London Times*, writing from Mansourah, in the Delta of the Nile, gives the following picture of the small Egyptian villages and their inhabitants: Each I saw was almost deserted. Only a few old women remained in charge of the tiny children not yet fit to join in the struggle for existence; all the rest—men, women, boys, and girls—were out in the fields, working from sunrise to sunset to keep life together. Other villages told the same story, every traveler in Egypt confirms it, and I am not going to draw any more harrowing pictures. Quite enough has been said to show that the agricultural population—nine-tenths of the whole people of Egypt—have benefited very little by the superficial progress, the material civilization for which the country is so remarkable. The historian of Mahomet Ali said, "The traveler sees with astonishment the richness of the harvests contrasted with the wretched state of the villages;" and the introduction of railways and canals has not changed this unfortunate state of things. But, as regards what I have described, the genial Egyptian climate must always be remembered. Sunshine and warmth for three parts of the year make a house of little importance, and, though earnings are very small, a constant succession of crops creates the same demand for labor at every season. The Dorsetshire laborer, with his slack times, and Winter rains, and climate demanding much food and clothing, is an object of more legitimate pity than the Egyptian fellah. But the Egyptian fellah ought not to be an object of pity at all. Egypt is virtually a neutralized country, and war cannot devastate it. The natural wealth of its soil is such that with a wooden plow which, as compared to the English plow, is as a pin is to a spade, the land returns threefold the produce of any land in England. The Nile does for Egypt what art has to do elsewhere. Yet in this country, so favored by nature, the mass of the population is in a state of misery. From sunrise to sunset, men, women, and children are at work in the fields to gain the barest necessities of life. The philosopher who deemed him happiest who has the fewest wants ought to have been an Egyptian fellah. He is sometimes even born in the fields. The women work up to the day of their confinement. They lie up one day, and are out again the next, and the baby is laid near them in the fields on a bit of sacking. Ignorance and pover-

ty lead to other sad consequences. Premature old age comes on at 40, and the population is kept down by a terrible infant mortality. Out of the 140,000 annual deaths, 80,000 are of infant children. It has been calculated that three out of every five that are born die before the age of two. For those that survive, an old Egyptian custom that is still practiced is most symbolical of their future. The child is put into a sieve and rolled about to the beating of drums. "It is in order to harden him," say the people.

THE CULTIVATION OF ENERGY.

The cultivation of energy is of the greatest importance, resolute determination in the pursuit of worthy objects being the foundation of all true greatness of character. Energy enables a man to force his way through irksome drudgery and dry details, and carries him onward and upward in every station in life. It accomplishes more than genius, with not one-half the disappointment and peril. It is not eminent talent that is required to insure success in any pursuit so much as purpose; not merely the power to achieve, but the will to labor energetically and perseveringly. Hence energy of will may be defined to be the very central power of character in a man—in a word, it is the man himself. It gives impulse to his every action, and soul to every effort. True hope is based on it, and it is hope that gives the real perfume to life. There is a fine heraldic motto on a broken helmet in Bolton Abbey, "L'espoir est ma force," which might be the motto of every man's life. "Woe unto him that is faint-hearted," says the son of Sirach. There is, indeed, no blessing equal to the possession of a stout heart. Even if a man fail in his efforts, it will be a great satisfaction to him to enjoy the consciousness of having done his best. In humble life, nothing can be more cheering and beautiful than to see a man combating suffering by patience, triumphing in his integrity, and who, when his feet are bleeding and his limbs failing him, still walks upon his courage.

More wishes and desires but engender a sort of green-sickness in young minds, unless they are promptly embodied in act and deed. The good purpose once formed must be carried out with alacrity, and without swerving. In many walks of life, drudgery and toil must be cheerfully endured, and the necessary discipline of life. Hugh Miller says the only school in which he was properly taught was "that world-wide school in which toil and hardship are the severe but noble teachers." He who allows his application to falter, or shirks his work on frivolous pretenses, is on the sure road to ultimate failure. Let any task be undertaken as a thing not possible to be evaded, and it will soon come to be performed with alacrity and cheerfulness. The habit of strenuous, continued labor will become comparatively easy in time, like every other habit. Thus even men with the commonest brains and the most slender powers will accomplish much, if they will but apply themselves wholly and indefatigably to one thing at a time. Fowell Buxton placed his confidence in ordinary means and extraordinary application, realizing the Scriptural injunction, "Whatsoever thy hand findeth to do, do it with all thy might;" and he himself attributed his own remarkable success in life to his practice of constantly "being a whole man to one thing at a time."—*Economist*.

POULTRY DEPARTMENT.

THE ROOSTER.

*A Poe-hymn originally and ornamentally written by
A Longfellow.*

Once upon a midday cleary, as I lingered weak and weary,
After sending many a quaint and curious mixture
My stomach to explore,
While I nodded, nearly napping, suddenly there came a flapping,
As of some one lightly slapping, slapping at my kitchen door.
"Tis some peddler," I muttered, "slapping at my kitchen door.
Only this, a deuced bore."

Ah! distinctly I remember, it was in the month September,
And the last expiring ember had gone out and smoked no more,
And I cared not for the morrow and I felt no pang of sorrow,
For I'd eaten ears a long row, ears of corn some half a score,
Corn and beans and apple dumplings, with the fixings, as of yore.
All of this besides much more.

And light blasts of wind uncertain, caused a rustling of the curtain,
Filled me with a dreamy feeling, I had often felt before,
No in time with my still breathing, I kept in my mind repeating,
"Tis some peddler now entreating entrance at my kitchen door,
With a lot of yankee jimecracks, or some book, with me to bore.
Only this and nothing more.

Presently my mind grew stronger, hesitating then no longer,
Sir! said I, your books and jimecracks I've seen quite too oft before;
But the fact is, I was dreaming, and the stillness intervening,
Gave it all the shade of seeming that I heard the scamp, Bill More,
The scamp who stole my chickens, whom the public calls Bill More—
Name fictitious evermore.

While thus o'er my dinner napping, half awakening, faintly gaping,
Soon I heard another flapping, only louder than before.
Surely, said I, certain that is a vain attempt to scare us;
Let me see what the old cat 'tis, and this mystery explore;
'Tis the wind, I faintly muttered, as I gazed towards the door.
Only this and nothing more.

Open then I threw the back door, when with many a flap and flutter,
Up there stalked a stately rooster, a saintly bird of yore.
Not the least obeisance made he, not a moment stopped or staid he,
But as bold as modern lady, perched outside my kitchen door,
Perched just upon my wood pile, perched outside my kitchen door.
Perched and sat, and nothing more.

Then this silly bird beguiling my wild fancy into smiling,
By the proud, important bearing and the countenance he wore,
"But you're better than a raven, or else I'm badly shaven,
Tall, proud and ancient rooster, wandering from the henroost door,
Tell me what the deuce has sent you here before my door?"
Quoth the rooster, "Coccadoodledoo," and nothing more.

Much I wondered, long I pondered, as my imagination wandered,
On the meaning of this tall bird, as he did these words outpour.
Surely, said I, friends are coming, this is a signal warning,

Soon I'll hear the cars a-humming, bringing friends of days of yore.
Then the bird with ruffled plumes cried louder than before,
Coccadoodledoo, and nothing more.

Then I stood engaged in guessing, but no syllable expressing
To the bird, who, with his bill, now snapped up an apple core.
All these things I stood divining, with my head at ease reclining
On an old peajacket lining, which hung beside the door;
But that old peajacket lining, that chicken thief, Bill More,
He shall wear, no, never more.

"Rooster," said I, "art thou evil, for thy action is uncivil?
By the corn up in the garret, by the hinges on the door,
Tell me what thy fowlest name is, lest I thy slender neck twist,
And spoil thy feathered necklace, and thy foul blood do outpour."
Then the bird with neck outstretched, and now much longer than before,
Cried, "Coccadoodledoo," and nothing more.

"Prophet," said I, "bird uncivil, prophet still, if good or evil,
Whatever may have sent thee here, to crow before my door,
Tell my mind suspicion filling, and the sheriff should be willing,
He should grasp a thieving villian, whom the neighbors call Bill More,
Grasp the thief who stole my chickens, whom the neighbors call Bill More?"

Said the rooster, "Coccadoodledoo," and nothing more.

"Be that word our sign of parting," said I, "old cock," upstarting.
"Get thee back into the henroost, give me not a sentence more.
Leave no feather as a token that my dinner nap you've broken,
Leave the silence 'gain unbroken, quit the wood pile 'fore my door,
Take thy claws from off my woodpile, take thy form from 'fore my door."

Said the rooster, "Cuttercadapcut," nothing more.

But the fact is, time is flitting, and the cock is daily sitting
On the remnant of the wood pile, quite near my kitchen door.
And his neck is still unbroken, tho' of pot pie oft I've spoken,
For those distant friends a token that I cherish them still more.
And the rooster every morning crows as loud as e'er before,
Coccadoodledoo, ever more.

(From Journal of Horticulture.)

THE EXHIBITION DORKING.—No. 9.

BY T. C. BURNELL.

Prize fowls, to a certain extent, are reared in an artificial manner; the result is that deformities and diseases are more frequently found in them than in hardily-reared farmyard stock, though the latter are often thought to be more perfect than they really are. Not many farmyard fowls would stand being scanned by a critical eye, while, from what I can find out from farmers, they lose very nearly as many fowls from death and disease as we do among our own more highly reared stock. Anyone thinking of becoming an exhibitor will do well to make himself acquainted with the most common defects, so that he may not be taken in when buying, nor waste entry money in sending out birds which he ought not to expect to win.

A Crooked Breast can be easily found out by passing the hand along the breast bone. If the bone is badly curved or indented the specimen should be rejected, as the defect is often hereditary, and will nearly always prevent such a bird from winning in the show pen.

Crooked Back, though sometimes apparent, can often only be ascertained by handling. The best way to proceed is to allow the weight of the bird's body to rest on one hand with the legs hanging down, while the other hand is passed down the back. If the spinal column rises in the middle it is called *hump back*; if the spine is twisted, *wry back*; while if a lump is found on one side of the body higher than the other, the *hip bone projects*. The latter deformity often causes the tail to be held on one side, called *wry tail*; but this latter will in a young bird sometimes proceed from weakness and inability to hold the tail upright, but

it should always be regarded with suspicion. A *squirrel tail* is when the tail is carried right over the back and almost touching the head. The latter is a great eyesore, and, as well as the preceding malformations, is most surely hereditary.

Bumble Foot is an enlargement or inflammation of the feet or toes. It is not peculiar to Dorkings, but is found in all large breeds, and I have seen several cases of it in the yards of one of the largest and most successful Brahma breeders in the south of England. Sometimes it occurs owing to a thorn or stone being driven into the sole of the foot and occasioning inflammation; but these cases are rare, and I am convinced it is generally an hereditary complaint, like gout in the human subject, and the only way to get rid of it is to ruthlessly blot out every specimen diseased this way, or at least not to breed from them. My old Dorking cock, cup at Birmingham and second at Crystal Palace in 1873, up to his death at nearly four years old, never showed the least trace of bumble foot, nor have I ever found it in any of his chickens; while, on the other hand, a fine bird which I bought cheap to breed from, thinking that a bumble foot would be no detriment for the purpose, threw chickens which showed corns on their *upper* toes when many of the birds were not six months old. The mischief generally begins by a corn growing in the pad of the sole of the foot, and this often proceeds no further. To prevent accidents, though, it will be better to pick this out with a blunt penknife, after first soaking the foot in warm water. Occasionally a little blood may appear, when it will be better to apply lunar caustic to the hole, as is frequently done to stop the bleeding from a leech bite. There will be far less chance of blood flowing if the operation be performed in the moulting season, when the blood flows principally into the newly-forming feathers. If a toe should become enlarged from any cause, accidental or otherwise, the swelling may be reduced, if not of too long standing, by the daily application of tincture of iodine with a camel's-hair brush.

Cram occasionally occurs in damp yards. The sufferer should be placed alone in a dry house or pen, and be bedded down in hay or straw, till he recovers the use of his legs. I do not believe that any physic will do good, and patience is all that is required.

Diarrhœa is occasionally troublesome; it is caused by some irritating substance lodging in the intestine. A large tablespoonful of castor oil is the best remedy, as that will remove the evil. With little chickens a meal or two of boiled rice sprinkled with powdered chalk will prove sufficient in most cases; or small pills may be made up of prepared chalk and chlorodyne, only using sufficient of the latter to consolidate the chalk. Each chicken to receive one twice a-day. This is troublesome, but those who will not endure trouble will not succeed in chicken-rearing.

Gapes—little chickens often fall victims to this disease. A small and tenacious worm is developed in the windpipe, which the chicken endeavors to dislodge by repeatedly gaping or opening the mouth, and this symptom gives the name to the disease. A simple remedy is to administer a small pill of pure camphor to each chicken daily. The best preventive is never to allow young chickens to drink stale or impure water, and always to keep camphor in the water.

Relaxed Crop cannot be cured by any medicine, unless perhaps when it first makes its appearance. It is a great eyesore, but when once established cannot be remedied, and so the only plan is to put up with it. If a fowl swallows any hard substance too large to pass into the gizzard, the proper course is to cut open the crop with a penknife and remove the offending matter; the wound should be made no larger than necessary, will bleed very little, and will rapidly heal. I consider slack crop to be hereditary, and by repeatedly breeding from birds with this defect we

could doubtless soon produce crops in fowls relatively as large as those of Pouter Pigeons.

Roup has rightly been called the scourge of the poultry yard. It generally proceeds in the first instance from a bad cold, but when a case is once established in a yard the germs of the disease are carried in the air and breath. The disease generally becomes apparent about the third day of infection; till then it is latent. Preliminary symptoms are sneezing and rattling in the throat, but occasionally one eye will become suddenly closed. When the running at the nose appears the disease is developed, but sometimes birds will run at the nostril without any previous warning. In every large poultry yard there should be a hospital pen in some out-of-the-way corner, where sick birds may be placed on the first appearance of illness, not only for their own comfort, but to prevent contagion. If a roup-y bird has once been placed in this pen it should afterwards be kept for roup-y birds alone, and should be periodically limewashed. In bad cases of roup, especially in old birds, the eyes close, the head swells, the discharge from the nostril and mouth becomes thick and purulent, and death soon supervenes. If the affected bird is not very valuable it should be killed on the first appearance of the disease, and buried to save the other fowls, as the disease is very contagious. The discharge from the nostrils proceeds from the mucous membrane of the back of the mouth and throat, and the only other disease to which it is analogous is glanders in the horse, the latter being equally infectious. The moment the disease appears Condry's red fluid (principally permanganate of potash) should be added to the drinking water till it becomes of a pinky color, and chloride of lime should be sprinkled about freely; and both precautions should be adopted through the whole yard. The only internal remedy which I have found effective—and I have tried them all—is a mixture of copaiba and oil of cubeb, in the proportion of four parts of the former to one of the latter, the dose to consist for a large fowl of twenty minims of the mixture made up in the form of a gelatine capsule; or copaiba capsules alone will do. A Dorking cock would require at least three capsules, or about sixty minims, in the day, to effect a speedy cure. In addition to this, the bird's throat, mouth, eyes, and nostrils should be sponged out daily with a strong solution of Condry's fluid, to correct the fœtor of the discharge and to promote more healthy action. I have not known the above remedies to fail, and may claim some little experience, as last autumn I bought ten old farmyard fowls purposely to experiment on. I shut them up in an old wood house at a cottager's with a bird in the most advanced state of roup, her eyes being nearly closed, the discharge from her nostrils most offensive. They had no water to drink, but moist meal twice a day, and on the fourth day eight out of the ten had a running at the nose and the others soon followed, and several of them rapidly became worse. I commenced the treatment above recommended on the eighth day, and before a week was over the whole were cured, including the hen which introduced the disease. The shed where these birds were confined was thatched at the top but open at the sides, and consequently the foul air blew away. I think this a better plan than shutting the birds up in a close stuffy pen.

Shell-less eggs with Dorkings are invariably caused by the hens being too fat; starve the birds for a day, and then feed them principally on vegetable food, to reduce the system.

For all slight indispositions I give a large tablespoonful of castor oil. Fowls will stand as large a dose of aperient medicine as a human being, and the reason why medicine is not generally effective with them is, that not sufficient is given.

Zinc ointment is very useful for cuts or wounds.

REMEDY FOR PIP.—Castor oil is called an excellent remedy. Give it every alternate day for a week.

(For Fanciers' Journal.)

SUPREME SELFISHNESS—REPLY TO "YOUNG BREEDER."

[During our removal the following article in reply to Young Breeder got mislaid, like many other good things. But it is too valuable to be lost, hence we produce it at this late day.]

The main design in publishing the awards at our exhibitions is to let the public know who are the most reliable or successful breeders. Premiums are chiefly valued by the majority of exhibitors, because they serve as a recommendation of their stock, thus enabling them to sell their surplus to better advantage. But if the premium birds have been purchased for the exhibition they are not specimens, or in any sense representations of stock which the exhibitor has bred and has for sale, and the publication of the awards carries a falsehood on its face. He who advertises his stock by parading before the public premiums won by fowls bought for the purpose, is practicing a deliberate fraud upon his customers.

Yet "Young Breeder" must be very young in the poultry business if he is not aware that this is frequently done.

I would have no objection to taking the "one more step" suggested by "Y. B." by requiring exhibitors to state the strain or strains from which their birds originated. This would assist in determining what strain or strains are entitled to the first place in publication.

There are very many breeders however, who now advertise their stock as bred from some of the leading strains, and who would not object to this. I do not object to giving a man who buys and brings into his neighborhood excellent birds, all the credit he is entitled to—but I would not permit him to claim the credit of breeding these birds, as this he has no possible right to.

A large portion of the worthless stock, of which "Y. B." speaks, is palmed off upon the public just in this way. I know men whose names have figured conspicuously for several years past in the published awards of prominent poultry shows, who have rarely won anything on birds of their own breeding, and yet the readers of the poultry papers no doubt supposed they were extensive breeders of first-class fowls.

Sometimes the premium birds were the only ones of this variety that the exhibitor owned, and these were perhaps sold at the close of the show. If a breeder gets his birds mated for him, and by the assistance of "well filled grain bins, and a faithful hired man," raises chickens that can win, this is all right. These winning chicks are supposed to be the best specimens of his flock, and he has more of the same stock to supply to those who favor him with their orders.

I would not enforce the rule strictly, where a dealer hired others to breed fowls for him, or when he purchased a large number of chicks from any one breeder to supply the trade, for in those cases as in that of the "faithful hired man" above referred to, the exhibitor has more of the same stock.

If not more than a dozen men on this continent—as "Young Breeder" asserts—have any other than a bought reputation, let the reading public know who those dozen men are, that they may purchase intelligently.

Any blockhead who has money can buy first-class fowls, and win on them, but he cannot buy the brains and the skill to breed them.

"Y. B." expresses his belief that ninety-nine cases of failure out of every hundred are produced by the worthlessness of the breeding-stock.

I probably know as much from observation and experience of the poultry business as "Y. B.," and I can point to a dozen instances of failure where excellent birds were obtained from thoroughly first-class breeds, to one which can be fairly attributed to the inferior character of the stock. Of course when parties pur-

chase fowls from persons who have little or no reputation as breeders, or only a bought one, they cannot expect to raise thoroughly first-class show birds.

As to poor birds being sent out by old and reliable breeders, you know one eminent breeder asserts that *his scrubs* will breed almost as well as his best.

Because there is so much poor stock in the country is the very reason why I would let the public know where the fine birds come from, that they may not be deceived and defrauded by this "show huckstering." Q.

(For Fanciers' Journal.)

AWARDING PRIZES.

No. 2.

FRIEND WADE:—

In my letter to you last week I intimated that I had more to say on the same subject, and with your kind permission will again urge the same points I then did, and endeavor to make them so plain that I cannot be misunderstood. I shall therefore again say, let the officers of our shows secure competent judges that know what they are doing, and will do it without fear or favor; let them scale every bird in the class—unless it is a disqualified specimen—and place the score card on the coop, that all may know where lie his merits and demerits. As I said before, no man can tell by walking along before a row of twenty or more coops of a class, which bird or three birds are the best, no matter how good a judge he is. If he had them roaming about a lawn that he could see them well he might do it, but in an exhibition coop it is impossible. But it has been urged by some, that it takes too much time, costs too much, or that no two judges see alike. In answer to the first let me say, if the time cannot be taken to do it well, do not do it at all, as there is more harm done by doing judging indifferently than most people imagine. And in answer to the last, let me say that good judges do see alike or so near it that six of them will not make more than one or two at most points difference in judging almost any specimen, which is near enough to place a premium where it belongs. Now one of my reasons for placing an arbitrary point for the awarding of premiums is this—and I cannot make myself better understood than by giving an illustration of the point before us. Let us suppose a case—I know where to put my finger on it, so I am not drawing on my imagination.

A gentleman is invited to judge a show or assist in judging one, and as he is a stranger to all exhibitions, he is met at the depot by some of the ex committee, and shown to the exhibition rooms. In answer to his question as to how they want their judging done, he is told "by the Standard." By and by he comes across one coop in a class with no competition, and though they are very ordinary birds, he is not quite satisfied as to how he will act, and asks what he shall do. He is told that they belong to Squire so and so who has rendered them good service in getting up the show, and he must have first and special on them, "even if it is a little off."

Next he comes across a coop that is similarly situated, containing birds that should be disqualified, but remembering the action of the executive committee in the former case, the judge again asks for advice. He is again told that the birds are the only ones of the class, and belong to Deacon so and so, and that he is an influential member, and must have first and special on them, as he purchased them expressly to win this. So the Deacon's and Squire's disqualified birds get first and special, and elated with their success they go into the fancy (?) poultry business, and their advertisement may be seen alongside of that of Warren, Felch, Williams, &c., who have spent time, money, thought and brains to be able to advertise first and special stock. Just what the Squire and Deacon can for a five dollar note. Now gentlemen, is this not true, and if it is true, is it right? I think it over and I'll tell you more about it next time.

JAMES M. LAMMING.

PARKER'S LANDING, Pa., June 13th, 1876.

TWO HUNDRED AND FORTY A YEAR.

BY SPANGLE.

Editor Fanciers' Journal:—

I saw it stated not long ago in a monthly poultry paper that the breeder of some Brown Leghorn fowls had "runs of two-years-old hens of this breed that had laid 240 eggs each, in a year—or twenty dozen on the average." This same "Leghorn" breeder had pullets (for sale, I suppose!) that he stated "laid 160 eggs each, the first year," and which "began to lay at 3½ months old!"

Mr. Lewis Wright says in one of his late poultry books that "the Hamburgs will lay 220 eggs per year," and another writer avers that he "kept 50 Leghorn hens, old and young, that laid in one year each by actual count, 207 average, during the twelve-month."

I have never seen any such layers as the first mentioned—namely, that would "average 240 eggs each in a year, at two years old." Have you? I have bred many kinds of domestic fowls for several years past, but I never could find this kind of layer, of the small or large varieties.

I have watched my flocks attentively, and counted their product carefully, from day to day. I never could get over 145 to 165 eggs in a year, out of the best of them. And I never knew any sort of domestic fowl that began to lay its eggs at 3½ months old, nor do I believe this ever happened; though I may be a Thomas, in chicken matters!

Nevertheless, I cannot but think these stories "too thin," nowadays—for in a long experience with poultry I have never yet chanced to become personally acquainted with such facts as I have quoted above. And so I remain incredulous.

What is the good of such statements? Who is benefited thereby? Can the tales be verified? Or, is it permitted to be published, through personally interested correspondence, whereby the writer simply obtains gratuitous advertising? Did anybody, (who was ever fooled by such nonsense) who has purchased such stock, ever yet get from the fowls he bought any such product? Or, did any one (except this writer, who was a Leghorn breeder, of course,) ever know a pullet to begin to lay eggs at 3½ months old?

I think this must be the breed that "lays two eggs in a day, frequently, and has been known to lay three, within four and twenty hours," as one notable chicken-author seriously asserts:

"Verily, wonders never cease!"

A SLIGHT MISTAKE.

Editor Fanciers' Journal:

In an address recently delivered by W. L. Brown, Esq., of Hyde Park, London, Ont., the speaker, who is described by a "South ern Poultry Journal" as one of the "most accomplished writers on poultry in any country," made the statement that Mr. Burnham of Mass., "presented Her Majesty the Queen of Great Britain with some of his finest (Light Brahma) fowls, which Mr. B. maintained were a distinct breed the original stock having been imported by him from Assam, in India, a territory watered by the river *Brahma*, from which river he named his fowls;" and "Mr. B's birds presented to the Queen are the same as our present Light Brahmas," etc.

Mr. Burnham never named his fowls thus. Dr. Bennett is the author of this misnomer. Mr. Burnham never took any stock in this "India" yarn—because he bred the first of these fine fowls (both the *Light* and *Dark* varieties) commencing in 1849. And he obtained his breeders from Pennsylvania, out of *China* fowls, through Dr. J. J. Kerr, and in 1850 from W. F. Porter of New York—the stock of both coming originally from Shanghai.

Thus Mr. Brown of London, Ont., who may be one of the best

authors on poultry, in a general way, is corrected as to the *Brahmas*. They never saw India, they did not come from Assam, they never reveled on the banks of the *Brahma* Poutra river, Mr. Burnham never said they did, and nobody in the United States ever claimed this except a very stupid person called "Col. Weld," and his English friend Wright, who did not know anything about the matter, except what Weld imposed upon him, regarding their history.

Yours &c.,

MELROSE, June, 1876.

G. P. B.

RESPONSE TO "GREENHORN."

Greenhorn makes the query "give the definition of *Game* as applied to this breed," and he awaits the answer of fanciers who breed *for feather* for show purposes I understand. Well, there are a great many definitions for *Game*.

Young Breeder would describe them as "degenerated Games, whose plumage reminded him of the Home Guards during the war," while perhaps A. D. Warren, and some others would describe for them as golden banded, high stationed, *solid* black breast, and *beauty* and courage are unexcelled, excellent eggs, flesh unequalled, and would grace the lawn of any gentleman. While the cocker would simply say "quack! quack! quack!" and pull out a spy glass to see the noble 1st Premium Black Red, leaping over ditches, flying over walls, with pupils enlarged, and tail between legs in heart rending terror, at the sight of those one and one-quarter inch spurs on the legs of the rusty, homely, squatty "pit" *Game* in chase.

We sometimes see the "fac similes" (!) of noted *Game* breeders in poultry journals, who breed "for profit," "for pleasure," and yet on the circulars of these gentlemen we see Tatars, Heathwoods, Clippers, Dusty Millers, Claibornes, Brown Reds, Black Reds, Derbys, (sometimes imported *direct* from the yards of Earl Derby, who we all *suppose* is breeding them yet, but I will guess not). Now why is this? I can't guess "for the life of me." I may have failed herein to give the proper definition, but "Greenhorn" (!) I think you have one of your own, and I presume many others, admirers of the *Game* fowls, will reply to your question more fully than I have.

MIKE.

WHERE DO THEY COME FROM?

In a late issue of a Boston daily, we find in the periodical statement of the condition of the market supplies in that one city, the following query regarding the weekly receipts of eggs there:—

"Where in the great western country, the Cape, or the state of Maine, the hens live that lay all the enormous quantities of eggs we can scarcely conceive, that are here by the tons; seventy-two dozen to a barrel, and no end of barrels."

This supply of eggs for consumption in Boston market is but a regular thing. Thousands of barrels arrive there every week from the West, from Cape Cod, from away down East, or from New Hampshire and Vermont, aggregating "tons of eggs"—but all are sold, at regular remunerative prices; the figures changing only a fraction of a cent per dozen at wholesale from week to week, during the greater part of the year.

In the fall and winter of course they command the highest rates but there is no over supply at any season. Everybody in the cities and suburbs eats eggs when they can be had. The hotels consume large quantities, the confectioners and restaurants other large numbers, but still they come, the hens continue to lay them, the farmers and poulterers continue to supply the demand. And there is very little deviation in the extent of the call for this commodity from month to month, except it be in the way of perceptible increase, from year to year. So at Boston—so at all other leading city markets—so it will continue to increase, as population enlarges at and around these great centers and we shall none of us be likely to live so long as to see any great decline in the demand for fresh eggs and good poultry, at paying rates. No fear of that at all events, whatever may result with the "fancy" stock in the country!

SPORTSMAN'S DEPARTMENT.

(For *Fanciers' Journal*.)

INTERNATIONAL BENCH SHOW.

The programme and classification following is in substance that contemplated by the Chief of the Bureau of Agriculture, of the Centennial Commission, under whose administration will be conducted the bench show of sporting and non-sporting dogs, to be held on the grounds of the Centennial Commission, September 1st to 8th.

Dogs of all breeds will be divided into the following fourteen classes, under nine sets of judges, viz:

Class 1st, *Hounds*.—Fox Hounds, Harriers, Otter Hounds, Beagles and Dachs Hounds.

Class 2d, *Greyhounds*.—English Greyhounds, Persian Greyhounds, Scotch Deerhounds and Italian Greyhounds.

Classes No. 1 and 2 to be examined by the same board of judges.

Class 3d, *Gordon Setters*.

Class 4th, *Irish Setters*.

Class 5th, *English Setters*.

Russian Setters, and other varieties of Setters to be judged with class fifth.

Class 6th, *Pointers*.

Class 7th, *Retrievers*.—English Retrievers, Chesapeake bay Duck dogs.

Classes 6th and 7th to be examined by same board of judges.

Class 8th, *Spaniels*.—Clumbers, Cockers, Springers, Irish Water Spaniel, King Charles, and Blenheim.

Class 9th, *Terriers*.—Dandie Dinmont, Scotch, Skye, Broken haired, Bedlington, Black and Tans.

Class 10th, *Bull Dogs and Bull Terriers*.

Class 11th, *Mastiffs*.—N. Fonnlands, St. Bernards, Siberian or Ulm dogs.

Classes 10th and 11th to be examined by the same board of judges.

Class 12th, *Shepherd Dogs*.—English and Scotch.

Class 13th, *Miscellaneous*.—Dalmation (or coach dog), Pomeranian (or Spitz), Pugs, Poodles.

Class 14th, *Toy Dogs*.—Cuban Lap Dogs, Mattese Lion Dogs, Japanese Hairless, Dwarf Black and Tan.

Classes 12th, 13th and 14th to be examined by the same board of judges.

Three graded awards will be made for 1st 2d and 3d best dogs over two years old in each breed, and same for 1st 2d and 3d best bitches, and the next in quality commended.

Three graded awards will be made for 1st, 2d and 3d best dogs over one and under two years old in each breed, and same for 1st, 2d and 3d best bitches, and the next in quality commended.

Three graded awards will be made for 1st, 2d and 3d best male puppies in each breed, and same for 1st, 2d and 3d best female puppies, and the next in quality commended.

A sweepstakes award will be made for the best foreign bred dog of any breed, one year old and over, displayed by any exhibitor, also for the 2d and 3d best; the next in quality to be commended.

A sweepstakes award will be made for the best foreign bred bitch of any breed, one year old and over, displayed by any exhibitor, also for the 2d and 3d best; the next in quality to be commended.

A sweepstakes award will be made for the best home bred dog

of any breed, one year old and over, displayed by any exhibitor, also for the 2d and 3d best; the next in quality to be commended.

A sweepstakes award will be made for the best home bred bitch of any breed, one year old and over, displayed by any exhibitor, also for 2d and 3d best; the next in quality to be commended.

The authentic pedigree of sire and dam is all that is required in entering dogs.

No charge will be made either for space, or as entry fee.

Those purposing to exhibit will apply for the official forms, which when returned will be registered, and in good time, the exhibitors will receive permits for space, and labels, to be attached to the animals, a necessary requisite to gain admission to the grounds.

All dogs entered for competition will be judged by the standard of excellence adopted by the London Kennel Club.

Independent of the awards that will be made by the Commission, the following is a list of individual prizes offered, which no doubt will be greatly increased in number before the bench show takes place.

"The Chicago *Field*," a silver cup for best setter (dog or bitch) of any breed one year old and over. "Forest and Stream," a valuable prize.

The Philadelphia Sportsman's Club donate \$200 for the purchase of two prizes, one for the best setter dogs of any breed, one year old and over, and one for the best pointer dogs, of any weight, one year old and over.

Mr. C. S. Westcott offers a suitable prize, value \$50 for the 2d best setter dog of any breed, one year old and over.

Mr. Frank Roan offers a silver cup for the best imported setter dog between one and two years old, and a silver collar for the best Dachshound dog of any age.

Mr. Chas. E. Tucker offers a silver cup for the best Cocker spaniel.

Jno. Kriller offers a silver mounted dog whip for the best American bred setter, one year old or over.

Capt. A. A. Clay offers a silver whistle for the 2d best American bred setter one year old or over.

The Detroit Gun Club, as appeared in the Chicago *Field*, will offer a very handsome prize for sporting dogs.

P. C. DeSAUQUE,

CHAS. S. WESTCOTT,

BENJAMIN RICHARDS.

Com. of the Phil. Sportsman's Club.

◆◆◆
CANINE LITIGATION.—Great interest has attached to a lawsuit which has been going on at Geneva to decide the ownership of a St. Bernard dog, the possession of which was disputed by an hotel keeper and a manufacturer of vermouth, both of whom were equally ready to swear to its identity. It appears that two dogs of the same litter, marked exactly alike, were given by their breeder to the hotel keeper and the vermouth manufacturer; one of the dogs answering to the name of Lion and the other to that of Tiger. Both these dogs were lost at the same time; one disappeared never to return; but the other, after having been missing for a week or two, was found and brought back to the vermouth manufacturer, who was not a little rejoiced to recover possession of his pet. The hotel keeper, however, heard that his dog had been found and had been taken to the vermouth manufacturer, and he lost no time in going to demand its restoration, for it should be added, to make the story more intelligible, neither of the two knew that the other had the brother dog. The vermouth manufacturer refused, of course, to give up what he considered his property, and the hotel keeper at once took proceedings against him. The witnesses upon each side were equally positive in their affirmations, and the judge ordered the dog to be brought into court with a view of seeing which of the parties he would recognize. Unfortunately, both in the interests of justice and for the reputation of the canine race for fidelity to their masters, the dog was equally enthusiastic in his recognition of both claimants, and even of the counsel and the judge himself. The affair seemed to be wrapped in the most impenetrable mystery, until a shoemaker, who had been employed to mend the collar of one of the dogs, came forward to swear that the dog which had been brought into court wore the collar which he had mended, and that he had done the work for the vermouth manufacturer. This evidence was held to be decisive, and the vermouth manufacturer was placed in possession of the dog.

EDITORIAL DEPARTMENT.

THERE IS MUCH TO LEARN,

And all the time there are fresh discoveries to be made, of greater or less consequence, in the yearly experience of a live stock breeder. There is a vast deal "that is new under the sun"—the assertion of that wise old man of early time, King Solomon, to the contrary, notwithstanding.

We may even "learn a little every day," if we are close and studious observers of the habits, needs, best comfort and convenience of our stock, raised and kept with a view to a profitable return, through its increase.

And while we watch and study to improve their condition and our own interests thus involved, there is a continuous pleasure in the task—if we duly love our vocation—that goes to form a large part of the ample compensation that follows the rightful methods of this work.

It matters nothing what kind of pet stock we may choose to breed, be it poultry, pigeons, dogs, rabbits, birds, guinea-pigs, or otherwise—so far as the point of deriving constant pleasing instruction in its care is concerned. All are interesting, each has its peculiar attractions for the varied tastes of different fanciers. But any and all have their uses, and during the practice, we may continually be gratified with the changes, the improvements, the growth, and the development of our chosen favorites.

THE OUTLOOK AHEAD.

The "dull times" experienced of late in all departments of trade—in manufactures, in commerce, in mechanics—when everybody is "short" of surplus funds, are felt proportionally and naturally among breeders and dealers in fancy live stock; and it is not to be wondered at that more or less complaint is heard that the traffic in this channel is not so thriving and busy this season, as has been the rule for several years past.

There has been no falling off in breeding poultry at all points, so far as we are informed. Sales have not been extensive, for fancy stock and large breeders are accumulating a liberal show of birds for the approaching fall and winter; while those who have raised choice fowls in lesser quantities and who have not made themselves so generally known, in many instances think there are signs that this thing is (or may be) overdone.

Now so far as raising nice poultry for ordinary sales in market is concerned, there is no danger of having too much of it, pro-

vided it is really good. For the best chickens, that will dress handsome, plump, and fair, will always find a ready demand from the farmers' hands, in any city market contiguous to his premises. At the same time, we are aware that a very general interest has been obtained in this country among amateurs and small fanciers, who have raised considerable numbers of birds for which they have expected to realize high prices, and who do not appreciate the fact that this business, like all others, has limits.

Now, although it may be that at this particular season, during these exceptionally "hard times," there exists a lull in our trade, this state of affairs ought not to prevent fanciers from giving due attention to their stock, and doing their best to keep up the purity of their strains, and the excellence of the varieties they cultivate; since, however, the traffic may slacken, or decline for the time being, in this business it comes about all right after such dullness, and good birds are in demand again as soon as a favorable movement in any of the channels of trade is revived.

During seasons of such apathy and depression, it is too commonly the case that poultry men lose courage, and suffer their stock to run down, because their, perhaps too sanguine expectations, are not promptly realized; while the few more judicious breeders husband their stock, keep up its purity, and breed what they breed as carefully and as steadily in dull as in more prosperous times. By pursuing this latter, wiser course—when the demand revives, they are in condition to respond with their standard strains; and these are the men who have no cause to complain of the "vicissitudes" of the trade.

Our advice to all who have good stock on hand is to keep it so, and by careful manipulation, continue to sustain its reputation and its real value, whether the demand for fancy stock be active or dull. The time comes round every year when really prime specimens are saleable; and no one, who raises the best birds, of any variety, who will not be able sooner or later to obtain amply remunerative prices for such specimens of desirable stock.

CORRESPONDENCE.

WESTERN PENNSYLVANIA POULTRY SOCIETY.

At a meeting of our society held June 16th, it was resolved to hold the next Exhibition on Wednesday, January 10th, 1877, and to continue until the 17th.

Will you please take some notice of the fact in your JOURNAL.

Our last Exhibition was a decided success, all premiums were promptly paid in full, and leaving a balance in the treasury.

Respectfully yours,

A. H. LANE, Sec.

CHALLENGE.

HOBOKEN, June 15th, 1876.

Jos. M. WADE, Esq.:—

DEAR SIR:—Several matches of pigeon races have taken place this and last year, between New York and Philadelphia fanciers, but very seldom we have seen a race where the birds have been tossed up at the same time and place. When birds are tossed up at two different stations it is very often the case that one bird will be favored by the wind or atmosphere, while the other will have to fly against the wind, and perhaps with bad weather, in which case the race is all together one-sided, but when pigeons all fly from the same place, and at the same time, the chances are very even.

I have therefore the pleasure to challenge any New York or Philadelphia fancier in a friendly match, for \$100 in gold a side; the birds to fly from Easton, Pa.; each party to have the right to fly three birds, all belonging to him, and the first bird returned to win the race.

I also offer another match from Scranton, Pa., for the same

amount. Both places are about the same distance from Philadelphia that they are from New York; the first match to come off July 1st, and the 2d July 15th, each party to place the full amount in the hands of Mr. W. H. Kirby, of N. J., from the time the match is accepted.

Respectfully yours,

L. WAEFELAER,
Hoboken, N. J.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—"The world is ever as we take it,
And life, dear child, is what we make it."

—A chromo with every egg now. —*Danbury News.*
Is that crow-mo a rooster? *Whitehall Times.*

Guess so, for a rooster can crow mo' than a hen. —*Norristown Herald.*

—He was a rough Yorkshireman, and had wrestled for a long time with a very tough piece of oak on which he had been unable to make any impression, and at last broke out with the imprecation: "Dom they pigs that didn't eat thee when thou wast an acorn."

—"RAMBLING BOTANIST."—A lady enquires for a work with the above title, adapted to the United States. If any of our readers know of such, they will confer a favor by making it known through the JOURNAL. Articles descriptive of the common plants of our country would be thankfully received at this office.

—One of the features of the Women's Pavilion at Philadelphia is a large collection of stuffed animals and birds killed by Mrs. Maxwell, known as the California huntress. A buffalo, a Rocky Mountain lion, and a grizzly bear are included in the collection, viewing which the sterner sex cannot but admit that woman has some qualifications for the exercise of the right of suffrage.

—CHRISTMAS DINNER FOR THE BIRDS.—One of the prettiest Christmas customs is the Norwegian practice of giving on Christmas day a dinner to the birds. On Christmas morning every gable, gateway or barn door is decorated with a sheaf of corn fixed on the top of a tall pole, wherefrom it is intended that the birds shall make their Christmas dinner. Even the peasants will contrive to have a handful set by for this purpose, and what the birds do not eat on Christmas day remains for them to finish at their leisure during the winter.

—HOW TO COOL A ROOM.—A writer in *Public Health* recommends that a dish or basin large enough to present a good surface of water be placed in rooms where the heat is oppressive and the water be changed once or twice in very hot days, to secure a general lowering of the temperature. The hot air of the room takes up the water in the form of atmospheric vapor and diffuses the greater coolness of the water throughout the room, until air and water become of the same temperature. When this takes place fresh water should be put in the dish.

—Lapland mothers are not in the habit of staying at home with their babies. The Laps are a very religious people, and take long journeys to hear their pastors. As soon as the family arrive at the little wooden church, and the reindeer are secured, the father shovels a snug little bed in the snow, and the mother wraps the baby in skins and dep sits it therein. Then the father piles the snow around it, and the dog is set on guard, while the parents go decorously into the church. Often as many as thirty babies may be seen laid away in the snow about a church.

—The toad, so says *Forest & Stream* almost, universally despised and upbraided for his ugliness, is yet a useful, good-natured quiet fellow, who recognizes his friends and those who are kind to him. Like the sparrow the toad has been considered a nuisance, and in some sections has been exterminated; but the exterminators have been only too glad afterwards to get him back by the expenditure of large sums of money. So useful are toads in gardens that they are sold in France by the dozen, for the purpose of stocking gardens to free them from many injurious insects. The toad lives almost entirely on winged insects, and never does harm to plants.

—TRAP FOR RATS.—A subscriber sends us his method, which he thinks "the best out." He takes a flour barrel or a keg, and ties over the top a sheet of very stout, stiff paper, or an untanned sheepskin stripped of the wool. Upon this cover he places corn or meal and feeds the vermin in this way in some secluded place until they become fearless of danger, and quite at home upon the

cover. He then smears the cover around the center with glue, and sprinkles corn, wheat, or meal upon it, which, when the glue is dry, adheres firmly to the paper or skin. He then cuts two slits crossing each other, several inches long, by which the central portion of the cover is made very treacherous footing. When the rats run across this center they slip through into the barrel, from which there is no means of escape. The openings instantaneously close up themselves, and other rats follow. —*American Agriculturist.*

—RAISING SQUABS (*young Pigeons*). B. F. Yates, of Buckmanville, has opened a new and curious source of income. He keeps a large number of pigeons, by which numerous young birds or "squabs" are produced. During the month of March he ships to a commission house in New York over \$200 worth of squabs, dressed and packed in boxes. The price obtained is about \$4.50 per dozen.

When in good order the squabs will average about one pound weight per pair, and by the time they reach the consumers they probably cost not less than \$1 per pound. They are thus a rather dear article of food, but there is a quick demand for all that are sent to market. Probably they are mostly taken by the fancy restaurants and high priced hotels. Mr. Yates does not raise all the squabs himself, but collects some of them from the neighbors who keep pigeons.

—SUBTERRANEAN FISH.—The Virginia City *Enterprise* (Nevada) is responsible for a report that curious specimens of fish have been found in the water now flooding the Savage and Norcross mines. The fishes are eyeless, and are only about three or four inches in length. They are blood red in color. The temperature of the water in which they are found is 128 degrees Fahrenheit—almost scalding hot. In appearance they somewhat resemble the goldfish. They seem lively and sportive enough while in their native hot water, notwithstanding the fact that they have no eyes or even the rudiments of eyes. The water by which the mines are flooded broke in a depth of 2,200 feet in a drift that was being pushed to the northward in the Savage. It rose in the mines to the height of 400 feet. This would seem to prove that a great subterranean reservoir or lake has been tapped, and from this lake doubtless came the fish hoisted from the mine.

—The Opossum (*Didelphys Virginianus*) was the first marsupial animal known, and was considered a marvelous creature by the early voyagers to America. All the existing species are American, but their fossil remains are found in many parts of the world. The young are born blind, naked and shapeless, and are not larger than a honey bee. The hair of the Opossum is woven into girdles by the Indian women. The chief characteristic of this singular animal is its peculiar mode of defense. In this it manifests no intelligence, and its instinct seems entirely at fault; when it finds escape from an enemy impossible, it deliberately stretches itself upon the ground, stiffens its limbs and submits to the cruellest tortures without showing a sign of life. This ruse is rarely successful and often causes it to fall the prey of an enemy over which it might win an easy victory in actual battle. I have never yet seen mention made in works on Natural History of the exceeding punishment the Opossum can endure, and yet survive, without apparent inconvenience. We are accustomed to hear of the "nine lives of the cat," and yet the opossum will receive with seeming indifference, a blow on the head from a bludgeon that would brain the vampire cat of Japan. I have seen them worried and torn by savage dogs till one would suppose all their bones were crushed; and yet they would as soon as they thought themselves unobserved—

"Fold their tents like the Arabs,
And as silently steal away."

J. M. McCANN.

—CATCHING THE SEA LION.—So far as I can learn, says a correspondent writing from the California coast, the Farallon sea lions are seldom disturbed by men seeking profit from them. In the egg season one or two are shot to supply oil to the lamps of the eggers; and occasionally one is caught for exhibition on the main land. How do they catch a sea lion? Well, they lasso him; and odd as it sounds, it is the best and probably the only way to capture this beast. An adroit Spaniard, to whom the lasso or riata is like a fifth hand, or like the trunk to the elephant, steals up to a sleeping congregation, fastening his eye on the biggest one of the lot, and, biding his time, at the first motion of the animal, with unerring skill flings his loose rawhide noose and then holds on for dear life. It is the weight of an ox and the vigor of half a dozen that he has tugging at the other end of his rope, and if a score of men did not stand ready to help, and if it were not possible to take a turn of the riata around a solid rock, the seal

would surely get away. Moreover, they must handle the beast tenderly, for it is easily injured. Its skin, softened by its life in the water, is quickly cut by the rope; its bones are easily broken; and its huge frame, rudely treated, may be so hurt that the life dies out of it. As quickly as possible the captured sea lion is stuffed into a strong box or cage, and here, in a cell to permit movement, it roars and yelps in its helpless fury, until it is transpired to its tank. Wild and fierce as it is, it seems to reconcile itself to the tank life very rapidly. If the narrow space of its bathtub frets it, you do not perceive this, for hunger is the chief passion, and with a moderately full stomach the animal does well in captivity, of course with sufficient water.

—**CALIFORNIA BIRDS**—The Water Thrush or American Dipper (*Cinclus Americanus*), is a California bird, remarkable for its partiality to brooks, rivers, shores, ponds and streams of water; wading in the shallows in search of aquatic insects, wagging the tail almost continually, chattering as it flies; and in short, possesses many strong traits of the Water Wagtail. It is also exceedingly shy, darting away on the least attempt to approach it, and uttering a sharp chirp repeatedly, as if greatly alarmed. It breeds in the higher mountainous districts, as do many of our spring visitants that regularly pass a week or two with us in the lower parts, and then retire to the mountains and inland forests to breed.

The voice of the little bird appears so exquisitely sweet and expressive, that one is never tired of listening to it.

The Water Thrush is six inches long and nine and a half in extent; the whole upper parts are of a uniform and very dark olive; the lower parts are white, tinged with yellow ochre; the whole breast and sides are marked with pointed spots, or streaks of black or deep brown; bill, dusky brown; legs, flesh-colored; tail, nearly even; formed almost like the golden-crowned thrush, except in frequenting the water, much resembling it in manners. Male and female nearly alike.

could produce a cataract of both eyes, in half an hour, by simply injecting a teaspoonful of a saturated solution of sugar between the skin of a frog or guinea pig. Dr. B. W. Richardson of London, has confirmed this, and these results are received by the medical profession as satisfactory. Now if a teaspoonful of sugar solution will make a frog or guinea pig totally blind in half an hour, can sugar be regarded as an innocent substance for young and growing persons? the writer asks; but let us substitute, for birds confined in a small cage, and without opportunity for exercise. This at least is worth thinking about, as almost every canary cage has its lump of loaf sugar, and the death rate among them is certainly excessive. The proper regimen for a canary is simply fresh water every day, canary and rape seed, and plenty of clean fine gravel or coarse beach sand on the bottom of the cage, renewed at least once a week. Hemp seed should never be given, except when the birds are breeding, and then but sparingly, as it is too rich and heating. A piece of apple, lettuce, or a little chickweed once or twice a week instead of every day will be much better for them. All foods which create fat should be avoided. Loss of song is generally occasioned by an accumulation of fat around the glands of the throat, caused by such food and want of exercise. If you have a room where your canary can be let out to spread his wings frequently, the exercise will prove highly beneficial.

(For Fanciers' Journal.)

THE AQUARIUM, NO. 4.

WM. F. SEAL.

Aquaria may be constructed of a variety of materials, but for many reasons I think slate preferable. Although iron is most commonly used in this country, it is open to serious objections, the most prominent of which are, 1st, the necessity of perfectly protecting the iron from the water to prevent oxydation. 2d, the liability to leakage if a soft cement be used, and the great danger of breakage of glass if a hard cement be used, from the expansive and contractive force of iron, and 3d, on account of electrical influences which I am quite sure prevail to a greater or less degree at all times, and often disturb the equilibrium of the aquarium. Many instances are on record of the death or partial paralysis of all the fish in iron aquaria during violent thunder-storms. But one case ever came under my own personal observation. In that the fish lost all control of their movements, and hung heads downward, with their tails just reaching the surface of the water. They recovered, so far as their powers of locomotion were concerned, but although they lived for a long time after, they remained stone blind. Such cases are isolated it is true, yet who can say that the same baleful influence is not exerted on the iron aquarium constantly, only in a less degree? I have had the water in an iron aquarium to become quite turbid during a thunder storm though quite clear and brilliant just before. On examination with an ordinary microscope on such occasions I have found no living animalcules, and the turbidity of the water I found to be due to the presence of myriads of dead animalcules which, though transparent when living, become white and opaque when dead. Very beautiful aquaria tanks may be made by any one out of broken pieces of slate or other stone, cemented together with Portland cement. They can be made to suit one's fancy, and although heavy, they are more pleasing to the lover of nature, as they are rough and irregular, and being devoid of sharp, angles and straight lines, are suggestive of little rocky pools, such as we often see in our rambles. The glass must be set in with an elastic cement. It is very difficult to make a wooden aquarium serviceable. It is only with great patience in their construction that they can be made water-tight. In stocking the aquarium the sand and gravel should be washed thoroughly, to remove all earthy or decaying

SMALL PET DEPARTMENT

AND YOUNG FOLK'S CORNER.

(For Fanciers' Journal.)

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending June 18th, 1876.

- 11 Gray Gophers (*Spermophilus franklini*). Presented.
- 1 Screech Owl (*Scops asio*). Presented by Rev. Edgar M. Levy, Phila.
- 1 Alligator (*A. Mississippiensis*). Presented.
- 1 Water Snake (*Neotia fasciata*). Presented by Jos. M. Wilson, Washington, D. C.
- 9 Prairie Dogs (*Cynomys ludovicianus*). Born in the garden.
- 1 Manatee or Sea Cow (*Manatus americanus*). Purchased.
- 48 Large Bull-Frogs (*Rana pipiens*). Presented by John H. Dusenbury, Phila.
- 1 Loon (*Colymbus torquatus*). Presented by Adam Matsinger, Phila.
- 4 Beavers (*Castor canadensis*). Purchased.

ARTHUR E. BROWN, Gen. Sup't.

PROPER CARE OF BIRDS.

The mysterious visitations of Providence among pet birds generally, and canaries particularly, are simply the result of want of judgment, and an appropriate verdict in such cases would be killed by kindness. If it were more generally known that the cakes, sugar, bon-bons, and other rich and dainty foods served up to them by fair hands, in gratitude for the sweet consolation of their songs are the cause of most of their maladies, and the shortness of their lives, they would be placed on light diet immediately. An article in the Philadelphia *Sunday Transcript*, on "Candy," has some facts which are interesting in this connection, although intended to apply to human beings. Sugar, as a food, is a failure. The chemist tells us that cane sugar contains three elements. The human body has some fourteen elements. Dogs fed on sugar died in forty days. Dogs fed on nothing lived just as long. The system has a natural loathing for food containing nothing but sugar. We pass then to the occasional use of sugar. Does it affect the conditions of the organs of the body? Several years ago Dr. S. Weir Mitchell proved that he

matter. Beach sand is best when it can be had. Bar sand which is principally composed of the alluvial deposits of streams should be avoided, as it is almost impossible to rid it of decaying vegetation, and mineral substances. The best plants for the aquarium are the *Myriophyllum*, *Valisneria spiralis*, *Anacharis*, of which we have at least three distinct varieties, although but one is given by botanical works. *Aratophyllum demersum*, or Mare's-tail, the tricularias or Bladderworts (particularly interesting aside from their great beauty, as being classified by Mr. Darwin among the carnivorous plants, the beautiful little vessels or bladders being designed to entrap animalcules). *Veronica Americana*, *Ranunculus aquatilis*, *Hydrocharis Morsusranae* or Frogbit, *Chara vulgaris* or Stonewort, *Callitriche verna* or Broad leaved Starwort, *Potomogoton lucens*, and many others, but this is sufficient to give variety to the most exacting.

Many aquaria fanciers have settled down to the exclusive use of *Myriophyllum* as the most satisfactory of all aquatic plants. They will do the best under all circumstances no doubt, and for those to whom the aquarium is no more than a vase of wax flowers would be, they are no doubt the best—but to my mind the flora of our waters is not less interesting than its fauna. As oxygenators the *Valisneria spiralis*, *Anacharis* and the *Utricularias* far surpass the *Myriophyllum*. To the microscopist they unfold a world of beauty and of wonder not to be described by words of mine. I had the pleasure a few days ago of viewing the circulation in a leaf of *Anacharis*, through a powerful microscope belonging to Mr. Holman, Actuary of the Franklin Institute, and inventor of the Siphon Slide for microscopes, and I must confess that I was more deeply impressed by the wonderful sight there presented than by all the grandeur of the great Exposition. *Ceratophyllum* and the *Utricularias* grow as well floating loosely as when planted. I have found each of them several feet long, but have never been able to find a vestige of a root to them, although I have followed them a foot or more into the mud. To any one who cannot succeed in growing the above named plants in the aquarium, I must say that it is not the fault of the plants, but that there must be something wrong in the management of the aquarium. Two small floating plants, *Lemna minor* (Duckweed) and another which I call *Staghorn Duckweed*, although it more closely resembles in shape the author of the Moose, should not be forgotten.

(For Fanciers' Journal.)

THE "ENGLISH" SPARROW AGAIN.

We have on a tree at the corner of our house an English or more properly house sparrows' nest. We were very much amused during its construction, at its appearance as it was so large and appeared to be so clumsily constructed. It is built principally of hay with some twine interwoven, and is so large that it would hardly go into a peck measure. As it was commenced in March, and as we had never before seen one built outside of a box, we thought that it was simply an ingenious shelter from the wind, or at all events a first attempt at architecture, but a closer examination revealed a most ingeniously constructed nest. The cavity opens to the south-west, thus sheltering it from the north-west winds which frequently sweep around our corner. In all other directions it is protected by the walls of houses. The cavity of the nest is fully seven inches deep, about three inches in diameter and inclined at an angle of about forty-five degrees, and is nicely lined with feathers throughout. It has become quite the fashion to ridicule this modest little bird because it has been denied that it is insectivorous, and Mr. Carlyle is said to have laughed when told of its introduction here, but sensible people judge by results, and we certainly have the laugh on our side in spite of Mr. Carlyle.

The year before the introduction of the sparrows here in Philadelphia, that disgusting and annoying pest, the measuring

worm, created such havoc among our shade trees that it was difficult to find in any part of the city, a tree which was not almost entirely stripped of its foliage. No one who lived there at that time will forget the appearance of Independence Square: the trees were almost bare, and it was impossible to walk through it without having a number of these disgusting creatures crawling over one's clothing, and the same may be said of all parts of the city. Now the sparrows may not have destroyed these disgusting worms by devouring them, and for that I do not blame them, but they do eat their eggs, which is just as effectual a mode of exterminating them. In the same way we note the disappearance of the ugly yellow caterpillar which followed the measuring worm. Apropos of the sparrows and worms it will not hurt to publish again an anecdote which has already gone the rounds of the press, but no doubt there are those who have not heard it. Shortly after the introduction of the sparrows a young gentleman was heard to ask a young lady "which she thought the greatest nuisance, the sparrows or the worms." She innocently replied that she had never had the sparrows.

(For Fanciers' Journal.)

PETS, AND THE FATE OF SOME OF THEM.

NO 2. THE PET CANARY.

"For in the storm and in the rain,
A little bird did sing!
A little bird of sweetest voice,
With love beneath its wing—
Oh! in the wind and in the rain,
A little bird did sing."

The pet canary is so well known, so many heart-breaks have there been over its timely or untimely demise, and so numerous are the stories told of them, that it would seem an almost waste of time to tell another, but here is one which has not been told more than *once* before, and which perhaps may touch the tender heart of some lady bird-fancier.

In the disastrous Bull-run fight, No. 1, the Colonel of a regiment which figured there was struck down by a musket-ball, and in due time was carried to his home in a distant city to die. Before the gallant Colonel went to the war, his especial pet was BEAUTY, a canary whose color he thought the richest, its song the fullest and sweetest ever heard from canary throat; and which, thinking to please, amuse, and beguile him from his weary, wasting sufferings, his wife now introduced into the sick-room. But the poor Colonel, nervous, pettish, and fretful, from the nature of his wounds, took a sudden dislike to his former pet, and peremptorily ordered his wife to throw poor Beauty out of the window! But Beauty would not be so thrust forth, and though the window was opened, she fluttered about the room or hovered about the bed of her once kind master, seeming to recognize and evincing a most unmistakable attachment for him, and, as it were, pitying his deplorable condition, while he, in a still more peremptory manner, insisted on the bird's expulsion from the room, and in order that the patient should not be further irritated she was finally put out *vi et armis*. The poor discarded pet for a moment perched in the branches of an aliantus tree which stood in the yard, then flew quickly back through the window, which, the weather being warm, had been left open, and forthwith alighted on the sick man's forehead, who seemed so touched by the affecting incident that he ordered no further attempt to be made toward removing the "incumbent," and from that time forth for the few days her master lived, Beauty's perching place, by day and by night, was upon the pillow where rested his dying head.

The Colonel died, and his body was taken to a distant place for interment, that his remains might moulder and mingle with those of his kindred, which caused the family to be absent for several days, during which time, strange to say, even in their

great grief, none seemed to think of the poor bird. When she at last was brought to mind, haste was made home to look after her and her wants, but poor Beauty was dead! dead! stork and stiff was she lying, in the hollow of the pillow where her master's head had so lately lain. Alas! poor dear songstress; she would never sing more. Too beautiful for interment, "her most sweet body" was handed to a certain taxidermist for preservation, from whom I had this sad, but true story of her death. HUCON.

A gentleman, dining with a friend, was asked what part of the fowl he preferred. "Oh, only a bone." This request was literally taken, and a bone, well scraped was sent to him. "Half of that, if you please," said he, sending back his plate.

Art received rather an awkward criticism from a free and easy young man who recently met a sculptor in a social circle, and addressed him thus: "Er—er—so you are the man—er that makes—er—mud heads?" And this was the artist's reply: "Er—er—not all of 'em; I didn't make yours."

Children have a hard time to learn the meaning of words; and what wonder is it? "Ma, what is lanker?" inquired a bright-looking child the other day.

"I'm sure I don't know, my son; where did you hear the word?"

"Why, at Sunday-school. You know they sing, 'We'll stand the storm, it won't be long; we'll lanker by-and-by.'"

A letter from Paris to a Philadelphia paper says, "Queer things are occasionally to be seen in Paris, but a queerer sight than that which I witnessed this morning on the Rue de la Paix, it has rarely, if ever, been my lot to behold. In taking my morning walk, I met a large white poodle, shaved and clipped lion fashion, who wore a round, black velvet cap, coquettishly placed on the side of his curly head. In his mouth he carried a basket, to the handle of which a small étern silk parasol had been adroitly attached in such a manner that in carrying the basket the dog held the parasol over his head, and so shaded himself from the rays of the sun. It is impossible to describe the gravity and aplomb of his dogship, nor the immense amusement of the street boys and the passers-by at this novel spectacle."

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

Advertisements for "COPIES" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the **Exchange** or **Want** column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

O. F. STACKPOLE, Goodwin's Mills, Lyman, Me., has extra Brown Leghorn year old pullets to exchange for Houdans, G. S. Hamburgs, Dark Brahmas, or B. B. R. Game hens, or year old pullets of good station and size; nothing given or taken of less than \$5 cents as per new standard.

STARR L. BOOTH, Bristol, R. I., has a nice double-barrel shot gun, made by Marton, London, No. 10 bore, 36-inch barrels, warranted London line trust, weight 14 lbs., to exchange for nice Light or Dark Brahmas; want only good birds. Write.

WM. J. CHINNICK, Trenton, N. J., will exchange Roses and Flowering plants, a general assortment, for Fancy Pigeons, or Lop-eared Rabbits.

JOSEPH H. REBMEISTER, Batavia, N. Y., will exchange 1 pair of Mottled Tumblers, 1 pair of Red Tumblers, 1 Red Female Tumbler, 1 Feather-legged Tumbler, and 1 single-barrel shot gun, for a good pair of White Pearl-eyed Jacobins.

PHILIP ROGERS, Baltimore, Md., will exchange six or eight Light Brahma cockerels, last June's hatch, first-class birds, for pullets of same variety.

A. C. HELTZELL, 807 North 2d St., St. Louis, Mo., will exchange Gray Foxes, single or in pairs, not skin, and two to four months old, for B. B. R. Games, or a male Black and Tan Terrier pup, or offers. All letters promptly answered.

BOX 489, Middletown, Ct., will exchange a Liver and White Pointer, 16 months old, fairly trained—a staunch dog, for an English Setter, well broke.

IRVIN W. CONRAD, Bervillie, Berks Co., Pa., wants to exchange 1 pair Partridge Cochins for Fancy Pigeons.

S. B. HEATON, Monroe, N. Y., has Houdan eggs, 1 pair Light Brahma chicks, (early hatch); chicks and young crows, grown and full feathered, healthy and mischievous, to exchange for Fancy Pigeons, Bronze Turkey's eggs, or Pekin Ducks, or eggs.

BOX 18, Delaware City, Del., has to exchange White Leghorns, Brown Leghorn cockerels, one Dominique Leghorn cockerel, one S. S. Hamburg pullet, one Brown Leghorn cock, Red Irish, Black and Tan, Gorton, Lavacack, and English Setter pups, one breech-loading shot-gun, for Brown Leghorn pullets, P. Rocks, or offers.

P. W. CAREW, Toledo, Ohio, wants to exchange a White Game cock, two "pit" hens, (one weighs nearly 5 lbs.); one Derby hen, two "pit" cocks, (one Henney), for Brown, Red, or Red-ple Games, fowls or chicks, or eggs of same. I will ship first, to a reliable party.

A. V. CUMMINGS, Stoneham, Mass., will exchange his Fox Hound, Spot, 14 months old, out of imported bitch, can give full pedigree, for small size English Beagle Harrier, that will run rabbits, or offers.

N. C. MITCHELL, Indianapolis, Ind., Editor Bee Keeper's Directory, will exchange a few tested Italian Queen Bees for first-class poultry.

D. Z. EVANS, JR., Town Point, Cecil Co., Md., will exchange Sheep, Swine, Poultry, Dogs, &c., of different breeds, and advertising in good rural papers, for A. No. 1 Lop-eared Rabbits, Harness, Robe, Blankets, Buggy, or merchandise. Postals not noticed. Speak quick!

S. B. KELLEY, Milltown, Me., will exchange one trio of Plymouth R. chicks, May hatch, or year old fowls, for J. A. Whitman's Fountain Pump, with hose and sprinkler in good order, and ready for use.

GEO. W. DIXON, Worcester, Mass., will exchange imported Lops, Buck, 2x5, value \$25.00; Buck, 2x4, value \$20.00; Doe, 2x4, value \$20.00; Doe, 1x4, value \$12.00. Pair of Hinnylans, valued \$30.00—6 in all, for \$40.00 cash, or merchandise at full value of each animal. White and Colored Guinea Pigs, and 2 pair young Lops, for most anything excepting live stock.

F. KRAUSE, Zanesville, Ohio, wants to exchange extra fine Lop-eared and Angora Rabbits, for a large Zee Aquarium, or a good Talking Parrot.

FRED. T. MARTIN, P. O. Box 87, Owego, N. Y., will exchange one pair Bronze Turkeys, one pair Brown Leghorns (Bonney strain), one White Leghorn cock, and one Buff Cochins hen, for set buggy, harness, or offers.

BOX 1256, Williamsport, Pa., will exchange, to make room for young stock, Buff, Partridge, White and Black Cochins, Light and Dark Brahmas, White Sultana Black African Bantam hens, two female Canary birds, French Acordian, Revolver for carpets, window shades and fixtures, chairs, or any kind of house furniture—anything that will not eat. Hens are all No. 1.

B. HULSE, Box 23, Allentown, N. J., will exchange 2 liters of Shorthorn pups, P. Rocks, W. & B. Leghorns eggs, and Fancy Pigeons, for Gold Sebright Bantam cock, Gold or Silver Sebright Bantam eggs or fowls, or W. C. B. Polands eggs or fowls.

HOWARD TWINING, Doylestown, Pa., has 8 Golden penciled Hamburgs, (6 hens and 2 cocks,) from Hurst & Tuck's celebrated stock; one pair took 1st premium at all the fairs they were shown last winter. Will exchange the lot for equally good Black Hamburgs, or offers. Speak quick.

JAS. H. PHILLIPS, Coventry, N. Y., will exchange one trio G. P. Hamburgs, pair of Part. Cochins hens, Buff Cochins, or eggs from No. 1 L. B's., or Brown Leghorns, for a lemon and white setter bitch, of good pedigree, not over two years old, or offers.

JNO. M. ROBERTSON, Box 173, Scranton, Pa., will exchange Baldhead and Red Spashed Tumblers, White and Spotted Fantails, Croppers, English Dragons, one trio Houdans, one trio Buff Cochins, one Scotch Terrier dog pup, 3 months old, cropped; one Skye Terrier bitch, a beauty; for Antwerp Carriers. First-class birds wanted, and a liberal exchange given for same.

Book Exchange.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

J. S. EDMONDS, Schenectady, N. Y., wants second-hand books on wood turning, Architecture, and wood working in general. Give name of publisher; also a large gold pen, give name of maker and size.

G. C. PEASE, Reading, Pa., wants cast iron Aquarium Frames, new or second-hand—octagon preferred; also bird seed. Will give Fancy Pigeons in exchange.

A. W. MCKINSTRY, Chicopee, Mass., wants a Black Spanish cock. A friend wishes me to procure for him a good bird, hatch of '74 or '75. Price must be reasonable.

HARTFORD, JULY 3, 1876.

No. 25.

EDITOR FANCIERS' JOURNAL:

I clip the following beautiful lines from one of my papers as a delicious morsel, too good to be lost as too many newspaper articles are. The Spring, the coming time of the Robin, to be sure is past, but the Fall is coming, when his song is still beautiful, as well as cheering—for has not another poet told us in a beautiful song—

"Robin sings so sweetly in the falling of the year."

H.

WITH THE ROBINS.

Sing, Robin, in the apple tree,
Sing loud your happiest strain,
My lover has come back to me,
And will not roam again.
He left me when the summer's light
Lay over all the land,
And only said, "Sweet love, good night,"
And fondly kissed my hand.

He did not come when morning came,
And days and weeks went by,
And though I fondly call'd his name,
There came back no reply;
But when the earth was white with snow,
And winter winds blew chill,
A letter from afar did show
He was my lover still.

When the first violet came out
To see if spring were come,
And bluebirds made a merry rout
About my quiet home,
I said, when robins sing, I know
His face I sure will see;
This morning you your red breast show,
And he is here with me.

Thomas S. Collier.

FISH-BUILDERS.

THE NESTS OF THE FINNY TRIBE—CURIOUS HABITS OF THE STICKLEBACK.

A writer in *Chambers' Journal* says that one of the most common of our British fishes, the tiny stickleback, has attracted considerable attention on account of its curious habit of building a nest—rivaling in intricacy the homes of our feathered friends—in which it deposits its eggs, and over which it keeps watch and guard till the tiny family are able to enter on the responsibilities of stickleback life. Such precautions are unusual among the finny tribes, whose eggs are generally left to chance, or, in some cases, adhere to friendly weeds till they hatch out, and the young ones face life in the world of waters, without a parent's care to guide them. The lordly salmon makes an apology for a nest by scooping out a hollow or "redd" in the gravel bed of the stream which it ascends for the purpose; but this, compared with the beautiful workmanship of the stickleback, is as the rook's collection of sticks to the mossy ball prepared by Jenny Wren for her bantlings. The instances of nest-building fishes are rare, and it is among tropical species that the majority of them occur. One of these, whose lovely colors have caused it to be christened the "rainbow fish," has lately been introduced in limited numbers into Europe, where its beauty has created quite a furor among the aquarium-keepers, and where it excites additional interest on

account of its possessing the peculiarity of building a nest for the reception of the eggs.

Probably the first person who has watched the whole of this operation was Monsieur Carbonnier, a French naturalist, who lately gave an account of his observations before the Paris Acclimatization Society. As in the case of the stickleback, it is the male fish which performs the principal duties of nurse and cradle-keeper; but the nest of the rainbow fish differs from that of the stickleback in the fact that it floats on the surface of the water, whereas the latter is built among the weeds beneath. The approach of breeding time is marked by the increasing beauty of color in the male fish, who dons his best robes in order to find favor in the eyes of his mate. His scales then assume all the varied tints of the rainbow, every movement causing them to scintillate with a metallic lustre and ever-changing hue, now flashing forth with increased splendor, now dying away for a moment, only to appear with greater variety and intensity of color. But his time is not all given to courting. He enters on the duties of his prospective position with vigor; and his instinct, amounting almost to sagacity, is thus exemplified in Monsieur Carbonnier's narrative.

The weeds growing in the aquarium in which some of his specimens were confined were of a kind which would not float. The fish tore off bits of the leaves in his mouth and expelled them toward the surface; but their specific gravity was too great, and his efforts were unavailing. Monsieur Carbonnier, with a quick perception of the fish's wants, replaced the plants with others of a finer texture, and then had the pleasure of seeing the fish renew its attempts with complete success. But the fish was too cunning an architect to trust to the natural flotation of his building materials, and after placing a few pieces together in position, he formed several air-bubbles in a viscid secretion, which he was able to eject from his mouth, and placed them in contact with his floating nest. Just, in fact, as engineers among ourselves have proposed to raise the Vanguard by means of immense air-bags, the rainbow fish, wiser than ourselves, formed his air-bags and attached them to his ship as a precautionary measure, to prevent its sinking from natural instability, collision with piscine Iron Dukes, or other outward causes. Day by day the work of knitting together the little morsels of weed progresses, till a floating domed island three inches in diameter is formed (the fish itself is not more than half the length); but this is, so to speak, only the foundation of the edifice, the roof being in reality constructed before any other part. Beneath this roof a complete circular nest is built, which the fish welds together with the greatest industry and patience, and not till it is complete does he seek his companion.

All this time the female has kept aloof, neither assisting her companion nor encouraging him by her presence in the work of nidification. But now she is induced to visit the home of her future progeny, and the labors of the exemplary parent are redoubled. When the minute eggs are laid, he collects them in his mouth, and places them carefully within the nest, which he continually supports with fresh bubbles, lest the precious cargo should overweight it. When all is safe, he stations himself on guard before the only opening in the nest, and awaits the course of events, ready to defend his handiwork against all comers, while his better half retires altogether from the scene. In about three days the eggs begin to hatch out. The parent fish then destroys a number of the supporting air-bubbles, causing the nest to sink deeper into the water, so that none of the young ones may be "drowned" for want of water. As long as he can, he prevents them from escaping from the paternal roof—the title is hardly appropriate, however, for neither father nor mother has inhabited the house; but their strength rapidly increases; and, just as boys and girls leave home to better themselves, the young rainbow fish burst from the father's apron-strings and are soon exulting in their new-found freedom.

POULTRY DEPARTMENT.

(For *Fanciers' Journal*.)

DURING THE LAST TWO YEARS

A vast deal of complaint has been current among the breeders and fanciers in America, that the hatching of eggs was difficult, and that, compared with results in prior years in this respect, the success of poulterers in all directions was noticeably meager—more especially where the Brahmas, Cochins, and other large fowls were being bred.

This state of things we have not failed to observe, and for three or four seasons we have watched for some clear explanation of the cause which has brought about this result—so commonly known nowadays, everywhere, among the fraternity in the United States.

We have had theories, and have published in these columns, from time to time, numerous opinions of those who have suffered from this curious, but almost universally occurring, incident among breeders—old and young. But the *real* trouble has not yet been made known, satisfactorily.

This season, so far as we have heard, fanciers have experienced better luck than last year. In many places, however, the results have been disheartening. In England, last year, but slight complaint was noticed; but this spring (1876), thousands of dozens of choice eggs set there, have proved infertile—for reasons as yet clearly unknown or unexplained.

A practical breeder of long experience informs us that last year out of over 1,200 eggs he set in March, April, and early May, he obtained but about three hundred live chicks—or say 25 per cent. from the settings. This year he has done better, getting out of 600 eggs over two hundred good chicks. All these are of the Asiatics.

Hitherto the chief reason for this non-success, has been attributed to the excessively cold and lengthy winter of 1874-75. But the last winter—though severe at times—was not prolonged, and this spring opened fine and promisingly. And now we have from a careful and observant experimenter, the following suggestions—which we consider very reasonable, and to the point.

He writes us that he "has experienced this same ill luck in late years," and adds, "I have sought diligently for the cause of this remarkable falling off in the average hatching of eggs from my own stock, and also from those I have purchased from reliable men in various sections of the country, all of which have come out about the same, in my hands. I have sent away, carefully packed as usual, several dozens of eggs for incubation—not more than a third of which have been found fertile. In some cases, not over two or three in the thirteen! And this has been about what I have hatched at home; while from others' eggs (purchased) my success has been little or no better, this or last year. And three years ago, I first observed the beginning of this failure among my own stock—although, so far as I could see, my birds were as healthy as ever; and such chicks as I did hatch, grew as

finely with me, or in the hands of others who purchased my stock, as had been usual in my experience.

"Now I am quite convinced that the real difficulty is that we have in this country (and in England, too,) been breeding from the same strains of poultry stock too long. In the case of the *Brahmas* and *Cochins* for instance, (all of which come down to us through a very few original blooded birds of each variety,) we have bred so many thousands upon thousands in the last fifteen or twenty years here, that it is not surprising the stock should weaken, and run out comparatively, by this time. Good birds are still raised, I know—and many more will be raised from these strains. But when we get down to producing from any well-known variety on the average, everywhere, not over two to three chicks from a full dozen eggs set, year after year—it seems to me we ought to look this fact squarely in the face, and make some exertion to effect a remedy for this palpable misfortune!"

We agree with our correspondent. If the reader will remember, it was but a few years ago that, both in England and America, the fine *White Dorkings* were common and were highly prized. The *Gray* or *Colored Dorkings* have now taken their place in England quite generally, while in this country, we know of very few flocks, scarcely any of the *White* variety, at present being bred. With us on this side of the water they have about "run out;" and it was found at the last that their eggs, by degrees, ceased to hatch here almost precisely as have some of the Asiatic varieties, within the past year or two.

We must therefore have fresh blood among our large birds. We hear of no importations from China, or India, *direct*—in late years—into England or America, of any of these favorite varieties. Would it not be well for our leading fanciers to get out from Shanghai or Calcutta some fresh stock, with which to infuse new blood and stamina into the strains we now have here, and which it is very clear are now deteriorating in such large numbers in proportion to the few that are still being successfully bred? We really think this is worth considering. M.

(From *Journal of Horticulture*.)

THE EXHIBITION DORKING.—No. 10.

BY T. C. BURNELL.

Amongst the different breeds of Dorkings, the *Dark* or *Colored Dorking*, on account of its superior size, has always been the favorite. This variety was originally called the *Grey Dorking*, then the *Colored Dorking*, and now is generally known by the name of the *Dark Dorking*, to distinguish it from the *Silver-Grey* variety.

The first and most important point in a Dorking is the shape. Most beginners are apt to think that five toes on each foot, and a freedom from leg feathers and crest, are all that are required to make a good bird. Not so; it is the peculiar shape which makes the Dorking—the square, deep, and massive body, and the full chest. The breast bone should be long and deep, to allow plenty of room for putting on flesh, as it is the Dorking's breast which gives it its pre-eminence for the table. The back should be broad and flat at the shoulders, and should gradually narrow to the hips; the legs should be short and stout, and with plenty of bone, as the leg is a good criterion of frame and capacity for putting on flesh; the thighs should lie close to the body, and not be carried stilt-wise, as in the *Cochin*. The above points apply equally to all Dorkings.

I will now state what is generally considered requisite in a show bird of the *Dark* variety; and first for the cock. Head of a good size, eye large and dark in color, earlobe red, wattles long and pendulous, comb either single or double. If the comb is single it must be perfectly upright, quite straight, free from any excrescences at the sides, and evenly serrated with about six or seven

DARK DORKING COCK.

sprigs; if rose-shaped (double), it should be close and firmly fixed on the head, square in front, flat at the top with the exception of numerous little sprigs, the sides straight and even, and the whole comb narrowing behind in a distinct point. The comb in either case should be of a good size, but without the least tendency to coarseness. Rose-combs in Colored Dorkings have lately become very scarce in the show pen, and not more than a dozen pens, I think, have been seen at the Crystal Palace Show for the last five years. They are evidently not popular, the reasons doubtless being that they are more difficult to find in perfection, that they invariably become coarse and ungainly in the second year, and that they are more open to being tampered with than the single combs; this latter, in my opinion, being a serious objection.

Rose and single-combed birds may be bred together, and a proportion of both will be found in the chickens; but this plan should be avoided if possible, as coarse and ugly combs are sure to be the result, and neither comb will become fixed in the strain. In a pen of birds for exhibition, of course the combs must match; if a rose combed cock and a single-combed hen were shown together, certain disqualification would be the result. Sometimes we find a bird with a comb something between the two—that is, a single comb in the front part expanding into two combs, as it were, in the middle, and joining again at the back, so as to form a large hollow. These “cup” combs, as they are called, will not now pass muster, and are only fit for the farm-yard. The neck hackle should be very full, and should fall naturally, the feathers not twisting over one another or rising in a hump behind the neck; tail very large and full, with the feathers unusually broad and arching, and the saddle hackles very plentiful; legs short and perfectly straight; toes, five on each foot, the fourth and fifth or hind toes being very distinct, and each growing separately from the leg, the fifth toes turning upwards; the front toes long, straight, and well spread, and the spurs set well inside the leg, in fact almost pointing at one another.

Formerly the color of a Colored Dorking cock was immaterial, but of late years, since a separate class has been made for Silver-Greys, this is not the case. The neck hackle should be clouded or striped with black, and not be white, as in the Silver Grey. The saddle, too, should be clouded, and the shoulders of a darkish tinge. The accompanying illustration, drawn from a cockerel of my own breeding, gives a very good idea of the color required in a Dorking cock to match the Dark hens, which are now so fas-

hionable. A cock will pass muster if he is not so darkly striped in the neck hackle; but a Colored Dorking Cock with almost white hackle and shoulders is not the proper mate either for the show pen or breeding for a Dark hen, any more than a Silver Duckwing Game cock is a match for a Brown Red Game hen. To a critical eye one is quite as objectionable as the other.

Occasionally we see cocks showing a good deal of red or chestnut on the shoulders. These will pass with a Dark hen and often breed very good pullets, but they are not so suitable in my opinion as cocks only showing black and grey. It is commonly thought that white in the breast or tail is a bad point. This is a mistake, and arises from confusing the colors of the Dark and Silver-Grey varieties. A little white in the breast of a Dark cock, or on the thighs, is no detriment, nor is white in the tail; in fact, I have never seen a really good Dark cock without white in the sickle feather—a “gay” sickle, as it is termed. My first prize cock at the Palace, and first cockerel at Birmingham, this year, both had white in the sickles, as also had my second Palace and cup Birmingham cock the year before, and I have yet to learn that it is any disadvantage. Of course a very white breast or tail is a disadvantage; but it is no disqualification if a bird is good in other respects, and often appears after a moult in a bird which was previously quite free from it.

I have said a good deal about the white in the tail, as the only results of rejecting gay-sickled birds would be to reduce the size of Dorkings by making the choice of show specimens much more difficult, or else to introduce the plucking-and-trimming system, which is such a curse to many other breeds. The color of the legs and feet should be white; the color of the flesh and skin of a fowl is always of the same tinge and color as the feet. So in the Dorking, which is essentially the table fowl, it is very important that this should be white.

I have now mentioned most of the necessary points, and to assist beginners will now state the most common defects. Many Dorkings have undoubtedly been crossed some time with other breeds, such as Cochins or Malays; but such crosses can nearly always be detected. Long legs and deficiency of chest are certain signs of a cross, as also are yellow beaks and too nails. A small tail, too, should be looked upon with suspicion, as a large and flowing tail is inseparable from a pure-bred Dorking. The comb in the cock sometimes falls to one side and lops behind; both these are signs of lack of condition and health, and are ruinous in the show pen, as also is a bad twist or bend in the comb, though a slight turn or “thumb mark” in the front of the comb is not so important as in a Spanish cock. A crooked leg is not at all an uncommon defect, and should be carefully looked to in buying a bird; but the feet, as a rule, are where the most attention is required, as not only are corns found under the feet, but the hind toes are frequently badly set on. The big toes often curve inwards and the front toes are sometimes set too closely together instead of being well spread. These two last are bad defects. Spurs are found outside, too high up, or at the back of the leg; these blemishes are fast becoming common, and require to be looked to. A decided dark tinge or “sootiness” in the feet is certain disqualification, as also are feathered legs.

(For *Fanciers' Journal*.)

WHITE CRESTED BLACK POLISH.

THE EFFECTS OF A VOYAGE.

In the long chain of God's handiwork and wisdom, as developed in the animal race, man stands at the head, alone gifted with a complete language, whereby he can communicate his thoughts, feelings, and impressions, but when we descend in the scale of living beings, we must satisfy ourselves to read, mark, and learn, what they would fain tell us, by their action and glance of the eye.

All domesticated birds and quadrupeds have a power to manifest pain and pleasure, by well-defined signs, which he that runs may read; even symptoms of their manifold diseases are being rapidly learned and remedies provided, in many cases complaints approximating to those of man.

An instance which came under my own observation, demonstrates the fact, that fowls are subject to the same painful sensations of a voyage as we are ourselves. On the 6th of the present month, I received advice from England of the shipping to me a trio of White Crested Black Poland Fowls, from which I judged that they ought to be, if not having arrived, at New York, and through the kind services of Mr. Booth, the superintendent of Adams' Express in this city, they were sought out and promptly delivered to me on the second morning following. I was glad to see the three beauties safely arrive, but at one glance I noticed they looked weary and listless. They had evidently not starved for food and water, judging by the abundance of a good quality of corn in the bottom of the hamper, and the vessel of water at the side. For the delectation of amateurs, we give the items of expense for transit from Liverpool to Hartford, by Baldwin Bros. & Co's American-European Express:

Custom fees, expenses and cartage,	\$1.50
Commission, \$2.00, freight \$10.55,	12.55
To butcher for attendance,	5.00
Collection,	.25
Express, (Adams)	1.00
	\$20.30

I took them out of the basket, and carefully examined them one by one: one hen had a slight bruise under its wing; the other had a little cold in one eye, which indicated something worse to follow, if not checked. I therefore took a soft sponge and applied water and castile soap, and gave it a few drops of tincture of nitre on sugar, which had the desired effect. The cock was apparently well, with the exception that it was evidently laboring under great distress and alarm; on being moved by hand, it thrust its head under its breast, and on being but down on the ground, put it flat down, and made a complete somersault, as deftly as any school-boy; it was evidently dizzy. When put on the roost at night, when darkness was setting in, he would scream in great alarm for five or ten minutes, as if anticipating another storm, when he would hide his head under his breast. None of them, on being first put in the yard, could walk steady, but moved about with a hop, skip and jump. These eccentricities, however, gradually wore off in two or three days. I saw they needed rest and quietness, and in a week they were almost restored to their former strength and vigor. I have imported birds before, but never saw the effects of a voyage so marked as in these.

ANDREW SUGDEN.

SHIPPING FOWLS.

At our last show I noted the various ways in which some breeders ship fowls. Some come in very heavy rough boxes—boards an inch and a half thick; [some in *lath* boxes, with no protection whatever from the elements. The best coops I have yet seen—or perhaps I might say—the most properly shipped birds I have seen, were some from the yards of J. Y. Bicknell. These coops were made of *thin* boards, *hard* wood with half inch pine bottoms and partitions; they were tight, except on top, so no cold draughts could affect the birds; a place for feed, and cups for water, in each box two separate trips was transported, at much less weight than one trio is generally boxed. If some of those "*Phaniers*" who ship a trio of Bantams in a dry-goods box, would only bear in mind that parties who buy fowls generally have their hen houses built, and don't want *lumber*—especially at *express* iv rates. Let the fanciers ship their fowls in light boxes

as possible, and perhaps the extra charges thus saved the purchaser, may possibly find its way into other pockets than that of the Express Co.

G. O. B.

HERRON vs. WARREN.

WORCESTER, MASS., June 13th, 1876.

J. M. WADE, ESQ., EDITOR:

MY DEAR SIR:—It is entirely true that in the fall of 1875, I received a bank draft for \$25 from Mr. F. M. Herron, Indianapolis, Ind., for a trio of my game birds. I filled the order Sept. 18, 1875, from my Leicester yards, and received from Mr. Herron a very satisfactory letter in praise for the birds. It is also true that on the 7th of Feb. 1876, he wrote me of the death of his cockerel, and wishing my lowest terms for another as good, and desired and urged that on account of his ill success, or loss, that I should furnish him a male bird at a less price. It is true that I replied to him, Feb. 9th, 1876, that I could only send him a late hatched chicken which would be A No. 1, price \$12. He replied to this letter still urging that I should sell him a cockerel at a less price than \$12, to which I replied Feb. 18, 1876, that the cockerel I should send would be all right for breeding, but I was so short I could not possibly let him have one less than \$12. It is also true that Mr. Herron sent me a bank draft for \$12 which I received, and on March 6th, 1876, from my Leicester yard, I sent him one of my best Belden Stags, hatched in Sept., 1875, and which Mr. Parker and myself *personally* selected and pronounced an A No. 1 cockerel. On receipt of this bird I received a letter from Mr. Herron stating that I had swindled him, and that he had returned the bird, saying he wanted immediately either the money or another bird and that he wished me to understand that A. D. Warren could not swindle him, and then enumerated the disqualifications which I pronounced in my letter of March 17th, 1876, to be entirely false in one particular at least; that of the wry tail. The letter of Herron annoyed me exceedingly. It made me feel sick to think I was engaged in such a business. It made me think that this man Herron said to himself "Well now I have got this man Warren entirely in my power—I am bound to get from him an old, fully developed bird, for with his reputation, he would make me a present, rather than undergo a controversy." He writes me April 28th, 1876, "I have delayed answering until I could get replies from Jos. M. Wade, and other prominent fanciers, but if you will send me at once, *expressage* paid, a bird that judges here or W. H. Todd of Vermillion, Ohio, pronounces 1st class, I will be satisfied; otherwise, I shall proceed to business," and then follows on a series of *threats*, and concludes the letter by saying "I am very much of the opinion that you do not know me but think you will, unless you do as I say, know me much better in the future than you do now, and further, that you will conclude that that little \$12 did more advertising for you than any similar amount you ever before became possessed of." To which I replied that I had sent him a first class bird. He had returned the same at an expense to me of \$4.20 with complaints that I declared false and untrue; that the bird was in my possession subject to his order. And May 1st, in answer to a letter from him, dated April 28th, in which he said if I did not at once send him the \$12 he should send to each of the poultry papers his story, and would have circulars printed to send to every poultry breeder in the States. Says he should be on hand at the Centennial, Boston, and what large shows there should be; would spend \$50 or \$100 if necessary, and ends by saying "Doubtless the good people of Worcester would be rejoiced to learn that A. D. Warren was an object of charity."

I say in reply to this, I wrote May 1st that my reply was the same substantially as in my letter of April 21st, with the addition that I should not do as he demanded of me. Said I would remit him \$7.80 less the \$4.20 paid for express or if he would remit me

\$4.20, I would send him another bird, but very generously suggested that his best method would be to make good his threats. After beating around for some time, and getting into the position that he had gone so far that he was obliged to do something, he has given the country his story. Since the starting of this, I have laid the subject before some of my friends, all of whom I think are honest men. One says, "Well Warren, if you have got the back bone to stand up to this thing, and challenge Herron to make a statement that shall affect your honor, and if he dares make it you can honestly repel his insinuations, do so, and many a hard working, good, respectable breeder will rise and pay you tribute. Another says, "any man who would say to me that my friend, 'Al. Warren, my boy,' would for the paltry sum of twelve dollars, take advantage of any one, I would tell him he either lied or was mistaken." Another says: "Take no notice of it, it is an old game to make."

In conclusion, Mr. Editor, let me say that the sum of \$12 or another of my birds would have silenced this matter, and certainly I desire no publicity, but sir, I do most sincerely think that this man Herron thought he could frighten me into his ideas, consequently I do not believe him to be an honest man. The bird I sent was a late hatched, but a perfect bird, so far as tail and health. I have him now, and I am sure that for such a bird this fall, Mr. Belden would charge me \$50 gold, and expenses. I have raised better birds, but he will now figure 85 points, I am sure by our standard. Herron alludes to other irregularities, which I shall make him prove outside of any poultry organ. I can say that from the sale of stock amounting to \$4,691, I have had six complaints only, and I do not think one of them reflected on myself as taking advantage. It is getting harder, and more difficult to suit the tastes of fanciers. They all want fully developed birds that will figure just 100 points; that is what it means, and any one shipping birds from Worcester Mass., to Indianapolis, Indiana, in the month of March, should not be held responsible if the chickens catch cold. A wry tail is another question, and unpardonable on the part of a shipper; this accusation I simply deny in toto, and if Mess. Fry and Christain subscribe their statement on the bird I sent, I have my opinion of their knowledge in that line.

This is a good time to make and hear complaints. It is high time reform should be the order of the day. If I am judged guilty in this, say so, and I will give up my clothing entire, which has belonged to honorable bodies. Herron writes in one of his letters that he understands A. D. Warren goes to the A. P. A. with all his complaints. He is right. That is the place to go to in my judgment, and I should go there every time in cases like this. My reputation is to me, of more value than any business I might have. I raise chickens more for the pleasure that others and myself derive, than for the gain. And I probably put out more money every year than any other breeder of a single variety in the world. And it only makes me happy when I know I have pleased a customer or friend. Those who know me best, know whether or not I would be guilty of such charges. And it is a duty incumbent on them to have this matter well weighed. Among the orders I have received for birds for the season of 1876, let me say I am perfectly willing to cancel all, if they are in any way influenced by this case. I in the future as in the past warrant full and thoroughly my stock, and shall never send out any but first-class Black Breasted Red Game stock.

Begging pardon for the time &c.,

I am very truly yours,

A. D. WARREN.

LEICESTER, MASS., }
June 16th, 1876. }

This is to certify that I have bred Game fowls for Mr. A. D. Warren for the past three years, and I know it has always been his aim to sell nothing but first class birds, and that he would on

no account allow one of inferior quality to leave his yards. In regard to the cockerel sent to Mr. Herron he was a very fine Beldon Stag but was late hatched and not as old when shipped as Mr. Warren usually requires them to be, but before sending he wrote to Mr. Herron informing him of that fact, and Mr. H. ordered him to be sent, and we selected him as a very fine bird, he had not a wry tail nor any deformity whatever. I would not send, nor would Mr. Warren allow a wry-tailed bird to be sent to any one. I consider it the worst kind of a disqualification in any variety of fowl. Any bird in Mr. Warren's yards that showed the least tendency to a wry tail, would be very short lived indeed.

G. F. PARKER.

SHERWSBURY, MASS., }
June 12th, 1876. }

I hereby certify that for the past two years I have bred Game fowls for Mr. A. D. Warren of Worcester, and that I have always found him exceedingly particular in the selection of his birds, and never knew him to send out a poor one, and I believe he would rather lose the sale of a trio at a fancy price than to sell an inferior bird for \$100. I know him I think, thoroughly, and know him to be a man above taking advantage of any one.

H. S. BALL.

AMONG THE FANCIERS.

A few days ago I went on a visit to some of our poultry men. C. E. L. Hayward has the largest variety of fowls and pigeons in New England. He lives on a farm in Hancock, but his express and post-office is at Peterboro, N. H. He breeds all the Asiatics, Brown, White, and Black Leghorns, S. S. G. S., and Black Hamburgs, S. S. Polish, B. B. Red and Blue Pile Games, P. Rocks, Dominiques, Black Spanish, B. B. R., and Silver Duckwing, Game Bantams, G. Sebright, S. Sebright Bantams, Black African Bantams, White Booted Bantams, White and Colored Musk, Rouen, Cayuga, White Crested Pekin, Aylesbury, Mallard, White Call Ducks, Bronze Turkeys.

His collection of pigeons is very large, and are nearly all first-class birds. He has nearly all the different colors of Fans, Jacobins, Pouters, Carriers, Trumpeters, Tumblers, Duchesses, Barbs, Magpies, Turbits, Swallows, Archangels, Snells, Priests, Ring-neck Doves, and other varieties on the way.

Mr. Hayward lives on a farm of about 400 acres, and is largely engaged in fruit growing and butter making, and keeps Essex swine to eat the sour milk. The fowls are kept in small houses, cheaply built and scattered over his farm. It is quite a job to tramp over his premises. Mr. Hayward told me that his sales of eggs had been very large this spring, and have hatched very well. His stock cost very high, and was obtained from the best breeders in the country. His Black African Bantams from Bicknell are extra good.

Mr. Hayward has never exhibited at any of our shows, but we hope to get him out next winter. I intended to visit E. R. Spaulding, the "Game Bantam Man," but it was too hot (92°). Shall try and look his stock over in Sept.

J. G. McKEEN.

ARTIFICIAL HATCHING.

The Chinese rear immense numbers of ducks, which are hatched by placing the eggs in a box of sand and they then keep the box of sand at a heat suitable to hatch eggs, when hatched they are fed on crawfish and crabs (I think they would be "backward" in their growth), cut in small pieces and generally boiled with rice; they (the ducks) are kept in boats, 300 or 400 in each, going out to feed every morning and returning when wanted by call of the master.

TERRE FILIUS.

PIGEON DEPARTMENT.

(For Fanciers' Journal.)

PIGEON FLYING.

NEW YORK, June 15th, 1876.

PROF. A. N. RAUB:

SIR:—Knowing that you are a pigeon fancier, and also a friend of the interesting pigeon called "le Voyageur," or homing Antwerp, and wishing to get from you a few references in regard to the distance of your place from Philadelphia, and also from New York, I have thought to write this letter, with the request that you publish your answer in the FANCIERS' JOURNAL, of Hartford, Conn. Last year for the first time in the Colombophilic sport of the racing of the Antwerps in the United States, the Philadelphia and New York fanciers had a few races; our New York birds had to fly from Philadelphia, and the Philadelphia fanciers' birds had to fly from New York. Our first race was for a valuable gold medal, known as the champion medal of the Philadelphia and New York flying pigeon fanciers. My bird won the medal, doing the distance from Philadelphia to New York in about 4 hours 30 minutes, while it took Mr. T. Grist's bird 59½ minutes more, and the other birds were ruled out of time, as they came too late to be taken any notice of. As you will see, sir, our birds made bad time, as a distance of 90 miles could be easily flown with clear weather and favorable wind in two hours. It happened that the day of the race was a very foggy day, at least, so in the morning. Here in New York, as is generally the case, like in all large cities, particularly when lying near the sea coast, it was very foggy at 6 o'clock, A. M., and as the conditions were that our birds should be tossed at 7 o'clock, it was very hazy at that time yet, although the fog had cleared off to a great extent. In Philadelphia, it seems, there was also a great cloudiness hanging over the city, but as Mr. Grist wrote me it was considerably cleared away at 7 o'clock. Mr. Grist's bird, who had flown the distance from New York to Philadelphia often, never took so long a time as it did the time of the race. Mr. Grist, although not winning the gold medal, insisted if the weather had been as clear in New York as it was in Philadelphia, that his bird would have made a better record, and might have beaten mine. May this be so or not, there is some irregularity and unfairness in flying birds in different directions and different atmospheres, and therefore I have taken the liberty to address you this letter, so as to see if the direction in which you live, should not be a desirable one to fly both the Philadelphia and New York birds, in case of races.

I think that Lock Haven lies west from Philadelphia, and also from New York; the distance is not much farther from the one place than from the other, and it being inland, and away from the sea coast, I think that the atmosphere must be pure and free from all gases and haziness. You are aware, sir, that the best authorities on the pigeon Voyageur attribute their remarkable powers of returning home from great distances to their extraordinary sharp eye-sight aided certainly by superior breed and instinct. All fan-

ciers of the homing bird, who have raced their pigeons know that if they send their pets to voyages in foggy weather they generally get lost, or at least stay away until the weather is cleared up before they can locate themselves, and be able to find their destination. It is then the first duty for a fancier to study the directions where generally the clearest weather prevails. As I said before, and as almost everybody knows, the sea coast is generally foggy, and I think therefore that we should keep away from the sea coast. Certainly we all know that the wind in the summer months generally blows from the south or south-west, and therefore it is not advisable to train toward the north, as in case of training in that direction the birds lose also one great point, which is that they have to fly against the wind, but when they are flying from the west to the east, as I think your town lies from Philadelphia and New York, the inconvenience which the birds might have by not exactly flying with the wind, will more than tenfold compensate by the clear atmosphere they will encounter by flying from the interior towns.

Lock Haven, by looking at the map, must be about 175 miles from New York, and about 155 from Philadelphia. Although in such a race the New York pigeons should have to fly about twenty more miles, this could be arranged by allowing time. A race from such a distance would certainly attract the attention of all the pigeon fanciers in the country, and stimulate the desire to breed and train the homing bird.

I propose then in the name of the New York fanciers a great pigeon match with birds bred in 1876, from the city of Lock Haven, on the 30th of September next; the first prize to consist of a valuable gold watch and chain, and the value thereof to be raised by a subscription of all the participating fanciers. I will lead the list with \$15.00, and although I have not spoken to Mr. Waelelaer from Hoboken, N. J., about it, I guarantee at least as much more from him, and if every fancier does according to his desire and means, we will be able to add perhaps another gold watch for a second prize. Now Sir, if every fancier will take care of his young stock, and keep them undisturbed till the half of August before he commences to train any of them, there is no doubt that all will have plenty of birds to participate in the race. Unluckily some young fanciers not accustomed to handle the flying breed, and not understanding the way they train in Belgium, commence to train and race their young birds in May, June and July, in some matches from short distances. This is not the way to do, as in these months the races should be done with old birds. In Belgium we commence to train our old birds about the first of May, and stop with them about the latter part of July. Between this interval all the racing is done with the old birds, and the young birds are left undisturbed. Then only we commence with the young birds, and as it might be of some interest to you, and to show that what I advance is true in every respect, I give you here below the places which are selected in Antwerp to train their birds from, and I will also give as near as I can the distances.

The Antwerp paper, the *Pigeon Fancier* of April the 29th, says: Public list of the exercises and prize races for the year 1876.

WITH OLD BIRDS:

Sunday, May the	7th, from Beveren,	5 miles from Antwerp.
Tuesday, " "	9th, " St. Nicolas,	12 " "
Thursday, " "	11th, " Lokeren,	18 " "
Sunday, " "	14th, " Ghendt,	30 " prize race.
Tuesday, " "	16th, " Ghendt,	30 " "
Sunday, " "	21st, " Valenciennes,	75 " prize race.
" " "	28th, " St. Quentin,	140 " "
" " "	June 4th, " Paris,	216 " "
" " "	" 4th, " Blois,	300 " for prize of honor
" " "	" 25th, " Chateauroux,	350 " "
" " "	July 9th, " St. Sulpice Saur,	500 " "

WITH YOUNG BIRDS BRED IN 1876 :

Sunday	July	16th,	from Beveren,	5 miles from Antwerp.
Tuesday,	"	18th,	" St. Nicolas,	12 " " "
Thursday,	"	20th,	" Lokeren,	18 " " "
Sunday,	"	23d,	" Ghendst,	30 " prize race.
Tuesday,	"	25th,	" " "	" " "
Sunday,	"	30th,	" Tournay,	50 " " "
"	August	6th,	" Valeciennes	80 " " "
"	"	13th,	" Albert,	140 " " "
"	"	20th,	" Creuil,	200 " " "
"	"	27th,	" Etamps,	240 " " "
"	Sept.	10th,	" Beaugency,	275 " " "

You will see Sir, that the old birds which for the greatest part are experienced birds, that is to say birds who have flown some distances the year before, are not given so many exercises, while young birds are trained with more caution. If I recommend to commence the training of the young birds only in the middle of August, instead of in the middle of July, as they do in Belgium, it is that the heat is generally a great deal stronger here than it is in Belgium and in the north of France, besides the month of September is a favorable month for training pigeons, the weather being generally clear, and very fine in this country.

Trusting Sir, that you will give the desired references, as also the railroad facilities with your plan from New York and Philadelphia,

I am Sir, yours respectfully,

JOHN VAN OPSTAL.

4 Lewis St., New York.

LOCK HAVEN, Pa., June 17, 1876.

JOHN VAN OPSTAL, ESQ.:

DEAR SIR:—In answer to your communication of the 15th inst., I would say that in a direct line as nearly as I can ascertain, our city is about 155 miles from Philadelphia, and 185 miles from New York. The town is accessible by rail from either New York or Philadelphia via Harrisburg, four times daily: at 9.40 A. M., and 3.15, 7.30 and 10.30 P. M. Our railway distance from Philadelphia is 226 miles, and from Harrisburg 118 miles.

From Philadelphia the towns of Reading, Pottsville, and Northumberland are in almost a direct line to Lock Haven; and from New York, the towns of Easton, Tamqua, and Northumberland are similarly situated, making good practice points from which to fly while training. At Tamqua, Col. John Hendricks, and at Northumberland Col. David Taggart, two ardent veteran fanciers, would doubtless be willing to give their assistance in caring for the birds, &c. I am unable to name any fanciers in either Pottsville or Reading, but there are numbers in both places.

At Lock Haven any assistance I might be able to render would be given willingly. I hope your challenge may be accepted, and that a match may be made for the time you mention. Our mornings here are generally beautiful and clear, and I think favorable to a good start. I trust that we may be able to get up a "rousing good" race, and that there may be watches enough to go around. Letters asking such information as may be in my power to give, will be cheerfully answered.

Yours,

A. N. RAUB.

(For Fanciers' Journal.)

THE LATE PIGEON RACE.

PHILADELPHIA, June 20, 1876.

In looking over the Journal of June 19, I must confess I was astonished in reading an article from my friend John Van Opstal of New York, on our late pigeon race on May 6th.

When Mr. Van Opstal was in Philadelphia lately, these are the arrangements he agreed to: For Philadelphia fanciers to arrange the race; that he should be perfectly satisfied with the arrangements they made as he knew they would be fair and honorable.

Now, I can assure you Mr. Editor and your readers, that the race was a fair and square one, and Mr. Van Opstal lost the race

fair on the merits of his birds. It is true he wrote to me after the race was over that the race ought to be flown over again, as he claimed the weather was not as clear at Trenton where his birds were tossed as it was at Northeast where ours were tossed. This is what I learned from those that took the birds to Northeast, the weather was clear there, and also those that saw his birds tossed at Trenton, and his birds were seen flying in the air very high. His birds were tossed fifteen minutes apart, and they flew around till they all got together and then went out of sight. His birds were tossed shortly after the train arrived at Trenton. It was impossible for us to toss our birds at the same time as his, as the train did not arrive at Northeast till after ten o'clock, and this is the reason our birds were tossed three-quarters of an hour later than his. He also states that I persuaded him not to fly the match over again. This is what I wrote him: that we would not fly over again for the same prizes as we had already won them fair and honorable, but if he was not satisfied with the result of the race he could have another match for anything he chose to name. Then he wrote me he was satisfied with the result of the race. He also states that I have made a mistake, and Newark is eighty miles instead of forty. It is he who makes the mistake and not I, as it is forty miles on Baltimore road. He also states that Philadelphia has not got a pigeon that can fly from Newark to Philadelphia in 1 hour 90 seconds. We did do it on 29th of April, and are willing to back our bird again if he will back his bird to do what he claims; that is, to fly from Trenton to New York in 1 hour and 5 minutes, as the Philadelphia fanciers think his birds cannot do it in that time, and he shall have clear weather and a week's training from the time this is published in the Journal, for \$50, and we will back our bird to do what we claim from Newark on the 29th of April. All I can say to my friend Van Opstal, if he is not satisfied with the result of the race on the 6th, we are open to fly again for anything he chooses to mention. We will fly 52 miles on the Baltimore Road, and he to fly 52 miles on New York road. The Grist fanciers will not accept any matches from the New York fanciers until they have settled these.

Hoping they will accept all three of them and prove to the fanciers which is right.

T. GRIST, Philadelphia, Pa.

A MAN who had been nearly talked to death by loquacious barbers went into a shop the other day which he had never patronized before, and handed one of the artists a card bearing the words: "Give me an easy shave." The barber motioned him to a chair, and then, turning around, winked at his fellow-barbers and said: "Here's a deaf and dumb 'un, boys; wants an easy shave." "Well, if you gash him he can't talk back," replied one who was lolling in his chair, waiting for "next." "No, you bet he can't," returned the first. "An easy shave be blowed! Why, he's got bristles on him like a Texas boar, and his skin looks tougher than a canal mule's." The boys laughed, and the operator, who in the meantime had lathered the man's face, indulged in further comments as he urged the razor over the facial territory before him. "What a nose that is," said he. "If he should sneeze where would it be! Well, his cheek is harder than a razor hone." "Do you want us to help hold his nose back while you go over his lips, Johnny?" asked another of the idle razor wielders. "Don't know but I will want a little help." "Be careful, and don't drop your razor down his ear, or you'll lose it," admonished another. "What a dirty head he's got," observed Johnny, as he ran his fingers through the boy's hair. "I say, some of you fellows write a card, and ask him if he don't want a shampoo." The card was written and presented to the man who shook his head at it, and, the job being finished, he rose from the chair. "It's all right, boys," said he, as he laid down his fifteen cents. "I didn't mind your talk any, I could stand it first rate so long as you didn't say anything about base ball, third term, or the whisky-ring frauds." He disappeared, and those barbers sat down and thought about him.—Chicago Times.

EDITORIAL DEPARTMENT.

THE FUTURE OF THE POULTRY INTEREST.

Judging from the past, we are inclined to think that the future of the poultry interests of American breeders may be foretold, in the light of the present day, if we reason from plain analogy.

We gave our views recently upon one important point, in connection with this subject—and urged upon the attention of our readers the necessity of *steadiness in purpose* in this business, because we have found in our experience in this matter that many fanciers are apt to deal altogether superficially with the undertaking, while at the same time they indulge in “great expectations” that cannot be realized through brief or uncertain exertions.

Many young breeders who embark in this enterprise hopefully, and under comparatively favorable auspices—who build capacious houses and procure costly specimens of stock—and who find upon their premises goodly numbers of what they esteem fine birds, after a year or two—also ascertain that, for reasons they cannot comprehend, their fowls are not saleable, or that the demand for what they expected to realize largely upon, does not prove so active as they had anticipated.

At the same time they see that Messrs. Jones, Smith, and Robinson—who have been engaged in the work for ten, fifteen or twenty years, and who have raised and sold hundreds of fowls while they have been getting a few dozens ready for disposal, still sell their choice specimens at good figures, and at the season's close have none to spare. This result discourages the younger fanciers, and they cry out “the business is overdone!” or “there is no sale for fancy chickens, now,” or “the bottom is dropping out, evidently!”

We repeat what we have said before, that the business of chicken-raising is a work of time, and there is but one way in which it can be made a successful undertaking—to any considerable extent. And this result involves method at the outset, the culture of good stock from the start, study and application continuously, and the making of the breeder's accomplishments known as widely as possible—when he comes to possess surplus stock—to the hundreds and thousands of would-be purchasers of his supplies, from season to season, through the proper channels of judicious advertising.

But over and above all it is necessary when the dull times come round—as come they will, from one period to another—that breeders should “hold fast to that which is good,” in this business. While they should never hide their light beneath a bushel,

at any time, especially should they remember that perseverance in any laudable undertaking is requisite to success. And because there occurs a slackness in trade, or a dearth in the demand for their stock at a given time, it is no reason that they “give it up so,” by any means! This plan surely will never lead to success.

And so we feel assured that the future of the fancy poultry interest is quite within the control and shaping of our breeders themselves. If the advice of one who has for years been engaged largely in this calling be useful, it is suggested again that those who have now on hand a surplus stock, should manage their flocks with care and good judgment—adhering to the principle that only the best fowls are worth keeping, nowadays; and looking forward to the time when the demand for good birds will again be active and brisk, as it has been for years, until within a very recent period.

It may be—and we think it is quite likely—that for the next twelvemonth, this successful activity so long enjoyed by the generality of fanciers will be checked. And such a result perhaps will prove healthful to the fancy. Prizes have ruled high, for ten years past. A decline is natural. We can't always expect to be riding upon the top of the wave, surely.

But let us be steady in our aim, and let those who this fall possess good strains of stock hold on to their choice breeds, and improve them, if possible, another year. The tide will turn, perhaps before we are aware of it. Those who have the stock to meet the demand that is certain to be renewed—as it has been over and over again in the past three decades of the history of the fowl trade—will be these fortunate breeders and they will control the near future of American poultry interests; and these, we feel confident, will be the men who will reap the profits hereafter to be realized in this enterprise, if an opinion can be formed upon the precedents that have been furnished by experience in the past.

CORRESPONDENCE.

DEPARTURE.

JOS. M. WADE, Esq., *Ed. Fanciers' Journal*:

DEAR SIR,—Being about quitting “My Maryland,” to take up my abode in the far off Orient, and auriferous State of California, I cannot help saying farewell to you and the readers of your interesting JOURNAL. I leave my Pigeons and Fancy Fowls behind me with a regret, that only those who are enthusiastic in the Fancy, can appreciate. I trust as soon as I get settled in that wonderful clime, I shall again enjoy the *valuable information*, and pleasant reading, found *always* in your columns, and will again indulge my fancy and passion for our pets. It may be, I shall take my favorite Antwerps, John and Bess, along with me.

If the soil of California produces such enormous vegetables and fruits, why should not its climate also stimulate animal growths in like proportion? If I find it so, I shall try and grow monster-fowls, to completely throw in the shade those huge ones now reared on the Atlantic Slope, and *Eastern Shore*. Go where I will, I must have my pet-pigeons, I grow fonder every day of the beautiful and intelligent birds. I hope the present interest in breeding fancy and useful poultry of all kinds will continue to increase, and that your JOURNAL will continue its prosperous career. *Adieu.*

H. F. WHITMAN.

BALTIMORE, June 23, 1876.

A correspondent of an English farming paper states that one of his tenants placed a pump in the piggery in order to pump the whey out of the cheese room, and adds, “One day I saw an old pig deliberately take the handle of the pump into its mouth and pump itself some whey.” There were evidently some brains in that old hog's head.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

FROM SPRING TO FALL.

From Spring to Fall the year makes merry,
 With days to days that chant and call,
 With hopes to come, and fears to bury,
 With crowns of flowers, and flowers for pall,
 With bloom, and song, and bird and berry,
 That fill the months with festival,
 From Spring to Fall.

Who knows if ever the skies were dreary
 With storm, and cloud, and waterfall?
 While yet the world's good heart is cheery,
 Who knows if rains will ever fall?
 The storm thinks long, the winds wear weary
 Till winter comes to wind up all,
 From Spring to Fall.

SWINBURNE.

—“RAMBLING BOTANIST.”—In answer to Rambling Botanist we are informed that a volume of “Practical Botany,” by Dr. Koehler, will be published soon by Henry Holt & Co. It is intended to serve as a summer “handy book” to those who know little of botany, enabling them by an easy key to all the flowering plants of this region [the United States east of the Mississippi] to identify any flowers they may find.

—M. is certainly wrong in supposing the Adder to be armed with a wasp-like sting. No serpent known to naturalists has a poisonous sting at the extremity of the tail. I have often been greatly amused at the marvelous stories told by southern Negroes of the wonderful “Hoop-Snake” which they say will take its tail in its mouth like the great Midgard serpent and roll as rapidly as the swiftest horse can run. It is armed with a dead envenomed “horn” near the extremity of the tail, and if it strikes it into a tree the leaves instantly wither and soon the very trunk is dead. Of course this snake is a creature of the imagination, as purely a myth as Griffin or Dragon.

J. M. McCANN.

—CORKS—The material from which corks are made is the thick, spongy bark of a species of oak that grows in the dry mountainous regions of Spain and other countries in the southwestern part of Europe. After the cork tree arrives at a certain degree of maturity it periodically sheds its bark, but the bark when removed artificially is superior for purposes of manufacture. When the tree is from twenty to thirty years old the bark is fit for use and may be removed every eight or ten years thereafter, without injuring the tree. Since the invention of glass bottles, in the 15th century, the manufacture of corks has been a source of great wealth in certain provinces of France and Spain where the cork tree is abundant. Cork is not confined in its uses to the manufacture of stoppers, but is also used to quite an extent in the manufacture of life-boats' buoys, insoles to water-proof shoes, &c.

—STICKLEBACKS.—Upon drawing the hoop of the net out of the water, and allowing only the net itself to remain submerged, we found in it several minnows, small catfish, and sticklebacks. There were several holes in the net, large enough for any one of them to have escaped through. The sticklebacks turned around, and as soon as they spied the hole, wiggled out. The others swam against the net, and tried to break through the sound part. One or two of them got in front of the hole, but stared at it, and then again beat against the net, until it was dipped under, when they all quietly swam out.

This was tried several times, and the Sticklebacks invariably looked for the hole and swam out immediately, while none of the others seemed to recognize it as a means for escape, but blindly dashed into the net, and were only released when the net was dipped under.

H. A. S.

—HOW THE BIRDS TOOK A TOWN.—Harald Hardrada was besieging a town in Sicily, the walls were so strong that he could make no breach in them, and the inhabitants had an abundant supply of provisions and arms. Harald ordered his fowling to catch the small birds that nested in the town, and flew away to the forest during the day in quest of food for their young. He caused splinters of inflammable wood smeared with sulphur and wax to be fastened on their backs, and enkindled. The birds, when set at liberty, flew immediately to their nests under the eaves of the thatched roofs; the town was soon in flames, and the captive citizens were borne away to the frozen regions of the north, far from the vine-clad hills and sunny plains of Sicily, the slaves of the worshippers of Odin, the Raven-king.

J. M. McCANN.

—THE TARTARIAN LAMB.—The earth is full of mysteries and marvels, the ocean has its gardens strange and beautiful, the flowers, emerald, blue and gold are animate, seek their prey and feel the pain of death, insects assume the form of blossoms, and air-plants, resplendent with the metallic glory of the hummingbird, or the snowy beauty of the dove, have eyes and wings, and seem about to soar away among the purple islands of the sky in search of rapturous lovers. But to me the strangest of all strange things is the Barometz. It is one of the genus *Polypodium*; a perfect lamb in form, the legs, the tail, the head, the neck, the ears, all are there, and to complete the picture it is covered with a golden fleece, fine and soft as the lambs of Spain! The Tartars say that it eats up all the grass and weeds within its reach, and Loureiro that the “fresh root when cut yields a tenacious gum like the blood of animals.”

J. M. McCANN.

—CRYOLITE.—This mineral is comparatively rare, and consequently is not found very often in private collections throughout the country. The chief (if not the only) locality for it is Greenland, at Arksut, and exported from Ivigiteit, from whence it is taken to several of our cities near the coast. It is also shipped from these places to more inland points, as, from Philadelphia, it is sent to Pittsburg, and Cincinnati, where it is used in the manufacture of soda.

It contains iron, and copper, pyrites, galena, siderite (Hydrous Carbonate of Iron), and pure cryolite, which constitutes the white portion of it, and is a fluoride of sodium and aluminum. Specimens are often found which contain beautiful crystals of the galena and siderite, and fine masses of the copper pyrites; also the characteristic cubical crystals of iron pyrites.

Its name is derived from the Gr. *κρύος* icy, and *λίθος*, a stone, and is sometimes called ice-stone, on account of its fusing at a very low temperature.

H. A. S.

—AN AMUSEMENT FOR YOUNG BOTANISTS.—A very pretty amusement, especially for those who have just completed the study or botany, is the taking of leaf photographs. One very simple process is this: At any druggist's get a dime's worth of bichromate of potash. Put this in a two ounce bottle of soft water. When the solution becomes saturated—that is, when the water has dissolved as much as it will—pour off some of the liquid into a shallow dish; on this float a piece of ordinary writing paper till it is thoroughly moistened. Let it become nearly dry in the dark. It should be of a bright yellow. On this put the leaf, and under it a piece of soft black cloth and several sheets of newspaper. Put these between two pieces of glass, (all the pieces should be of the same size,) and with spring clothespins fasten them together. Expose to a bright sun, placing the leaf so the rays will fall upon it as nearly perpendicular as possible. In a few minutes it will begin to turn brown, but it requires from half an hour to several hours to produce a perfect print. When it has become dark enough, take it from the frame and put it in clear water, which must be changed every few minutes, till the yellow part becomes perfectly white.

—ANTELOPE IN MAINE.—M. A. Clark, Esq., of Danville Junction, Me., who has a fine collection of animals, writes to Forest & Stream under date of April 22: “I have just received from the Colorado plains a pair of antelopes (male and female) two years old this spring, and they are as tame as a cosset lamb, and to my surprise the buck is in full horn, as I always supposed they dropped their horns in winter same as deer. I find by placing them beside my young deer of the same age, that the antelopes are a little the largest, but their legs are smaller and more delicate than those of the deer. I am also just in receipt of a tame beaver from Three Rivers, Province of Quebec, and it is a curious sight to see him taking his breakfast from a birch club.”

A description of the gigantic mammals known as Brontotheriæ, whose fossil remains are found in abundance on the eastern slopes of the Rocky Mountains, in Dakota, Nebraska, Wyoming, and Colorado, is furnished to the last number of Silliman's Journal, by Professor O. C. Marsh of Yale College. He says these creatures nearly equalled the elephant in size, but the limbs were shorter, being intermediate in proportion between those of the elephant and rhinoceros. They had long slender tails, and the nose was probably flexible as the tapir.

—CHARACTERISTICS OF A BLUE TURBIT.—The standard characteristics of a Blue Turbit I consider to be as follows: A short broad head; beak also short, in fact, the shorter the better. The crown or crest behind the head should taper to a point, if the Turbit is what is termed a point or peak-crested bird; but if a Shell-crested Turbit, the crown or shell should be spread out the whole width of the back of the head. The purple or tuft of feathers on the breast should open and turn back both ways, somewhat like a

fill of a shirt; the larger and more conspicuous the purple the greater the value of the bird. The thighs should be quite clean—i. e., not the slightest shade of blue or any other color except white on them; the wings should be blue, with two narrow black bars across each; brown or rusty feathers are a serious defect; each wing should have ten white flight feathers. The breast, underparts, flight feathers, tail, and back should be white, and quite free from any colored feathers. Both cock and hen should be rather small, and the cock should have a nice gloss around the neck.—F. H. in *Journal of Horticulture*.

PETS AND THE FATE OF SOME OF THEM.

BY HUON.

NO. 3. THE PET ARMADILLO (GENUS *Cachicama*).

"Be not mindful of high things, but condescend to those of low estate."—*St. Paul*.

There has lately arrived at the zoological garden, Philadelphia, one of those animals strictly belonging to S. America, known as the ARMADILLO. It forms a link between the Sloth and Ant-eater, created it would seem, purposely for scavenger work, and to clear away all manner of vermin—living or dead. The wonderful little foreigner attracts much attention, he being quaint in all his ways, and dressed in a suit of armor from head to heel, which possesses immense strength, and yet has such pliant flexibility that it permits perfect freedom of motion, and no one can study him for a moment without a feeling of admiration and wonder at the all-wise forethought displayed in adapting the diminutive little animal to the arid waterless wastes, on which it is destined to live. Too feeble to resist if attacked—too slow of motion to resort to flight, and possessing no cunning to escape by concealment, nature has compensated him by giving him a suit of plate armor, in which he can roll himself into a ball after the manner you have seen a wood-louse do, in which shape it is next to impossible for an enemy, be it bird or mammal, to bite, eat or hurt him, nor can he in any way be gobbled up as food, unless he be bolted like a huge pill.

Now it was one of these strange animals that a certain gentleman, "once upon a time" selected for a pet! He (the Armadillo, not the gentleman) belonged to the species called by naturalists *Tatou septemcinctus*, or the "7 banded," but his owner called him "Moxey" "for short." He had the head of a rat, the ears of a rabbit, the tail of a lizard, and was covered all over by the horny plate armor already spoken of, and his locomotion! Ah! Halchen Mio! talk about the poetry of motion! You should have seen the graceful movements of Moxey! His walk was—

"Not in beauty, like the night of cloudless climes and starry skies,"

yet it was the most extraordinary of all locomotions, and a sight to behold.

"Why, he did not walk off on his ear did he?"

No! but he did on his long, pointed toe nails—a feat quite as quaint and curious, as though he had walked on his ear, I assure you. Look at this one in the Zoo—see how he goes wobble along. "Going to topple over?" Not a bit of it. He is quite as firm on his pins as you are my dear Pacific, who with your high heeled shoes, are also, Moxey-like, walking on your delicate pointed toes. Don't wait for Moxey to topple over, as he will do that no sooner than you will, my dear lady.

"Yes, yes, do get on with your story."

"Well, Moxey was like all his race, a "night bird." During the day he was not much of a show, except in the manner of his sleeping, and he slept all day. You should have seen the positions he assumed to sleep. He would roll himself into a ball, and rest on his head. Now that is more than any human could do, and

though some of us in cold weather, do assume as much of the ball shape as possible, when we sleep, still I do not believe we could stand on our head and do it! I am sure I could not, could you friend McCann? or you my dear Pacific?

Moxey then, as I have said, was merely a "sleeping beauty" through the day, but when night came there was "high jinks" with the young gentleman. Then Moxey was worst seeing! How he would dart along on the tips of the toe nails which adorned his queer looking feet, and thereby producing a kind of rapping noise, beating the Rochester rappers at that work all hollow. Making excursions to all parts of the room, he would stop now and then to think of something he had left undone apparently, or perhaps remembering something he should have done, he would start off in another direction, and as suddenly stop again, altering his mind, away he darts to another corner, moving round as though he had fifty things to do, and under the impression that he ought to do them all at once, and finally he would take to burrowing, this he would endeavor to do anywhere and everywhere. If chased by any one you should have heard the squealing of Moxey! It was unlike any sound ever heard before. He was no fighter—none of this tribe are—but if he got a chance, Moxey would give a sly bite which one would not care to experience a second time. He could not stand the least morsel of cold, therefore a fire had to be kept up for his worship, summer as well as winter. In his captivity Moxey was not allowed to have any of native delicacies, putrid flesh and such, but was obliged to eat good bread and milk like a christian, and he had learned to like that diet so well that he was getting as fat as a butter-ball on it, so well did he look that though not half grown, a gentleman of Philadelphia offered \$50 for Moxey, but his owner would not part with him for double the amount. His brothers and sisters can be purchased in Nicaragua for 6 or 8 cents each. "True," said his owner, "but not one of them would have been an educated Moxey!"

Moxey's greatest fun was in playing hide and seek, and that seems to be "the humor" of the whole Armadillo family. In his captivity, when he could not burrow any other way, he would gather together all the boxes, great or small, he could find, and piling them in a corner he would thus construct a barricade, behind which he would hide, especially when he wanted to go to dream-land, which, as I have said, was through the whole livelong day, and it was astonishing to see what heavy boxes the scamp could move from point to point. In this "box" and "barricade," business it was that the poor fellow, as well as his master, came to grief. One night he had built his barricade of some heavy and inappropriate furniture, and a piece which could not be made to fit, it was thought afterwards, had toppled over on him. In the morning his kind master was horrified to find poor Moxey with the sharp edge of a heavy box pressed into his neck—just between his ears and his armor—which had choked him to death, and he had been for some hours gathered to his fathers', never more to burrow or barricade, and the place which knew him, was to know him no more.—R. I. P. Moxey.

(For Fanciers' Journal.)

THE FLITTING OF THE BIRDS.

The "Doctor," though neither naturalist nor ornithologist to a great extent, yet having a love for our "poor relations," on going his rounds among his patients one morning, picked up, and brought home, a mite of a sparrow, which, too young to fly, had fallen from its nest in a futile attempt to do so.

Our children took kindly to the little waif and gave it a toy cradle for a house, with a pinch of cotton placed in it for a bed where it rested contented for some forty-eight hours, being fed meanwhile from the lips of a charitable sympathizer. At the expiration of that time Sparrowchen, as the mite of flesh and feathers had been

named, was removed from its cradle home and placed in the garden, at the foot of a rose-bush, where the warm sun of June fell not too hotly upon it. Then followed one of those strange incidents, which though occurring around us every day, yet we have not learned how to call them, or clearly define whether they be of Reason or Instinct. Sparrowchen had not been in the garden five minutes before one of its race full grown, flew down to it, twittering and chirping most volubly, and in another moment feeding it with a crumb! Was it the actual father (the visitor was a male) or was it merely a relative? I cannot tell, but there it was and during the day at intervals it came with chirp and food, to cheer and strengthen Sparrowchen.

When night came, and before cats commence their promenade, some friendly hand took up Sparrowchen and put it "in its little bed," only to be let out again in the morning when the visitations of the elder sparrow would be repeated. Thus it went on for several days and Sparrowchen, growing in strength, had put on quite a respectable feathery dress; when a change of conduct took place in the older sparrow. It would not come down to the ground to feed the young one any more, but from the fence-top would chirp and twitter, thus calling the little one to come up there and be fed. For two days we watched this proceeding during which time the call was not a success, as Sparrowchen could not yet fly, or was too timid to attempt to do so; but on the morning of the third day after the first call from the fence, when Sparrowchen was let loose in the garden it flew some ten or twelve feet and then alighted under a scarlet geranium. Soon after this evident trial of strength down came the tempter upon the fence-top, from whence he called Sparrowchen to come up to him. Finding the call not attended to, down he came to the foot of the geranium, and then and there demanded the why and wherefore! Now commenced some earnest conversation. Elder sparrow seemed very urgent and positive—Sparrowchen fluttering and timid—more words of encouragement on the part of sparrow the elder, when all at once the talk ended, and Sparrowchen taking heart and wing, soared upward to the fence-top at one swoop with elder alongside of it! Surprised at its wonderful achievement Sparrowchen, without a single word of encouragement, once more expanded its tiny wings, and into the far beyond of a neighboring garden,—full fifty feet away—it passed from our sight, never more to be recognized by us as an individual sparrow!

Strange coincidence! On that very June morning, and but an hour later, the call came to Bird Halchen,—a bird we had held in our aviary for more than twenty summers—and on the wings of matrimony she flew away, vanished from our sight, and has

"Gone from our gaze like a beautiful dream."

Sparrowchen we may never recognize again, but Bird Halchen we trust, will come back to loving hearts long before those other birds, the swallows, "homeward fly."

EWIN E. HULFISH.

Mr. Kortwright, her Britannic Majesty's Consul in Philadelphia, is a great swell, and represents the Queen with all possible dignity. No one can see him without being impressed with his appearance. The story is told that one day as he was walking down Walnut street, a stranger accosted him as follows: "Will you be kind enough to tell me, sir, the price of that house?" pointing across the road. "Sir!" said the Consul, "do you take me for a real estate agent?" "Oh, no, indeed, sir," replied the other, respectfully, "but I supposed from your appearance that you owned the whole city."

Young man, do not mope. You have no cause of depression. If you drink beer, you will in the next thirty years consume enough to make a lake of 300 square feet surface and three feet deep, on which small steamboats could navigate. Never give up.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"To Exchange for Cash" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* columns.

No Exchange or Want will be inserted unless accompanied with 25 cents.

JOHN CUSTER, No. 921, 2424 St., Harrisburg, Pa., has one trio of Sultans, good; 1 trio of Brown Leghorns, to exchange for young Mocking birds, or Grey Parrot. What offers?

J. M. SMYER, P. O. Box 94, York, Pa., will exchange a fine young Pointer dog, warranted good stock, for Game Bantams and Runts. They must be premium stock. Will send on approval. Communications on the subject solicited.

C. W. BANKS, St. Denis, Baltimore Co., Md., will exchange an old Italian or "Steiner" violin, or any variety of fine Fancy Pigeons, for a good double bird gun, (breach or muzzle loader), in good repair; also a large single duck gun, No. 5, and a 30 gallon new, heavy copper kettle, for best Fouter, Calcutta Fawn, and imported Blue Antwerp pigeons.

W. H. BROOK, Eagle Point, Ill., will exchange extra fine Poland China boar pig, value \$25.00; Partridge Cochins, importations of Ellis and Williams; Rouen Ducks, very fine and large; for musical instruments, revolvers, rifles, shot guns, Spencer's carbine. Make me offers.

C. P. IVES, Meriden, Conn., will exchange copies of Davis' Illustrated History of Meriden and Wallingford, 900 pages, for any variety of Leghorns, Turkeys, water fowls, or Rabbits. The book is a standard work; only standard fowls wanted in exchange. What offers?

C. T. G. CHACE, No. 206, Franklin St., N. Y., will exchange P. Cochins, Fowls and Chicks, (Bracket), D. Brahmas (Feln) hens, W. C. B. Pouter, White Bantams; all kinds of Ducks, for L. Brahms chicks or fowls, P. Rock chicks, Bronze Turkeys, Brown Leghorns. What offers.

J. H. NORRIS, 212 Erie St., Buffalo, N. Y., will exchange one four jointed fish pole, with cover for same, cost 1.45; 1 hand bracket saw, cost \$1.50, and 3 or 4 pairs Tumblers, for Poultry or offers. All communications answered. Speak quick.

C. S. LINCOLN, Warren, Mass., will exchange Cooper's "Game Fowls," a new copy, for two standard Blue Game hens, one or two years old; light color preferred; no red allowable. Send birds at once, and book will be forwarded promptly.

R. M. CLOSE, Maple Grove Yards, Sullivan, Ohio, will exchange fine Berkshire pigs and fancy poultry for a good light, silver-mounted double harness, or Davis Sewing Machine.

DR. B. S. TRASK, Alletown, Newaygo Co., Mich., will exchange a tame Deer, one year old, for breech-loading shot Gun, Target Rifle, or offers.

JNO. F. HOUSER, Tamaqua, Pa., will exchange 1 pair D. Brahmas, 3 trios P. Cochins, 7 Light Brahmas hens—all '74 and '75 hatch, and very fine large birds, for thorough-bred pigs.

G. W. SEYBOLD, 32 Rowland St., Newark, N. J., offers to exchange a fine Red Setter dog, 2 years old, a liver and white Cocker Spaniel, 14 months old, a white Spitz bitch, and a Black and Tan bitch, (all the above are fine specimens.) for White Leghorns, Common, or Fancy Pigeons, or offers.

W. H. SWAN, Stamp's Landing, Miss., will exchange Downing's Fruits and Fruit Trees of America, Thomas' Fruit Culturist, for Brahmas, Game Bantams, or Hamburgs.

J. H. B., Box 368, North Attleboro, Mass., wants to exchange his folding coops, for young chicks, (value 75 cents each.) for offers.

BOX 1256, Williamsport, Pa., will exchange, for want of room, all of his breeding stock, 1 cock, six hens, Dark Brahmas; one cock, three hens, White Sultans; one trio Black African Bantams, one pair White Frizzles, one Trio White Guinea, five Black Cochins, two Light Brahms hens, one Jap. Silk cock, two female Canary birds, for anything that won't eat.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

REV. F. M. GRAY, Seaside, Staten Island, N. Y., wants a Shetland Pony, trained to saddle. Name age, price, and give general description.

W. H. SWAN, Stamp's Landing, Wilkinson Co., Miss., wants two (2) B. B. G. Bantam pullets or hens.

**BLACK ROSE-COMB BANTAMS,
MY SPECIALTY.**

Black African Bantams,

Fine Light Brahmas.

During the show season of 1876 my stock won ten first premiums. Having exhibited them myself at four exhibitions, winning six first premiums on old and young, some figuring as high as 97 points, this fact alone should be a sufficient guarantee of the purity of stock and perfection of markings. No birds to dispose of at present. C. B. ELBEN, Pittsburg, Pa.

EGYPT'S WONDERS.

THE GIGANTIC PYRAMIDS AS SEEN BY RECENT AMERICAN TOURISTS.

A recent letter from an American gentleman, who has been sight seeing in the wonder-land of Egypt, contains these quotable passages :

"We visit the Pyramids. The distance from Cairo is nine miles. Proceeding to Boolah, a section of the city lying on the banks of the Nile, we cross the river on the new iron bridge, a splendid structure, and pursue our course to the ancient village of Gezerch; little but unsightly ruins now mark the place where once stood the magnificent palaces of the Mamelukes. Thence our route is quite direct by the new and well graded avenue, to the Pyramids. There are lines of thrifty trees on each side of the excellent thoroughfare; the beautiful date palm is often seen. A charming panorama is spread out before us—fields of emerald green extending over thousands of acres, with the great Pyramids and the desert as background; every rood of available soil is cultivated, the little tributaries of the canal conveying water from the Nile and distributing the precious element over and through the soil as desired, assuring richest fertility.

The atmosphere is so clear that we seem to be very near the Pyramids, when the distance is three or four miles; on we go at moderate speed, for full half an hour after it appeared we were within ten minutes' drive of our destination. As we approach the great tombs a feeling of disappointment is experienced; they seem very much smaller than their prodigious measurements had pictured them to the mind's eye. This impression, however, is at once dissipated upon ascending the plateau and taking a position in the center of one side of the great Pyramid; there one fully realizes the immensity of this wonder of the world. As the eye slowly pursues the upward course, step by step, over the layers of great stone blocks, it seems when the height of the tremendous pile is at last reached, that the apex almost touches the sky.

It is a marvelous sight; it startles the mind and awakens a sense of wonder that memory must always retain. And here, at edge of the great desert of Sahara, upon a rocky eminence of many acres, one hundred feet above the plain, stand the mighty Pyramids—monuments of fully if not of wicked tyranny, it may be said, but testimonials nevertheless of amazing human achievement that has been the marvel of ages. There they stand, towering heavenward in sublime proportions, ragged from the assault and desecration of man, but little affected by the work of time. The chief monuments on the plateau are the Great Pyramid or Pyramid of Cheops, the Second Pyramid or Pyramid of Chephren, and the Third Pyramid or Pyramid Mycerenus, several smaller Pyramids, many ordinary tombs and the Sphinx. They are clustered about upon the rocky platform, within a few minutes' walk of each other.

The Pyramids are in quadrangular or square form, and, as represented in pictorial illustrations, running up with regularity of proportions to an apex. The oldest and largest, the Pyramid of Cheops, measures 749 feet on each side of the base; its slant height

is 568 feet, and its perpendicular height 450 feet. The area of its base is 61,835 square yards, or 13 acres. According to the computation of engineers, it contains about 6,500,000 tons of solid masonry. There is a subterranean passage to the great vault in the center, which is 90 feet below the base, the sloping passage-way thereto being 320 feet in its gradual descent. There are two chambers above the base, known as the queen's and the king's. They are reached by ascending galleries and zig zag passages, the former chamber being 67 and the latter 138 feet above the base; but the upward course traversed is a distance of 124 and 274 feet, respectively.

With Bedouin guides, three for each of us, Judge Batcheller and myself made the toilsome, and, but for the strength and steadiness of our reliable guides, most perilous interior ascent. With lighted candles these lithe and muscular Arabs precede us down a steep subterranean passage some distance, then upward and upward in winding and difficult ways, the men guarding, lifting and almost carrying us in some places, until we reach the queen's chamber, an apartment 17 by 18 feet in length and breadth, and 20 feet high. Here we are glad to take a rest and get breath. The walls are of immense granite blocks, handsomely polished and fitted together with perfect exactness. The flooring is of the same material.

We pass through an aperture to another gallery of forty or fifty feet, running up at an ascent of many degrees. It has the appearance of a marble slideway; it is about five feet in width, and on each side, elevated two feet above, is another and narrow way, running parallel with the main gallery, and finished as if for ornament, and to represent a sort of balcony for the main gallery. The structure is of polished marble, and the purpose of its original construction is not known. It may have been intended as a slideway for the elevation of sarcophagi to the room above. It is now utilized as a sort of ladder, footholds having been roughly cut or rather broken into the center structure, so affording the means of ascent, by the most fatiguing effort, however, and with no little peril to life and limb, if undertaken without efficient assistance from the lusty and supple Arab guides. One is almost carried by them up this steep and dangerous ascent.

Then there is another zig zag passage through an aperture so small that one is obliged to creep on hands and knees a considerable distance; at last the king's chamber is reached, involving much greater fatigue than was endured from the first climbing. Dripping with perspiration and panting for breath in that close atmosphere, charged with the mold of ages, we make our hasty observations. The chamber is 34 feet long, 17 feet broad and 19 feet high. At one end of this room is a sarcophagus of red granite or porphyry, without lid, and bearing no inscription. The walls and flooring are composed of immense blocks of polished granite, eight of them making the floor and sixteen the sides, so closely fitted together that it requires careful inspection to discover the seams or joints where they are united. One of these blocks must weigh hundreds of tons. How they were raised to this great altitude and placed in position so perfectly is a secret among the lost arts which we may never know.

To be Continued.

POULTRY DEPARTMENT.

A LITTLE COMFORTER.

Hie, Chickabiddy, to cover, to cover;
 Cuddle your yellow brood under your wing;
 Above, in blue heaven, the harpy hawks hover,
 Below you the cruel cat crouches to spring.

Even the merry north wind is a foe to you,
 Over your ruffled back turning your tail,
 Rousing your fussy cluck, bringing but woe to you,
 Worry and hurry, and cackle and wail.

Poor Chickabiddy, now what can I do for you?
 Build you a cosy coop, sunny and safe?
 Feed you, and set our old Bosc to cry "Boo!" for you,
 When the cats frighten you, poor little waif?

Why, 'twas last spring you were one of the chickens,
 Pecking and chirping, so happy and free;
 But time has wrought changes, and as trouble thickens,
 The care of your family falls upon me.

Well, I'm a boy that has leave to go fishing;
 But then, the wind blows, and the sky is too clear,
 So I'll just stay at home, and put off what I'm wishing,
 To attend to your wants, Chickabiddy, my dear.

ANNA BOYNTON.

(For FanCIers' Journal.)

AWARDING PRIZES.

No. 3.

In my last letter I endeavored to show how premiums are sometimes given at some of the smaller shows of the country, and although some may think the picture overdrawn, I can assure you it is not, and I think some of your readers will bear me out in what I have said. Now I would ask, could this be done were the American Standard of Excellence used as the inflexible guide of the Executive Committees of these shows, or of the judges who are called upon to decide the awards? And do you think a judge or an executive committee could hide behind their favoritisms were the specimens all scaled, and the score cards placed upon the coops for the inspection and information of exhibitors, and the public? Or if the merits and demerits of each bird were placed upon a score card do you think the same opportunities would be open to unscrupulous judges to favor their friends? Certainly not. But so long as birds are judged at our shows by comparison only, so long will this injustice and unjust discrimination be made in favor of friends, and leave the judge the opportunity of hiding behind his *idea* (?) of which is the best bird, and who can successfully contradict him? Now I do not wish to be understood as saying that all judges, or all judging is included in this class, for I know it is not. But I do know that too much of this kind of judging is done for the good of the poultry fancy, and I also know that something must be done to put a stop to it if we want the business to flourish, and poultry breeders be respected as they should be. But some may say it takes too much time and expense to judge an exhibition if every bird is scaled. I will admit it will take a little

more time but not so much as is supposed by many for an expert judge will scale half the birds in a class while a comparison judge is making up his mind—in many instances—not which bird is entitled to first premium but which he will give it to. And again an argument in favor of scoring each bird is, that poultry raising is a very important branch of American industry, and much of its future usefulness depends upon its exhibitions, and hence they should be honestly and honorably conducted, that purchasers may not be misled in the purchase of their breeding stock. Another point in this connection is the manner in which birds are exhibited—whether by single birds, pairs or trios, and also whether or not the name of exhibitors should not be placed on the exhibition coops. Of these I may have something to say in the future.

JAMES M. LAMBING.

(For FanCIers' Journal.)

THE SHOW PRIZE QUESTION.

Editor of FanCIers' Journal:

The interesting proposals broached a few weeks ago in your paper relating to the prizes offered by poultry societies at their annual exhibitions, seem to be a matter of common interest among American fanciers, and the several articles which have succeeded your first allusion to this subject, each has its commendatory suggestions in furtherance of your views.

There are points in the details of your proposed improvement in this matter, which associations might find it requisite to adopt from time to time; but in the main, the reduction of the number of premiums, and the increase of the amounts or value of the three advised prizes—first, second and third—seem to me to be the chief features that appear in your suggested method of offering prizes at our shows in the future.

As you hinted in a late number, we are now educated up to a much higher standard of breeding fowls in this country than formerly. The time has been (in the past) when a trivial "commendation," a paper "diploma," a fourth, fifth, or sixth premium was availed of with satisfaction by novices and amateurs, but all this is now gone by. There are too many good breeders among us at present, and though all can not be the best, there is a compensation, amidst the strong competition nowadays current at American shows, if a contributor finds himself justly awarded a "second" or a "third" prize, and it pays him in the end, in more ways than one, to be thus fortunate. It does not pay him to do his best for a whole year, to find on his cages in the exhibition the words "commended" only, "hon. mention," or to receive a printed "diploma," six weeks after the fair is over! With others of your correspondents, I really hope the improvement you suggest will be adopted—at least in all our leading large shows, hereafter.

In connection with this subject, it seems pertinent to allude to a matter which may not be general in practice, but which has come under my observation in two or three instances, at which I have been surprised; and this is the use that is made of bogus prize cards—after the shows have been closed. One of your late correspondents says he had four hundred clean, bright prize-cards pasted up in his fowl house, at one time. I hope he came honestly by them, and doubtless he did.

But I do know of two or three fowl houses and pigeon-lofts, upon the walls of which were posted some dozens of similar illuminated cards, as "dumb evidence" of the triumphs of the proprietors at certain exhibitions—"first" and "second" prizes being thus indicated as having been awarded them, not half of which they ever received, *officially*. Still, they find this to the eyes of visitors to their premises a very taking style of advertising, and a very cheap mode, as well!

At the last show of the Maryland Poultry Association (at Baltimore) a very neatly designed premium card was got up by the

secretary of that society, G. O. Brown, which was not only attractive in form, but by being filled up clearly in writing, by the officials, (instead of merely being printed) is not so readily counterfeited as most of these ordinary premium cards may be.

Something of this character it would be well for societies generally to adopt. The groundwork in tint is a very pretty combination, and the general form of the design is a novelty. Over this, upon the face of the card is officially written the award, which is signed in full by the secretary of the society. The possessors of this kind of evidence, may "post" such cards upon their premises, without fear of question as to their genuineness. And I mention this specimen, because it is the neatest and prettiest arrangement for this purpose that I have yet met with.

This idea of displaying the real premium cards side by side in the neatly kept fowl house, at home, is a good one. Yet, to my mind, the exhibition of such evidences of superior merit, "got up for the occasion," under false pretences, is altogether reprehensible, and unworthy, in any man's case.

Yours, &c.,

NEWARK, N. J., June, 1876.

PREMIUM.

EGGS FOR BRAHMAS.

Why is it that the thoroughbred or fancy Brahma lays a smaller egg than the common Brahma found on many farmers' premises? It is because they have been bred for size and external appearances without regard to the internal or really valuable qualities. Now I believe in large Brahmas, but would it not be well if breeders would discard all indifferent layers even if they do excel in size? I think it would. If breeders would only try to increase the disposition to egg production, our Brahmas could, in a few years, be made to equal the small breeds in the number of their eggs. Before the "hen fever" struck me with much severity, I kept and still keep a few common or farmers' Brahmas, and I can truly say that in point of size of their eggs they far surpass the immense Brahmas which I now keep. It certainly seems reasonable to suppose that such large fowls should lay eggs proportionate to their size. I remember well how disappointed I was when the box containing my first five-dollar-a-setting eggs was opened and found to contain Brahma eggs no larger than those of the Hamburgs which we then kept. I always thought the dealer of whom they were ordered had picked out the very smallest eggs to send to his Jersey customer. But I find that the hens which hatched out of those eggs lay eggs fully as small. In every flock a few hens will be noticed to lay uniformly large eggs, and many of them. If the eggs laid by such hens were always set and the course persevered in for several years, I have no doubt that as much progress could be made in this direction as has been made in size.

(For Fanciers' Journal.)

"TRIPS AMONG THE FANCIERS."

BY W. E. FLOWER.

Early the following morning after our arrival home, our friend W. G. Blake drove up to the door with his sorrel trotter and invited us to take a ride; nothing loath,

"We jumped into the waggin,

Whilst Blakey held the nag in,"

and away we sped at pace a *liddle* above 2.30; a drive of some four miles brought us to Frankford, Pa., and we drew rein before the home of Mr. John Clapp. Mr. C. is one of "ye olde time" Fanciers, and one of the pioneer breeders of Dark Brahmas, he still retains a few of his old favorites, but of late years his "Fancy" inclines to dogs and gunning. Mr. C. showed us a very fine imported setter dog, a beautiful white with lemon colored ears; entering the house we were shown numerous stuffed specimens of Snipe, Woodcock, Partridges, &c., which had at different times fallen victims to the unerring aim of our friend; one specimen of the Virginia Quail or Partridge we deemed worthy of especial note, it being the largest and most exquisitely marked of this variety that we have ever seen, the pencilling upon its breast, being almost equal to that of a well bred Dark Brahma Pullet; as Mr. C. makes frequent trips to Maryland, Delaware, and other localities in pursuit of game in season, he could doubtless contribute some very interesting items to the "Sportsman's Department" of the JOURNAL.

Leaving Mr. C.'s, our next halting place was at the residence of Mr. James Lightfoot. Mr. L. makes a specialty of Houdans, deeming them the best fowl for use or show; he is a very enthusiastic admirer of this variety, and showed us some very fine specimens; one of his imported hens being particularly fine in crest and beard as well as size. Having viewed them to our satisfaction, we signified our readiness to depart, and the question where next? was decided in favor of "The Zoo."

So with our weather eye open for the tall (police) man dressed in blue, Blake eased up on the lines, and we were soon speeding out Girard Avenue. Leaving our horse in charge of an attendant,

we entered the garden and spent several hours very pleasantly wandering through the different buildings and enclosures; many animals, birds, etc., were quite familiar to us, made doubly so from the many pleasant and interesting contributions to the "Journal," by "Huo." While looking at the Owls, Hawks, and Eagles, we remarked what a fine thing it would be if a house similar to that occupied by them were built and stocked with "Fancy Pigeons," such as Barbs, Carriers, Pouters, Owls, Turbitts and other high class birds. What an endless source of amusement it would afford to visitors to watch them in their graceful evolutions, and especially during the spring and summer when building their nests and rearing their young. Will not "Huo" broach the subject to "the powers that be?" Another attraction, we think, would be a number of small houses or sheds with covered wire yards or runs for the accommodation of pure bred fowls; with proper care and management, this department might be made self-sustaining, and who can tell the number of new varieties that might be propagated there. Having gone the rounds and "seen the Elephants," as well as "the Lions," we called for our steed and were soon traveling for home.

To be continued.

DEATH TO INSECT PESTS.

EDITOR FANCIERS' JOURNAL:

Since I sent you two weeks ago the account of the "wonderful discovery" I think I have accidentally made by the application of which to garden plants and tender vines, the pestiferous insects that so annoy us may be readily destroyed,—I met with this following paragraph in a city paper:

"A new and destructive pest, the nature of which has not yet been learned, has lately been injuring the orange and lemon trees in southern California, attacking the roots near the surface, and causing the decay of the trees. Whether the pest is an insect or a disease is not known."

Now I recommend to those who may be troubled with the above, to scrape away the top earth around the tree trunk, and apply the liquid I described in your issue of June 19th. This pest is a *parasite*, and liquid hen manure generously applied upon the bared surface roots, half a dozen times every other day, will destroy this nuisance, I have not a doubt. I repeat that in my own experience (in various ways) in the garden, upon currant and rose bushes, or vines, etc., its effect has been wondrously beneficial towards ridding us of insects.

H.

VALUE OF POULTRY MANURE.—Fifty guineas will make, in the roosting house alone, one-half ton per annum of the best manure in the world, or more than enough to manure an acre of land, 700 lbs of guano being the usual quantity applied per acre, and poultry manure is known to be still richer in ammonia and fertilizing salts. No other stock will give an equal return in this way; and the figures will demand careful attention from the farmer.—*Prairie Farmer.*

FOOD FOR YOUNG GOSLINGS.—The *Cottage Gardener* says that nothing is so good for goslings as grass; that is probably why so many are kept where there are commons. Oatmeal put in a pan of water is excellent food for them, and it is often wise to add some bran to it. Chickens should have bread and milk, chopped egg, cooked meat cut up fine, crumbs, sods of growing grass, fresh earth, and, in bad weather, beer.

"I am apt *Toulouse* those geese, before the season is over," said a farmer to a friend; "why," replied the other, "I am also troubled about my ducks, as they will certainly *Rouen* me, if I keep them longer, as they have a habit of *Pekin* up my melon seeds, as soon as planted (a *meloncholy* fact), of which they are exceedingly fond."

TERRE FILIUS.

PIGEON DEPARTMENT.

A PROPOSITION FOR PIGEON RACE.

MR. EDITOR:

Your number of this day contains a challenge from Mr. Louis Waelelaer of Hoboken, N. J., in which he proposes to fly a match with any Philadelphia or New York fancier for \$100 in gold, a side, the birds to fly from Easton, Pa. Also another match for same amount, the birds to fly from Scranton, Pa., each fancier to fly three birds each, and the first returned bird to win the race.

I will not accept exactly Mr. Waelelaer's challenge, but I will make him another proposition, that is, to fly one bird each from Easton, and one bird each from Scranton, the bird winning both races to win the \$100. Should each bird win one race then they should fly again from Lock Haven, Pa., and the bird winning from this place to win the match.

Times being dull, and to stake \$100 gold on one match is rather too much, I think. Should I lose the races, I should like to have at least a little more amusement for my money.

I would rather see a race though, with four birds, one of Mr. Waelelaer, one of mine, and, if possible, two of two different Philadelphia fanciers, to fly from one of the two named cities, Easton or Scranton, the entry fee to be \$25 for each bird, and the bird coming in first to win the race. This would be a nice race, and a good chance to win \$100, with 25 dollars only.

Trusting that either of my propositions will be accepted, I remain, Sir,

Yours truly,

JOHN VAN OESTAL.

4 Lewis St., New York.

PIGEON FLY.

MR. EDITOR:

Five of Mr. Waelelaer's birds and two of mine flew this day at Tobyhanna, Pa., on the Scranton Road, 122 miles from New York, and our birds made splendid time, three of Mr. Waelelaer's birds arriving at 10.28, and my two arriving at 10.40, Mr. Waelelaer's two other birds also arriving shortly after his three others.

Next Thursday our birds will fly at 8 o'clock from the office of the Republican at Scranton, and Mr. Jno. M. Robertson, the well-known Antwerp fancier, will have the kindness to attend to the letting loose of the birds.

A great many Scranton fanciers will be invited to see the departure of our aerial messengers.

It is astonishing, Mr. Editor, how favorable this inland road is for the racing of the Antwerps, Mr. Waelelaer having lost only one pigeon out of his twelve, and I did not lose one out of my five. We intend to fight it out on this line, and expect to have a 200 mile flight shortly after our race from Scranton.

Be so kind as to publish the above, so as to give your numerous readers, and particularly the Antwerp fanciers, a glance of the performances of our favorites, the Antwerp Carriers.

Yours truly,

JOHN VAN OESTAL.

NEW YORK, July 1st, 1876.

(For Fanciers' Journal.)

THE CARRIER.

POWER OF WING AND COMPASS.

"I hear a voice you cannot hear
Which bids me not to stay;
I see a hand you cannot see
Which beckons me away."

There has been much interesting writing on the powers of the Carrier Pigeon, the length and rapidity of their flights and modes of training, along with speculations as to their guide for their homeward course. The latter points to the theory of this bird flying by sight alone. I find that the Rev. E. S. Dixon in his very interesting work, "The Dovecote and Aviary," takes this same view; and though I always hesitate to place my opinion against that of such men of letters as Mr. Dixon, still on this point (the guide of the Carrier on the wing) I beg most respectfully to differ. It is pretty well known that I am not an Antwerp-Carrier fancier, and do not encourage the Antwerp as a bird that ought to be in the fancy for several reasons which I shall not discuss at present. But Antwerps I keep for two purposes: first, as feeders for my young Pouters, and second for table use. For both these purposes I find them most suitable. First, then, as to the power of wing possessed by this bird. I do not think this point is yet fully developed in this country; but so far as my personal experience goes I shall give it. The plain narrative I think may answer the purpose best. It may be interesting, and I hope will not weary readers.

Several years ago, when in Manchester, I called on Mr. W. Millward, bird dealer, from whom I had all my Belgian Canaries. He had lately arrived from the Continent, and brought with him a stock of Antwerp Carriers, which he then found to be most unprofitable. Not having before seen such birds, which I could be sure of having been imported, I purchased three pairs. The stock consisted of mostly blues, some mealies, and some nameless colors; but all were self-colored, and all showing a cross of the Owl, a slight division of the feathers on the breast. Some of them had the breast feathers slightly turned, indicating the frill. They were wild as newly-caught Hawks, and strong enough to carry before them a pane of window glass, as one of them did when in my possession. After much care and caution I found them to be hardy birds, breeders almost the year round—indeed, I am never without some few young ones. During the season when early light they take two flights per day, the cocks and unoccupied hens at about 7 A. M., the hens and unoccupied cocks about 1 P. M.

The flock invariably fly southward, and are away for about an hour and a half each time. I have seen them fully ten miles south, still holding in that direction. When first noticed on their return they are always at a very great height; but should it be blowing hard (the weather seems of little consequence to them) they often return from the northward, having no doubt been carried to the east or west beyond their home. Three years passed when a friend came on a visit from Ledbury, Herefordshire. This friend saw my Antwerps, and expressed a wish for a pair or two to breed for table use. After his leaving for home I caught three pairs all bred in my loft (Antwerp loft, for with them I have nothing else). They were put into a box (not a basket or cage), and addressed to a mutual friend in Manchester, as they could not reach Ledbury in one day from Glasgow. They reached Manchester in the evening, were rebooked for Ledbury next morning, and reached their destination that evening; but until then were not taken out of the box in which I had placed them. Before sending the birds away I pulled the flight feathers out of the right wing of each bird, and my instructions were, "keep them confined with such a netting as will let them see the locality, till they have each a nest of young ones, and are sitting upon their second eggs." Those instructions were rigidly adhered to. One night the netting was removed according to instructions, and the birds were at liberty the next morning. A man was set to watch. The cocks took sundry short flights, and by-and-by relieved their mates occupied in incubation; the hens came out, and at once took wing. The date I cannot now give precisely—let me call it the 18th of July. On the morning of the 20th I had a letter from my friend dated the day before (the 19th) saying, "the birds were yesterday morning let out, but two of them have not returned. I am afraid they are lost." While in the act of reading my friend's letter my man who attends to those birds, came into my office saying, "I think two of Mr. ———'s birds are back." Scarcely believing him I went out into the yard, and there certainly were two of the hens I had sent to Ledbury.

Now, I can tell to a mile the distance between Glasgow and Ledbury, Herefordshire, by railway; but I will let our readers measure the distance as the crow flies, and decide whether or not this is a very long flight. Mark first, those birds had never been trained; second, they had never been in the hands of anyone till caught by me, when I pulled the flight feathers from one wing of each bird. These birds would leave their cote at Ledbury about 10 or 11 A. M., on the 18th, and as I did not know what day or week they were to be set at liberty, of course I did not expect them, and at all events I certainly did not expect they would at any time return to Glasgow on the wing. For all I know, they may have reached on the evening of the 18th or during the day of the 19th. Two months after this I gave a pair to a friend in Paisley—a pair of young ones. They had only been two days outside the loft, and never had left it beyond a hundred yards. They were taken away squeakers, and confined with a netting in front for three weeks. When let out they were at their birthplace in ten or twelve minutes. It is only seven miles to Paisley by road. Those birds had never been flown.

J. H.

A wild pigeon roost has been discovered in Pike county, Pa., five miles long and two miles wide, and the number of pigeons which nightly assemble there is estimated at millions. A party of lumbermen raided on them a few nights since, and with long poles succeeded in killing over 10,000. Each one brought away as many as he could carry, which was a small portion compared with the number left on the ground to feed the foxes and wolves.

A San Francisco parrot has military qualities of a high order. It has brought a flock of pigeons to obey its orders and follow its lead.

SPORTSMAN'S DEPARTMENT.

(For Fanciers' Journal.)

BREEDING DOGS FOR SPECIAL PURPOSES.

BY M. VON CULIN.

DELAWARE CITY, June, 1876.

Editor Fanciers' Journal:

DEAR SIR:—Until recently the breeding of dogs so as to develop disposition, size, shape, color, &c., &c., fitting them for different grades of usefulness and ornament, seems to have been considered (if it was considered at all) as a singular exception to scientific principles. I will venture the assertion that nine out of ten Americans suppose each particular strain of dogs to have been accidental, when many of the most valuable breeds, among them the setter, pointer, spaniel and greyhound, have been bred by scientific men, upon scientific principles, for a score of generations. It is just as much a science as is Chemistry, Astronomy, Geology, &c., the principles applied are just as positive and uniform in their results, and a single departure in one crossing will often cause trouble which ten proper crosses can't rectify. I wish to speak more particularly of breeds used in field sports. The intellect of the dog, usually called instinct, is cultivated exactly as it is in a child, by tuition and imitation, with this difference, that the dog (to a certain extent) inherits the cultivated mind of the parent. The life of the dog is too short to acquire all that is required of the educated dog of the period by tuition and imitation, consequently, an all wise Providence through the principle of *herédité* has given us the power otherwise impossible, to make of him an almost human companion, assistant, and protector. We don't mean to say that educated parents will beget educated puppies, and transmit all of their virtues, with none of their vices, but that either virtues or vices in which the parents take most delight, and understand most thoroughly, these are the characteristics which will be most prominently transmitted (*cæteris paribus*). As an example, cultivate unsociableness, gluttony, ferocity and antagonism, in other words, the brutal, through a series of generations and we get the bull-dog; cultivate sociability, gentleness, submissive affection on the mind, and you have an animal who will understand and obey your words, and actions, and often times obey in anticipation of your wishes, and in the setter and pointer, through the same principle (when properly and strictly applied). We have whelps which before they are weaned from the dam will point each other in their play, and when taken into the field, will point as staunch as a rock, the first thing with feathers on which they smell. Not only do they inherit the disposition to hunt, point and retrieve, but they are pre-disposed to feathers. In Europe this principal of *herédité* as applied to the breeding of dogs is not new; in America, if it is old we have not profited by it as the Europeans have, consequently the long figures paid for dogs imported from the most noted kennels in Europe, such figures as the uninitiated would require proofs of before crediting. £100 and £10 for passage and care, making \$532.40 in gold, is among the

figures paid for some of the best importations. These are facts the proofs of which, I will furnish any one upon application. More sport, and a fuller bag can be had with a superior dog, and an ordinary gun, than with an inferior dog, and the best gun money can buy.

DOES A DOG THINK?

If the following story about "Colonel," a dog owned by Charles Kestler, a hotel proprietor of Denver, Col., is true we should answer the question in the affirmative. The story is told by the *Denver Tribune* of April 26, and runs thus:

"The animal is about five years of age, and has been with his present master from his (the dog's) birth. One of Colonel's amusements is the play of 'ball.' From some cause or other no one of the reasoning human family saw fit to pay any attention to Colonel's wishes and feelings in regard to the ball business during all of yesterday forenoon, and the ball itself was laid away in a drawer that occupies the center of a writing desk in the main office of the hotel. The Colonel stood this with canine dignity for several hours, but finally concluded on making an attempt to secure his ball, without regard to the human race. He spent the better portion of an hour in trying to open the drawer by pressing his feet against it. As this only made matters worse, he next endeavored to secure the 'open sesame' by pulling the knob in the center. This knob, however, was both small and round, and the Colonel could secure no grip with his teeth. His next effort was a 'rear' attack, and was perfectly successful. Going under the desk he manifestly observed the location of the back of the drawer, and also saw (and reasoned) that by standing on his hind legs he could insert his front paws between the back of the drawer and the back of the desk, and so press the former forward, and thus secure his much coveted treasure, the ball. To think, with such a dog as Colonel, was to act, and almost sooner than it can be told, and in the presence of a number of parties interested in the matter, the drawer of the desk was pressed out. Colonel at once appeared in front, from under the desk, and leaping upon it he saw and eagerly clutched his plaything. The efforts made by Colonel, his temporary confusion and distrust, his perseverance and final triumph, were all witnessed by a number of gentlemen."

STAMFORD IN FRONT.

Plunket Pups in Stamford, Ct.—three beauties. Mr. R. H. Gillespie of Stamford, Ct., has added to his already well stocked kennel, a red Irish Setter Pup, out of Hudson's (No. Manchester, Ct.) Stella by Plunket. For full pedigree of Stella, see No. 170 Burges' book. Mr. W. C. Harding of the same place has added to his kennel, two pups out of the same litter. Stamford may well be proud of this addition, as there is nothing better in America. Mr. Wadsworth says, that Stella is the finest bitch that Plunket has served in this country. She was imported by Mr. Hudson, when four months old, and is now about two and a half years old, is a deep red with some white on breast, and is an excellent field performer.

A short time ago a small black dog, belonging to Mr. George Wilson of Milestown, Pa., walked deliberately into the race near Clapp's mill, and held his head under the water until he was drowned. The dog was in good health and able to appear to three meals and a lunch daily. No cause is assigned for the rash act.

In Switzerland, a milkmaid, who is a good singer, gets more salary than others, because under the influence of music cows "give down" better and give more milk. An Orange county farmer is trying to hire Kellogg and Nilsson to sing round his pump.

ITEMS.

What a fountain of blessing is a cow! She is the mother of beef, the source of butter, the original cause of cheese, to say nothing of shoes, horns, hair, combs and upper leather. A gentle, amiable, ever-yielding creature, who has no joy in her family affairs which she does not share with man. We rob her of her milk, and we only care for her that the robbery may be perpetuated.

Here is a Boston boy's composition on "The Horse."—"The horse is the most useful animal in the World. So is the Cow I once had thirteen ducks and wastwo drakes and a Skunk killed One. he smeldt Orful. I know a boy which had 7 chickens but His father would not let him rais Them so he got mad and so he bored a Hole in his mothers wash tub. I wish I Had a horse—a horse weighs 1,000 pounds."

An ornithologist observes that in the northern countries of Europe, when the storks, after the breeding season, prepare to migrate southward, they make flights to test the capabilities of the young birds to accomplish the journey. When any one is found not to possess the requisite strength, it is deliberately put to death by the others. Storks feed principally on frogs, and the mothers know that the weak would die of hunger if left behind.

How is this for cats? If a cat doth meet a cat upon a garden wall, and if a cat doth greet a cat, O need they both to squall? Every Tommy has a Tabby waiting on the wall, and yet he welcomes her approach always with a yawl. And if a kitten went to court upon the garden wall, why don't he sit and sweetly smile, and not stand up and bawl; lift his precious back up high, and show his teeth and moan, as if 'twere colic more than love that made that fellow groan?

During the winter of '67, Harry McN., of Baltimore, while acting in the capacity of commercial tourist, i. e. drummer, visited Wilmington, N. C., and stopped at one of the "first-class" hotels. At the breakfast table he gave an elaborate order to the waiter, and, included in it "two soft-boiled eggs." Sambo went to the kitchen, but soon returned and asked, "Mass Boss, did you want dem eggs scrambled?" "No," said Harry, "I want them soft-boiled." "All right, sir," and off he trotted again. In a few moments he loomed in again, and remarked in a most persuasive tone, "Mass Boss, you better have dem eggs scrambled." "What the d—l do you mean?" roared Harry. "Well," said Sambo, "Mass Boss, I'll tell you; dem eggs aint very fresh, and dey'll look better scrambled." Harry canceled the order for hen fruit in toto.

"A CONTRARY MULE.—A farmer in this county, says a North Carolina paper, has a mule so awfully contrary that he can do nothing with it. Put him in harness and it is hard to say which way he will travel. Put a saddle on him and he appears to doze, but try to mount him and he will all of a sudden begin to kick every way—straight out, straddling, with all four legs at once. As to eating, he will eat anything, from his feed trough up to a wooden saddle. The owner took a notion to have him shod; but he kicked out the blacksmith shop and returned home. The owner tried to kill him, some time back, so he tied his ears with a trace chain and rode him for six consecutive days and nights as hard as he could under whip and spur. The fact is, that he nearly killed himself in the effort, and had to be carried up stairs to bed, and his firm belief was that the mule would die that night; but, to his astonishment, the next morning he found that the mule had kicked to death a Chester sow weighing 300 pounds, bit a piece out of his horse's shoulder, ate up a saddle, blanket, and bridle, tore down the fence, and was splurging about, more devilish than ever, to find something else mear to do."

A PENDING GERMAN BATTLE.—The other day a simple-minded German called on a grocer to pay a bill, giving him a \$10 note. The grocer examined it closely and said: "Hullo, where did you get this note?" "Vot is de reason mit dose note?" replied the honest Teuton; "don'tshe wash good, hein?" "Good?" answered the grocer; "why, you're a lucky man—that note is worth \$10.50." "Ish dat so? Why for?" "You see the signature over here, don't you?" "Dose things like a corkscrew mit de worms? Yah." "Well, that's Spinner's signature." "Vell." "Well, Mr. New is now Treasurer of the United States." "You don't tole me so! Vell?" "Well, and notes signed by Spinner are getting scarce, and people pay five per cent. more for them than for the new issue." "By shiminy, ish dot so?" "Yes. Lemme see your bills. Why every one of them is a Spinner. Man alive, your fortune is made." In pursuance of the grocer's advice Mr. Schneider called at the Subtreasury Saturday afternoon to get the premium on his bills; what success he had it is impossible to state, but he was seen later in the evening lurking round the street by which the grocer must go home and on being accosted by an acquaintance, the following conversation took place: "Der peebles von Sharmanny fights well, hein?" "O yes; the Germans are unquestionably a military nation of the first-class." "Some big fights, hein? Leipsic?" "Yes." "Und Sadowa?" "Yes." "Und Koniggrutz?" "Certainly." "Und Worth and Mars-la-four, and Gravelotte und Sedan?" "Of course, of course!" "Dose was all big battles, und der Deutsch licked?" "Yes." "Vell, you joost wait till dat grocery store shuts himself und you saw Deutsch victory vot makes you forget all dem little ones."—*Chicago Tribune.*

LONG LIFE.

A great many people are worrying about this and that as being injurious to health, and living in dread lest they should do something to shorten their days. It is a question whether the world would be much the loser if such timid people should have their fears realized, and be translated in a hurry, for the world needs brave folks, and such as worry lest they shall not live at all.

But, leaving this point without discussion, it may do us all good to remember that longevity is largely a matter of inheritance, and depends very little on what we do or do not do, provided we do not commit suicide. Whether we live long or briefly on the earth is a matter that was largely settled before we were born. Our ancestors and yours, reader, had more to do with the solution of that problem than we can have.

The truth is, as science teaches, longevity is a family trait. Sobriety, and a regard for the principles of hygiene, will not necessarily insure long life. These may maintain a condition of health and vigor, but length of life is largely determined by inheritance. Longevity is a talent. It may be improved like any other talent, or it may be wasted; but no amount of cultivation will create it. In spite of intemperance and exposure, a man who has this talent for long life may become a centenarian. A saddler, aged 113, whose grandfather died at 112, and his father at 113, was asked by Louis XIV, what he had done to attain to such length of days; he replied: "Sire, since I was 50, I have acted upon two principles; I have shut my heart and opened my wine cellar." Again, Golondrewski, a Pole, notwithstanding the hardships of eighty years of service as a common soldier, the fatigues of thirty-five campaigns under Napoleon, the sufferings of the terrible Russian campaign, the effects of five wounds, and the recklessness of a soldier's life, survived, and in 1846 was still living at the age of 102. But, it is to be observed, his father attained the age of 121, and his grandfather 130. A well-known literary character, M. Quersonnieres, was living at five score in the full possession of all his power. He said: "My family descends from Methuselah; we must be killed to die; my grandfather was killed by accident at 125 years of age, and I," he added, smiling, "invite you to my burial in the next century."

EDITORIAL DEPARTMENT.

OUR ARTICLE ON PRIZES

To be awarded at exhibitions of poultry in the future has drawn forth several replies, some of which we have printed as evincing a coincidence in our views, generally.

What we aimed to suggest was a reduction in the multiplicity of awards that should be made, in these latter days. We have outgrown the old rules, and we have come to breeding much higher grades of fowls all over the country. Our Standard calls for much better classes of birds to be placed in competition at our American shows, nowadays, than formerly; and the premium lists have been very largely increased in value and numbers, for grades.

We still think that three kinds of premiums—for first, second, and third, in both adults and young stock—amply sufficient. The "highly commended" amounts to nothing. This, or any additional prizes (except specials) only complicate matters, and are of no earthly use to breeders or fanciers towards selling such stock, as compared with the reputation obtained by carrying off 1st, 2d, or 3d premiums.

As to giving some kind of an award to every body, any how, we need only observe that judges could never get through with a large show if they were obliged critically to scale all the fowls of all varieties (whether good, bad, or indifferent) that are now every year exhibited at the principal or leading shows. This is highly impracticable.

If we can come down to the three premium rule, we can save a great deal of trouble to the judges, and this will aid towards inducing every man to breed his best for the shows. Any judge who is competent to act at all, can very soon determine where and which the birds are in an exhibition-room which fall below the three grades each of adults and chickens to which we have referred.

These can be passed, and the others can be sorted and pronounced upon, readily, but if, as one correspondent suggests, we are to have all the birds scaled, and a fourth or fifth society prize awarded to each variety of old and young—the last portion of this duty will never be performed with any degree of satisfaction to any body, and the amount of labor thus entailed is beyond endurance, ordinarily, at our large shows.

For ourselves we trust that a reform will be made, this year, in the respect we have mentioned. At least let us try the experiment fairly, and ascertain results. We seriously think this is the best thing we can do, in justice to all concerned.

CORRESPONDENCE.

INQUIRY.

EDITOR JOURNAL:

Can you, or one of my many readers, tell me through the JOURNAL, if there is any cure for blindness in a mocking bird. My bird, for this last, three weeks, has grown entirely blind. I feed nothing but Rich's Prepared Bird-food. He is an excellent singer, notwithstanding his blindness.

Yours, &c.

X. O. P.

PLAINFIELD, June 29, 1876.

CENTENNIAL POULTRY SHOW.

JOS. M. WADE, ESQ.:

DEAR SIR,—Having been appointed Superintendent of the Poultry Department of the International Exhibition, it is my earnest desire to have the display of both American and Foreign-bred fowls the largest and best that has ever taken place in the United States, if not in the world. In order to do which I respectfully ask your co-operation by not only exhibiting the best birds of your own well-known strains, but by inducing others to do likewise. The Centennial Commission through the Chief of the Agricultural Bureau, is disposed to extend every facility to all exhibitors of fowls, pigeons, and birds, that may be entered, either for competition or exhibition. Entries are now coming in, and will be received until Sept. 1st. Let us make the event one of the greatest features of the Centennial Exposition, and one that all fanciers may feel proud of.

For particulars regulating the display, I would refer you to the revised circulars and entry-blanks, which will be mailed, upon application to this department.

Any other information that you may desire will be cheerfully furnished by

Yours fraternally,

JOHN E. DIEHL,

Supt. Poultry Dept.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—The cats of the Isle of Man are without tails.—*N. Y. Sun.*
Why re-tail such an old tale?

—What did a blind sawyer do to have his sight restored?
He took his horse—and saw! H.

—Moody and Sankey have been invited to hold meetings in New Haven, and 1,000 people signed the invitation.—*Phila. Times.*
It has been reported that the "fools are not all dead yet."

—A Maine cow swallowed \$50, and they gave her emetics all in vain.—*Boston Post.*

Why give it to her in vein—would it not have been more effectual in her stomach?

—A disconsolate girl stood up to her neck in a pond near Sacramento for an hour, deciding whether to drown herself. Then she concluded to live, and waded out.
She should be engaged at the Zoo as a wader-bird.

—The editor of a Western paper observes:
"The poem which we publish in this week's *Herald* was written by an esteemed friend, who has lain many years in the grave for his own amusement."

He must have been a regular dead-head.

—A dog ran into a garden in Waterford, N. Y., after being poisoned with arsenic, and saliva from its mouth flew on some lettuce. An entire family was made almost fatally sick by eating the lettuce.—*N. Y. Sun.*

Served them right, the chief cook especially. Any one so careless or filthy as to place lettuce on the table without first washing it deserves to be poisoned.

—My friend Huon, usually so accurate, and always so interesting, speaking of the tiger in "*Zoo Notes*," No. 21, says: "Standing

in fear of but one enemy, the *Bison*, and monarch over every description of reality, roams the savage and powerful Bengal tiger." Surely Haon means the Buffalo (*Bos Bubalus*), and not the Bison. The geographical range of the tiger extends on the North into Siberia.

J. M. McCANN.

—**DOGS WITH WHITE POINTS**—Your correspondent, Mr. McCann, is right in stating that "Dogs with white points invariably have white tipped tails." I have bred setters for a number of years, and am constantly thrown in the society of breeders and sportsmen; these are all unanimous in this point. The reason setters with white feet are often seen with solid tails is from the simple fact of the white tips having been pinched off. I do not mean *docked* as we understand *docking*, but the little white tip pinched when the dog is grown; this cannot be noticed and the tail appears of a natural length, and properly feathered, which is not the case in a regularly docked animal.

O. D. F.

—**A PEACE LOVING DOG**.—The Reading Times tells this of a Quaker dog in that county:

Solomon Leshor, of Perry township, who resides near Shoemakersville, is the owner of a large black dog, which is called "the peacemaker." The dog will allow no fighting in his presence; will not allow members of the family to take hold of each other roughly; nor does he allow cock-fighting, the squealing of pigs or anything upon the premises suggestive of quarrelling. Should such a thing take place he immediately punishes the wrong-doer. If a cow horns another he promptly bites the offending beast. If the pigs become restive he leaps into the pen and settles them in short order. Moreover he is bitter in his opposition to tramps, and will allow none to come on the premises. Mr. Leshor says no money would induce him to part with the dog.

—**A MONKEY IN A CHINA STORE**.—Yesterday morning, about nine o'clock, a large, white-faced monkey, owned and kept by an Italian at his fruit-stand, corner of Ninth and Arch streets, escaped from a box in which he was confined, and got into the street. A crowd of boys at once started after the animal and chased him about the street, and during the excitement, the monkey ran into the china store of Metz & Madden, No. 910 Arch street, and at once commenced the work of destruction. He jumped from shelf to shelf to escape his pursuers, and at each jump he threw to the ground valuable articles of glass and china ware, and even went so far as to pick up pieces of ware and throw them about the store and at those in pursuit of him. He got, eventually, into the window of the store, and broke nearly every article in it, and, before he was captured, he destroyed between \$300 and \$400 worth of goods.—*Phila. Ledger*.

—**BALTIMORE ORIOLE**.—Speaking of the oriole, its habits, songs, and tractableness, the *Ordnburg Journal* says, "An old bird which should happen to be trapped would probably quit singing on being deprived of liberty, but one caught young and fed from the human hand will make a most delightful and tractable pet, and happiest when closely surrounded by people, will sing marvelously sweet notes and trills. We know one of this sort, that when liberated from its cage will go to the hand of its owner, assist in threading a needle or ripping a seam, nestle on her shoulder, stand on her hand, and bathe in a bowl of water, and when it has had its liberty of the premises to its heart's content it will go back into its cage and sing its merry tune. It will eat fruit, cake, bread and milk, potatoes, and sugar, lean meat, nuts and eggs, and is especially fond of house flies and small angle worms and insects, and will catch anything tossed to it just as a smart dog will a cracker. Talk about that bud being mournful!"

—**THE BEECH TREE AND LIGHTNING**.—The question asked by me in weekly gossip—"Is the beech tree, *Fagus ferruginea*, ever struck by lightning?" has been answered in the affirmative, by Dr. Hickey, and Mrs. Stephenson, for which information they will please accept thanks. I have often been told there was a tradition among the North American Indians that this tree is exempt from injury by lightning, and that whenever possible they seek its shelter during thunder storms. A writer in London "Science Gossip," states that *Fagus sylvatica* is never struck by lightning, and that assertion has never been contradicted. The bark and wood of these two trees are not distinguishable. The only difference seems to be that the European variety has larger foliage and is more compact in habit. It is the principal wood used in France for making *salois*, or the wooden shoes of the peasantry, being preferred for this purpose to every other wood except walnut, on account of its property of not absorbing water.

The beech tree is universally admired for its elegant habit and beautiful foliage, varieties of it being found in most parts of the world—those in southern latitudes being evergreen. The covering, enclosing the kernel, contains a volatile, narcotic, poisonous

principle, called *Fagine*—though beech oil is used as food in France and other countries, the oil cake which remains being considered excellent for poultry, and in Switzerland the leaves are used for filling mattresses. That the beech-tree is less liable to injury from "the fire horses of the fairies, and the shining chariots of the geni," than any other of equal height is certain—but J. A. S. suggests the brilliant idea, that for this reason it should be rejected, and that we should plant around our dwellings only those trees known to be good conductors—the tulip-tree, *Quercus alba*, &c.—thus ignoring the sublime invention of Franklin, and rearing wooden lightning-rods to Thor! What effect would be produced by an immense *Liriodendron*, riven by a thunder bolt, crashing upon the roof-tree of an average country cottage.

J. M. McCANN.

—**THE ORIGIN OF THE TERMS "6 PENNY," "10 PENNY,"** etc., as applied to nails, though not commonly known, is involved in no mystery whatever. Nails have been made a certain number of pounds to the 1000 for many years, and are still reckoned in that way in England, a 10d. being 1000 nails to ten pounds, and 6d. being 1000 to 6 pounds, a twenty penny weighing 20 pounds to the 1000 and having just one-half the number of nails to the ten pounds of the 10 penny, and in ordering the buyer calls for 3 pound, 6 pound or 10 pound variety, etc., until by the Englishman's abbreviation of pun for pound the abbreviation has been made to stand for penny instead of pound, as originally intended; and when it comes to less than one pound to the 1000, such as tacks, brads, etc., they are reckoned 6 oz., 8 oz., 12 oz., etc., and the manufacturer who would make less than 1000 nails to ten pounds for a 10d. nail, would be looked upon as a cheat, as in former times the difference in the cost of the manufacture of one pound of the small nails over the larger sizes was much greater than now. As nails are now made and sold, the dealer only asks for the sizes needed, by the usual designation, and the fact that there are now but about two thirds of the number of nails formerly called for in the pound does not lessen the value.

—**WHAT IS MEERSCHAUM?**—A great many persons have asked this question and have been answered "Sea foam" and judging from its light, specific gravity and pure color, have believed it and looked upon it with wondering eyes, regarding it as a great curiosity, miraculously changed by Nature from the common sea-foam to the beautiful article which constitutes it.

Now it is not to be denied that Nature does bring about many wonderful changes, but in this case the aforesaid explanation is entirely amiss.

Meerschaum is a species of clay, being a Hydrus Silicate of Magnesia consisting of one part each of Silica, Magnesia, and water. It is found in both America and Europe, especially at Natoli.

When first taken from the earth it is soft, and, when rubbed with a little water, will give a lather similar to soap. When desired to be made into fancy articles it is first boiled in oil or wax, and then baked, by which latter process it is converted into an Anhydrous Silicate.

There exists some controversy in regard to the derivation of its name, some writers claiming it to be from the German Meer, the sea, and schaum, foam, suggested no doubt by its appearance, while others assert that it is a corruption of its Tartar name Myrsen; but it is more than probable that the former one is the correct one. It is known in Persia under the name of Kiefekle, from-keff, foam or seum, and-gill, clay or mud. Its mineralogical name is Sepiolite.

HARRY A. SLOCUM.

—**A NATURAL FISH POND**.—Rev. Robert Wilson, in the Popular Science Monthly, describes a natural basin on the "Woodbo" plantation, about forty miles from Charlestown. Walking toward a clump of tall cypresses, you suddenly find yourself on the brink of a miniature lake, the ground being firm up to the water's edge. An irregular basin, about fifty yards long by a dozen wide, is hollowed out in the blue limestone rock which underlies the soil but a few inches from the surface, and this is filled to the brim with slightly opaline yet perfectly clear water. The bottom slopes adroitly from either side to the middle, where it is fully twelve feet deep, and there exists an irregular fissure extending the whole length of the basin, and varying from two to six inches (apparently) in width. The basin swarms with fish of every variety common to the waters of the region, and of every size. Schools of fry keep near the edges, hundreds in number, while in the deep waters may be seen full grown perch and bream, catfish, black bass, pike and alewives. Watch the bottom for awhile, and you will see these fish issuing from the fissure in the rock, the larger bass (four to eight pounds) never venturing far from it, and darting into it at the least alarm. I well remember a pike nearly three feet long, which I have often struck with a fishing cane, but which I

never could capture. The largest fish will not take the hook, on account of exposure to view; but the smaller bream, perch and bass bite with great eagerness, and I have often caught from twenty to sixty in an afternoon, selecting the best fish by sight, and placing the bait at their very mouths. Sometimes the basin is almost empty of fish; an hour afterwards enough will be visible to overstock a dozen ponds of equal size. By day, eels are rarely visible, and you may stir up all the patches of grass along the bed without discovering one; at night they are frequently caught, the negroes sometimes "gigging" them of the largest size. The temperature of the water is the same winter and summer—about 62°—and the fish bite best in the coldest weather.

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending June 27th, 1876.

- 1 Woodchuck (*Arctomys monax*). Presented by Wm. R. Striery, Phila.
- 1 Woodchuck (*A. monax*). Presented by McCadden & Sevan, Phila.
- 3 Barn Owls (*Strix flammea*). Purchased.
- 1 Chaparral Cock (*Geococcyx californianus*). Purchased.
- 2 Screech Owls (*Scops asio*). Presented by Frank Mowrey, Phila.
- 26 Horned Toads (*Phrynosoma cornuta*). Presented.
- 2 Peafowls (*Pavo cristatus*). Bred in Garden.
- 1 Horned Toad (*Phrynosoma cornuta*). Presented by Mrs. Paschall, Pischallville, Pa.
- 1 Red Fox (*Vulpes fulvus*). Presented by W. W. Whildin, Phila.
- 1 Woodchuck (*Arctomys monax*). Presented by Martin Goldsmith, Camden, N. J.

ARTHUR E. BROWN, Gen. Sup't.

(For Fancier's Journal.)

ZOO NOTES NO. 24.

THE SEA COW—(*Manatee latirostris*.)

In the northern end of the Carnivora house and in that particular room where once dwelt the beautiful eland, will now be found a tank formed of glass and wood, 12 feet square and 3 feet deep, with capacity to hold some six and a half tons of water, where sport and apparently enjoy existence a sea-cow, in which you behold (*Halchen mio*) the veritable triton of heathen mythology, the siren of the Argonauts, and the mermaid of Purchas, and ancient mariners and travelers by the sea in general.

Naturalists do not agree as to where in the animal kingdom the sea-cows have place. Some have set them among the pachyderms (thick skins), between the elephant and hippopotamus. Others, from their fish-like form and aquatic habits, have placed them as intermediate between pachyderms and true cetacea (the whale and its kind).

There are several species of the sea-cow, two of which are found in America, another in Africa, and though all are tropical, strange to say, none are found in the Pacific or Indian Oceans, nor on any shores which are not washed by the waters of the Atlantic. Thus we find the home of the sea-cow in the Gulf of Mexico, along the Florida coast, around the West India Islands, the shallow bays of the Antilles and the quiet creeks of South America. It is at the mouths of rivers, or in the rivers themselves, that the sea-cows find their food which consists of seaweed, floating scum, and the aquatic plants which abound in the shallow waters and along the banks. Being gregarious, they are found in troops, and keeping near the shore, always in shallow water, they are easily captured, the only difficulty being caused by their thick skin, and therefore harpoons, sharp lances and iron arrows are employed. Thousands of them are thus captured yearly, the sea-cow being quite an important item of commerce, as the flesh salted and dried is a very wholesome and palatable food—while from the skin is

made leather of most remarkable strength and durability, as well as "cowhides," which are said to be superior to the best "hippopotamus" stock, and from the fat most excellent oil, purer than any other animal oil known. No wonder the poor sea-cow is fast being exterminated (as is known to be the case), and now comes another demand for them—Zoos want them, and already has the London got its show of them, and our Cincinnati sister is likewise prepared with its specimen sea-cows.

Halchen.—Why call them cows? they have neither legs nor horns, and in no way resemble a cow.

Grampy.—Well, every thing must have a name, and as with a new play or novel, a "taking" one is very important, but you are mistaken as to there being no resemblance to the cow. The fleshy nose, with the nostrils opening on the end of the snout, much resembles that of a cow, but if you do not like this name, there is one or two more for you to choose from—*Manatee*, for instance, which comes from the creature's flippers looking so much like hands (*manus*) hence the name. If this does not suit you, you may call it *Lamantin*, as *Buffon* does, which comes to the same thing in French. Both these are good in zoology, and you therefore need not be afraid of misnomers.

Halchen.—Whence the stories of their being "nereids," tritons," or "mermen," and "maids?"

Grampy.—The sea-cows have a habit of congregating in the shallow places, or on the rocks and there standing upright, with bodies half out of the water. At a distance, with their thin lips (whiskers on the upper lip of the male, and woman's breasts on the female) they much resemble human beings, which resemblance, doubtless, gave to the lively imaginations of the ancient sea-travelers the wonderful stories of the fabulous beings you mention, especially the "mermaid," who

"On the rocks do sit with comb and glass in hand,"

to warn jolly Jack to sheer off. In "Purcenas Pilgrimage" you will find a full description of the "woman-fish," which may have helped Barnum in his manufacture of one.

Halchen.—Then there never were such things as "mermaids," and so forth?

Grampy.—Never—though Pliny and a host of writers give descriptions of them—though Aristotle and others maintained the existence of them—though a mermaid was actually seen in Epirus in the time of Alexander, and a record made of it—though one was seen in Poland in 1554—another in Antwerp, by Aldrovandus—another in the reign of King Roger in Sicily, and still another by Captain Whitbourn off Newfoundland in 1610. Yet they never existed, and science, through the lips of Sir Humphrey Davy, declares that a "human head, human hands, and human mammae are wholly incompatible in the same creature with a fish's tail." Therefore put not your trust in these ancients, *Halchen mio*, for there is no end to the wonderful and impossible in their stories of what they have seen—in their paintings and in their sculptures. I remember to have seen an account of a picture (which was praised, too, as an "old master") representing Abraham about to sacrifice his son by shooting him with a blunderbuss, and we all have seen the Greek sculptor's Laocoon where the python or boa, not content with crushing the miserable priest to death, must increase his dying agonies with a bite. Now had the sculptor possessed any knowledge of snakes he would have known that the tribe which crushes never bites.

Halchen.—Do you know you are discussing art? Let us come back to nature. Tell me on what food are these sea-cows now living?

Grampy.—Grass taken from the Schuylkill, and though there seems an abundance of it in the river, yet such voracious maws have they, that the commissariat may have to go over to the Delaware for a future supply. It is even under consideration

whether sea-weed from the New Jersey coast of the Atlantic will not be wanted, as preserved food for the winter.

Halchen.—How large do they generally grow, and what of their natures; are they fierce or dangerous in any way?

Grampy.—They have been found to measure twenty feet in length, but the average is about twelve. They are of gentle disposition, perfectly harmless, even when attacked; of man they are not afraid, and very rarely—if ever—quarrel with each other. Having very strong affection for their young, when danger approaches, a whole troop will unite for their general protection, and placing the "small fry" in the center, the older ones form a ring for the common safety. It is said that if one is struck by a harpoon its companion will tear the weapon out, and if a "calf" be taken prisoner, the captors are sure of the mother, as her maternal affection will not allow her to go far away from her unfortunate offspring. I wish we could say as much for all human mothers.

Halchen.—One word more. Where did these sea cows come from?

Grampy.—Demarara, one of the three countries of British Guiana, S. A., for which see map, and "when found make a note on't."

HUCS.

(For Fanciers' Journal.)

MR. DOZY, GOLDFISHING.

BY SPERMACETI.

"What are you doing there?"

"Oh, me an' pap is a ketchin' goldfish."

This question was propounded by yours truly, while walking near a pond in the neighborhood of Mr. Dozy's old fashioned store. On reaching it my attention was attracted and my curiosity excited by seeing Mr. Dozy and his son Solomon in the water, with their pantaloons rolled up as far as the law allows, and tugging earnestly at what appeared to be the end lanyards of a large net, fully fifty feet in length. My question referred to their occupation, and it was Solomon who, being nearest the shore, elucidated the mystery.

After a short interval of hard dragging, during which I waited with considerable interest to see the result of the haul, the two fishermen got the net up on the beach. As it made its appearance the rapid flashes of gold and silver light told that it contained at least some booty. But when spread out on the ground and opened, the net disclosed a heap of beautiful fish, numbering at least three or four hundred. But they were not all goldfish, fully one-half were silver fish, so named for their color. These silver fish are worthless to sell and "tarnal pests," as Mr. Dozy pettishly remarked as he and Solomon heartlessly threw them out on the ground to die.

The goldfish ran in size from the length of your little finger to fish of a pound or a pound and a half in weight. The larger and smaller ones were put back in the water and those of about three inches in length were carried up in pails to the house, where they were transferred to a tank kept in readiness for them.

I found Mr. Dozy in a good humor with the success of his haul and perfectly willing to give all the facts he knew about goldfish.

"Goldfish," said he, "ain't a salt-water fish, like the whale, Jeemes, but he likes to live in fresh water. I reckon Long Island was the first place anybody ever seed goldfish. They hev been in this pond as long as I kin remember. Air you goin' to publish this, Jeemes? Ef so be you air, you'd better not be too sartin they was found on Long Island fust, for I ain't dead sure."

I took the old gentleman's advice and didn't make "dead sure" until I made inquiries, and I found that he was right in having misgivings about his opinion. The goldfish is of the carp family and native to the Celestial empire, which supplies us with fire-crackers and tea and much-abused emigrants.

It is a curious fact that one may stock a pond which has previously had nothing in, with goldfish and in the course of a few years silver fish will also appear in that pond in large quantities. Mr. Dozy told me this curious fact, but could advance no theory which threw any light upon it, and at last appealed to me as a newspaper man, who necessarily knew everything, to explain the matter.

I promptly suggested, my reputation as a newspaper man and a pisciculturist being at stake, that the gold and silver fish being similar in form, though different in color, the probability was that the male fish was silver-colored while the female is golden.

Now I don't want any scientist who happens to read these lines to take up my opinion, above delivered, and knock it into "smithereens" with his learning. Let him be considerate, for I feel very proud of it and think it worthy of Seth Green, the man who always has his pockets full of fish spawn.

Mr. Dozy says he used to get \$12.00 per hundred for his fish, but like every other business it has become less profitable in these hard times and now he only receives \$8.00. By inquiry at the places where they are sold in New York, we find the retail price is anything from \$5.00 per pair to ten cents a fish, the price varying according to the greenness of the customer.

I don't imagine I have given my readers any vast amount of information in the foregoing account about goldfish, but we can't be always bothering ourselves about adulteration and monopolies and Cincinnati conventions, and it is sometimes a relief to read something which does not necessitate a strain on one's faculties, and it is my idea that this article exactly fills that bill.—*American Grocer*.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged. "To Exchange for cash" or "FOR CASH," "WANTED A PURCHASER," or "TO EXCHANGE FOR CASH," etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

CARPENTER, Box 108, Mt. Kisco, N. Y., has a Carpenter's Chest of Tools, 75 pieces; also Brass Drum Music Box, in good order. Will exchange for Cabinet Organ, or offers.

JOSEPH REBEISTER, Batavia, N. Y., has for exchange a Cut Rifle, valued at \$10.00, for Pancy Pigeons.

A. G. MILES, Harrisburg, Pa., will exchange a thoroughbred Setter dog pup, 4 months old, second to none in the United States; also a full blood Heatwood B. K. cock, 5 lbs. weight, for Pancy Pigeons. If not as represented, I will return goods and pay expenses.

WARREN BECK, York, Pa., will exchange 3 hens and one cock, fine; 1 very fine white-faced Black Spanish cock, 1 pair Splashed Tumblers, 2 pair Black Tumblers, 1 yellow cap Maggie cock, 1 pair Quakers, 1 pair White Pans, 1 Turbit cock, for one foot-power scroll saw, or Black-wing Swallow hen, or Silver Dun Carrier cock, or Mottled Fan hen. Make offers.

WILLIAM HUNT, Tirol, N. Y., wants to exchange three very fine Aylesbury drakes, for ducks, or one pair of Toulouse geese; Drakes are Bicknell's best stock; geese must be fine. Will also give White Leghorn roosters, Smith stock, for geese or ducking bantams. No half breeds.

JOHN F. MYERLE, JR., 229 Church St., Lancaster City, Pa., will exchange a thoroughbred Beagle Hound, well broken for hunting, for a solid Blue Turbit hen, or Antwerp, Carriers, &c. Speak quick. All letters answered.

E. F. SMITH, Milton, Northumberland Co., Pa., has one pair of Maltese kittens, and one Chinese dog, to exchange for Chickens or Pigeons, or offers. This stock is good, and want the same. Dog is a good watch dog, and well broken to perform or do anything.

HARRY K. WELSH, York, Pa., will exchange, for Pancy Pigeons of any variety, as fine a Light Brahma cockerel of Coney, Churchman, and Carpenter strain, hatched late last season, as is to be found in Pennsylvania, or eggs of same variety for Pigeons. Expect good specimens, as cockerel is; also Tumblers and Fans for other varieties. Write.

JNO. F. HOUSER, Tanawaga, Pa., will exchange 1 pair D. Brahmas, 3 trice F. Cochins, 7 Light Brahms hens—all 74 and 75 hatch, and very fine large birds, for thorough bred pigs.

ROOM 7, P. O. Building, Hartford, Conn., would like some fine American Song Birds, or Canaries, with cages, in exchange for choice selected eggs of most any variety. Write on Postal Cards, or any other cards. Double quick.

J. F. FERRIS, Hartford, Conn., would like to exchange a policy of Life Insurance in one of the best companies in the country, for a good horse and buggy. Write for particulars.

FANCIER, Room 7, P. O. Building, Hartford, Conn., would like a nice sitting of Duckwing Game Bantam eggs, in exchange for other eggs of Leghorns, Cochins or Brahmas.

OLIVER D. SCHOCK, Hanburg, Berks Co., Pa., will exchange young Fancy Pigeons, White, Red, and Yellow Barbs, Black, Red, and Mottled Jacobins, Archangels, Tumblers, White Fane, and many other varieties, for Poland, China, or good Chester White Pigs. Must be A No. 1, from 6 to 10 weeks old.

J. W. TATUM, Wilmington, Delaware, has a Learner's Telegraph Machine, Key, Sounder, (and Battery, if desired) complete; is nearly new and in perfect order; also a fine pair American Rose-comb Dominique Cocks. Will exchange for first-class pure-bred Brown Leghorns, either fowls or eggs.

LOYD B. PHILLIPS, Norwalk, Conn., has for exchange 1 trio of Partridge Cochins, or White Leghorn Chicks, for 1 trio of S. S. Polish; also, 1 trio Breeding Stock of Partridge Cochins for a Printing Press, or offers Stock A No. 1.

W. J. HOLDEN, Hudson, Ill., will exchange small black and tan male Pup, three months old, pure bred, for Light Brahma Cockerels, or other fancy poultry.

HERBERT LODER, Box 638, Stamford, Conn., would like to exchange a few good White Leghorn hens, for Plymouth Rock hens of same quality.

G. R. HAY, West Laurens, Otsego Co., N. Y., will exchange one pair Blue Games, one pair Houdans, one trio Partridge Cochins for Watch, Harness, Gun, books, or offers.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

IRVING M. BARKER, Middletown, Newport Co., R. I., wants a first-class Red-wing Turbit hen, for which I will give a good bargain.

GEORGE STRANGE, Ransom, Hillsdale Co., Michigan, wants a pair of Lop-eared and a pair of Dutch Rabbits; all must be of the best breeds or be returned. Do not want to pay a fancy price.

HARTFORD, JULY 17, 1876.

No. 27.

EGYPT'S WONDERS.

THE GIGANTIC PYRAMIDS AS SEEN BY RECENT AMERICAN TOURISTS.

[Continued from No. 26.]

There is a perpendicular shaft of 155 feet from the queen's chamber down to the entrance passage below the base of the Pyramid. It is believed this shaft was sunk by the masons, after finishing the room, to afford them the means of egress, the opening into the gallery and sloping a cent having been most effectually barred with masses of granite on the inside, by which the existence of the upper apartments referred to were concealed for ages. One of our Beilouin guides proposed to work his way out by going down this dark well and through the passage into the outside opening below, but we could not "see it" fifty cents worth, and did not consider it worth while to contribute at all for the performance of a feat in the dark.

Emerging from the great monument, we did not care to undertake the less difficult and fatiguing performance of ascending the Pyramid, nor did we even respond to the Arab cry, "hip-arrah—six franc and run up top and down ten minute"—"hip-arrah, say go?" We contribute two English shillings each to the old sheikh having charge of the guides, and a shilling backsheesh to each one of those attending us, and that seemed sufficient without investment in the "hip-arrah" business. We again view the Pyramid from the outside. The great stone blocks furnish steps upon which the ascent is made. They vary in size from two to four and five feet square. The Arab guides, two and three for one person, almost lift one from step to step. There is a space about thirty feet square at the summit.

When was this stupendous Pyramid constructed? Authorities differ as to the time. There is little doubt that it was built under the direction of the tyrant ruler, Cheops, who reigned some 2,500 years before Christ. The work was probably completed about 4,300 years ago. It is said by both Diodorus and Pliny that 360,000 men were employed twenty years in its construction. Herodotus wrote 2,300 years ago that 100,000 men were employed in the quarries of the Arabian hills in cutting the stone and transporting it to and across the river; thousands more were occupied in dragging the material to the Lybian hills. "Of the time," he says, "passed in this arduous undertaking, ten years were taken up in the construction of the causeway for the transport of the stones, a work scarcely less wonderful, in my opinion, than the Pyramid itself."

This causeway was 3,000 feet long, 60 feet wide, and 75 to 100 feet high. Some remains of the great work are now visible. The second and third Pyramids were not built till many years after the first. These two have subterranean vaults only, there being no chambers above. The second Pyramid is nearly as large as the first; some of the smooth casing which originally constituted the exterior of all these Pyramids still remains on this one, 130 to 150 feet from the top. Upon this surface it is said that hieroglyphics had been cut to such an extent that if those upon

the two larger Pyramids were copied upon paper, "more than ten thousand books would be filled with them."

The stones originally constituting the surface of the Pyramids were so precisely adjusted, as a writer in the twelfth century declared, that "not even a needle or a hair can be inserted between any two of them." Now the Pyramids are ragged and bare; layers of the great stones have been taken off; the Pyramids for centuries furnished quarries out of which modern Egyptians have built cities. And yet their outline remains the same; they have been reduced only twenty to forty feet in length of sides, and fifteen to twenty feet in height—hardly appreciable in comparison with the immensity of the whole.

We visit the ruins of old tombs near by. The great sepulchral chamber is cut out of the solid rock. The external structure embraces a temple, from one of the apartments of which a vertical well leads to a sepulchral chamber, in which was buried the mummy. Here are exhibited the results of an immensity of labor as well as marvelous mechanism in the work of excavation through solid rock, and in the fitting into walls of polished granite, slabs or blocks, of size varying from ten to twelve feet in length, six and eight breadth, and a foot or more in thickness—the pieces being so nicely adjusted that a pen-knife cannot now be inserted between them. The mason-work of these temple tombs, which are of large dimensions, now stands perfectly and "is plumb" as when completed with such mechanical exactness, thousands of years ago. Forced or voluntary labor, one fact comes to us in tangible and unmistakable forms down the ages, namely, that men knew how to work, and they did work upon honor in those days whereof we have the history, now possessed mainly from such monuments as these, with accompanying hieroglyphic inscriptions.

Our next observation is the Sphinx. It is located on the east side of the platform or plateau of Giza, about one-fourth of a mile from the Great Pyramid. The idea of the Sphinx is said to have originated in Thebes. Its name, as given in the hieroglyphics, is translated as meaning "the sun god, the type of all kings." The Sphinx is a monster in proportions as well as in the figure presented; it is the bust of a man, with the body and legs of a lion, designed, it is supposed, to represent the union of intellect and power required in a king. Only the head, shoulders and back are now visible; the rest is buried in the sand. The head measures thirty feet from the top of the forehead to the bottom of the chin, and fourteen feet across. The face is considerably broken, but enough is preserved to indicate the general features and their expression. The Sphinx does present, in rough portraiture it is true, but still very distinctly, a marked resemblance to the likeness of Washington. It is an amiable, tranquil countenance, yet bearing an expression of majestic power. The body is 140 feet long, with hands protruding fifty feet more; nearly all concealed, however, by the accumulations of sand. What it was in its unutilized condition, and when fully exposed to view, is described by Pliny and others. The monster was cut out of solid rock; the face looks out toward the Nile. The height from the crown of the head to the floor between the paws, is seventy feet. Between

the paws was a temple where sacrifices were performed. From this temple a flight of four steps ascended to a platform; thence an inclined plane led to the top of the rock in front of the Sphinx. These excavations required not only prodigious labor, but great mechanical skill and art ability. One who had carefully studied this remarkable monument, wrote that "nothing could be grander than the appearance of this mysterious creation fronting the worshipers, and rising more and more above their heads as they descend the long flight of steps to lay their offerings at his feet." There is, indeed, something very sublime in this expression of religious sentiment. Dean Stanley says of the Sphinx: "We may well wonder what it must have been when on its head there was the royal helmet of Egypt, on its chin the royal beard; when the stone pavement by which men approached the Pyramids ran up between its paws; when immediately under its paws an altar stood, from which the smoke went up into the gigantic nostrils of that nose now vanished from the face. Its situation and significance are worthy of its grandeur; if it was the grand representation of royalty, then it fitly guards the greatest of royal sepulchres; and, with its half-human, half-animal form, is the best welcome and the best farewell to the history and religion of Egypt."

(For Fanciers' Journal.)

"PRINCIPLES, NOT MEN."

Anonymous writers may be "muddlingers," but it has not seemed to me that the muddlingers of the Journal have been the anonymous:—Vide last year's siege of Toid, Van Winkle & Co., or, call it if you will, one "battle of Waterloo!" or, that the anonymous was because they were afraid to express their views over their own signature.

In the first place, our worthy chief says in italics: "*Anonymous communications not noticed*," so it is to be supposed that he, knowing the writers, does not permit those a place in the Journal's columns, whom he may not, if he desires, or necessity demands, hold responsible for the articles.

In the second place, the Journal is for the promulgation of ideas, the advancement of every interest pertaining to the fanciers. It is not dealing with men, but ideas; so an article is not given to the public from the *man*, but the *mind*. I think it the true way, and must confess it one of my likings in the Journal's management.

We all of us are but human, and in spite of our better judgment do worship at the altar of fame. If an article is signed by a name that has gained notoriety, or by a name we know, or whose owner is endeared to us, we are apt to read that first, and but few of us can read it with a single mind: an old prejudice will warp our judgment, or favoritism will make us lenient. If an article on the contrary be anonymous, we must be content to seize the idea and judge of it according to its merit, as we can know nothing of the writer's practice, profession, or honor.

Let us take for instance this battle for the Standard. If we did not know a little of the "Ed. P. B.'s" history, might we not feel a little differently? and were "Young Breeder" to write over his cognomen, would we not have a respect for his judgment from the knowledge we have of his experience and success?

There is still another thought. The best of us when we are worsted in an argument are apt, when arguments fail, to fall back upon personalities, and one leads to another, until what began in all friendliness, ends in a general recrimination; all of which may be pleasant to participants and partisans, but not especially promotive of the fancier's interests.

And still another thought. Let us suppose that by thought, and untiring patience, a fancier has originated a breed, or brought them to the highest perfection. In the pride of his success he wishes others to share with him his knowledge. He does not wish alone

that others should see *what he has done*, but in the true fancier's spirit, he wishes all to know by what slow steps the success was attained. He does not wish it known for personal aggrandizement, "an axe to grind;" "do not believe in him," and the cry is, but for the profit of others. He tells the world over his own signature, he has "an axe to grind;" so given is this pusillanimous world to the seeking of motives. So he must submit to having his motives misjudged, he must keep his success to himself, or use the anonymous. So I think it is not that the writer's fear to sign their names, but because they would wish their views to be commented upon independent of themselves.

I have reason to think that sometimes our worthy chief has suppressed the names of the writers of different communications, that the mind of the reader might not be biased by knowledge of the writer's previous experience.

I wish we might all meet in the Journal's columns in a pleasanter spirit, united in a common interest: the gaining of fresh knowledge, the enlargement of ideas, and the attaining to higher culture. When we have successes, record them in detail upon our Journal's pages, that others may profit by our efforts. In our failures, not be disheartened, but seek advice and help from those who have trod the road before, and maybe stumbling over the same rough places, having found a helping hand, are ready in their turn to give all the assistance in their power.

ANONYMOUS.

A NATURAL FISH POND.—Rev. Robert Wilson, in the Popular Science Monthly, describes a natural basin on the "Woodboo" plantation, about forty miles from Charlestown. Walking toward a clump of tall cypresses, you suddenly find yourself on the brink of a miniature lake, the ground being firm up to the water's edge. An irregular basin, about fifty yards long by a dozen wide, is hollowed out in the blue limestone rock which underlies the soil but a few inches from the surface, and this is filled to the brim with opaline yet perfectly clear water. The bottom slopes abruptly from either side to the middle, where it is fully twelve feet deep, and there exists an irregular fissure extending the whole length of the basin, and varying from two to six inches (apparently) in width. The basin swarms with fish of every variety common to the waters of the region, and of every size. Schools of fry keep near the edges, hundreds in number, while in the deep waters may be seen full-grown perch and bream, catfish, black bass, pike and alewives. Watch the bottom for awhile, and you will see these fish issuing from the fissure in the rock, the larger bass (four to eight pounders) never venturing far from it, and darting into it at the least alarm. I well remember a pike nearly three feet long, which I have often struck with a fishing cane, but which I never could capture. The largest fish will not take the hook, on account of the exposure to view; but the smaller bream, perch, and bass bite with great eagerness, and I have often caught from twenty to sixty in an afternoon, selecting the best fish by sight, and placing the bait at their very mouths. Sometimes the basin is almost empty of fish; an hour afterwards enough will be visible to overstock a dozen ponds of equal size. By day, eels are rarely visible, and you may stir up all the patches of grass along the bed without discovering one; at night they are frequently caught, the negroes sometimes "giggling" them of the largest size. The temperature of the water is the same winter and summer—about 62°—and the fish bite best in the coldest weather.

A countryman, strolling through New London recently, had in hand, with his rural Phillis, impatient to visit the circus, exclaimed, on seeing a bunch of bananas suspended in front of one of the fruit stores: "I'll be moved if them ain't the biggest beans I ever seen, Sophrony."

POULTRY DEPARTMENT.

A NEW VARIETY.

TO THE ED. OF THE JOURNAL:

In the spring of 1874, I purchased of a gentleman prominent in the "Fancy," a sitting of Brown Leghorn eggs, which yielded me 9 chicks, 3 of which were as "black as Egypt." On asking for an explanation, the gentleman informed me that he was not acquainted with the stock of the sire; that he was an imported bird, &c., &c. One of the Blacks died and the other two I raised; the cockerel had an "uncertain" comb and plumage, and a dull disposition, and I sent him to fat. The pullet was a shy, quiet creature, somewhat larger than her "Brown" sisters, and had a magnificent crown-comb. She commenced laying early in the fall, laying 22 eggs in November. (I would give something to know how many times she laid six eggs, skip a day and then six more.) I had her in a yard poorly sheltered from the sun, with some hens I was not breeding in season of 1875, and one excessively hot day I found her dying at the side of the water-pot. On opening and examining her, nothing could be discovered amiss. She contained a large number of embryo eggs.

Three genuine Brown Leghorn pullets—to all appearance—that hatched with her, I kept and bred from, mated with a cockerel bird from a Bonney cock and a Kinney hen. Among the chicks I noticed some crown-combs, and wrote those to whom I had sold eggs, offering to exchange if they had any; but received no reply. I raised a trio of these Crown-Combs in 1875, and I think all who have seen them will bear me out in the assertion that they are as unique and handsome as any domestic fowl that scratches American earth. They are plumper than the Brown Leghorn; as perfect in form as those pictured; the pullets are of a dark green shade, penciled throughout, (a gentleman said he should describe them as green or dark velvet ground,) the comb runs from the beak three or four serrats single and lone, then assumes a higher and circular form, the serrats appearing like antlers, the cup spreading out and lying flat on the heads of the pullets since they commenced laying. They were rather late chicks; commenced laying in January, and have kept it up to this time, without any sign of brooding. They have surprised me during the late dry and exhausting "spell." I have not kept a strict record, your everlasting "Pencil" is almost always a "Miss Nancy,"—but I feel pretty certain the trio have yielded 10 and 12 eggs a week for several weeks past. I know they have laid 2 a day for a number of days last past. The eggs are larger than the Brown Leghorns, are pure white, and in my experience they are better layers than the B. L., and are more docile. The cock is a most superb figure, resembling the Brown Leghorn in feather more than the pullets; the comb is large, erect, antlered, and crown or cup; a wonderfully abundant hackle, bright golden striped with black; neck long and beautifully arched; breast very full, and penciled in red, golden, and black down to the shanks; wattles very long and thin.

Have managed to get four chicks fairly started from this trio.

The truthful recital of the haps and mishaps through which they have come thus far, would equal anything ever related in weird or fairy tale. I positively began to grow superstitious over them, and when the last hen had finished the 9 I gave her, I wouldn't have "sot" another with the chance of getting a red crown of gold from each egg. I carried the load buyers of eggs expect all of us to carry.

The gentleman I bought the eggs of undoubtedly believed he was selling the genuine article; I certainly should not hesitate to sell eggs sired from a bird bought of a reputable breeder; although an immense amount of the dissatisfaction at present prevailing is owing to the breeding birds not having been *proved* before being put upon the market. When this is done different results from the present will be seen.

One of the finest pair of Light Brahmas I ever saw exhibited, the purchaser was forced to discard after examining them *through their stock*. If this had been his rule in breeding, it is plain to be seen that if he affected the poultry interest at all, it would be for the better; whereas he has probably injured it, and to an extent it would be hard to tell.

One of the noblest *appearing* stock horses that ever appeared at a fair was owned several years since in Vermont; all his stock were defective in the spine, some so bad that they never stood upon their feet. Yet just such a "rooster" will come from under Messrs. Felch & Co's hands so decked out that one is led to believe he is celebrating the event, Burnham and the rest of 'em is so certain almost. "By their fruits ye shall know them." When are we to have a standard that is not a delusion and a snare?

But what are my Crown-Combs? Their real manner of breeding I think is past finding out.

P. WELSH.

LINDEN, July 6, 1876.

WILD AND MONGREL GEESSE.

The Wild Goose (*Branta Canadensis*) which we are accustomed to see on its passage every spring and fall, is as well worthy of domestication as any variety of water fowl that we have upon our farms. To the great majority of our people they are only known as they see them in flight. They have never seen them in the poultry yard, and never enjoyed them as a delicacy upon the table. In a few districts their value has been discovered, both for ornament and for use, and the raising of wild geese has become a regular and profitable business. They are more generally raised in Rhode Island, about the shores of Narragansett Bay, and in Eastern Connecticut, near the Sound, than in any other district with which we are acquainted. The bird is thus described by naturalists: "The head, two-thirds of the neck, the greater quills, the rump and tail are pitch black; the back and wings brocoli-brown, edged with wood-brown; the base of the neck anteriorly, and the under plumage generally, brownish-gray; a few white feathers are scattered about the eye, and a white cravat of a kidney shape forms a conspicuous mark on the throat; upper and under tail coverts, pure white; bill and feet black." They do not walk so gracefully as the common goose, but are entirely at home on the water, and are beautiful objects upon any pond or stream in cultivated grounds. They make a pleasing contrast with white swans, common geese, or ducks, upon any lawn or woodland park. To the farmer they are of chief value for their flesh, and for crossing with other varieties to raise mongrel geese, which are an article of luxury in city markets, and command very high prices. The wild goose has been so little domesticated that there has been no departure, in the color of the plumage, or habits, from the original type. They are strictly monogamous, and the old gander, when mated with the goose for the season, rarely leaves her, unless it be for some former mate, who unexpectedly returns to him. In breeding the pure birds, it is usual to have not more than two or three pairs upon the same premises, and if each pair could have a separate

breeding place, it would be likely to save quarreling among ganders, and disturbance among the goslings. The breeding birds are pinioned at the first joint of the wing, to prevent them from flying, an operation is usually performed while they are young. When first brought to a new location, they should be kept in a pen or hurdle near the spot where they are to breed. They will soon become accustomed to their keeper, and if regularly supplied with food, will give no more trouble than common geese. Abundant feeding, especially during the first season, is essential to the highest success. The young are strong and hardy, and soon learn to shift for themselves. The wild birds are not nearly so prolific as the tame varieties. Each goose lays six or seven eggs at the first litter, and if these are set under other birds, she will lay a second time. The birds increase in size for several years, and their weight will depend very much upon the abundance of their food.

Mongrel Geese, with which the market of large cities are scantily supplied, are the delight of epicures; they are a cross of the wild goose upon some domestic variety. The mongrel goose is usually larger than either parent, and the flesh is held in the highest esteem, either because of its excellent flavor, or of its very high price. The early birds are most desirable, as they can be marketed in August at the watering places at the highest price. The wild gander is usually mated with a domestic goose, because she will produce two or three times as many eggs as a wild goose—thirty and forty eggs are secured by the skillful poultryman, and are hatched under hens or other geese. The young birds are hardy, and easily raised. They should have a good pasture, with a pond or brook, and be regularly and bountifully fed. The object is to secure early maturity, and sell while there is the greatest demand. The business pays well.—*Ex.*

NON-SITTERS.

Hamburgs and Leghorns are non-sitters—so said—now I would like to know how they get the name, for I have a Brown Leghorn now with young chicks; and a Black Hamburg hen, (from J. Y. B.,) sitting. How is this? has change of climate anything to do with it? I would like to know. Every and all kinds of chickens I have used are disposed to sit, except pure Houdans.

Will you or J. Y. B., answer?

JOHNE RET.

PACOLETT, S. C.

OSTRICH FARMING—Parties in California have commenced the work of ostrich farming and the conditions appear to be favorable for success. A gentleman in the Cape Colony had a stock of four hens and two cocks, and finding the old birds unreliable for hatching he devised an incubator which has been used to great advantage. It consists of a box about three feet square and holding about twenty-five eggs. This rests upon a copper or zinc pan, filled with hot water, and has four or five openings, through which the vapor ascends to the box. The eggs are first kept at a temperature of 102 degrees, but in four weeks is reduced to 98 degrees. The period of incubation is 42 days, at the end of which time the eggs are punctured to enable the chicks to break the shell easily. When hatched they are allowed to run about like ordinary fowls. In natural hatching the average number of birds raised is eighteen out of twenty eggs; in artificial, not more than one in twelve fails. At the last accounts 85 birds had been sold, with 280 on hand. The profits of the sale of the feathers of 20 old birds and their progeny, in four years, amounted to \$100,000.

Hard to beat—A boiled egg.

If you're asked to take an egg and won't, is that an-egg-ative reply?

PIGEON DEPARTMENT.

FLYING MATCH.

EDITOR FANCIERS' JOURNAL:

I have come to an arrangement with Mr. John Van Opstal, to fly three matches for one hundred dollars; the bird winning two out of the three to win the stakes. Our first race will be on the 15th from Scranton; the second from a place between Easton and Lock Haven, and the third from Lock Haven. I would have seen with pleasure some of our Philadelphia friends if they would have joined us, but did not hear from them yet.

Yours respectfully,

LOUIS WAEFELAER.

HOBOKEN, N. J., July 12th, 1876.

THE HOMING PIGEON.

On the 8th of June, at the Zoological Society's Gardens, London, Mr. W. B. Tegetmeier gave a very interesting and instructive lecture on homing pigeons. The lecture was illustrated by a number of maps, charts, pigeon whistles used by the Chinese, several specimens of homers, blue rocks, dragons, photographs, and many other appliances connected with the subject.

The lecture commenced by stating that near the coast in many parts of the world, living among the rocks and cliffs, was to be found the common blue rock dove, the parent of all the races of domesticated pigeons.* There are only forty specimens of wild animals capable of domestication, and amongst this number is the wild blue rock, which is possessed of the faculty of taking long journeys in pursuit of food, and of then returning home. From this love of home and their quickness of flight they have for many ages been used as messengers both in this and other countries. The introduction of the telegraph almost entirely superseded their being used as formerly, especially in this country; and to the Belgians must be given the credit of breeding the homing pigeon up to its present high standard of perfection.

In Belgium pigeon racing is now the national sport of the country; it is under the patronage of the king, who annually gives the first prize in the great National Concour. The Belgians have two papers exclusively devoted to homing or voyageur pigeons. The manner in which the Belgians train their birds is very different to the plan which used to be adopted in this country, when frequently only a single bird was started; there they commence training the young birds short distances of five, ten, and twenty miles, and as they get older and stronger the distances are gradually increased, until they often fly as many as 400 or 500 miles in a day. The birds are sent in large flat hampers, each capable of containing about forty birds; and during the racing season as many as 400 or 500 of these baskets may be occasionally seen at some of the railway stations in France. After the birds have been entered in any race they are stamped and placed in the baskets, which are

* Darwin and Tegetmeier have both written this, but the origin of the high class fancy pigeons has never been proved. J. I. C.

all scaled and despatched under the care of a properly appointed attendant or convoyeur, who looks after their wants. On their arrival at the town from whence the race is to take place, the baskets are carefully inspected by the maire to see that the lead seals have not been tampered with. The whole are liberated at the same time, generally between four and five o'clock in the morning. By this system all the bad birds are lost, only the good ones reaching their homes, and the best of these are used for breeding purposes; so that for many years an artificial selection of the strongest and best adapted birds for flying purposes has been carried on in Belgium.

The blue rock is well known from its wildness, but it has not the power of flight possessed by the homing Antwerps, and it is more irregular. The feathers of the wing are narrower, and the whole plumage softer. That of the homer is much harder, the feathers appearing as if they were glued together; the wings overlapping one another, being broader and shorter, mere length of wing not conducing to rapid flight. These Belgian homers in some instances fly at the rate of from forty-five to fifty or even sixty miles an hour. In the race from the Crystal Palace to Brussels the telegram announcing the liberation of the birds was received in Brussels after the arrival of the first birds. In the long 400 or 500 mile races from the South of France the birds usually returned the same day. The longest race on record was from Rome to Brussels, a distance of 900 miles. Eighty birds were despatched, and it was twelve days before any of them returned, only fourteen ever returning.

Mr. Tegetmeier then touched upon the question as to whether it was by instinct or by sight that the birds were enabled to fly long distances, his own opinion being the birds went by observation. In support of this view, he stated some years ago he offered to give £10 (at that time a very large sum for flyers) for a pair of birds that would fly eighty miles without having been previously trained, but no one accepted the offer. Other people affirmed birds would fly by night; but this was also fallacy; and it was found in Belgium the birds never returned after half-past eight at night, neither would they fly during a fog. Only a few days ago a bird of his was liberated in Surrey, the day being beautifully fine there, while in London there was a dense yellow fog, and the bird, not being able to see any of the objects with which it was familiar, started off in another direction, and was caught the same night on the lighthouse at Dover. He next explained the various modes in which pigeons have been utilized; how, by means of relays of pigeons, the late Baron Rothschild was able to inform the British Government of the result of the battle of Waterloo; how useful they were in carrying letters into Paris during the time of the siege, and he gave a very interesting account of the way in which this was accomplished. The letters were not to exceed twenty words each, the charge from England was 5d. for each word, and 6d. for registration; the letters were opened, copied, printed, and photographed in a very small space, 200 communications weighing only one-eighth of a grain, the postage on which amounted to £50, so that one pigeon could carry letters the postage on which amounted to several thousand pounds. During the siege of Paris sixty-four balloons came out, containing ninety-one passengers and 900 kilometres of despatches, and 363 pigeons; out of that number only fifty-seven returned. At the present time in Germany all the forts are provided with flights of pigeons.

Mr. Tegetmeier concluded by stating that he was making some experiments with pigeons for lightships, to be used in cases of wrecks, as recently happened to the Deutschland; the birds to be started from the lightship announcing to those on shore any accident which might happen at sea. It appears that some of these lightships are only visited once a month, and to keep birds in close confinement for so long would nearly incapacitate them for flying; but to prevent this as much as possible, large cages were to be

made in which they could fly, and by stamping their wings with different letters, according to the recognized code of signals, the desired information would be conveyed to those on shore, and to make the birds conveying messages more easily discernible, they might be dyed any required color by means of aniline dyes.

ITEMS.

Ballet girl and geese are the animals that can stand the longest on one leg.

When a chicken has the toothache she always expects a chicken will come to pullet.

Cattle are dumb beasts, but by getting together in large numbers they make themselves herd.

"A white bearded Tumbler," remarked a friend of mine as he drank down a glass of beer. TERRE FILIUS.

Pass along your hot weather items. It is so hot in Iowa City that the cat fish come out under the trees and fan themselves with their tails.

Two irate cooks of New Orleans threw eggs at a policeman who endeavored to separate them, until he strongly resembled an omelet, and appeared disgusted in the egg stream.

A wit was dreadfully bored by a stupid fellow who persisted in talking to him on natural history. "There's the oyster," at last said the bore; "what's your notion as to the idea that the oyster is possessed of reason?" "I think it may be true," said the wit, "because the oyster knows enough to shut its mouth."

Somebody, who considers fishing a scaly business, thus apostrophizes the finny tribe:

And when an angler for his dish,
Through gluttony's vile sin,
Attempts—the wretch!—to pull thee out,
Heaven give thee strength, thou little trout,
To pull the rascal in!

He came from the country seven years ago, and is now a well-to-do merchant. Last week he wrote to the old folks, telling them he had married a lady with a very fine voice—a "mezzo-soprano of quite extraordinary compass." Yesterday he received an answer from the maternal side of the house, informing him that his lamented aunt was afflicted with something of that sort during her life, but had always found relief in placing a mustard plaster on the sole of each foot, and drinking a pint of dandelion tea.

There came to visit the poet Longfellow an Englishman who, like Sir Charles Coldstream, had "traveled everywhere, seen everything, and done everything," and yet was terribly ennuied. "Haw! yes, Mr. Longfellow, thought I ought to see the great American poet, 'n' sent in ma card." The poet asked the visitor to be seated, when he resumed: "Yes, see Mr. Longfellow; I've been great traveller, Sir; been all over the Continent, been to Iceland, Sweden, Norway." "Indeed; you must have found much to interest you?" "Well, something, but it's getting to be an awful bwar. I've just come from Egypt; old country—antiquities, you know." "Yes," replied the poet, "many interesting remains of past ages." "Ah, yes, just so, exactly; heaps of old ruins. I like ruins. Now everything's new in America, you know—can't find any old ruins so thought I'd come 'n' see you."

The Eureka (Nev.) Sentinel of May 10th says: Capt. Roach, the Deputy Assessor, don't fool much with the Chinese in the matter of assessing them for real and personal property. When he goes into a store and sees a stock of goods therein, and the owner greets him with a smile "childlike and bland," saying: "Me no sabe sesse, no sabe store, no got a bioberty, no Chinsaman

keep store," the Captain does not get into a rage, but looks around for what can be construed as personal property; then he hies himself to Main street, procures a dray and is soon loading it up with goods from the store that no one owns, and sends it away to the auctioneer for sale. Charlie Ah Kow was thus treated yesterday, and bets were even that when the dray was loaded Charlie would fork over the money; but he didn't, and only said; "I don't care, me go see 'um lawyer."

AN ELYSIUM FOR LAZY MEN.—A North Carolina letter says; Well, we are lazy in Norfolk, that's a fact. But there is no need of working here. If a man has energy enough to dig a worm he can take a pinhook and sit down on the wharf and catch fish enough in one day to last him two. If he is too lazy to dig a worm he can tie a piece of flannel rag on a string and catch enough crabs to last him a day or two, and if he is too lazy to tie a piece of flannel to a string he lays down on his back on the sand at ebb tide, opens his mouth, and when the tide comes in the crabs run into it. What need is there of work in a country for which nature has done so much?

NEW FOOD FOR SILK WORMS.—Californians interested in the silk-worm business are very much gratified with the result of some experiments in Württemberg, which seems to prove that these useful creatures thrive as well on lettuce as on famous mulberry leaves. The great drawback to the successful culture of silk in California has been the lack of food for the worms. If time justifies the decision that lettuce will serve as good a purpose as mulberry trees, then there will be no reason why that State should not count its silk crop as one of its most valuable products. The experiments made on this lettuce diet, accidental at first and then purposely, seemed to show that if the lettuce leaves were perfectly freed from moisture, they were as eagerly eaten by the young brood of worms, and the resulting cocoons were of as good quality, as those fed on the traditional diet.

A SMALL BOY'S ESSAY ON TOBACCO.—Tobacco stores are mostly kept by wooden Injuns, who stand at the door and try to fool little boys by offering them a bunch of cigars, which is glued in the Injun's hands, and is made of wood also. Hogs do not like tobacco; neither do I. I tried to smoke a cigar once and it made me feel like epsom salts. Tobacco was invented by a man named Walter Raleigh. When the people first saw him smoking they thought he was a steamboat, and as they never saw a steamboat they were frightened. My sister Nancy is a girl. I don't know whether she likes tobacco or not. There is a young man named LeRoy who comes to see her. He was standing on the steps one night, with a cigar in his mouth, and he said he didn't know as she would like it, and she said, "LeRoy, the perfume is agreeable." But when my big brother Tom lighted his pipe, Nancy said, "Get out of the house you horrid creature; the smell of tobacco makes me sick."

A MONKEY'S MEMORY.—A few months ago, says a foreign paper, a lady who is well known in the French fashionable world happened to see in the streets of London a monkey begging pence from the public in the prettiest manner for the benefit of his master, an organ grinder. The marquise took a fancy to it, bought it, dressed it in the grandest of raiment, and made it a pet. The lady the other day had in Paris a fashionable reception, and of course he was the wonder of the room. In the course of the evening a young lady sat down at the piano, and accompanying herself, sang with exquisite taste a little drawing room song. As soon as the lady had finished, the monkey, who though now partially civilized, had not forgotten his former duties, seeing something near him that reminded him of his old occupation, seized it and transferred it into a temporary hat and commenced a collection. The vocalist laughed, the marquise looked vexed;

but to the amusement of everybody, the animal went the rounds and collected a large sum. His task ended he jumped upon the knee of the singer, amid shouts of laughter, and deposited the contents of his hat in the lady's lap. The collection was devoted to a charitable fund.

PIETY AND GOOSE.—A correspondent of the Cincinnati Commercial is responsible for this yarn:

I recently heard this amusing story of a very "pious" old colored woman, who was cook for the gentleman to whom she formerly belonged. During a "big meetin'" in her church, Aunt Sally appropriated one of her employer's geese, and had it nicely roasted for the preacher and some of his invited guests. The gentleman of the house discovered the theft, but said nothing about it until the next day, when he called up Aunt Sally to give her a lecture about it. In the course of the conversation he said:

"I did not care about the goose; I would cheerfully have given you that if you had asked me for it; but I am mortified that you should have stolen it, and that you should have feasted your preacher on stolen meat, and have afterward gone to church to shout as loud as ever."

The old woman indignantly replied:

"Well, you say you wud hab gub me de goose! What de use, den, to make such a fuss about it? And as fur my stayin' away from church on dat account, do you s'pose I'se gwine to neglect my blessed Jesus for one old goose?"

FEEDING HENS.—On a second return home, I found a second complaint from the best read poultry man in these parts—who had charge of my hens—that they had made poor returns for the care given them. I found reasons enough in the fact that they had not been watered. "Why, I never water mine!" exclaimed my model poultry grower. Faithful biddies! No wonder they welcomed their mistress, and flew straight to the watering trough. No wonder, after pining for shells, that they risked their necks in the attempt to get them, as they were being pounded up. It does one's heart good to see them crowd around for their hot wheat bran, stirred either with scraps or wetted with skim milk, and partly baked in the oven. On the fourth day, they rose up to sixteen eggs from seventeen hens; after this last cold wave passed over us, from seven to ten eggs—whereas they were reported as having laid from one to five daily. I have reason to know that water helped more than any other one thing. If, next to fresh meat, there is anything I enjoy giving the hens, it is clear water; also a hot bran mash made in the "pot liquor" saved from a boiled dinner; potato parings can be saved to boil tender before adding their bran for their morning dish. The Country Gentleman taught me to bake all feed for my young chickens. I have never had a case of gapes since.—MRS. FARMER, in *Country Gentleman*.

VENTRILOQUISM EASILY LEARNED.—According to a writer in the Chicago Advocate, the ventriloquist's art is as easily learned as falling off a log. He maintains that there is no difficulty in acquiring the power. In the first place, he says, speak any word or sentence in your own natural tone, then open your mouth and fix your jaws fast, as though trying to hinder any one from opening them further or shutting them, draw the tongue back in a ball, speak the same word, and the sound, instead of being formed in the mouth, will be formed in the pharynx. Great attention must be paid to holding the jaws rigid. The sound will then be found to imitate a voice from the other side of the door when it is closed, or under a floor, or through a wall. To imitate a sound behind a door partly open, the voice must not be altered from the original note or pitch, but be made in another part of the mouth. This is done by closing the lips tight, and drawing one corner of the mouth downwards or towards the ear. Then let the lips open at the corner only, the other part to remain

closed. Next breathe, as it were, the words out of the orifice formed. Do not speak the words distinctly, but expel the breath in short puffs at each word, and as loud as possible. By so doing you produce the illusion in the minds of your listeners that they hear the same voice which they heard when the door was closed, but more distinctly and nearer on account of the door being open. The lips must always be used when the ventriloquist wishes it to appear that the sound comes through an obstacle, but from some one close at hand.

MIRAGES IN COLORADO.

A correspondent of the *Denver News* writes, "During our rides among the farmers and stockmen in different sections of Saguache and San Luis valleys, we have several times been treated to unequalled views of those most wonderful of landscape phenomena—mirage. On one occasion, a bright, cool morning, while on the opposite side of the valley from Saguache, and eighteen miles distant, we saw distinctly outlined, between the hills in the neighborhood of the town mentioned, the broad, unruffled surface of a lake. So perfect was the illusion, and so wonderfully transparent, that even at the great distance named we could plainly distinguish two prominent buildings upon the rocky shore opposite, and their full outlines distinctly mirrored in the translucent depths. Other objects overhanging the bright bosom of the lake cast shadows beneath which were as perfect and plain to the naked eye as though we were within a stone's throw of the spot. And another time bunches of hay-stacks and strings of fences seemed suspended in mid-air at a distance of two or three miles. Beneath them could be seen the sharply-outlined horizon, and above the bluest of ether alone filled space. 'An unconscious journey to dreamland,' some incredulous reader may exclaim, but such a one can see enough in a week's visit here at this season to convince him of a queer reality. The experience of a prominent ranchman in the upper end of the valley, though of a different nature, is quite remarkable and apropos here. He was out hunting cattle a short time ago, and was suddenly enveloped in a severe rain-storm, with the wind blowing directly toward him. He rode in this manner for quite a distance, when the rain turned to snow, and the current of the air as brisk as before, with the wind still in its original direction. Then, in again proceeding on his way, he was afforded any amount of food for speculation by the storm of snow still persisting in its travel toward that of the rain. Believing the gentleman to be thoroughly reliable, I give this for what it is worth, and if one scientist be influenced to rack his brain in regard to the whys and wherefores of the singular freak of the storm-king, a worthy object will have been attained.

ORNAMENTAL FEATHERS.

"Fine feathers make fine birds," says the proverb. Yes, that is true, but it requires much labor and skill to make the feathers so fine that the "birds" will desire to wear them. Few who jauntily wear an ornamental feather realize how deftly the hands of women have worked to give it the graceful curve of beauty. In Vienna, Austria, about two hundred and forty women and apprentices are employed in the manufacture of ornamental feathers. The following account of the method is taken from an English journal:

The coloring is done by men, the other process mostly by women. African ostrich feathers are most usually manufactured. These are white, black, gray and dapple, and are classified according to quality, as "prima," "secunda," &c. Other feathers frequently worked are those of the white heron, bird of paradise and maraboo (there are genuine maraboo feathers and false). The white prima ostrich feather is the finest of all.

The feather is cleaned first by a cold soap bath, well washed twice

or thrice, and then put into warm soap baths, afterwards well washed in cold water, then blued a little, pressed, and swung to and fro in the air until the hairs have spread and the feather is quite dry.

Next, with a small sharp knife, the strong rib at the back is cut away. The feather loses its stiffness, and acquires pliability. With small feathers this is attained by scraping the rib with glass. Then the hairs on each side of the rib are made to curl in, with a blunt knife, and the requisite uniformity of shape is given them by combing them over a slightly-warmed iron.

Next, in order to hide the rib, the worker with a blunt knife twists here and there some hairs of the feather spirally over the rib until it is completely concealed by them. The feather is then threaded with a wire, folded in paper, and so completed.

The same process is followed with gray and black ostrich feathers, except that the gray are generally, and the black always colored. White feathers are only colored for some particular fashion of color, as blue, rose, violet, &c.

If the hair on a feather is not dense enough, or the feather is defective, then two or three feathers are sewn together and curled. This is done with both short and long feathers.

Long feathers are called "leaf feathers," "Amazons," short feathers, generally three of a bundle, are called "panache." Single and sewn feathers are distinguished in both.

The hair of the ostrich feather is also much used for the manufacture of fancy feathers: cockades, fringes, &c., are made of these. The feathers are twined by a machine, and then joined to the hairs of other feathers. These combinations are called "pleureuses," and pieces of ostrich feather are sewn together to a length of some ells, and called "bordures," and are used to decorate dresses.

There is an American ostrich feather called "vulture," which is worked like the African, but is inferior to it in quality. Tempting white feathers, called maraboo, are much worked. They are used for fancy feathers, the points of small white or colored pigeon feathers, and very small fragments of silk and the like are joined onto them. "Bordures," for ball dresses, are made of them. It is evident, from this account, that "to show the white feather" is a process which entails some trouble and expense.

Editor of Fanciers' Journal;

SIR:—Had I been aware that Tennyson had taken out a "patent right" for all the Brooks in creation, and that Wm. Gardner Barton as agent had assumed the responsibility, I should certainly have hesitated before infringing on so sacred a right, notwithstanding the *prior claim* of Robert Burns and others; however, as the past cannot be recalled, and as Wm. Gardner Barton formerly of 88 Bridge street, thinks my *small stream* "would look well" beside Tennyson's *large brook*, "of course," I submit to his superior judgment. But,

It's strange, says Swift, and so say I,
The smallest scribbler cannot try

His hand at verse or prose,
But what some upstart critic will
Like carrion-crow thrust in his bill,
And meanly interpose.

Although the puny scribbler's theme
Is nothing but a mountain stream,
Mill-pond or shady nook,
The would-be critic is surprised,
And swears the stream is plagiarized
From some one else's brook.

And then on mischief fully bent,
He madly rushes into print,
And loudly blows his horn,
Proclaiming to his friends around,
Behold a hero who has ground
Up a whole

EDITORIAL DEPARTMENT.

WE PLEAD GUILTY

For any delinquency in getting out THE JOURNAL this week—With our editor absent—and the mercury denoting 100 degrees and upwards, a great part of the time, we crave a little indulgence for the delay, and really think it may be our due. It may seem to some who patiently wait each week for the appearance of THE JOURNAL, that it is a very easy and trifling matter to issue a Weekly devoted to the specialties of Poultry and Pet-Stock, but to those who know a tithe of the labor to be performed in getting out a large edition each week in the style and shape of THE FANCIERS' JOURNAL, it presents a very different aspect.

WITH THIS NUMBER (27)

We enter upon the last half of the third year of the FANCIERS' JOURNAL. We look over the past two and a half years spent in hard work, in placing before the Fanciers of this country a Weekly Journal devoted to their interests—with feelings of pleasure and pride. We realize that THE JOURNAL must continue to grow, that its scope is wide enough, its field large, its duty plain, and that in the future, as in the past, its growth will be gradual and brought about by hard and persistent labor. We shall endeavor to do our whole duty, with "Malice toward none—with charity for all."

MRS. SOUTHWORTH'S new story, *Ishmael*; or, *In the Depths*, has passed to the eighth edition, and its sequel, *Self-Raised*; or, *From the Depths*, is already in the sixth edition. Mrs. Southworth is, without doubt, one of the most popular American writers of fiction, and her books are always in demand, and command a large sale. T. B. Peterson & Brothers publish a fine new edition of silver works, numbering forty-one volumes in all, in uniform style with "*Ishmael*," and "*Self-Raised*."

CORRESPONDENCE.

INFORMATION WANTED.

Do any readers of the FANCIERS' JOURNAL receive the *Poultryman's Advertiser* of New Albany, Ind., given by Goodhub & Kraft? If so, will some one please answer through the columns of the JOURNAL.

In last April I sent the amount asked for subscription, and the week following 25 cents for an advertisement in exchange column. I have never heard anything from, nor received the *Advertiser*. Is it a humbug? Can some one explain, so that no others may be humbugged, and oblige,
Yours truly,

J. A. LANDENSLAGER.

PILLOW, Pa.

IMPORTATION.

WARREN, MASS., July 13th, 1876.

DEAR SIR:—

I have to-day received from J. C. Cooper, Cooper Hill, Limerick, Ireland, two magnificent pairs Yellow Duckwing Games. One pair won cap and first prize at Cork. They came on steamship City of Chester, in fine health and condition.

Yours very truly,

CHARLES S. LINCOLN.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

PSYCHE.

(To the Greeks Psyche was a butterfly and was also the soul.)

I spoke last evening to a doubting lady,
Of the moth Luna, of its size and beauty;
"Find me this wonder in some woodland shady,"
She said; and I went forth unto my duty.

Yet had her light behest passed from me wholly,
When sauntering townyard through a forest way,
I saw upon a shrub that blossomed lowly,
The lovely Luna in her green array.

Like some sweet soul but newly passed the portal,
Her early chrysalis she had disdained,
And with the impulse of a thing immortal,
She strove to use the wings she had attained.

But may be new-born spirits lack the power
Of flight at once, within that better sphere,
Nor can they free themselves within the hour
From things that bind them to existence here.

"'Tis Psyche! 'tis the Soul!" I said, "Eureka!
It is a spirit from the shadowy land.
That doubting lady, I'll arise and seek her,
That she may be convinced and understand."

I went; she saw, and at it marvelled duly,
Nor wonders now at my triumphant praise;
She frankly owns that I had spoken truly,
And God is great in His mysterious ways.

June, 1876.

W. WHITMAN BAILEY.

—A fish dealer in the Fulton market, New York, was arrested for the alleged inhuman treatment of thirty-nine turtles. The arrested asserted that turtles were insensible to pain; and that they suffered less on their backs, dry shod, than they would were they free to crawl about in tanks of water. Prof. Agassiz has said, that turtles are the most sensitive of animals.

—GEESSE KILLED BY LIGHTNING.—A flash of lightning was seen to strike a flock of wild geese at St. Louis the other day, and one of them fell to the ground. On being picked up the goose was found to have a scarred and burnt hole extending from the back down through the body, there being no question but that the electric bolt passed through the flying bird. The feathers were somewhat singed.

—DEER HORNS.—A friend just returned from a visit to his farm in the mountains, informs me that he saw while there, the head of a buck having three perfectly developed horns—two being on the right side, and all of equal size and beauty. During numerous hunting expeditions to the Alleghanies I have seen the horns of many deer—all differing from each other, but never any-

thing like this. At the beginning of winter the bucks engage in furious combats, and sometimes the times become so intricately entangled that the animals are unable to release themselves, and die a lingering death from starvation, or fall an easy prey to the Puma. The horns are shed annually, and during early summer are "in the velvet," being soft, easily injured, and covered with hair; later in the season they harden, and every year after the first, a new time is added, so that the age of a buck may be readily known. Females are sometimes seen with horns like those of the male.

J. M. McCANN.

—**HISTORY OF MULES.**—Mr. Anthony Kilgore, in the *National Live Stock Journal*, gives the following interesting history of jacks and mules in the United States:

The first pure-blooded Catalan jack ever brought to Kentucky was in 1832, by the Hon. Henry Clay. His sire and dam had been imported from Spain into Maryland, where Mammoth Warrior was foaled. Warrior, as he was called, was fifteen hands high, and young when imported from Maryland, Kentucky, at that time, had no jennets but mongrels, mostly a light shade of blue, with gray, buff, and grizzly hair, nearly as stiff as hog bristles, generally with a colored stripe across the shoulders and down the back, ewe necked, flat in the rib, low carriage and heavy-headed, entirely destitute of any good quality except hardihood and ability to get a living where any other animal save a goat would have starved to death. With such jennets began the first effort to improve the race in Kentucky, and to Warrior they flocked in droves. He seemed to cross advantageously with them, just as the Cashmere goat crosses off the common hairy goat. His progeny seemed rapidly to lose the leading traits of their dams, and to inherit in a remarkable degree the color and outward characteristics of their sire. Four years thereafter, Dr. Davis, of South Carolina, imported direct from Spain the second pure jack, Mammoth by name, sixteen hands high, and of great weight to his height. To Mammoth was bred the young Warrior jennets, then just

naming, this making the second cross of pure blood; and upon these two crossed rest to-day the breeding of the race of jacks known throughout the United States as the Kentucky jack. It will thus readily be seen that Kentucky owes her position and character as a mule and jack breeding State to this direct infusion of Catalan blood. In fact I risk nothing when I attest that no jack in America has acquired celebrity as a mule-breeder unless more or less partaking of Catalan blood, and that there is not one large, smooth, active mule on the continent, not indebted to the same infusion of this potent and powerful blood.—*State Register*.

—The royal striped Ichthyophthalmite, on exhibition in the Agricultural building at the Centennial, was severely bitten by the wild Psittacoglossum of Borneo yesterday, and in endeavoring to separate them the keeper struck the gray-nosed Anguimonospermous on the head with an iron bar, instantly killing it. The Acanthopterygius has been sold, because it is so difficult for the Commissioners to obtain the Hypotracheliums, which constitutes its only food."—*Iowa Hawkeye*.

Clear as mud! and so true!

—**"THE TWO DOGS."**—A neighbor and relative of mine—a breeder of fancy sheep, has two dogs; a cross between the bull and the greyhound—large, fleet and fierce, and filled with a consuming hatred of the whole canine race. Let them only hear the yelp of a cur anywhere upon the farm, its doom is sealed, be it large or small, male or female it matters little, it is hunted as a pack of beagles would a hare. Dogs may pass along the highway with impunity, let them cross the fence into the field, and they will taste of South Down mutton—nevermore. Trained to this sport from an early age, it seems to afford them all the delight to destroy their brothers, that it does an English fox hound to be "in at the death" of his cousin Reynard. One sleeps at the house, the other at the barn, if during the night the younger one gives the alarm, the other goes immediately to ascertain the cause—if there seems

to be no occasion for it, the son is severely chastised, as a warning not again to disturb the repose of his parent without a cause.

J. M. McCANN.

—**THE SCORPIONS OF EGYPT**—That indefatigable naturalist, Mr. Frank Buckland, has recently published the following account of a fight between a mouse and a scorpion, the illustration (representing the thick of the combat) having been drawn on the spot by a spectator:

"In February, 1868, I received a box by post containing twelve scorpions, kindly presented to me by my friend, the late lamented J. Keast Lord, who had caught them under a stone at Heliopolis, in Egypt. Wishing to test the power of the scorpion's sting, I got a glass globe and turned in one of the scorpions. A mouse having been caught in the trap, I thought I might just as well let the scorpion try his powers upon it as the cat. I therefore shook the mouse into the glass with the scorpion. The scorpion, an average-sized one, immediately resisted the affront; and the mouse,

who had never evidently seen a scorpion before, did not know whether he was his friend or his enemy. Not liking the continued jumpings of the mouse, the scorpion twisted and began brandishing about his sting. The mouse shortly crossed his path. The scorpion instantly lunged his sting into him. This challenge woke up the mouse, who began to jump up and down like a jick in the box. When he became quiet, the scorpion again attacked the enemy, with his claws extended like the pictures of the scorpion in the zodiac. He made another shot at the mouse, but missed him. I then called 'Time!' to give both combatants a rest. When the mouse had got his wind, I stirred up the scorpion once more, and, as 'the fancy' say, 'he came up smiling.' The mouse during the interval had evidently made up his mind that he would have to fight, and not strike his colors to a scorpion as he would to a cat. When, therefore, the scorpion came within range, the mouse gave a squeak and bit him on the back; the scorpion at the same moment planted his sting well between the mouse's ears on the top of his head (see engraving). The scorpion then tried to retreat, but could not, for one claw had got entangled in the fur of the mouse. The mouse and scorpion then closed, and rolled over each other like two cats fighting, the scorpion continually stabbing the mouse with his sting, his tail going with the velocity of a needle in a sewing machine. When the scorpion got tired, the mouse got hold of his tail with his teeth and gave it a sharp nip. The mouse seized the opportunity, and immediately bit off two of the scorpion's side legs. He then retired, and began to wash his face. I had expected, of course, that the poison of the scorpion would have killed the mouse, but he didn't seem a bit the worse for it. When I examined him the next morning, he was quite lively and well; and had nearly eaten up the whole of the scorpion for his breakfast. Of course I rewarded the mouse for his plucky conduct by giving him some milk, and by letting him go in a place where it was not likely the cat would find him.

"Scorpions are inhabitants of hot climates; they live among stones, logs of wood, etc., in such places, in fact, as those inhabited in England by wood lice and centipedes, etc. They are said to attain the length of twelve inches in Batavia; and along the Gold Coast, I have heard (but hardly believe it) they are found as big as a good sized lobster; the general size is about three inches long. It not unfrequently happens that scorpions are brought to England in timber, ships, etc., and I have seen more than one scorpion thus brought over."—*Scientific American*.

—LICHENS.—How, I wonder, does the Florida moss differ from the growth that makes picturesque every live-oak in California! sometimes tiny handfuls cling to the branches, sometimes long garlands that the passer by can grasp in passing, are pendant.

In summer they are dry, crisp and elastic, returning to their shape though you crush them in your hand, but in winter, when rain soaked and opened by the breeze, they are like great sails some coarse in texture, others lacelike fronds, pendent from an apothecia covered coriaceous base. Is it a growth of the same species that covers the southern and western exposure of every tree, unpainted house, fence and rock? Sometimes a clump of delicate tissues, sometimes an oval patch of light grayish green coriaceous membrane, sometimes a circle of green or black or brown or yellow, that placed in the water expands into a moss-like beauty.

Nothing in California has interested me more than these, that I have called, ignorantly I suppose, lichens. Will some correct me if I have named them incorrectly!—*Pacific*.

—TEACHING BIRDS TO SING TUNES.—This is done in the town of Fulda, where they keep regular educational institutions for bull-finches. They place the young birds into classes of six to ten each, and keep them in the dark, turning a little hand-organ for them when they are fed. Finally, the birds commence to associate the music with the feeding, and when hungry they commence to sing a few notes of the tune they hear daily. Those who do this are at once placed in a more cheerful room, when light is admitted. This encourages them and makes them more lively. Then they like to sing, and are taught more. The most difficult part is the first starting of the birds, some of which have to be kept a long time in the dark, and on starvation rations, before their obstinacy is overcome. In order to teach them several tunes they receive (after being first taught in classes) private instruction from the little boys of Fulda, each of whom has a few private pupils of this sort. Their education lasts nine months, when it is completed, and the birds sent into the world as accomplished performers. The principal markets are London, Paris and New York. They are valued in Europe at \$20 for every tune they sing, so one who can sing three tunes costs \$60. In New York they bring even more than that.

—REPLY TO MR. MCCANN'S QUERIES.—Though not a "New England" reader of THE JOURNAL, I think I can offer some suggestions, which may enable your correspondent Mr. McCann, to solve the mystery concerning the "Mysterious sounds" which perplexed Mr. Gosse, the Author of the "Romance of Natural History." The Acadian owl or sparrow owl, in Massachusetts called the saw-whet owl, is, with perhaps one exception, the most diminutive member of that class of birds, so far as our knowledge extends. It measures but six inches in length, and about eighteen inches in spread of wings. It affects the solitude of pine forests, is nocturnal in its habits, scarce ever moving in the day unless disturbed, but all life and activity after dark, when it seeks its food. It generally builds its nest half way up a pine tree and lays two eggs. This bird is often heard, but seldom seen. It is well known in Europe, and is there known as the Tengmalin owl, or the Death owl—deriving this latter appellation from the tradition, which says that "when an Indian hears one of these birds uttering its melancholy cry, he whistles towards the spot from whence the sound proceeded, and if the bird does not answer him he expects a speedy death. How the English (for Mr. Wood is my authority) came in possession of this tradition to our exclusion, I cannot say. I have never heard this bird, but have conversed with those who have, and am fully satisfied that it is the proprietor of the sounds which so perplexed Mr. Gosse. A friend of mine, an experienced ornithologist and taxidermist, and who for the past fifteen years has spent the greater part of his time among the birds, was unable during that period of securing a single specimen. The winter before last, being very severe, a number of them made their appearance in this vicinity. I was fortunate enough to secure the first specimen the same winter, and the following spring five or six other specimens were obtained by different persons, all of which are now preserved in the Academy of Natural Sciences of Allentown, where Mr. McCann can see them any day, but where he cannot hear them.

PETS AND THE FATE OF SOME OF THEM.

BY HUON.

NO. 4. THE PET CAT (*Felis domestica*).

"Over the heart in the years that have flown,
No love like mother's love, ever was shown."

OLD SONG.

About the pet cat there hangs a great many tales; indeed there is no end to them nor of them. All of the wild ones are made pets of in the Zoological Gardens and menagerie, and all the domestic ones are the pets of the household from the cat of old Egypt (*Felis maculata*) to the Manx cats without tails, the Kilkenny cats about which there is a great tale, the Angora or Angola cats with their long, silky hair, down to Tortoise-shell tabby, and lead-colored Maltese.

There seems to be no animal which asks so much of human sympathy as the cat—none more capable of giving sympathy in return, nor one more treacherous or ungrateful. On a cat of the two former qualities and the non-belief in the latter, there seems to be no quadruped so well adapted for being a pet of the ladies, to which persuasion of humanity they generally fall. A friend who heard I was under exercise of mind about the "fate of pets" has imparted to me the following tale of a cat with its cat-astrophe, which tale I hope will not prove too long for Fancier's readers, for fear of which however I have cur-tailed said tale as much as possible.

Once upon a time in a certain household there was a pet cat who was the mother of one kitten, and both mother and child were very beautiful. Like Jephtha, Judge of Israel, this one daughter pussy dearly loved, and never was mother cat so well pleased in all cat land, than when some one was noticing her little one.

When kitty grew old enough both it and its mother were allowed the use of the parlor, where a nice little mat was spread for their especial use. One day mother cat had an idea that kitty was old enough to have a change of diet, and having made up her mind as to what would be best for her darling she went forth in search of it. She soon returned with the head of a young chicken, which cook had just chopped off in the kitchen, and this the mother laid down close by kitty's mat, and then withdrew a short distance to watch the result.

Kitty was too young and tender however, to be thus tempted; still preferring the "milky way" she remained passive on the mat. The mother waited awhile, when thinking perhaps the young lady was bashful and therefore would not make her first attempt on carnivorous food in her presence, left the room. All this had been observed by Tabby's mistress, who closed the door upon that worthy feline, and at once threw the chicken-head out of the window, and gave kitty in lieu thereof a nice saucer of bread and milk which was at once devoured. When the mother was again admitted to the room, seeing no remains of the head she concluded that

it had been eaten, especially as kitty was full of play; so a game of romps or hide and seek was started, and for a time "all went merry as a marriage bell."

Two days after mother cat was fortunate enough to capture another chicken-head which she as before took to kitty, with the same results however, that is, her leaving the room, the casting out of the chicken-head, and the substitution of bread and milk; nothing of which however was dreamed of in the mother's philosophy. In due time kitty learned to eat, and then—O! woe is me for the poor mother—she was to be sent from home and in accordance with a promise, made before her birth, she was given away to a friend who wanted a pet, and who lived a considerable distance off. Her departure took place during a temporary absence of her parent, who upon her return immediately noticed the vacant mat whereon her darling was wont to repose, but whose lithe form with its silky coat was to rest thereon no more! She must have thought that kitty was playing her a trick as she at once hid herself behind the end of a sofa thinking thus to draw her out! But no kitty came forth, and after vainly waiting she became uneasy and ran up to the mat as though it were to make a personal inspection. She seemed to know that the mat was *cold!* then kitty must have been gone some time. Now she was evidently excited, running to every hole and corner of the room and even into the entries leading to it. Finally she ran in despair, it would seem, to two of the household who were watching her motions, and looking them in the face, first one and then the other, she moaned and moaned most piteously, saying as clearly as a cat can say—"give me back my child, Oh! give kitty back to me, or my heart will surely break." Poor mother! She and her darling had forever parted!

The first impulse of Tabby's mistress, was to undo what she had so innocently done, and yet which was so cruel in its result; that was, to bring kitty home again to her mother, but a circumstance just then prevented; the matter was in a measure forgotten, and the claim of the bereaved mother deferred to a more convenient season. She was allowed however to remain in the parlor, holding her place on the little mat which still remained for her occupation.

How Tabby spent her first lonely night could not be told exactly; but in deep trouble, and without sleep as indicated by her low, smothered moan, heard at intervals until the household were once more taking up the cares and burthens of the day, when poor Tabby's burthen was found to be in sitting near her once favorite corner, with her eyes riveted on the now vacant mat; from which spot she could not be persuaded to move. In vain was her breakfast set in her sight! She could not eat but, like Isaac of York, seemed to say—"bring me back my daughter, and you may do what you will with me!" She did not seem inclined even to move, save when some shadow—might it not be kitty's?—flitted across her vision. The family supposing she would soon get over her loss, done every thing except the right one, to alleviate her sorrow, but there was nothing to encourage them in the actions of Tabby through the whole of that day or the next, but the morning of the third day brought a change at all events. When the marketing was brought home Tabby went to the kitchen, where she was soon in possession of her favorite morsel—a chicken-head. Forthwith she carried it to the parlor and carefully placed it on the mat; and then quietly waited, and watched from her usual corner! Watched and waited, for her who was to come never more—that mother's darling who was lost to her forever! In a state of doubt and despair, she kept her post of watch for weary hours. There she was during the long tedious hours of the day. There she was when twilight came on; and there she was when night dropped her mantle of darkness upon the earth and closed the scene. Through the early hours of the night there might have been heard a low complaining from the cat's corner of the closed parlor, but when the morning came and the shutters were opened, all was quiet,

for the sunlight fell upon the mother cat, with her fore feet resting on the mat,—dead! Did her life go out in the delicious dream that she was playing with her kitty? or that in her velvety paws she was carrying her beloved to the house-tops of cat-paradise? Perhaps!—let us hope so. *Requires CAT-in pace.*

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for *Exchange only*, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"TO EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

No Exchanger or Want will be inserted unless accompanied with 25 cents.

LEGHORN, care of "Fanciers' Journal," Hartford, Ct., has Brown Leghorn fowls or chicks to exchange for Black Breasted Red Games, fowls or chicks.

JNO. F. HOUS, R. Tamuqua, Pa., will exchange 1 pair D. Brahmas, 3 tris P. Cochins, 7 Light Brahmas—also all '74 and '75 hatch, and very fine large birds, for thorough bred pigs.

JOHN F. MYER, JR., 229 Church St., Lancaster, Pa., will exchange a fine pair of mated Trumpeters, good breeders, for pointers or Barbs; also a fine Terrier Bitch, cannot be excelled, for offers of Fancy Pigeons. All communications answered at once. Speak quick.

E. R. BLOOMER, 659 Main St., Elmira, N. Y., will exchange two Lop eared Bucks, 9 weeks old, ears now 14½ long, for two Lop-eared Does. Must be good ones.

JOHN E. SCHUM, 150 South Water St., Lancaster City, Pa., will exchange a fine pair of Muscovy Ducks, a good Rifle; also lots of Rabbits, and some Fancy Pigeons, such as Snells, Tumblers, Turbits, Nuns, Trumpeters, Bald Heads, Jacobins, &c. Make me offers. Speak quick.

CYRUS McCULLY, Hubbard, Ohio, will exchange a few extra fine Black and Tan pups, parents first-class ratlers. Duckwing game preferred. Make offers.

G. C. WILSON, Milbury, Mass., will exchange a pure Spitz dog, about nine months old, for Golden Setbirds, Bantams, or Brown Red Game Bantam hens. Write immediately, describing fowls. The dog is trained to do a number of tricks, and is a splendid pet. Silence a respectful negative.

W. M. T., Forest & Stream, 17 Chatham St., New York, wishes to exchange Red Irish Setter puppy, with fashionable pedigree, for fowls of any description.

BOX 17, Foxburg, Clinton Co., Pa., wants to exchange a B. B. Red Cock, a Ginger Red Stag, a Derby hen, and several hens, pit stock, for Brown Breasted Reds bred to feather.

E. R. KRAUSE, Box 508, Zanesville, Ohio, wants to exchange extra fine Lop eared, and some of Angora Rabbits, for a large Zice Aquarium, or a good talking Parrot, or a good pocket Rifle, or offers.

J. H. NORRIS, 212 Erie St., Buffalo, N. Y., will exchange 1 tin box, with lock and key, cost \$2.75; 1 brass fishing pole reel, cost \$2.00; 7 small fishing lines, 3-50 foot braided lines; 14 sinkers; 16 hooks, assorted, cost \$5.30; 1 hind bracket saw, cost \$6.50, for Houdan, Dominique Leghorn pullets, or offers. All communications answered. Speak quick.

M. HART, Room 23 Sraton House, Washington, D. C., will exchange one pair Pua fowl, cock two and hen three years old, for W. C. B. or G. S. Poland, Partridge, Choline, or Schright Bantams, or offers. Stock must be good, as mine are. Write.

CHARLES W. HOITT, P. O. Box 425, Nashua, N. H., has two Silver Dun Homing Antwerps, males; 1 pair Blue-winged Turbits, 1 pair Blue Antwerps, 1 pair Spangled Tumblers, (now breeding), to exchange for colored Fans, or Belgian Canaries; also 1 Bloodhound and 1 Setter, for offers. Both dogs well bred.

K. A. BRANDEL, 119 N. William St., Buffalo, N. Y., will exchange 1 White Turbit cock for a Black tail Turbit hen, and 1 pair White Jacobins, and 1 White Turbit cock, for a pair of Owls, any color, (yellow preferred), or anything in Owls, Turbits, or Barbs. Must be good.

J. L. PFUGER, Milton, Northumberland Co., Pa., has for exchange one pair Duckwing game Bantams, 1 White Leghorn hen, 2 Partridge Cochins hens, for Black B. R. game Bantam hens, or Fancy Pigeons.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for *Sale, Exchange, or Wanted*, will be allowed at 10 cents for each and every insertion.

THE POLAR AND TROPICAL WORLDS—by Dr. Hartwig, illustrated, leather, 810 pages, new, cost \$5.50. J. H. Cummings, Winstboro, S. C., wants to exchange the above for Doyle's Poultry Book, Cooper's Game Fowl, or Field Glass, (army size), or Bantams. State condition of books.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

UNITED STATES BONDS—by Rev. Isaac W. K. Handy, new, 670 pages, gilt cloth, cost \$4.50. J. H. Cummings, Winsboro, S. C., wants to exchange the above for Doyle's Poultry Book, Cooper's Game Fowl, Field Glass, or Bantams.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.
The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

C. G. WILSON, Millbury, Mass., wants a Brown Red Game Bantam hen or pullet. I do not want a duck-toed, parrot-toed, squatty bird, but a symmetrical, good stationed bird. Silence a respectful negative.

LEGHORN, care of Fanciers' Journal, wants an offer for 15 Brown Leghorn Cockerels—large and small. Speak quick!

BLACK ROSE-COMB BANTAMS, MY SPECIALTY.

Black African Bantams.

Fine Light Brahmas.

During the show season of 1876 my stock won ten first premiums. Having exhibited them myself at four exhibitions, winning six first premiums on old and young, some figuring as high as 97 points, this fact alone should be a sufficient guarantee of the purity of stock and perfections of markings. No birds to dispose of at present. C. B. ELBEN, Pittsburg, Pa.

KATYDID.

Sultry was the Summer evening,
And the weather hot and dry;
Here and there a small cloud lingered
In the crimson western sky.

But when night had spread her mantle
Over woodland, vale and hill,
Not a zephyr was then waiting,
E'en the aspen leaf was still.

Languidly I sat reposing,
Half asleep, within the glade,
When methought I heard a murmuring
Voice amidst the maple shade.

Silently I sat and listened,
Wondering if there could be
Dryad, sylvan elf, or fairy,
Hiding in the maple tree;

Not a leaf to me seemed moving,
But amidst the branches hid,
Something in a voice mysterious,
Softly whispered "Katydid."

What? But not another sentence
Fell upon my anxious ear;
Could some disembodied spirit
From another world be near?

Half ashamed, I asked the question,
Is it friend or foe that's hid?
Or is there a spirit present?
Still the answer "Katydid."

Who was Kate and where her dwelling?
Was there any one could tell?
Was she some lone Indian maiden,
And the fairest, of the dell?

Seriously I put the query,
To what seemed so strangely hid,
"Can a woman keep a secret?"
Still the answer "Katydid."

What could be the solemn mystery,
So religiously concerned?
Katydid, but what? who knew it?
Would it ever be revealed?

Stranger still, a woman's secret,
From the babbling world is hid;
For the wisest village gossip
Cannot tell what "Katydid."

PETER PEPPERCORN.

(For Fanciers' Journal.)

GLEANINGS FROM A COUNTRY LIBRARY.

The skeleton of an elephant in the museum at St. Petersburg, which was sent to Peter the Great by the Shah of Persia, measures sixteen feet and a half in height; and probably this is the highest authentic instance on record.

William IV., when residing in Bushy Park, had a part of the mizen-mast of the Victory, against which Lord Nelson was standing when he received his fatal wound, deposited in a small temple

in the grounds of Bushy House. A large shot had passed completely through this part of the mast; and in the hole a pair of robins had built their nest and reared a brood of young ones. It was impossible to look at this without reflecting on the scene of blood which had occurred to produce so snug and peaceable a retreat for a nest of harmless robins.

It is generally well known that birds are very active agents in the extension of vegetation, and that fruit and flowers are, to a great extent, rendered prolific by the insects which visit their blossoms; but few people are aware of the means through which fish are formed in lakes and ponds which are not connected with other waters. Here, too, an insect is the principal agent. The large water-beetle, which is in the habit of feeding upon the spawn of fish, occasionally in the evening climbs upon the stems of rushes &c., out of the water sufficiently high to enable it to take wing; in these circumstances it has been caught, and, putting it into the water, has been seen to give out the spawn with which it had gorged itself previous to taking flight, both in a digested and undigested state; so that, on trial, it has been found that it produces fish of various kinds.

THE LENGTH OF SERPENTS.

The old Roman historians report that the army of Regulus while attacking Carthage, was assailed by an enormous serpent, which was destroyed only by the aid of the military engines. The skin of this monster measuring 120 feet in length was sent to Rome, and preserved in a temple till the time of the Numantian war. Diodorus Siculus mentions a serpent which was captured, not without loss of human life, in Egypt, and which was taken to Alexandria; it measured forty-five feet in length. Sutorius records one that was exhibited in front of the Comitium at Rome, which was seventy-five feet in length. A well-known picture by Daniell represents an enormous serpent attacking a boat's crew in one of the creeks of the Ganges. The monster was killed and is said to have measured sixty-two feet in length.

Thirty-six feet is the longest serpent ever measured in modern times, that may be considered reliable.

THE VEGETABLE CATERPILLAR.

The moth from whose eggs are produced this caterpillar is of the genus *Spinix*, and is named by the New Zealanders *pepe*. Its period of life is from November to December—the commencement of summer in their country. About the end of the eighth or the beginning of the ninth month, this caterpillar buries itself in the ground to the depth of five or six inches, previous to assuming the chrysalis form; and it is a singular fact, that the insect descends into its subterraneous hiding-place with its hind-part downwards. In the second month of the following year small reed-like plants, about three or four inches high, may be seen growing in great numbers from the ground under the shade of the *rata* trees; this plant being dug up carefully is found to grow out of the head of the caterpillar just described, which, however, no longer possesses any vitality; for cutting into its body, it is found to consist of a tough whitish substance, similar to a fungus. In the tenth month the reed-like plant dies away, but springs up again the following year, dying away again in the tenth month, and sending out a fresh shoot yearly for three or four years, probably till all the animal matter supplied by the caterpillar has been consumed.

J. M. McCANN.

POULTRY DEPARTMENT.

UNITED STATES CENTENNIAL COMMISSION.

BUREAU OF AGRICULTURE. }
PHILADELPHIA, July 10th, 1876. }

SIR:

The Exhibition of Poultry will be open on Oct. 27th, and close on Nov. 6th.

The display will be made in coops provided by the Commission, and located under the shelter of the cattle stalls, which will be prepared for their reception.

Transportation charges must all be paid in advance. Express Companies will deliver specimens on the Exhibition grounds, when addressed with official labels.

Each coop used in the transportation of birds must be of sufficient strength to serve for their return, and must be marked with the proper shipping directions.

Numbers alone will distinguish birds in the show yard, preceding the award of prizes; afterwards full opportunity will be given to exhibitors to display their cards and trophies. All specimens except Games and Game Bantams must be exhibited in natural condition; pulling, splicing, or inserting feathers, coloring or otherwise altering the appearance of birds, will bar them from receiving awards.

Misstatements as to age, or breed, will cause the exclusion of birds from competition.

Birds of evident inferiority will be denied admittance, even though the owners may have received a permit.

Birds may be sold at private sale at any time during their exhibition, but no bird in the event of being sold, will be allowed to be removed prior to Nov. 7th.

Birds possessing points of excellence will be reported upon according to their inherent and comparative merit.

Exhibitors whose stock is recommended by the judges for an award, will receive a special report, and the diploma and bronze medal of the United States Centennial Commission.

The judges in each group will also make a general report upon the development and present characteristics of each breed, especial reference being made to birds of superlative merit.

Awards will be made in the Gallinaceous division on pairs of both fowls and chickens.

They may be entered in pairs, trios, or quartettes.

In the Aquatic and Columbarian divisions, awards will be made in pairs, consisting of male and female, regardless of age. In the Song and Ornamental division awards will be made on single specimens.

Exhibitors of song and ornamental birds will furnish their own cages.

Special premiums from societies and individuals must be awarded through the hands of the Centennial Commission.

Entries will remain open until September 1st.

Applicants for space, will, when their stock is accepted, be fur-

nished with permits and official labels, without which, entry to the yard cannot be had.

All specimens must be on the ground previous to 6 o'clock P. M., on the 26th day of October.

Entry blanks will be furnished upon application to this office.

Respectfully,

BURNET LANDRETH,

Chief of Bureau.

JOHN E. DIEHL,

Supt. Poultry Dep.

WHICH IS THE MOST PROFITABLE BREED OF HENS TO KEEP.

This seems to be a difficult problem to solve. After ten years' experience, with a number of different breeds and an almost endless variety of crosses, I have come to the conclusion that there is more in the proper management than in the breed. For five or six years, the Brahmas were my first choice but I have finally decided that some of the smaller breeds—as for instance the "Leghorns," "Houdans," or "Polands"—will pay best.

A hen weighing three or four pounds can lay one egg in a day, while a hen weighing twelve pounds can do no more. The amount of feed required to grow one chicken to twelve pounds should raise two or three smaller ones. When full grown the difference in food is less, but there is still a difference.

A laying hen will lay her weight in eggs in a very short time, and requires food accordingly. A miller cannot run his mill without grain, neither can a hen, a part which some people seem to overlook.

When a person is sufficiently interested in the poultry business to pay extravagant prices for eggs of—to him at least—new breeds, he is very likely to give them extra care and attention—at least while they are a new thing—and the result is a good margin of profit, for hens will pay every time if well taken care of and the profit corresponds with the care taken.

Pleased at the result, the next step he will probably send an article to the papers saying that the "Brahmas," "Leghorns," "Houdans," or whatever the variety may be, are, all things considered, the most profitable breed to keep, little thinking that the hens rejected would probably have given as good results under the same improved management.

I have kept the Bolton Grays, Polands, Dorkings, Black Spanish, Light and Dark Brahmas, Buff and Partridge Cochins, Dominiques, and White Leghorns. Each and all have their strong point, also their demerits.

One breed are good layers but unfit for the table, another takes on flesh rapidly but lay sparingly. One kind will allow you to almost step on them and another are as wild as hawks. One bears confinement well, others not at all. And so it goes. I have not yet found the breed that is perfect in all respects.

It is perfectly proper for persons to have their pet kinds, but overstrained statements, and fixed up figures to sustain their choice should be avoided.

My average number of hens has been about one hundred, and I have kept an exact account of all moneys received or expended, and am not obliged to depend upon what my neighbors say, or to guess at results, for the figures are before me. Feed raised has been put down as feed bought. Eggs and poultry used in the family have been reckoned as sold.

Now it is not my intention to inflict all these figures upon the *Rural* readers, suffice it to say that after allowing for all mishaps and losses—that have been considerable—and for all mistakes—which have been many—the net cash profit figures up to something over nine hundred (900) dollars for the ten years. To be sure this is not as good a showing as we often read about, but is very satisfactory to me.

The manure made is also worth considering. Then the service the hens have done by destroying worms, bugs, insects, etc., is beyond estimate, as is also the great pleasure in taking care of them, and the satisfaction of testing different breeds. On the whole I am well pleased with poultry keeping.

NELSON RITTER.

SYRACUSE, N. Y.

AYLESBURY DUCKS.

Last September I had forty-three Aylesbury ducks, young and old. Two years ago this spring I procured two dozen eggs from a party in Rye, N. Y., I forget his name, from which I got seven ducks. Not the fault of the eggs, however, but one hen got sick under which I had put half of them. The forty-three spoken of above came from that start.

I cannot give any account of the profit and loss but I can state some facts.

They commenced to lay about the 1st September and continued through that month and October and until the 10th of November. We obtained fifty two eggs in September and ninety-six in October but only twenty in November. They commenced again the 2d of February in which month they only laid fifteen eggs. In March I got one hundred and forty-nine and in April two hundred and eighty-six, and in May two hundred and ninety-five, and so far in June (the 18th) one hundred and thirty-four.

I have however forgotten to say that our spring number is only twenty-two for we have had some very fine eating during the winter from our fall flock. I can assure you that it was very toothsome eating.

Of the twenty two we have lost two, and seven are drakes. These are the facts and "we want facts young man." Let me recapitulate—In September, we got 52 eggs; October, 96; November, 20; February, 15; March, 149; April, 286; May, 295; June 18, 134. Total 1,047.

I don't think this a very bad showing, but as I have said before, I cannot state anything in regard to the profit because my fowls and ducks are all fed in common.

I have no pond of water for them to resort to, but I have some low land through which there is a wide drain to which they resort when permitted, and where we have sometimes to deny them, as our garden is in that neighborhood and they are very fond of "garden sass." I see that Mr. Bicknell in the June number of the Poultry Bulletin, says that from two to four ducks are allowable to one drake. I think I have had too many drakes this spring and shall hereafter have only one drake for three ducks.

Young ducks are very tender and require peculiar feeding and much care. In the article above alluded to, Mr. Bicknell says that they should be fed only cooked food, composed of the meal of corn and oats ground together in which by measure add an equal quantity of wheat bran with which mix some finely-chopped cooked meat of a cheap kind. I have not had very excellent luck this spring with my ducklings, but hope to have better now that I have adopted Mr. Bicknell's plan of feeding,

RIDGEWOOD, N. J.

B. Z.

HOUDANS.

The English Ag. Gazette while speaking a good word for the Houdan, is quite averse to placing it first in the list:

"We are frequently asked what breed of poultry is considered the best—a very puzzling question to answer without a statement of circumstances, by which we mean situation and size of run, whether eggs or chicks are the chief consideration, if beauty of plumage or a quiet easy-going disposition is of consequence. When informed on these points, it is comparatively easy to name two or three varieties of fowls which if properly tended, will satisfy the demand for "profitable poultry." At present there is a

strong endeavor to force Houdans to the top of the list, and there leave them permanent among fowls. We are of those who dispute their right to that position. We know, and readily allow, that their merits are great, that under trying circumstances they hold their ground, and that, if considered on the table as well as producers of eggs, they will hold their own. Hardy, weighing well for their size, consequently compact and plump, quiet, and with flesh of a good color, they are in the first class but not at the top of it. Some people admire them in the yard or pen, others dislike their appearance, though "massed" or seen in large numbers they would please the eye of many who are not partial to a solitary bird. Some good judges consider that no bird looks better alone in the competition pen than a good Houdan. That is a matter of taste, and we must leave every one to consult and please his own eye. Our object now is to resist the efforts of Houdan fanciers to place their favorites at the top of the list, while, as we have said, we are quite alive to their just claims upon the favor of poultry keepers.—R. N. Y.

HERRON vs. WARREN.

JOS. M. WADE, ESQ.:

Dear Sir,—I would apologize for again annoying you, by answering Warren, were it not that I consider it my duty to present the matter fairly to your readers, and feel, that from your relation to Fanciers, it is your duty to protect their interests to the best of your ability. The question at issue is one of facts, and one which it would seem that all poultrymen would be interested in. Those who are, I request to read again, carefully, my statement, &c., in your paper of June 12th. Therein I present verbatim, all of Warren's letters relating to the transaction in which he agrees to send me "a chicken which will be A, No. 1." He receives my money and sends me a bird with a wry hen tail whose secondaries are black where they should be bay; who has the roup, and who is so weak he can hardly stand up. I present three affidavits properly sworn to, giving accurate description of bird—one of my own, and one from each of two of the most prominent officers of our State Poultry Association, who are disinterested, and not connected with me in any manner whatever.

INDIANAPOLIS, IND., July 29th, 1876.

Andrew Linneman, being duly sworn, says that from the 28th day of June, 1875, to the 10th day of June, 1876, he was in the employ of F. M. Herron, during which time he had charge of said Herron's chickens; that about the 11th day of March last, said Herron received from A. D. Warren, one black breasted red Game Cockerel; that said Cockerel was so weak in the legs he could hardly stand up, and had the roup; that he had a wry hen tail; that the outside web of his secondaries were black with faint bay streaks, and that he considered said bird unfit to breed from and worthless; that said bird was received on Saturday; that he, said Linneman, gave him some roup pills, and shipped the bird back, Monday, two days after.

ANDREW LINNEMAN.

Subscribed and sworn to before me this 29th day of June, 1876.

WM. B. BURFORD,
Notary Public.

Warren in his reply does not deny any part of the description, excepting as to health and wry tail. He also presents certificates of character from Messrs. Parker and Ball, who are either his employes or interested in the spoils. A total absence of affidavits is noticeable. Warren says that on receiving the bird he also received a letter from me stating that he had swindled me, &c. It is false.

Why does he not produce my letters; When I received the bird from him, I thought the fault was with some of Warren's

employees—that he had not seen him, and when he did see him, would either send me such a bird as he agreed to or return my money. I said nothing about swindling in my first letter, and the only approach to a threat or anything objectionable that was in it was that if that was the best bird he could furnish for \$12, I wanted my money back. After writing three times, drawing on him through the bank, and waiting five weeks without hearing any thing from him, I concluded it was an intentional and pre-meditated swindle, and since he has refused to do anything which others say he ought, I am satisfied that he knew what was done from the start. He still has my money, and I think the same of him that I would of any thief or burglar who might rob me of the same amount, except that I think the thief or burglar would be the most honorable of the two, he sailing under true colors.

Warren has made false quotations from my letters, and endeavored to place me in a false position thereby. I call upon him to produce them entire in regular order. If he thought, as he must have done, that I would pocket his swindle, as his other victims have, and not take the trouble to expose him, he did not know me, and if he thinks I am to be frightened off by his misrepresentations in his published article, or his sneering manner, he still does not know me. He says he offered to remit me \$7.80, which is false. (See his letter of May 1st.) I leave it to the public to judge whether or not I was warranted in threatening to publish him, and whether I have kept my word. His friends, from whom he quotes, I do not know, and if they uphold him in swindling, I do not want to know them. They are in every way qualified to be his friends all around.

I believe the bird was, as Warren wrote, late hatched. He weighed less than 4½ pounds. He says he was hatched in Sept. I have one of my own raising, hatched Oct. 1st, that weighed over a pound more at the time Warren's bird was received. Warren says he will figure 85 points. He might if Warren would put gold bands on his legs, and the gold bands would overbalance a wry hen tail, &c. Of course a first-class bird which he agreed to send me, or my money at the proper time, would have silenced the matter. I asked for nothing but what was right, but when he charges me with trying to frighten him into sending me one of his old, fully developed birds, he makes a false charge. I never intimated anything of the kind to him, nor did I ever think of it. You, Mr. Editor, can judge from my letters to you whether such was my idea. I cannot imagine what could have put such a thought into Warren's head, unless it was because I required first premium birds last fall, and his ideas of such are so closely connected with his old, fully developed birds, with gold bands around their legs, with which he took his premiums at Buffalo.

I am satisfied that Warren overrates his reputation, when he thinks that it will enable him to sell a bird with a wry hen tail for a first-class one, and then make the public believe that the bird had a perfect tail, with four affidavits to the contrary. I have seen judges puzzled to decide whether or not a bird had a wry tail when it carried it first on one side and then on the other, but this one from Warren carried his, all the time he was here, in one position, viz., dropping over to one side two inches or more. Warren may have shown another bird to his friends, for I believe the man who would perpetrate the swindle he has, and stick to it, would do worse. Let Warren preserve his patience—the matter shall go to the A. P. A., at the earliest opportunity. A bird might catch cold in March in going to Indianapolis from Worcester, but it could not get the roup, as this bird had it, in that time, had it been in proper condition when sent. Had Warren been the man I supposed him to be, from his advertisement in *The World*, his opinion of me would have been of consequence; now, I value it as I would that of any scallawag I had brought to justice. As to his alleged other irregularities, which he says he is going to make me prove, any of your readers may post themselves

by writing to Geo. C. Barker, Esq., of Newport, R. I., and E. Hindekoper, Esq., Meadville, Pa.

And I would advise all who have sent Warren orders for birds, for the season of 1876, or who may contemplate doing so at any time, to write these parties, asking for their experience, and also to keep my experience in mind. Warren's warrantee has been worthless to me.

I have two pullets to show for \$37 I have sent him, besides expressage paid, and I did not get any "gold bands," either. Remember if you send Warren your money without seeing the birds, and get served as I did, you neglected your warning. It does no good to lock the stable after the horse is stolen.

Any one who has been similarly treated by Warren, will confer a favor by advising me of it. Trusting that I have not taxed your good nature too much, I remain,

Very truly yours,

F. M. HERRON.

INDIANAPOLIS, IND., July 6th, 1876.

COCHINS AND BRAHMAS

At this season of the year give fanciers a deal of trouble, oftentimes, through their persistent desire to set. In almost any man's yards, this month, where the Brahma or Cochins fowls are kept, the bulk of these mature birds will show broodiness, and adhere to the nests with a pertinacity quite discouraging, frequently.

We are entirely opposed to the numerous cruel devices that are resorted to by impatient or inconsiderate breeders to "break up" the fowls at such a time, who are thus merely following the natural maternal instinct—and ducking in cold water, driving them about, thrusting them to fast in a dark empty barrel, and other foolish modes adopted too often, are simply of no use, and are inhuman, as well.

Let them rest. Put a few glass or wooden eggs under them and let them sit two weeks, quietly. Then break up the nest, and remove them to new quarters. They will thus quickly get over the inclination to brood longer—as a rule—and if placed with a young crower, for a few days, they will give you no further trouble. This is the best mode we have found to break up these late summer-inclined setters.

EDITOR FANCIERS' JOURNAL:

I send you another newspaper cutting, which, in these days, when the centennial is paramount in every song and story, I think is too good to be lost.

E. E. II.

Where, where will be the birds that sing

A hundred years to come?

The flowers that now in beauty spring,

A hundred years to come?

The rosy lip, the lofty brow,

The hearts that beat so gayly now?

O, where will be love's beaming eye,

Joy's pleasant smiles, and sorrow's sigh,

A hundred years to come!

Who'll press for gold this crowded street,

A hundred years to come?

Who tread your church with willing feet,

A hundred years to come?

Pale, trembling age, and fiery youth,

And childhood with its brow of truth—

The rich, the poor, on land and sea;

A hundred years to come!

We all within our graves shall sleep,

A hundred years to come.

No living soul for us will weep

A hundred years to come.

But other men our lands will till,

And other men our streets will fill,

While other birds will sing as gay,

As bright the sunshine as to-day,

A hundred years to come!

SPORTSMAN'S DEPARTMENT.

(For Fanciers' Journal.)

LEAVES FROM THE JOURNAL OF A HUNTER
IN THE ALLEGHANIES.

J. M. M'CANN.

Oct. 24th, 1874.—Started with Hal on a hunting expedition to the mountains. The weather delightful, the trees crowned with more than regal splendor—glorious in emerald, crimson, gold and russet—the crystal streams murmuring musically over shells and pebbles, or falling in a shower of silver over mossy rocks, and gliding away under the arch of the laurel. The mountain scenery grand and beautiful—here the roaring river winds its way around the hills—then glides in silent beauty through the fertile valleys. Cedar and pine reach down their arms and play lovingly with its waters—little islands of reed look out from its bosom,—and the crested kingfisher dips his wings in its waves. In a wild gorge where the foaming river had torn its path through the hills, as the sun was sinking into his couch of waters—trailing glories over cloud and mountain, we saw our first painter. Our horses reared and plunged so that we could not use our rifles, but the animal showed not the slightest sign of fear, only looked at us quietly from under a white umbrella. As he was not a large specimen we did not try to kill him, but rode on up the mountain and passed the night with a veteran hunter, on whose breast the puma had cut his initials, and the bear had done some "picture writing."

Oct. 25th.—Morning cloudy and cold; the only road a bridle-path over the mountains. Met a native clad in homespun, mounted on a miserable looking pony, and provided with an immense pair of saddle-bags—"Doctor or preacher?" asked Hal. Seng-digger, replied I. But on entering into conversation with the "great unknown," we made the discovery that he was indeed a disciple of Æsculapius. On Hal's inquiring where he attended lectures—"Why, you see, boys," he replied, "I don't use none of your strong medicine, I doctors with roots and yarbs." "Doctor," said Hal, "my friend here is interested in the study of anatomy, would you be good enough to tell him in what part of the body is the tendon of Achilles?" The doctor was dumb, and I replied, Hal, doesn't it unite the patella to the humerus?"—"Why in course," said the doctor, as he turned down a path leading to the river. "Oh I see!" Hal shouted after him, "unites the patella to the humerus and is lubricated by the gastric juices.—Man is indeed "fearfully and wonderfully made!" In the evening we entered the beautiful valley of Canayne, high up among the mountains. It is more than twenty miles in length and from two to eight in width, and level as any Texas prairie. Surrounded on every side by lofty mountains, it is an amphitheater in which wild beasts display their strength, their courage, and their cunning. The Black Water flows slowly and silently down the valley, and falls in one unbroken sheet a distance of fifty feet at its southern border. Every thing tells us that here is the bed of a mountain lake whose waters have

escaped to the sea in the distant eld. The streams are full of trout, and parties from the Eastern cities pitch their tents here in summer and enjoy the sport that old Isaac loved. The bark of trees shows the marks of the claws of bear and puma, and the paths of the deer the impress of many feet.

Oct. 28th.—Hal killed a large buck this morning, and in the evening I followed a wild turkey up the mountain until sunset.—Coming down saw a fine gobbler reposing in a hemlock, and interrupted his dreams with a ball from my Henry rifle—murdered him there in his sleep with the drapery of his couch around him. The power of vision in these birds is marvelous, and their sense of hearing wonderfully acute. A deer may crash through the thickets and bound over the laurel, and they are not disturbed—if you only crush a fallen twig under your foot, you see only a metallic glimmer of gold and emerald flashing under the pines, and they are off on flying feet, like the bird of the desert. There are only two known species—*Meleagris gallo-pavo*, and *M. ocellata*, a native of the warmest parts of North America, a smaller but far more beautiful bird than the former. Its plumage rivals that of the peacock in metallic brilliancy; blue, green, bronze, red and golden hues are finely mingled, forming eyes on the tail; whence the specific name. The mode of trapping the wild turkey in the Alleghanies is to build a covered pen, and then commencing a trench some distance away, leading it into the prison. Corn is then drilled along the bottom of the ditch, and the pen covered over with the branches of hemlock or pine. The turkeys gathering up the grain, pass into the pen, and always seeking for an opening at the top, never think of looking down for the aperture by which they entered.

We piled the pine knots on the fire in the hut that night, and told strange stories, while our dogs answered the howl of the gray wolf on the mountain. In the middle of the night when our fire was only a bed of smouldering embers, the dogs became furious, some wild animal no doubt was prowling round our camp.

Arising from our bed of hemlock boughs, rifles in hand, we stepped outside the hut—and there he stood in the pale moonlight—a strange, savage looking creature, six feet from "tip to tip,"—leaning on a rifle longer than himself. He was a hunter from the North Fork, had followed a wounded deer until late, and had lost his reckoning in the darkness. Rude and uncultivated as the bear he hunted, he was nevertheless an interesting companion. He could find his way, he said, anywhere through the forest, by the bark on the trees, that on the north side being thicker than the rest, and covered with moss. The horns of deer differ greatly in size and form in the largest specimens. On some they stand out far and free, and on others they droop low over the eyes—had once killed a ten-tined buck. Saw a huge wild cat once, lying dead in the snow; he had mounted a deer for a ride, but had lost his seat and his life by his steed passing under the trunk of an uprooted pine. Watched a deer lick one night concealed among the foliage of a birch tree that leaned over the water. Soon a painter appeared on the scene, and selecting this very tree as suited to his purpose, commenced to climb it; but becoming alarmed before he could bring his rifle to bear, on it bounded off into the forest, but prowled around all night screaming and lashing the ground with its tail. Had never known but one man to be killed by a Puma—Neice Flanagan of the Otter Den. He wounded it in the laurel thicket on the mountain, when it sprang upon him and tore him to pieces. It was followed by its tracks and blood in the snow, and killed; was a very large male nearly eleven feet in entire length. Several children on Cheat river, straying away into the forest at various times, had been killed, remnants of bloody clothing being found where the Puma held his feast. Thus we talked until long past the "noon of night," and when we awoke next morning the sun had turned the mountain tops to gold, and was throwing long lines of light down the valley. The hunter went

his way, and Hal and I started in different directions, he going up the mountain and I down the river.

We had each a pair of dogs tied to our belts, and it is really marvellous, how when thoroughly trained, they will follow you through the thickest laurel and never get entangled. A deer might come within twenty feet of you and they would not think of giving tongue. Saw several during the morning, but too far away for a shot. They are graceful, beautiful animals, seen in their native wilds, bounding over the laurel, or drinking at the streams—very different from those seen in city parks. After hunting several hours along the Black-Water, I became fatigued and sat down under a pine to rest. Suddenly a low whine from my dogs attracted my attention, and there not fifty yards away, in an opening in the forest, stood the finest buck I ever saw. Noiselessly I raised my rifle, glanced hurriedly along the barrel, and the report rang clear and loud over the water, and died into an echo among the mountains. The deer, free of wounds as a militia Colonel, bounded along the paths of the forest, waving a white plume in the face of the foe, as proudly as ever did Henry of Navarre. How often, thought I, by our excessive eagerness to grasp the prizes, or to enjoy the pleasures of life do we lose them forever! Disgusted by this want of success I returned to camp, and in the evening went trout fishing—caught all I wanted with my hands in the shallow streams. At this season of the year they leave the deeper waters and come into the brooks in shoals.

It was now almost dark and Hal had not come in. I was becoming alarmed, when I heard the faint report of his rifle up the river. I piled on the pine knots, discharged my gun at intervals, and uncoupled my dogs and sent them to him. Nearer and more distinct became the reports of his rifle, and in about an hour he came in. He had become bewildered in the rhododendron thickets, and had lost his way in the gathering gloom. He killed a "spike" duck at the foot of the mountain early in the morning. We had a splendid supper—wild turkey, venison, and trout, with roasted potatoes and bread purchased from the only settler in the valley, living some miles up the river.

Lighting our pipes and seating ourselves before the light wood fire, Hal commenced the conversation with—"you knew Cameron McDonald, Mac, he came to this valley two years ago to hunt, and never returned. It was supposed that he lost his way and was frozen in the snow. Well, to day I found his skeleton lying beside a log on the mountain. Poor Mary Morris always said he would come back, you know, and could never be made to believe that he was dead. It must have been a terrible death—alone on the wild mountain, in the roar of the storm. I knew the gun by the silver deer and golden dogs that had ornamented the stock." All night I heard the groans of the dying hunter, or saw him struggling through the blinding snow.

October 30.—With the assistance of our neighbor we buried the bones of the hunter this morning, under a beautiful pine tree and placed a large stone over his grave, and carved his name upon it with our hunting knives. Though that lone grave on the mountain-summit will be seen by few, yet He who led the chosen children through the walk of the wilderness, may have found here a jewel for his crown.

November 5.—Our neighbor, Mr. Freeland, came down to camp this morning, saying he had a large bear in his trap on the mountain. Hal and I went with him and found an unusually large specimen exerting his strength on the logs of his prison, and foaming with rage. I maddened him with a ball from the Henry through the brain. The black bear is a very powerful and savage animal, a single blow of his paw will crush a man's skull, and his embrace is said to be most affectionate. They are only dormant during exceedingly cold weather when the ground is covered with snow; if the winter is mild and warm and food abundant, they are active all the year.

November 8.—Wounded a fine doe on the mountain this morning. Released Vipe and Vep, and they caught and killed her, after a lively chase of half a mile. Did not tie them, but allowed them to hunt back to camp—soon heard them fighting furiously down by the river, and on going to them found they had just killed a large otter (*Lutra Canadensis*.) Belonging to the *Musteloidae*, the Otter is of aquatic habits, web-footed, and like all the waseel family kills every living animal that it can conquer—even though it does not require it for food. Its principal food is fish, and its fur is valuable and beautiful.

November 16.—Commenced the homeward journey this morning; the sun shining brightly through the flying clouds, though the mountains are covered with snow—cedar and pine are decked with pearls, and the frost gems are sparkling everywhere—beautiful as Sinbad's Valley of Diamonds.

November 19.—Arrived at home this evening, Hal singing his favorite hunting song—

"My heart's in the Highlands, my heart is not here;
My heart's in the Highlands a-chasing the deer;
Chasing the wild deer, and following the roe,
My heart's in the Highlands wherever I go."

NEW YORK, July 9, 1876.

EDITOR JOURNAL:

As there has been said so much lately in your Journal about betting and racing, and as Mr. Thomas Grist did not seem to have been satisfied with my remarks about our Trenton race, and about my remarks also that Newark is not forty, but eighty miles from Philadelphia, which he sustains is right, by meaning Newark on the Baltimore road, while I was ignorant that there was such a town in that direction, as I never heard of any other Newark than the one nine miles from New York in New Jersey.

Mr. Grist also says if my friend Van Opstal is not satisfied with the result of the race of the 6th of May, we are open to fly again for anything he chooses to mention. We will fly our bird 52 miles on the Baltimore road, and he to fly 52 miles on the New York road. This proposition is good enough for Mr. Grist's interest, as he perfectly knows that in such a race, as a general thing, he has the advantage over me. The road to Philadelphia from New York lays in a low country, not far away from the sea coast, and is nearly always hazy or cloudy, while the further you go from Philadelphia towards Baltimore, the further you go away from the sea coast, and the clearer the weather gets. I will not then, let myself be let in an ambush, as the Indians generally do to trap our Union soldiers, but I will be on my guard to fight the battle at least on a square footing.

If I did not answer Mr. Grist's proposition in last number, your readers must not suppose that I was keeping silent on account of being afraid to meet my honorable antagonist; not at all sir; I have made Mr. Grist several propositions since, to fly our match over again, not from the same places though as they flew from

before, as I consider it unjust to fly birds 80 miles apart, as it must always be more favorable for one bird than for another, but I have proposed to fly my bird half way to Philadelphia, and Mr. Grist's bird also half way from Philadelphia to New York, or to fly our birds each 50 miles on the Easton road, or both our birds from Easton, or to fly my bird 10 miles above Philadelphia and Mr. Grist's bird from Baltimore. Although in this last named race our birds would not fly in the same atmosphere, at least I should consider it to be far enough away from the sea coast to have a fair show. I also proposed to fly my bird from Baltimore, and Mr. Grist's bird also from Baltimore, the bird doing the mile in the shortest time to win the race, or Mr. Grist to fly 90 miles above Baltimore, and my bird from Baltimore.

Neither of those races seemed to be agreeable to Mr. Grist, and hence our inability to make a match. I am not willing to fly for any amount Mr. Grist might choose, but for a reasonable sum no matter how small, as I intend to race more for pleasure than for great amounts.

Now, sir, seeing that the prospects for a race were very meagre, I in company with my friend Mr. Waefelaer, of Hoboken, went on from Easton, Pa., towards Scranton. Our birds, seven in number, flew from Tobyhanna, on the Scranton road in fine style, some of them flying the 122 miles in 2 hours 28 minutes, and all seven coming back in a short time thereafter. But our race from Scranton, about 150 miles from New York, came off on the 6th, and our birds, the same seven who flew from Tobyhanna, a few days before, performed a task which if it was not substantiated by positive proofs, would be believed as a mythological dream.

On the morning of said day, our seven birds were set free from the roof of the Morning Republican, at five minutes past nine, and one of my birds, named after the hero of New Orleans, Andrew Jackson, did the herculean task to fly the distance of 150 miles in 140 minutes, which is certainly one of the fastest races ever flown in any country, having arrived at 11.32, New York time, which would make 11.25 Scranton time. I send you herewith the accounts of the race as published in the New York Evening Telegram, and also the account of the Morning Republican of Scranton, Pa.

Yours Respectfully,

JOHN VAN OPSTAL.

THE COURIER OF THE CLOUDS.

TRIAL TRIP OF ANTWERP CARRIER PIGEONS—FROM SCRANTON TO NEW YORK IN TWO HOURS AND TWENTY-SEVEN MINUTES—THE START FROM THE REPUBLICAN OFFICE.

The trial trip of the Antwerp carrier pigeons from this city to New York, yesterday morning, was attended with a good deal of interest and proved eminently satisfactory, the homing qualities of the couriers of the clouds having been demonstrated most successfully.

The birds, seven in number, were released from the Republican building at five minutes past 9 o'clock, in the presence of a large assemblage, who watched their circling flight with an eager interest. The roofs of the adjoining buildings were thronged with spectators, as were also all windows coming in view of the starting point, while Wyoming avenue was filled with persons wishing to catch a glimpse of the aerial *voyagers*. Mr. John M. Robertson, of this city, to whom the birds were consigned on the day previous, assisted by a few friends, marked the several pigeons previous to their flight. Mr. Waefelaer's birds were marked as follows:

Leopold 2d, B; Counte De Flanders, D; Princess Charlotte, F; Duc De Brabant, G; Francois Louis, A. Mr. Van Opstal's birds Jupiter, No. 2, E; Andrew Jackson, C.

A message of 207 words, written on fine tissue paper, was attached to the last named bird, and a briefer *billet* fixed to Mr. Waefelaer's Princess Charlotte. The morning was clear and bright, when the

voyagers were tossed to their journey, a circumstance calculated to aid them materially, as they depend entirely on observation, and not on instinct as so many suppose. The three first tossed up, ascended rapidly, and striking out swiftly in a southerly direction, were soon lost to sight. The other four hovered around the starting place for nearly fifteen minutes, circling higher and higher until they were nearly lost to view, when they too were seen winding their way to the southeast, leaving the spectators to conjecture as to what time they would reach New York, and if they would ever find their way home. At ten minutes past twelve o'clock yesterday noon, Mr. Robertson received the following telegram from Mr. Van Opstal:

NEW YORK, July 5th.—Eleven thirty-two A. M., "C" home with message. JOHN VAN OPSTAL.

This shows that the bird performed the journey, 150 miles, in two hours and twenty-seven minutes, and carried the message of 207 words all right—making about a mile a minute. The second telegram received was from Mr. Waefelaer of Hoboken, who stated that his bird Leopold 2d, marked B, arrived home at 11:55 A. M., making the trip in two hours and fifty minutes.

A telegram received at the Republican office last evening from Mr. Van Opstal of New York stated that Princess Charlotte P. and Duc de Brabant G, belonging to Mr. Waefelaer; and Jupiter No. 2, belonging to Mr. Van Opstal, arrived home at 12:38, and the other two at one o'clock. The success of the fleet-winged voyagers was eagerly inquired after yesterday throughout the city, many of them being of the opinion that some of them would be lost on the way, and the telegrams announcing their arrival home were discussed with as much avidity as though they were announcing the result of some political convention.

PIGEON RACE.

NEW YORK, July 18th, 1876.

MR. EDITOR:

According to arrangement with Mr. Waefelaer of Hoboken, N. J., to fly three matches for one hundred dollars, the bird winning two out of the three to win the stakes, we had our first trial on Saturday last from Scranton, Pa.

In the first trial my bird, Andrew Jackson, won the first race, doing the distance of 149 miles in about three hours.

Andrew Jackson is a small, blue checker cock, which I bred in the spring of last year, out of my imported birds, from Antwerp, and flew only as far as Trenton, N. J., last year.

This year he has been traveling quite lively, as the following will prove.

Newark, Rahway, New Brunswick twice, Trenton, Bristol, Dover and Washington, N. J., twice, Easton, Tobyhanna, and Scranton, Pa., twice.

Our next flight will be to a place between Easton and Lock Haven, and finally from Lock Haven. The last named place must be about 250 miles by rail from New York.

Yours truly,

JOHN VAN OPSTAL.

WALKING FISH.—William W. Wilcox, who has just returned to Middletown, Conn., from California, brought from Sherman, Colorado, on the line of the Rocky Mountains, 8,200 feet above the level of the sea, 2,000 miles, in a tin pail, two fish of a species called by the boys out there the walking fish. It has four legs, which it uses when on land, and its skin is as smooth as an eel's. When in the water, the legs double up, and a ring of fins around the neck stands out like a ruffle and is used by the fish in swimming.—*Evening Post*.

True affection grows stronger as it grows older—the same may be said of an egg.

EDITORIAL DEPARTMENT.

An Australian letter, dated June 2d, contains the following: "About a fortnight since, a party of well-sinkers in search of water in the Darling district, struck a hard substance at a depth of 200 feet from the surface. On digging round it, they found it to be the petrified remains of an aboriginal. Whether pre-adamite, prehistoric, or how they came there, they cannot say; all they know is that they found them in the position stated."

During the recent session of legislature a bill was introduced to encourage the destruction of certain wild animals in Humboldt and Mendocino counties, California.

The first section provides that

\$10	be paid for the scalp of each panther or Cal. lion.
10	" " " " Grizzly bear.
5	" " " " Cinnamon or black bear.
3	" " " " wild-cat—

When by proper oaths and affirmations the justice of the peace has become assured that the animals have been killed within the counties named.

But no bounty is to be paid unless the scalp has both ears attached. And from the bounty, the justice may retain 50 cents as his fee.

CORRESPONDENCE.

INQUIRY.

Will the writer on the Carrier Pigeon signing himself J. H., be so kind as to let us know the distance by rail, from Glasgow, and Ledbury, Herefordshire.

J. VAN OPSTAL.

New York, July 9, 1876.

CORRECTION.

I am just in receipt of your paper No. 26, of July 10th, and see in the account of our race from Tobyhanna, Pa., 122 miles from New York, that I forgot to mention that our birds were set free at 8 o'clock, A. M.

J. VAN OPSTAL.

New York, July 9, 1876.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—A lady in Bedford, N. H., has met a watery grave by being run over by a milk train.

And being in the *Milky way* must now be one of the stars!

—Within a year seven members of the Boston bar have been convicted of various crimes.

"Turn about" is fair play.

—Thirty millions of rabbits are consumed annually in England. That's what they called them; "Hare pie" said Mr. Weller—"is werry good—when they'r not made o' kittens."

—A Mr. E. M. York of Lodi, California, keeps a large patch of mulberry trees for his chickens to run in. The trees, though but three years old, are some ten feet high—and bearing full—furnishing for his poultry both food and shade.

—LOONS CAUGHT WITH FISH HOOKS.—Two loons were recently caught in Lake Winnepesaukee, near the Weirs, on hooks set in forty feet of water, to which depth these strange birds descend in pursuit of food. One magnificent specimen was taken alive, and is now on exhibition at the engine house of Niagara 1, at Lake Village.

—Two pretty girls dressed as nuns, have been collecting money in Baltimore ostensibly for a charitable institution. They used their beauty and adroitness so successfully upon men that a large amount was given to them.

"Beauty and adroitness!"—For fooling men there are *nun-such* powers!

—A REASONING MONKEY.—Mr. Darwin tells a story, as an example of the reasoning powers of a monkey that was scratched by a pet kitten. At first Jocko was immensely amazed. Recovering from his surprise, he set at work to discover the location of the claws. After a severe tussle he got the four feet of the kitten within his clutches, saw the nails thrust from their guards, and with the broadest grin of satisfaction he proceeded deliberately to bite the points off of each one.

—A picture of the British Royal Academy has the inscription;

"Journeys end in lovers' meeting;
Every wise man's son does know."

The London *Times* says, "We earnestly hope that this quotation, with which we candidly confess our unfamiliarity, is not by any famous poet; since logically considered, it is little less than idiotic."

The *Times* is rather hard on one William Shakespeare—supposed by some to be a famous poet—The "idiotic" lines occur in "Twelfth Night" clown's song, Act II.

—One of the strangest coincidences occurred on White street, at midnight of Sunday, June 4th, at the time of the death of James Carrigan.

The upper sash of one of the windows had been lowered to give the patient more air. His daughter, Mrs. Seavey, and Mr. J. L. Lucas, a friend of the family, were both present. Just before midnight, when Mr. Carrigan gave unmistakable signs of sinking, a robin flew in and resting on the lowered sash, gave forth in clearest tones its well-known song; and the moment death claimed its sufferer as its own, the bird flew out into the darkness of the night whence it came.—*Saratogian*.

—In the midst of the eggs of the lobster, there lives an animal of extreme agility, which one author considers the most extraordinary ever subjected to the eyes of a zoologist. "Let us," he says, "imagine a clown in a circus, with his limbs as far dislocated as possible, displaying tricks of strength and agility on a heap of monster cannon balls, which he struggles to surmount; placing one foot formed like an air bubble on one ball, the other foot on another, alternately balancing, and extending his body, folding his limbs on each other, or bending his body upwards like a caterpillar; and then we shall have but an imperfect idea of the attitudes which it assumes, and which it varies incessantly.—*Scientific American*.

—THE WORSHIP OF ANIMALS.—Man in his search after Deity, has given his adoration to almost every living creature—from the mouse to the elephant—from the royal eagle to the golden bee—called upon them in time of danger and trouble, and reared many of his proudest temples in their honor in the olden times. The first pagodas of the Orient were the homes of the sacred insects; birds and reptiles that the people of these strange lands adored.

The hooded snake with its eyes of fire was a god, the hideous crocodile by the golden sand of the Ganges, or the waters of the Nile, a deity loved and honored with the blood of the fairest in the land. Pigs were adored in the isle of Crete, the weasel at Thebes of the hundred gates, rats and mice in Trous, the porcupine in Persia, ants and flies in Thessaly, the eagle in Malabar, the white elephant in Siam, the raven in the Sandwich Islands, the lapwing in Mexico, the stork in Morocco, the bull in Egypt and Benares, the owl in some of the islands of the South Sea—it was the emblem of luxury among the Greeks. In Madura they venerate the ass, and suppose the whole race to be animated by the souls of their nobility. Sometimes they are worshipped here.

J. M. McCANN.

—NEST-BUILDING FISHES.—The *Anabatis* form one of the most remarkable of all species of fishes, owing to their capability of living for a long time out of water, a power which has formed in them some curious habits. The *Ambassis* *searhens*, or climbing

—AN AMBITIOUS DAHLIA.—Mr. John H. Sharer, of Saratoga Springs, is the happy possessor of a dahlia that has now reached the height of six feet three inches, and is still a-growing. It was planted last January, in a quart can, and has never been removed. The greatest diameter of the stalk being not over a quarter of an inch, it rests for support against a frame work, one end of which finds room in the can. The plant has record of one blossom and is developing another.

The growth of this dahlia has been remarkable. In seven days it grew five inches, in fourteen days, eight inches, and in twenty-seven days, twenty-eight and a half inches.

Mr. Sharer is anxious to know "where it has started for, and when it is going to get there."

—THE BLACK BEAR (*Ursus Americanus*).—In the mountainous districts of West Virginia during the summer season, the cattle are allowed to run at large; the only attention they receive from the herdsmen is an occasional salting. These men, living in the wild

perch, of India, has been known to live for six days out of its appropriate element; and some will sometimes quit the water and wander over the land, so far from any stream, or pond, that they were formerly supposed to have dropped from the clouds. The German naturalist Daldorf states that he once saw one of these species which had climbed a tree to a height of five feet; but this is stated by other observers to be an impossibility. This power is due to the peculiar structure of the pharyngeal bones, which, in a cavity in the base of the skull, are dilated into voluminous laminae, forming cells in which a supply of water may be carried for the purpose of keeping the gills moist.

But the gourami's instinct is more peculiar than that of any other member of the tribe. By their united labors, the male and female construct a well built nest, in which the ova are deposited, and which protects the young fry from the thousand enemies by whom infantile fish are pursued and tormented.

The body of the gourami is of a brownish color, varied with some golden tints on its sides; the belly is of a silvery brown. The conformation of the fish is high from its belly to back, and the body is narrow; the head is short, the mouth small and protrusile. The scales large and round. The fish is properly herbivorous, but will eat insects and earth worms; and it is so voracious that, says M. Dabry de Thiersant, the Crocoles of the Mauritius call it the hog of the river.

The gourami, like most other *Anabatis*, is found throughout the East Indies, and is a valuable food fish of delicious flavor, resembling that of the European carp.

Many attempts have been made by the French to acclimatize it on this continent, especially in Cayenne; but little success has been met with. In Algiers, other attempts have been made, and greater encouragement followed. At the Cape of Good Hope and in Australia, the experiments were entirely successful.—*Scientific American*.

mountains near the haunts of the Bear, the Puma, and the Deer, have fine opportunities of observing their habits; and I have passed many a pleasant evening in lonely mountain cabins, listening to their anecdotes of these animals. As all these men are hunters, as well as herdsmen, they often "find themselves the hero of the story." One of these men told me he was once out on the mountains looking for cattle that had strayed away from the "range," when he came suddenly upon a large bear and two cubs. They all took to flight, but one of the young ones fell considerably behind the others, when the old one came back, caught it up in her arms and spanked it just as a mother would a child. He says that the scene was so strangely human that he laughed immoderately, and made no effort to use his rifle. The cub when released ran with great rapidity, and soon all were concealed in the laurel thickets. Hunters frequently enter caves known to be occupied by bears. They are provided with a burning pine torch, and armed with hunting knife and rifle. When they see the bear they endeavor to kill it instantly by a bullet through the brain. I saw a hunter who had been frightfully mutilated by a bear into whose den he had penetrated. His light went out, and Bruin becoming alarmed, attempted to escape from the cave, which he could only do by passing directly over the hunter's body. The aperture was too small to allow him a ready exit, and the man was fearfully mangled and torn before the bear succeeded in forcing a passage over him.

When the chestnut fruit is ripe, the bears ascend the trees and bend the limbs toward them until the bears are within their reach, then pull them off and throw them to the ground; there they afterwards collect them into piles, break open the burs and feed upon the nuts.

They also rob the wild bees of their honey, and are sublimely indifferent to the venom of their stings.

J. M. McCANN.

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending July 10, 1876.

- 5 Daubenton's Curassows (*Craz daubentoni*).
 - 7 Trumpeters (*Psophia crepitans*).
 - 12 Love-birds (*Agapornis pullaria*).
 - 1 Gallinule (*Gallinula*).
 - 2 Red-breasted Guans (*Penelope pileata*).
 - 4 Greey's Guans (*P. greeyi*).
 - 3 Parrakeets.
 - 1 Dove.
 - 3 Finches.
 - 1 Troupin.
 - 1 Crow-Blackbird (*Quiscalus purpureces*).
 - 1 Marmoset (*Hypale jachus*).
 - 2 Macaque monkeys (*Macacus cynomolgus*).
 - 2 Pig-tailed monkeys (*M. menestrinus*). Purchased.
 - 1 Screech Owl (*Scops asio*).
 - 1 Red-bellied Terrapin (*Enys rubriostris*). Presented.
 - 2 Gray Foxes (*Vulpes virginianus*). Presented by A. R. McHenry, Jr., Philadelphia.
- For the week ending July 16th, 1876.
- 8 Burrowing Owls (*Athene cucularia*).
 - 3 Swift Foxes (*Vulpes velox*).
 - 2 Whip Snakes (*Masticophis flavigularis*). Purchased.
 - 2 Prairie Wolves (*Canis latrans*). Presented by Chas. Noble, Phila.
 - 1 Young Alligator (*A. Mississippiensis*). Presented by John Schneider, Phila.
 - 2 Rattlesnakes (*Crotalus durissus*). Presented by S. W. Hudson, Hudsonale, Pa.
 - 1 Bittern (*Botaurus lentiginos*). Presented by R. McClinton, Philadelphia.

ZOO NOTES NO. 25.

THE SKUNK.—(*Mephitis Mephitis*.)

The Skunks in the Philadelphia Zoological Garden comprise but a single family. Perhaps the reader will think one quite enough; or even one too many. The visitor, however, will find the entire family harmless, and quite safe to be acquainted with, the glands, from which such a terribly offensive effluvia can be ejected, having been removed from each and every one.

America, with its many other points of greatness, is the only country which can boast of a skunk! No other continent has a genuine one. The Zorilla of Africa, and the Mydaus of the glands of Asia, though claimed as skunks, are now conceded by all naturalists as belonging to other and distinct genera.

Besides the common skunk which will form the subject of the present "note," there is the white backed skunk, *Mephitis Meso-leuca*, which is found in the regions about Hudson's Bay—the Texas skunk, and the Californian resembling one another very much, and inhabiting the same tract of country. [The Texas skunk, by the way, is the animal about which Audubon, in his "Quadrupeds of North America," gives us such an amusing story—much more amusing to us is the adventure than it was to him, I think.] Lastly, there is the pretty little Zorilla (*M. Bicolor*) the handsomest of the genus, which is also found in Texas and California. These are the only skunks found in the United States. Mexico has four varieties, Peru, Chili, and the more southern portions of South America boast about as many more. Return we now to our skunks of the Zoo.

This species is widely distributed through the states—is most abundant in the northern and middle, but may be found from 57° N. to Florida and Louisiana, and W. to the Mississippi river; and is probably the most notoriously detested quadruped that ever set foot on the continent of North America.

Intensely offensive as he is, "*Mephitis Mephitis*" or the common skunk, is quite a handsome beast nevertheless—standing no higher on his pins than a good sized cat. He is about 17 inches in length, with a tail 12 inches long, tipped with white. Black he is in color with a narrow line of white on his forehead, a broad triangular patch of white on his neck, and a continuous fine white line on each side of his spine. This description, however, will not do for all of the same family even, for there will be found considerable variation in the marking of each. When the parents happen to be marked exactly alike, their offspring will be of the same pattern, but if there be a diversity of pattern in the parents then their offspring seem to be marked all sorts; the white marks being very prominent in some, while they will be quite wanting in others.

Mother skunk is a very prolific animal; she will present her spouse with from four to eight at a birth—indeed as many as fifteen skunks have been found in one burrow. To his hole in the ground the skunk retires when winter sets in; he does not lay up any food, but being in excellent condition at the time he stows himself away, he lives on his own fat, dozes out his life till the warm sun of spring calls him forth, much like the genuine hibernators, though he is not classed among them. Cleanly in his person and habits is Sir Mephitis, never soiling his delicate fur with his offensive effluvia any more than the rattle snake poisons himself by his own venom. Properly skinned, his flesh is no way tainted by his secretion, and proves delightful to the taste of the red-man and even to the white, in many parts of our far distant land.

The fearfully offensive oil-glands, two in number, are situated at the base of the tail, and from those the animal can eject the offensive liquid with a force sufficient to hit an enemy ten yards distant. When the Indian wants to cook and eat his skunk, he takes his carcass to a running stream of water, and under the surface he dissects the glands and skins him—the water washes all offenses away, and your skunk is ready for the roast.

It is lucky for the perfumer's trade that his skill in essences has not, as yet, attained the powers of concocting a perfume equal in persistence to that secreted in the oil glands of the skunk. If such were the case the sale of one vial would supply you or me, my dear Pacific, a whole life time. A handkerchief odorized with any scent so permanent would resist the combined powers of soda, Babbitt, and Sam Ling's Chinese Laundry as long as the good Belfast threads would hold together. The trap in which the skunk has been caught, the clothing which the cat-worm wore, and which received the skunk's special attention have been buried deep in the earth for weeks but in vain—in vain all other remedies—No,

Bury, or wash, or rub as you will,

The scent of the skunk will cling to you still.

The habits of the skunk are strictly nocturnal, hence you will seldom see him to good advantage in the Zoo, unless you happen to be in the garden after, or at least, near dusk.

A more predatory, thievish, treacherous, blood thirsty poacher, you could not scare up, than is the skunk. His home, which is built with an eye to murder, consists of a horizontal hole, always dug near a pond or still pool of water, and if you will take a glance at his powerful claws which seem to have been given him for the special purpose, you can see how easy it is for him to establish such a homestead. A well worn path down to the water's edge, marks this hole, the entrance to which is usually strewn with ducks' feathers, tips of wings, heads, beaks, and feet of fowls, together with a good collection of well picked bones. Ducks are the skunk's sweet morsel.

"How does he catch them?"

Why my dear madame—in this way—I have told you that he has his home near a pond or pool, and that he placed it there with an eye to murder, kill, and devour. He knows that on that pond the water birds come to pass the night. During the day he lies asleep in his burrow, but when the shades of night have come down, and all is quiet around, and the unsuspecting birds are floating on the water, with their heads beneath their wings, then out from his hole in the ground steals crafty Sir Mephitis, and noiselessly creeps he down his well beaten path to the water's edge. Does he dive? does he go in with a splash? not he. As smooth as would a pound of butter, or a link of sausage glides he in, and in perfect silence skims he towards the sleeping birds, marks a plump one for his own, seizes it by the breast and in spite of all the flapping, quacking, and struggling, draws his victim to the bank where it is killed and eaten without salt, remorse, fear, or any other seasoning. Seldom can he get more than one of a night (which is quite enough you think, but suppose he has a wife and thirteen little ones to look after?) for the other birds on the pond take warning and flee to some safer place—"To be caught by some other skunk?"—Perhaps, such is nature's law.

"But he cannot always get water fowl! what is he going to do then?"

Well, my dear Pacific, he is not going to starve. Not he. He will visit your habitation, and he will enter your barn, if you have one. If its doors are all fast, he will creep under it, and perhaps be rewarded by a nest full of eggs which one of your hens laid there when she stole away—if he don't succeed on the first night he will mark your hen-roost and come again the next night, when both hens, eggs and chickens may suffer. Indeed, it is upon record how one of the poaching rascals entered a cellar one night where the "help" found him, and thinking him, she said, "nuthin'" but a black cat she made war upon him and became the victor, as she killed him, but poor girl, another such victory might have killed her, for so great was the stench created by the "pesky varmint," as she called it, that she was violently sick for more than a week afterward, while everything in the cellar, bread, meat, vegetables, and all kinds of provisions were entirely spoiled!

"Is the secretion so powerful and disagreeable as all that?"

Yes, Madame. Mix the scent of the worst mud taken from the city docks (San Francisco, or Philadelphia), at dead low water, on one of our last hot July days—Thermometer 104°—with the refuse and smell of the gas-works—a bone boiling furnace, a knacker's yard, a tallow-trying house, and a carrier's shop—mix them I say altogether, and I will venture to assert that the resulting odor produced would be as the "attar of roses," or that other special perfume of yours, my dear young lady, (which makes your presence remind one of the gardens of the Hesperides), compared to that abominable effluvia the special property of the skunk.

I have often wondered why this terribly offensive secretion was given to any animal. Nearly every book on Natural History tells us that it is a protection against its enemies. I think not. The badger has no such weapon, nor the pine-marten, the weasel, the ermine, or the fisher, and yet they all live in the same localities, feed in the same robber fashion and have exactly the same enemies to contend with, yet none of these are armed in that fearfully offensive manner! No, it must be for some other than defensive purposes. What if it was for doctor's stuff? Let us see, what place it fills in the *Materia Medica*. Asthma first, then hysterics and several other nervous disorders. It is not pleasant medicine dear reader, and if you must take "skunk," take it through your nose. I once heard of a man who took three drops liquid, through the mouth; he was benefited, but he was for days and days such a nuisance to the entire household, his friends and himself, that he declared he would sooner die than become so offensive again. The remedy was worse than the disease.

"Then beyond the filthy medicine it furnishes, you have not a single good word for the skunk?"

O yes; I have several. It is very fond of its young, and always takes very good care of them. It possesses considerable courage, and yet does not intrude upon mankind unless driven to do so by hunger. Keep out of his way, and his skunkship will do you no personal injury—and finally—of what skin, Halchen mio, was that beautiful set of furs which, during the cold days of last winter, both adorned and kept your graceful person warm?

"Why, of pine-marten to be sure." Yes; that's what your furrier called it, but it was skunk, my dear young lady, and let me tell you that many thousands of skunk skins are yearly manufactured into "sets," and sold as "mink," "marten," "sable," or under any other name the dealers may choose to impose upon you. By cutting out the white stripes and re-joining the black fur, these handsome "sets" are made. The furrier says he has managed to get clear of all unpleasant scents, but you know, by experience, that you must never venture to keep your "set" on, not even for a moment, if you can help it, in a warm room, for the perfume it then and there gives out, you find is not quite as refreshing as that which is wafted from "India's coral strand," the "bower of roses on Bendemeer's stream," or the groves of "Araby blessed."

In some future "Zoo Note," I may give a short history of the fur-bearing animals now in the Zoo Garden, that is, if Fanciers' space will allow, and your patience, kind reader, is not exhausted.

HUON.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for Exchange only, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"To exchange for cash" or "for rabbits," "wants a purchase," or "wants an offer," etc., etc., cannot under any circumstances be admitted to the Exchange or Want column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

E. G. FLANDERS & CO., Manchester, N. H., have to exchange two horse pistols, for Brown Leghorns, or offers. Speak quick. Write on Postal card, or any other kind of cards.

W. DICKEL, Reading, Pa., will exchange one Buck and two Does, of Himalayan Rabbits, for a first-class Yellow or Dun Carrier cock or hen.

DR. REINHARDT, 64 E. Eager St., Baltimore, Md., has an old "Cremona Violin," worth five hundred dollars, which he will exchange for offer—at a much less figure, and will give as reference, as to its value and condition, the best violinists of Baltimore.

LOCK BOB 1556, Hornellsville, N. Y., will exchange one fine red and white Setter Slut, 11 months old, and one jet black English Setter Slut, 2 months old, for game fowls or fancy pigeons, or other property.

H. B. GIBSON, 55 West Fourth St., Cincinnati, Ohio, offers to exchange a fine Black and Tan bitch, 11 months old, and weighs but 2 pounds and 2 ounces, for a full blooded Water Spaniel. Must be liver, or liver and white, or solid black.

LEGHORN, care of "Fanciers' Journal," Hartford, Ct., has Brown Leghorn fowls or chicks to exchange for Black Breasted Red Games, fowls or chicks.

JNO. F. HOUSEH, Tanquepa, Pa., will exchange 1 pair D. Brahms, 3 tripe P. Cochins, 7 Light Brahma hens—all 74 and 75 hatch, and very fine large birds, for thorough-bred pigs.

M. HART, Room 23 Seaton House, Washington, D. C., will exchange one pair Pee fowl, cock two and hen three years old, for W. C. B. or G. S. Polands, Partridge Cochins, or Sebright Bantams, or offers. Stock must be good, as mine are. Write.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

THE AMERICAN KENNEL AND SPORTING FIELD—by Arnold Burgess. T. D. Adams, Franklin, Pa., wants the above and Cooper's Game Fowl, for G. S. Hanburs, Black Spanish, B. B. R. Game hens, Imperial Egg Food, and Home Cook Shellers.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

LEGHORN, care of Fan-iers' Journal, wants an offer for 15 Brown Leghorns Cockerels—large and small. Speak quick!

SPEAK GENTLY.

Speak gently! It is better far
To rule by love than fear—
Speak gently—Let not harsh words mar
The good we might do here!

Speak gently! Love doth whi-per low
The vows that true hearts bind;
And gently Friendship's accents flow;
Affection's voice is kind.

Speak gently to the little child!
Its love be sure to gain;
Teach it in accents soft and mild—
It may not long remain.

Speak gently to the young, for they
Will have enough to bear—
Pass through this life as best they may
'Tis full of anxious care!

Speak gently to the aged one,
Grieve not the careworn heart;
The sands of life are nearly run,
Let such in peace depart.

Speak gently, kindly, to the poor,
Let no harsh tone be heard;
They have enough they must endure,
Without an unkind word!

Speak gently to the erring—know
They may have toiled in vain;
Perchance unkindness made them so;
Oh, win them back again!

Speak gently! He who gave his life
To bend man's stubborn will,
When elements were in fierce strife,
Said to them, "Peace, be still."

Speak gently!—'tis a little thing
Dropped in the heart's deep well;
The good, the joy, which it may bring,
Eternity shall tell.

DAVID BATES.

THE DISPLAY OF AQUARIA AT THE CENTENNIAL.

Among the many attractive displays is that of the Department of Aquaria on the west side of the Agricultural building. It is in charge of Prof. Fred. Mather, who is thoroughly posted in fish culture, and it has been arranged not only for the interest of the fish-breeder, but for the gratification of the people and the study of the naturalist. The display is contained in thirty-five large tanks and aquaria, one tank alone being twenty-three feet long by seven wide and four deep. They are divided into three classes—those for salt water specimens, those for fresh water, and the third for cold water fish. To supply salt water, a tank, capable of holding some ten thousand gallons, has been built outside the building, and water brought from the Atlantic by way of the Camden and Atlantic Railroad. Fresh water, of course, is plentiful, but to keep cold water fishes properly, the water before reaching the aquaria passes through a coil of lead pipe packed in a box of ice.

The specimens of fish include not only the edible but other speci-

mens, and some of them quite singular looking. The water in the tanks, etc., is kept properly replenished by means of a small steam engine, while several of the aquaria contain plants in such quantities as to preserve a perfect adjustment of the relations between the animal and vegetable kingdom, so that there is no need of replenishing the water.

The collection of fish is not quite complete, but will be in a short time. The British Commission have despatched a large tank to Bermuda to bring back some of the curious fishes and corals found there. Among them will be angel sharks, brainstones, madrepores, and other corals, etc. A tank has also been sent to the Atlantic coast, and will return with specimens of sharks and other sea-water fish. Beside these it is expected shortly to have a specimen of a cat-fish weighing over one hundred pounds, and other fish from the Mississippi basin, to be furnished by Messrs. J. W. Peters & Co., of St. Louis, while the local (Delaware) fishes will be furnished by Mr. Rutan, of Gloucester.

Later in the season the hatching process will be illustrated, when trout and salmon begin to spawn. Several of the forcing machines are already on exhibition.

Among the specimens now on exhibition is an aquarium containing about a dozen crabs, and the creatures seem to skip around as if there were no cares nor Centennials in the world. Then come specimens of the big king crab, or horse foot, so called from its resemblance to the horse's hoof. Its movements can be easily seen through the glass, and its habits well studied.

After these come numerous specimens of terrapin, one aquarium alone containing about twenty-five, who from their lazy movements seem to take the world easy. In the largest tank are kept a number of green turtles, the heaviest weighing over three hundred pounds—an immense fellow, with a big thick head, and long, wide flappers. In the line of toad-fish there are about a dozen specimens. They are curious enough looking and yet seem just as contented at the Centennial as when taken from their homes.

Of the fresh water eels, some very fine specimens are shown; also, of lakesheepshead or fresh water drum, and rock bass. Then come specimens of Graylings in large numbers from Michigan, and Oswego bass or Southern chub.

Perhaps the most curious-looking creature is a specimen of the hell-bender, an ugly, repulsive-looking establishment belonging to the family of salamandridæ. The one on exhibition is about twelve or fifteen inches long and has no sternum. The ribs are rudimentary, the legs or fins are four in number, with four fingers each. The salamandridæ have wonderful recuperative powers. The limbs may be removed and in less than a year they will grow again.

There are shown long-finned chub-suckers, black gill sun-fish, large black bass and moon eye fish or lake herring. In one aquarium are gathered hundreds of small specimens of California salmon, the eggs of which were sent from California to the United States Commissioner and hatched at Marietta, in Pennsylvania.

In addition to those named, there will soon be exhibited specimens of sturgeon; also trout from the great lakes, and a lot of fresh water fish, to be furnished by the Ohio and Michigan Fish Commissioners. An assistant of the Aquaria Department of the Exhibition is now in Ohio in connection with the matter.

Prof. Mather also has in charge a number of bottles containing the spawn of shad, young lobsters, and a number of specimens of fresh water insects injurious to fish culture.

The exhibit already attracts large numbers of visitors, and when it is completed it will be one of the most interesting features of the Agricultural Building.

POULTRY DEPARTMENT.

(For Fanciers' Journal.)

AWARDING PRIZES.

No. 4.

PARKER'S LANDING, Pa, July 20th, 1876.

FRIEND WADE:

Those articles which I have written on judging and awarding premiums, have had the effect of calling out several of our best fanciers in private letters to me, some suggesting a slight modification—which I shall herein notice—but all commending the course I have taken. There is no doubt but that a little reformation is needed, and by the aid of those most interested in the matter, we will certainly accomplish all that is necessary. But it will not be done if we do not see to it in time, and I notice so far as I have heard that all societies are making arrangements with A. P. A. judges to judge their shows. This is a step in the right direction, and one that will lend confidence to exhibitors, for they will have a guarantee that the work will be done right when the judge has his reputation at stake. And I would say to all societies, whether poultry exclusively, or agricultural societies, where poultry is to be exhibited, let nothing but A. P. A. judges be appointed, and you will give better satisfaction to all concerned.

Now I will notice one or two suggestions made to me by the correspondents before mentioned. One suggests that three premiums are not enough for such shows as Boston, Buffalo, Chicago and Pittsburgh. I grant that these four places may be exceptions and perhaps more than three will be necessary. Again the same writer says: "Suppose the three best pairs—or birds, as the case may be—all score over 90 points, and there are still several that score over 85 points; what will you do with them?" I will tell you. When I fixed 90, 85 and 80 as the points above which I would award the three premiums, I had several things to consider. In the first place perfection, or 100 points, is what we are all aiming at, and the Light Brahma cock, that three years ago would score 90 points, will not score 80 now, and consequently is not as near perfection as a 90 point bird of 1876. In other words we are improving our stock, and the standard must consequently come up with our ideas. Again, 90 points is deserving of a first premium now, but I hope will not be in 1878, and when that time comes we can raise the standard to 95 for first premium. But we will never have to raise it to 100, as nature never makes anything perfect, not in domestic poultry at least. As an instance that 90 points is high enough, I might cite the case of the National show at Chicago, where the first premium, Lt. Brahma cock only scored 88—I believe. And if, as my correspondent suggested, all three premium birds or pairs should score over 90 points, and still there should be more left scoring over 85, I should be happy to think we were making such rapid strides toward perfection, and say to the owners of the 85 point birds "go on in your good work, try, try again, and next year may be you can reach 95 instead of 85, and make some one else take a back seat." Therefore the gentleman's argument does not

affect my position, as mine are *short stakes* set to go as *far beyond* as breeders can, but below which they *must not fall* and expect honors.

My reasons, as I have before stated, for writing these articles is to fix as it were a *standard of values*, that is to make first premium mean 90 points or more, second premium 85 points or over, and so on. So that when John Smith advertises first premium stock the world will know that his stock is first premium stock—i. e.—it scored over 90 points. This is my sole object and I think by advocating it I am trying to improve the poultry business and make it *what it really is*, one of the greatest industries of our country. Swindles are perpetrated every day—if I may believe the statements I see in poultry journals, and those made in letters which I receive—and many of them are caused by advertisers stating their stock as first and special premium. Let me just here give you an instance of a friend's investment of \$3 for 26 first-premium Lt. Brahma eggs—12 chicks—one black as a raven, two white as snow, nine hocks, four single combs, one wry tail, one five toes, and three almost without hackle. A happy family certainly, and one that made my friend *cock* poultry, poultry men, and himself. Yet the counterpart of this can be found almost in every county in the country. This kind of thing is what makes the complaints we hear about, and this is what places the poultry business in the repute it is held in by many, and can we blame people that have been thus used? Scarcely, and yet blaming a fraternity for the actions of the individual, is like blaming a church or secret society for the short comings of a member, and is the exception instead of the rule.

But let us weed out the exceptions, and in this Centennial year let us inaugurate some new rules that will single it out in the future from other years. I predict for all poultry societies a better list of entries with better stock, and better patronage than ever before, and in return for this increase, let them make some improvements that will recommend them to the public patronage. And I tell you again, nothing will go so far towards this as appointing good and responsible A. P. A. judges and scoring all birds, placing the score cards on the coops that all may see how and when the judge found material for the decision he has given. There is more in this than most people imagine, for exhibitors who know their business when selecting birds for a show take the standard of excellence in their hand, and pick out the birds they mean to show by its teachings. Now if they do this and take their birds and pay their money, is it fair to them to put in some *comparison* judge that can only see feathers on the legs, a good comb or hackle, or tail, or dead weight to the detriment of all other qualities combined. I tell you it is not fair, and you cannot do *justice*, not to say, give *satisfaction* by such work, and we must have a reformation in this matter to meet the demands of the times.

JAMES M. LAMMING.

A LACK OF POULTRY LITERATURE.

Whereas, There is at the present time, no work on poultry, of a late issue, to meet the wants and needs of the great mass of breeders and fanciers, that is at the same time within the means of a man of ordinary purse.

Whereas, In the present hard times, in which dollars are likened unto cart-wheels, a man with only the usual number of wheels can not afford to purchase "Wright's Illustrated," and yet feels the need of a work nearly, or quite as explicit, but not as expensive.

Resolved, That the times demand that some good friend of the "chicken man" ought to give us a publication of that kind. Now we would not refer to the numerous poultry journals in the country when we mention "a lack of poultry literature" for surely we have enough of them, full as many as fanciers are able, or willing to heartily, and substantially support, but we do need

a work on domestic poultry—not to begin back to the days of Adam, or even to date back as far as the Flood—but something for the present generation. Let us have something that does not represent the exclusive ideas of one single man, but rather let us have a complete encyclopedia of poultry—their breeding, management, &c., of the different varieties. Let it be gotten up, if need be, in a cheap, popular style, a work that the masses could afford to purchase, and we predict that it would meet with a large sale. If need be, let some publisher of repute, procure sound, substantial articles from breeders well-known as fanciers of long experience and sound sense, on the specialties with which they are familiar, the breeds that they “*know*” and can write about understandingly, and if properly edited, it would make a valuable work that would find its way into the hands of every fancier.

HOSEA.

HOW TO MAKE IT PAY.

Not a few engage in the rearing of fine fowls from pure love of such pets, and a desire to improve them, and others combine these qualities with a desire to make them, profitable. If, my friend, you combine the first two traits, the last will be sure to follow, and in that way, and that only, can you “*make it pay*.” In starting out with a new variety, do not scan the columns of your poultry paper to see who offers that variety for the smallest possible consideration, or who will send you a nest of eggs for half the price for which reliable breeders can afford to dispose of them, but rather ascertain by careful inquiry where the very best birds, or eggs, can be found of the variety you are in want of. At the same time prepare yourself with a careful and distinct knowledge of the particular variety you wish to try, and then by care in breeding and mating your stock you may make your mark in the poultry fraternity of our country. If managed properly, and above all *commenced right*, it *DOES PAY*. Do not try to do too much with too little room, and less means. Do not over crowd. Remember “*cleanliness is next to godliness*,” and it equally applies to your hennery, your parlor, or your person. Do not expect too much. Too many are led to believe that by a system of mathematics they are to make their investments in fowls pay 200 to 1000 per cent. They are led away by the “*clap-traps*” of many would-be poultry men, who see a fortune in figures, but who never live to possess one.

One word to fanciers. In my travels among poultry men, generally about the first question I am asked is, “*Does it pay you to advertise*?” Yes, *IT DOES PAY ME*. Careful, judicious advertising will pay under any circumstances. It is my rule in business, and I am largely engaged in mercantile pursuits, though I always devote a portion of every day to recreation, and that recreation I take in caring for my poultry) to carefully compute my business each month and devote a certain per cent. of the month's receipts to defray advertising expenses of the month ensuing. In my poultry business I devote ten per cent. of each month's receipts to advertising. For instance, my sales for one month this year were upwards of five hundred dollars, and at the end of the month the publishers, *my friends*, were just as sure of their ten per cent. (fifty dollars) as though it had been paid to them. By this means I have progressed thus far, and *MY MARK* is yet a long way ahead. It is a rule in my business not to patronize a man who does not advertise. I am afraid to do it, for an advertiser has a reputation to protect. The extent and growth of advertising proves its popularity. I never knew a man who tried it faithfully to refuse to repeat it or ever discontinue it. Steady, uniform, and persistent advertising benefits every business man under any and all circumstances. Breed well, feed well, care well, love well, advertise well, you must and will succeed.—*E. exchange.*

(For Fanciers' Journal.)

*THE DUCK QUESTION.—NO. 2.

BY J. Y. DICKNELL.

The highest authorities in ornithology claim that all the varieties of domestic ducks have a common origin in the wild Mallard. This question we feel neither able nor anxious to discuss, but shall dwell on such facts as we consider of most importance. No class of domestic fowls stands higher with us than ducks. They require little room by comparison, are easily kept, and if properly fed, free from tendency to disease. A stream of water or a pond is generally considered indispensable to their success; but, although with proper care either is of advantage, neither is a necessity. With those who desire to keep ducks the only question is “*have you room for them?*” If you have a small yard you can keep one pair, and the number may be increased according to the size of your range. If they have their liberty and have access to a stream or pond a large number may be kept. In such a case the breeding stock should have their liberty, and when laying, fed *only once* a day, and that at night, when they will invariably return for their evening meal, and can be housed and the eggs, which are deposited at about daybreak, can be secured. *Never over-feed*. If they have access to streams and marshy fields where natural food abounds, very little other food is required. Better not feed at all in this case, than feed too much, for they easily put on fat and become unfertile. Always give them their liberty as early in the morning as possible, for then is their best time to procure food. In case the number of eggs is not equal to the number of ducks, each duck should be caught and an external examination of the lower part of the body by carefully passing upward where the perfect egg should be, will show whether the egg is there or not. All that is minus the eggs should be let out, and the others retained till they have laid. While ducks are furnishing eggs, when they are moulting and *especially* when they are confined in yards, the principal amount of food furnished them should be cooked mush, the same as will be recommended hereafter for ducklings. Insect or animal food is of vast importance to both ducks and ducklings. If this is furnished them in the shape of refuse meat, worms, or insects, it will increase the supply of eggs in the former and produce astonishing growth in the latter.

If the above rules are observed, success may be expected whether water is abundant or not. Domestic ducks do not pair off like wild ones, and only one kind can be kept on the same run without danger of crossing. It is not safe to keep two kinds within a mile of each other on the same stream, unless some obstruction will prevent them from coming together. If a neighbor keeps mongrel or common ducks, furnish him with a drake like your own, or you will be in danger. A very low fence is all that is required to keep them within bounds, for, although they are great foragers, they are clumsy and not inclined to scale a fence if only two feet in height.

We never allow more than from two to four ducks with one drake, yet we are not certain but that twice that number may be safely given him, never having risked it.

To be continued.

(For Fanciers' Journal.)

RAMBLES IN NEW ENGLAND.

BY OUR STAFF CORRESPONDENT.

During the past few weeks business has called us into many of the great centres of chickendom in New England, and we are pleased to note the genial warmth and hospitality with which we are received by the “*men who raise chickens*” in every part of the country. By the way, speaking of raising chickens, we recent-

* Absence from home, and procrastination on account of other business, are the causes of delay since our first.

ly called on our friend Rogers, at Wethersfield, Conn. We found him putting his original ideas into practice—for on a small yard not forty feet square, he had over five hundred Light Brahma chicks of all ages, from five days to five months old—in perfect health—rearing them by his new method—taking them from the hen when forty-eight hours old—and placing them in his “artificial mothers,” and as they grow larger, changing them into coops of greater size; rearing them, and successfully too, in these confined quarters until they are large enough to use for broilers, or at the age of three or four months to turn out with the full grown fowls. Mr. Rogers’ theory is, that they *thrive better in confinement* than if allowed to run at large; of course he provides every possible variety of food for them—green grass and vegetables, chopped meat and bones—and everything the appetite of a chicken could wish. When we were shown his yard of early chickens, *two hundred* in a coop ten feet square, and a yard only a trifle larger, with its “five story feeding trough” (a curiosity of itself) built with a platform in front of a long trough, or feed box, and one above the other so that the whole two hundred chickens could eat at one time, and not get into each others way, or crowd away the weak ones. We really thought he was practically demonstrating that his theory was a decided success. Mr. Rogers is quite an inventor, having brought out many well-known agricultural implements that have been in use for years. We left him with an impression on our mind that his idea if carried out as he does it, with the same amount of time and attention, the same rigid adherence to order and cleanliness, might under similar circumstances be made equally successful.

In our travels about the country we are led to believe that the interest in improved fowls is steadily growing. On every side we find that farmers as well as fanciers are giving more attention to it, and this season are raising a much larger number of chickens than in any previous year. We are pleased to note this steady improvement, and healthy growth; it indicates that the poultry journals of the country are doing their allotted duty in educating the people in this most pleasant of out door occupations.

We note the fact that new societies are being formed in every section, and there are very few large towns that has not their local “Poultry Club.” The present indications are that the coming exhibition season is to be a very successful one. Fanciers generally throughout the country have been very successful in securing fine early chickens, and are already selecting the would-be prize-winners for Buffalo, Boston, Hartford, and other large shows to be held the coming season.

One word to those who have choice fowls to dispose of, and yet do not find a ready sale. The cause is easily ascertained: **THEY DO NOT ADVERTISE.** We meet parties every day who say, “our sales are few,” why? Their advertising is confined to some local paper, or “half and half” agricultural sheet. If you wish to *increase sales*, patronize those papers devoted to *your specialties*, and in doing so, remember the FANCIERS’ JOURNAL.

NON-SITTERS.

ANSWER TO JOHNNIE RET.

Our non-sitters are varieties of fowls that seldom or never show any inclination to sit. For instance, we may have yards containing from ten to twenty fowls each of non-sitters, viz.: Hamburgs, Leghorns, Polands, Spanish, and the French breeds, and it is only occasionally that one will become broody. Some yards may have from one to half a dozen during the season, and others none. I find occasionally a broody one in every variety of non-sitters from a Hamburg to a Houdan, and that is no evidence of impurity or that any cross has been introduced. We have had uncommon warm weather here this season and I find more broody non-sitters than ever before. Perhaps warm weather has some

effect on them. I am sure I have more of an inclination to *sit* (in the shade) when the thermometer runs from eight to ten above 90 than at other times.

I never dare trust one of these fowls with a clutch of eggs, for, although she *may* prove to be a good mother, she is more likely to quit her nest prematurely and apt to be nervous and a very poor mother. J. Y. B.

A PREVALENT DISEASE AMONG POULTRY.

I have just been reading some interesting articles in “The Feathered World”* (*Die Gefiederte Welt*), and take the liberty to send you a translation of some communications on a disease which has given serious trouble to many breeders in our own land. I apprehend that what the German writers here call disease of the eyes (*Augenkrankheit*) is the same as, or similar to, what we call roup. I will send you the first and last of these communications only, as the others are not specially important. The first appeared in “The Feathered World” of Sept. 16th, and is as follows:

SICKNESS IN THE POULTRY YARD.

FROM F. ESSMANN.

In my yards, which are stocked with some what valuable fowls, there has lately appeared a disease which was previously unknown to me, and by which I have suffered considerable loss. It appears as follows:

At first the fowl is attacked by a catarrhal cold, the nostrils become closed, then loss of appetite and weakness ensues, accompanied by a rattling in the throat. In the mean time the eyes have become much swollen, generally closing so as to entirely exclude the light, and when this stage of the disease is reached the fowl soon dies. At first I feared that some good neighbor had a hand in this play, or that the sickness had entered my yard by a Bantam cock which I had recently bought, and which died soon after. But after having guarded the rest of my fowls from any possibility of being tampered with, and, in warm rooms, protected them from all liability to sudden colds, I still find that the trouble has not abated, but rather increased.

Can you in any way inform me as to the origin of this disease, or its remedy? Unless I can receive some aid, I fear the loss of my whole stock.

The editor of “The Feathered World” called the attention of its readers to this article, and in some following numbers, a few answers were given; but none which threw sufficient light on the subject to warrant my sending them to you. In mean time, Herr Essmann had been treating his fowls by the advice of a friend, with what success, his next communication, appearing in “The Feathered World” of November 11th, will show.

THE DISEASE OF THE EYES IN POULTRY.

BY F. ESSMANN.

Please allow me to give you more in detail the progress of the disease among my fowls. The sickness is that described in “Oettel’s Poultry Yard,” as disease of the eyes. Immediately after the appearance of my former communication in your paper, an apothecary in Newstadt, C. Guedcke, was so kind as to send me several preparations for its cure, consisting of oil, salve, and pills. Of the oil, each patient received a tea-spoonful daily; the salve was used for anointing the nostrils and eyes, and the pills were given to the worst fowls every day. The latter appeared to be chiefly intended to work upon the digestion. Besides this treatment, the fowls received plenty of grain, chiefly barley, and fresh water several times a day. In the course of eight days,

* “Die Gefiederte Welt” is a weekly paper published in Berlin, by Dr. Carl Russ, and devoted to the interests of breeding and sailing poultry, birds, and other pet stock.

I was able to allow five of my diseased hens to run at liberty; in fourteen days the evil had nearly all disappeared, and now all my fowls are in as good condition as before. I wish further to add that during all this time, I kept the sick birds apart from the well ones.

To this letter was appended the following article by the editor of "The Feathered World."

In consideration of the fact that this disease to which our notice has been called appears only too often in our poultry yards, we give here the following account of it, with remedies, taken from Oettel's noted work.

"The disease of the eyes is a new and unpleasant phenomenon entirely unknown until within the past few years. It originates chiefly in taking a sudden cold, changed water, and damp or musty food. At first, a light white foam appears within the eyelids, which daily increases in consistency; then the parts around the eye become much swollen, the lids are closed, frequently ulcerated and discharge a thick matter. All the juices of the body are now drawn to this center, the consequences of which are emaciation and death. According to homeopathic treatment, simple aconite is given with good results, and the earlier the better. As an external remedy, white salve of zinc* may be used at the same time by rubbing it into the eyes and nostrils. A weak solution of white vitrol (Schwefelsaurem Zinkoxyd) is also a good wash, especially if applied at an early stage of the disease.

Besides these, the following is well recommended: After thoroughly cleansing the swollen eyes with fresh water (soft water is the best), use a solution of *culpri sulfurici* 0.05. *Aqua destill.* 25.0. This is applied to the edges of the eyelids with a small brush, and also a little is dropped into the eyes and allowed to operate for a few minutes, when they are well washed out again with pure water. A poultry breeder of much experience in France recommends the following, which he has found effective in nearly every case, whether applied in earlier or later stages of the disease:

White vitriol, - - - -	1 gramme.†
Opium (tinct. opii. spl.), - - - -	2 "
Blue vitriol, - - - -	0.50 "
Quince and rose water, - - - -	30 "
Camphor water, - - - -	15 "

And where solid matter was formed in the bill or throat:

Honey of roses, - - - -	30 gramm.
Mauriate, - - - -	4 drops.
Pulverized borax, - - - -	1 gramm.

Still another simple remedy is:

30.0 <i>Aqua destill.</i>
0.06 <i>Argent. nitr.</i>

Quite recently an experienced pigeon breeder has recommended herring pickle, one tea-spoonful every other day. This he has given to pigeons afflicted with a similar disease, with the best results. Fowls would probably need the same, given every day and in larger doses."

I hope if any of my readers have fowls troubled with this disease they will make a trial of some of these remedies offered in Oettel's work referred to as authority by Dr. Russ, and communicate to you the results. I confess that the medical terminology in the above article is somewhat frightful to those unacquainted with it, but I think that any skillful apothecary would gladly come to their relief, if applied to. The Latin terminology I have allowed to stand as in the original article, only translating German names, which would sound somewhat strange to most of our dealers in medicines.

Very truly yours,

W. G. TODD,

Poultry Review.

* Zinc-salve, probably what is called, in English nomenclature, butter of zinc.

† The French gramme is equal to 15.4325 grains troy

(For *Fanciers' Journal*.)

MORE ABOUT PRIZE AWARDS.

JULY 21, 1876.

MR. J. M. WADE:

DEAR SIR:—I wish to add my mite to the already strong effort that is being made for reform in the number of prizes offered by our poultry societies, and the manner of awarding them. I quite agree with you when you say that three prizes in each class at our poultry shows are sufficient; indeed, in my opinion, two prizes in each class at some of the smaller shows are all that should be awarded, unless there are more good birds shown than is generally the case. There are, no doubt, many exhibitors who would rather carry home a third premium, or even high commendation, than receive no notice whatever, but I fail to find anyone who is benefited by receiving a third or lower prize. We do not find in our poultry periodicals any advertisements of third premium owls, and in these days of great rivalry between amateur as well as professional breeders, there are few who are willing to purchase a third premium bird when first or second premium stock may be had for a very little more money; and the purchaser of eggs for hatching will, in all cases, send his orders to the owners, or *advertisers*, of first premium stock, when the prices charged are the same, and they generally are.

We need reform in the manner of awarding prizes. The revised Standard has some defects, but nevertheless it is the best guide breeders have ever had, and if we all try to follow it we ought to have our birds judged conscientiously by it, and our progress honestly reported. It is also necessary that the judging of fowls at our shows should be done with as much uniformity as possible, to the end that winning a premium should mean the same thing in one section that it does elsewhere. The truth is, that in many shows prizes are altogether too cheap, and to illustrate this point I will give a bit of my experience:

Early this season I had need of a cock for one of my yards, having lost a very good stock bird, and I corresponded with several advertisers of "first premium" fowls of the breed in which I am the most interested. One party offered to sell me a cock which had won second prize at —, second prize at —, and first prize at —, &c. I was of course tempted by this grand display, especially when I found that the published reports of those shows tallied with my correspondent's statement. I next inquired how many points the bird scored, and the reply opened my eyes some: "I do not know *exactly*, but he figured *about* 70 points." I had a cockerel in my own yard at the time that would crawl a good deal further up the scale than that, but he was not good enough to suit me, and I did not want to breed from him, neither did I, yet here was a man advertising "first premium" stock, and no doubt selling eggs from it, whose first premium bird scored "about 70 points." It seems to me that no bird should be awarded first, second, or third premium, unless it figures 80, 85, or 80 points respectively. It might sometimes happen, if this rule was put in operation, that the winners of all three prizes would score more than 90 points each, with, perhaps, only a point's difference between any two. Or, the specimens shown in a class might be so poor that no bird could be found to score 80 points. In the latter case, of course, no premium would be awarded, and it would be far better for a society to keep its premiums, than to throw them away on fowls that cannot score 80 points.

The old system of scoring by the Standard, and awarding prizes by comparison, is vicious, and it fills some yards with first premium birds when they do not merit the distinction. By adopting a single rule, any poultry association can make a premium awarded at one of its shows mean something more than a heading for an advertisement, and a snare for the inexperienced purchaser of fowls, or eggs for hatching.

Yours truly,

FANWOOD.

THE EXHIBITION DORKING.—NO. 11.

BY T. C. BURNELL.

The Dark Dorking Hen should be similar in shape to the cock, with a square, broad, and lengthy body set on short legs. The comb, if single, should be large and falling to one side, a small upright comb being a great eyesore. By some it was thought impossible to breed cocks with upright combs from hens whose combs fell over, but this fallacy was contradicted by Mr. Hewitt in the *Journal of Horticulture* for June, 1867, and I copy his notes, which will be interesting and instructive to many. Mr. Hewitt says:—"In giving my opinion as to the formation of the comb of a Grey Dorking hen, I quite agree that the comb should be of moderate size, well serrated, and hanging over the face on one side. The theory propounded of breeding from what is commonly known as a 'prick-combed' Grey Dorking hen has been again and again attempted, but I never yet knew a single individual who persisted in the experiment a second year, for disappointment was the invariable issue, and the chickens thus produced proved utterly useless for exhibition. Anyone purposing to breed Dorkings I would strongly advise to mate together a cock having a perfectly upright comb with hens whose combs fold and then turn over the face, it matters not on which side. He will then find, if well-bred stock birds, that all his chickens will have combs exactly of the same formation as the parent birds. In Spanish fowls the same rule again holds good. It is only great age or want of health and condition that will cause the combs of either Spanish or Dorking cocks to fall over if they are truly-bred birds. In the latter case it very frequently happens that restored constitution causes the comb to become again as exact and firmly fixed as ever. The different formation of the comb is in the breeds referred to simply characteristic of sex, as in the mane of a lion or the antlers of a buck."

As regards the color of a Dark Dorking hen a good deal of latitude is allowed, provided the general appearance of the bird is of a rich dark color. Whatever a few may say to the contrary, it is impossible to ignore the fact that the old Brown and Light Grey birds do not now meet with favor either from judges or exhibitors; partly owing to the fact that the Dark hens handle the best from being more tightly feathered, and partly because they present a more attractive appearance to the eye. My taste inclines in the hen to a jet-black neck hackle and tail, the back and wings being of a dark gray color, and each feather spangled at the ends with a darker marking, the shaft of each feather being distinctly white.

This latter feature is invariably found in all good Dorking hens, and adds very much to the general appearance by contrasting with the dark feathers. With a black hackle I like to see a salmon-colored breast, but the hackle is often striped with white, and the breast color may be of any tinge from light salmon to dark chocolate, as long as it does not present a washed-out appearance.

Color is far more difficult to obtain than size. The latter may be obtained by good and judicious feeding and breeding from large-sized birds not too nearly related; but nothing will bring color unless it is in the strain. Beginners are apt to think that all they have to do is to buy a couple of good hens and a highly-commended cockerel at a large show, and to breed from them; but this will nine times out of ten end in failure, unless the cock comes from a good strain; as, no matter how dark and good the hens are, if the cock be not also bred from dark-colored birds it is impossible to say what the chickens will turn out. Before buying a cockerel to breed from, I like to see what the stock hens of the yard are like. It is very bad policy to take the show birds as a sample, as these have very likely been bred by some one else. Though the darker-colored cocks as a rule are most likely to breed dark chickens, this is by no means a certainty, and we shall never know

what our chickens are to be like unless we know for certain that the cock comes of a good strain.

The principal defects to avoid in a Dark Dorking hen, in addition to what I have alluded to when speaking of the cock, are upright comb and "sooty" feet, the latter being much commoner in the hens than in the cocks, as also are white earlobes. A red or rusty color on the wings is also to be avoided.

Dorking eggs are white and unusually large. The chickens when hatched are very pretty, and should be uniform in appearance, with a broad dark band down the center of the back, and with two narrow white stripes on each side of it. As a rule the little chickens with the broad band of color down the back of a sound dark tinge are more likely to make dark chickens; and even from the very best birds it will be futile to expect more than two or three in a brood to reach the required standard of shape, size, comb, color, and feet, while not one bird in a thousand is perfect in every respect.

The best of rearing a number of Dorking chickens is, that the "wasters"—birds which can never pass muster—are at the very best for the table when at about ten weeks old, and should then weigh from 2½ to 3 lbs. each. I constantly weigh my chickens, and find that cockerels at two months old should weigh from 2½ to 2½ lbs. if they are ever to be the heroes of a show pen. At four and a half months old 7 lbs. is a fair weight, and at six months many weigh 9 lbs., and some 10 lbs. I, of course, allude to show specimens; but a cock weighing 10 lbs., if dark and perfect, is likely to win many prizes, as is a hen of 8½ lbs. These weights are mentioned only for the sake of comparison, and birds may generally be made 2 or 3 lbs. heavier by fattening; but this would be worse than useless, as birds now are never weighed, and it is frame and bone which carry the day.

It is impossible to give a standard of points of any real use, as judges will always differ as to the amount to be allowed for condition, nor will they agree as to the relative value of shape, size, and color; but the following scale gives my own idea on the subject. Allowing one hundred marks for a bird perfect in size and every fancy point, I would deduct the following marks for the following defects:—

Want of shape,	- - -	from 5 to 25 points.
Want of size,	- - -	" 5 to 25 "
Bad color,	- - -	" 5 to 15 "
Badly-formed feet and toes,	- - -	" 2 to 15 "
Defective comb in hen,	- - -	" 1 to 5 "
Defective comb in cock,	- - -	" 2 to 10 "
Sooty feet,	- - -	" 2 to 15 "
Slight bumle foot,	- - -	" 10 to 20 "
Spur rather outside (cock),	- - -	" 15 to 20 "
Absence of white shaft from the hen's feathers,	- - -	" 5 to 10 "
Want of condition,	- - -	" 15 to 25 "
White ear lobe,	- - -	" 1 to 3 "

All deformities, bad bumle feet, spurs right outside, and very dark feet are fatal disqualifications, and I think badly-crooked breastbones should be so too.

A perfect and complete marriage is, perhaps, as rare as perfect personal beauty. Men and women are married fractionally, now a small fraction, then a large fraction. Very few are married totally, and they are only after some forty or fifty years of gradual approach and experiment. Such a long and sweet fruit is a complete marriage that it needs a very long summer to ripen in, and then a long winter to mellow and season in. But a really happy marriage of love and judgment between a noble man and woman is one of the things so very handsome that if the sun were, as the Greek poets fabled, a god, he might stop the world in order to feast his eyes with such a spectacle.—*Theodore Parker.*

PIGEON DEPARTMENT.

DESPATCHES BY CARRIER PIGEON.

THE BIRD ANDREW JACKSON MAKES 149 MILES IN TWO HOURS AND THIRTY-TWO MINUTES.

A preliminary trial of speed between carrier pigeons was commenced to-day (July 6th) from Scranton, Pa., in view of the great contest which is to take place this month, within a distance of 190 miles from this city. Scranton is 149 miles from this city. The first pigeon, Andrew Jackson, arrived here at 11.32 A. M., having left Scranton at nine o'clock. The following statement tells its own story:—

Special Despatch by Carrier Pigeon to the Telegram.

OFFICE OF THE REPUBLICAN,
SCRANTON, Pa., July 6, 1876. }

A thrilling affair occurred at Dunmore, a short distance from this city, on the morning of the Fourth, when a young woman named Jennie Dorman, eighteen years of age, was blown to death at the mouth of a cannon with which her brother, a small boy, was celebrating the day. The lad filled the weapon with a heavy charge of powder, broken bricks, pieces of tin, &c., and just as he touched a match to it his sister happened to pass in front of it, and received the entire charge in the side. The charge produced a ghastly wound, exposing the unfortunate girl's entrails. She lingered in great agony for three hours, when death relieved her of her suffering.

J. E. BARRETT.

This dispatch was sent by a carrier-pigeon named "Andrew Jackson," belonging to Mr. Van Opstal, of No. 4 Lewis street, of New York, who transmitted it at once to the Telegram. Mr. Van Opstal's bird was released with the message at nine o'clock this morning from the tower of the Republican building in company with five other birds of the Antwerp breed, belonging to Mr. Waefelaer, of Hoboken, N. J.—N. Y. Telegram.

JOTTINGS.

INSTINCT OF YOUNG PIGEONS.

Sometimes when a young pigeon gets old enough to feel an inclination to mate, he may be observed picking up sticks and straws, holding his head back as he tries to get a firmer hold of one, and perhaps, even flying with it from the ground to the roof, or from the floor of the loft to a roost, where, after apparently playing with it for a moment, he drops it. His actions are similar to those of a bird who is building a nest, though he has no use whatever for his burden but to drop it. This is almost comical, and is interesting as being an act prompted by instinct, and of the utmost importance when usually practiced, but of no use in certain individual instances. A hen scratching a board for worms, is another example. It would seem as if there were a connection between the desire for a mate and family, and the act of picking up sticks, and shows that the act itself is gratifying to the bird.

TOBACCO-STEMS AS A REMEDY FOR VERMIN.

Some one has recommended that tobacco-stems be provided for pigeons to use in building their nests. The suggestion is not a

new one, and I believe I half-tried them a few years ago. But this year, after some of my young birds had become very lousey, I threw into the loft tobacco-stems cut into pieces four or five inches in length. They were immediately made use of by the pigeons, and the result was, that, though there may be lice upon the old birds and about the loft, none of the nestlings have appeared to be in the least annoyed. I advise all to try it whose lofts are infested.

P. B.

SHIFTING YOUNG PIGEONS.

JOS. M. WADE:

DEAR SIR.—I will relate an incident that I think is not common among fanciers. I have a pair of Blue wing Turbits that I prize very highly, and in my absence from home they left the loft and built their nest in the crib, being there exposed to danger in various ways, with no place in the loft that I could shift the eggs. I put them under a Turtle dove that had built on an apple tree in my orchard, and threw their (the doves') eggs away. They sat on them twelve days, and one egg hatched, the other was added. The young bird grew very nicely till it was six days old, then it began to require more food than the doves gave it. Not wishing to lose it, I then took it to the loft and placed it under a pair of black barbs that had been sitting on eggs two weeks, and by shifting it is doing finely.

JNO. W. WAMPLER.

ITEMS.

Some one asked the elder Dumas for his autograph. "My autograph!" he cried; "you can find plenty of them floating about in the shape of notes, and you will know that they are genuine by their being all protested."

RED INK.—The following recipe for a beautiful red ink is given by Metra, of Paris: Dissolve 25 parts, by weight, of saffranin in 500 parts warm glycerine, then stir in carefully 500 parts alcohol and an equal quantity of acetic acid. It is then diluted with 9,000 parts water, in which is dissolved a little gum arabic.—*Scientific American*.

ONE of the boy reformers, in a speech a few evenings since, made this remark: "I have three good reasons for keeping the pledge not to use tobacco: First because I am to have \$5 at the end of the year; second because I have pledged myself not to use it, and third—the strongest motive of all—because I'll get a whipping if I don't keep it!" It is unnecessary to say that the speech was applauded.

"EDDYKASHUN.—Jake was heard calling across the fence to his neighbor's son, a colored youth who goes to school at the Atlanta colored university:

"Look hyar, boy, you goes ter school, don't yer?"

"Yes, sir," replied the boy.

"Gitin' eddykashun aint yer?"

"Yes, sir."

"Larnin' rithmetick and figgerin' on a slate, eh?"

"Yes, sir."

"Well, it don't take two whole days to make a hour, do it?"

"W'y, no!" exclaimed the boy.

"You was gwine ter bring dat hatchit back in an hour warn't ye?"

"Yes, sir."

"An' it's been two days sence yer borrowed it. Now what good's eddykashun gwine to do you thick-skulled niggers when yer go to school a whole year and den can't tell how long it takes to fotch back a hatchit."

EDITORIAL DEPARTMENT.

ADVERTISING.

We recently reduced our advertising rates to ten cents per line, each insertion, and we trust that with the opening of the fall season, to see our advertising columns well filled. We are repeatedly assured by our patrons that in no other way do they reap so great a benefit as they do in the use of the columns of the FANCIERS' JOURNAL. We are gratified to know this, and intend to make it in the future doubly so.

We make no extravagant assertions, but are willing the past should speak for itself. Our advertising columns during the busy season, show who the "live men" of the fancy are; and our "exchange columns," clearly prove that this, too, is a popular means of advertising at a very low rate. We have recently added a "book exchange," where for the trifling sum of ten cents anybody can exchange any book he has, or secure any book he may wish to, and "all for ten cents."

We are in daily receipt of letters from every part of the country, mentioning the unusual good success that Fanciers have experienced this season in getting out fine flocks of chickens. We predict that they will be heard from during the coming exhibition season, and that a greater number of really meritorious birds will be shown than in any previous year. A large number of early broods have been successfully reared, and these birds are now in such a state of maturity as to render it an easy matter to select a few extra choice ones, on which to expend a little care in further developing them for the show pen. Fanciers who give their time and personal attention to it will surely be well repaid, and every appearance now indicates that new life and energy is to be infused into the business (or rather pleasure) of raising fine fowls and improving them.

CORRESPONDENCE.

IRISH SETTERS.

CENTREVILLE, Q. A. Co., Md.,
July 20th, 1876.

DEAR SIR:—Will you do me the favor to give the information I am about to request. I wish to know if you can give me any authority of a true Irish setter being black. I have a dog of that color, which was represented to me as being of the Irish strain; it has been suggested to me that I am deceived, on account of the color.

H. D. G.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—The steamer Bessemer, built with the view of preventing seasickness, has proven a gigantic failure. It has been purchased by an iron merchant of Leeds, who will take out the engines and "dispose of the rest of the vessel"—for "old iron," we presume.

Considering what a vast sum of money it cost to build this vessel, its fate is indeed ignominious. As a naval architect, Bessemer is not a success.

—GLASS COVERED LEAD.—The Chinese are masters of a process which so far as we know, is not practised by any other people, for covering plates of sheet lead with thin layers of colored glass.

With these sheets the domes and sides of their temples are plated, giving them a singularly lustrous and gorgeous appearance. Specimens of this glass-covered lead are in the hands of French manufacturers, who hope to discover the secret of the process.

—THE WEAVER BIRD'S NEST.—This pretty creature thus contrives to elude its enemy, the squirrel: It weaves its nest of hay, closely entwined, and in form like a steeple hive, with many winding passages, round the various mouths of which are formed pent-houses, or rims, to carry off the rain. This structure is suspended by a thread so slender that the squirrel, how ever wistfully he may gaze on his prey within, dare not put his nose into it for fear of a tumble, while at the same time, the little bird pops in and out, perfectly secure.

The compensations of nature show reason. It is not reason in the brute creation. It must be the reason of the Creator.

—A PUZZLED PIKE.—In the great aquarium at Brighton, England, a pike was introduced among the trout and other fish. At first its behavior was quiet and commendable, but after a while the discovery was made that it had a great fondness for the trout—such an extreme liking, indeed, that it did not hesitate to chase, catch and eat them. Various plans were tried to stop the havoc it made, all of which failing, a plate glass partition was inserted in the aquarium between it and the trout. The trout watched its former companion swimming around on the other side of the glass, and darting at them with great velocity, succeeded in bumping its nose violently against the thick plate. Evidently wondering what was the matter, it repeated the experiment several times, until, convinced that there must be something wrong, it reluctantly ceased its efforts.

—A CANARY BIRD SAVES A HOUSE FROM FIRE.—A few nights since, Mrs. George Bockius, Little Britain, Lancaster county, was awakened by unusually loud screams and cries from her canary bird, whose cage hung in the kitchen. Arousing her husband they both listened for a few moments when a noise was heard as of the fall of the cage to the floor and Mr. Bockius hastened down stairs. On arriving at the kitchen he found the room on fire, the flames having spread around the ceiling and burned off the string that secured the bird cage. By the application of water Mr. Bockius succeeded in subduing the fire which is supposed to have originated from a lingering spark from the previous day's ironing fire, lodged somewhere about the ironed clothing. Considerable clothing was destroyed. The house was undoubtedly saved from destruction by the expiring cry of the pet bird.—*Oxford Press*.

—A PARADISE FOR LOVERS OF FISH.—St. Augustine, Florida, the oldest city in the United States, is remarkable for the variety and beauty of its fish. Every description of salt water fish is caught there, from the Jew fish, which supplies the place of our Northern halibut, and the grouper, like our cod, to the whirray, with a body like a flounder and a tail seven feet long, tapering from an inch in diameter to less than an eighth at the small end. The mutton or hog fish is a delicate, fine-grained fish, and is considered the best fish for boiling; in weight it runs from five to twenty-five pounds. The grouper is generally used for baking, stewing or chowders. The dolphin, king fish, Spanish mackerel, bonito and rock-fish are the largest, running from fifty to one hundred pounds. The Jew is cut into steaks and fried like halibut, and in weight often reaches 600 pounds. Turtles are caught weighing as much as 500 pounds, the price being generally five to six cents per pound.—*American Grocer*.

—A discovery, the importance of which cannot at present be fully estimated, was made a few weeks since, on the river bank, not far below the city. Deposits of native mercury were found and the fact communicated to Dr. Armand Mercier, President of the Athenaeum, who appointed a commission to make an investigation of the matter. This commission is still at work and has not yet rendered a report of their proceedings. Deposits of the metal in its globular form have been detected in St. James and St.

Charles parishes, noticeably on the Drouet plantation in the latter parish, and in every instance, both in the clayey soil of the river bank and in the interior, only a few feet below the surface.

These developments have led to the belief that mercury exists in large quantities in the State, and its collection and purification may become an important branch of industry. Loam containing mercury may be worked to advantage when the percentage amounts to three or four pounds per ton.

Although the metal is usually found in the shales of the Silurian period, and in talose and argillaceous slates, it is frequently obtained from alluvial deposits, as in the case of Huancavelica, in Peru, where it has been found to the amount of 600 pounds in digging a ditch six feet in depth, and in the tertiary marls and conglomerates, as at Montpellier, France.

The metal has a high value in medicine and the arts, and where it is gathered in a native form the operations of purification are comparatively simple.—*N. O. Picague, June 24, 1876.*

—**WHAT A SPIDER TAUGHT THE BRUCE**—Robert Bruce, the hero king of Scotland, wearied by the toils of many battles, and disheartened by disaster and defeat, lay one night in the barn of a loyal cottager.

In the morning, his head still reclining on the pillow of straw, he beheld a spider climbing up a beam of the roof. It fell to the ground, but immediately re-commenced the ascent. The hero becoming interested in the movements of the insect, observed it attentively.

Again and again it fell to the floor, only to renew its attempts immediately after each succeeding failure. Twelve times the insect was baffled in its endeavor, but the thirteenth trial was crowned with success. The king starting from his couch exclaimed, "This poor insect has taught me perseverance! I will imitate its example; have I not been twelve times defeated by the enemies of my country? On one fight more hangs the independence of Scotland." In a few days the thirteenth trial was made; it was the glorious battle of Bannockburn. The thistle had saved Scotland from the Dane, the spider from the English.

J. M. McCANN.

—**STORY OF A ROBIN.**—Pretty stories are told of robins. The following, from *Our Dumb Animals*, is true, and shows how little robins are trained and educated to fly:

The poor little robin looked so miserable and helpless that, out of pure compassion, we bought the bird, and put it into a cage to keep it out of the way of cats, intending, so soon as it should be able to fly, to let it loose. It was just able to hop about. It ate a little, but seemed drooping and melancholy, and no doubt missed the diet of worms which its parents had hitherto provided for it. After we had had it two or three days, the cage was placed outside upon the terrace, with the door open, and we watched to see what Robby would do; but, almost before he had time to do anything, a large robin lit upon the terrace at some distance from the cage, and then advanced cautiously towards it. The little one presently hopped out, and then the old one began to fly a very short distance, waiting for the little one to come up with it, and then starting again for another short fly.

Robby improved perceptibly after a few attempts. We supposed that that was the last we should see of him, but when after noon came, he returned to his cage and the old bird departed. The following day the cage was again placed outside; the old robin made his appearance and gave Robby another lesson in rather longer flights, but he was not able to get as high as the boughs of the trees, and he returned to his cage in the afternoon. The next day, and the next, the same thing occurred, the flights becoming longer and bolder. At last one bright day, Robby's education being completed, I suppose, he flew away.

—**PARAFFIN AS A MANURE AND INSECTICIDE.**—An interesting discovery has been made by a Scotch farmer, which promises to be of immense importance to agriculturists and horticulturists generally. During some attempts to destroy various pests of the garden, the gentleman in question, who records his experiences in a Scotch paper, hit upon petroleum or paraffin with the following valuable results. Finding his peas and beans, when sown, devoured by rat and mice, he soaked the seed, prior to planting, in paraffin, and was rewarded by seeing them untouched by the vermin and uninjured by the novel treatment; on the contrary, every pea and bean germinated, and the crop was enormous. Stakes five ft. and six ft. high were insufficient to support the abundant growth, and other measures had to be adopted to keep up the plants. Onions and turnips were secured against the attacks of maggot and fly by watering between the rows with a mixture of two ounces of paraffin to six gallons of water. This had the effect of destroying and keeping off these destructive pests, and at the same time

of greatly stimulating the growth of the roots, the quality and quantity of which were immensely increased by this treatment.

The writer suggests that paraffin might be mixed with dry earth and subsequently sprinkled over the soil, as guano, which would render its application more easy on a large scale than by watering with a diluted mixture of oil and water. Its fertilizing properties, he thinks, would be found to be equally well developed, and its uses as a destroyer of insects, beetles, wireworm, rats and mice, and other pests would be just as great. For watering plants affected with blight, or vines with phylloxera, and similar purposes, a very weak solution should be used, and will be found perfectly effectual.

To protect seeds about to be sown it is simply necessary to soak them for twelve hours in paraffin; they are not injured by the oil, and the flavor and smell imparted to them are such as to effectually prevent birds as well as animals and insects from touching them.

The proportion of two wineglassfuls of paraffin to six gallons of water is recommended for application as a manure to green vegetables of all kinds. Onions and carrots should be watered with it when one inch long.

How flowers are affected we are not told. I shall certainly make some experiments in this direction, and see if such beneficial effects cannot be secured in the rearing of plants. There seems no reason why this should not be the case. For the present I will quote the following instance of the effects of the manure on peas: "A friend tells me that, hearing of my experiment, he sowed four rows of peas, in contiguous rows; before sowing the seed, he divided it, sprinkling one half with paraffin oil, and soaking the other part for a night in paraffin oil, when those that were sprinkled grew to 15 in. high, the soaked peas were 4 ft. in height."

—C. E. F. In the Country.

—**THE CRUELTY TO ANIMALS BILL.**—According to the "British Medical Journal," the following important memorandum has been prepared by some of our most competent authorities with reference to Clause 5 of the Cruelty to Animals Bill now before Parliament, by which cats and dogs are exempt from experiments: 1. Cats and dogs are the only flesh-eating, warm-blooded animals available for the purposes of experiment in England. Agreeing in this respect with man, these animals (and especially the dog) resemble him also in the functions of digestion, assimilation, secretion, and generally in the chemical processes of life. For instance, inhalation of carbonic oxide produces diabetes in the dog, but has no such effect on the rabbit. Again, the bile in the dog differs in composition from that in vegetable feeders; and without experiments on this animal it is useless to attempt to extend our knowledge of the action of the liver by direct observation, so as to apply it to human physiology and medicine. Moreover, the brain in cats and dogs is constructed on the same (convoluted) type as in man. This is not the case with rabbits and guinea pigs, the only other small mammals which can be readily procured. 2. Morbid processes in cats and dogs resemble those of man far more closely than do those of rabbits or any other animal available for experiment. Thus: 1. Tuberculosis is so readily excited in rodents that experiments with a view to the prevention or cure of this disease must be made on other animals, by way of check, before application to the case of man. 2. Cancer, on the other hand, unknown in many animals, is common in dogs, and upon their observations and experiments must be made, with a view to ascertaining its true nature and treatment both in dogs and in men. 3. The process of fever is excited with difficulty in many animals; but in cats and dogs it is easily produced, and closely resembles the same process in man in its relation to temperature, circulation, &c. 4. Hydrophobia must be studied in dogs and cats, with a view to its prevention in these animals, and so removing this terrible disease from the list of human maladies. 5. The same remark applies to various parasitic diseases—cutaneous eruptions (favus and ringworm), and internal parasites (hydatids and tapeworms), which are transmitted from dogs or cats to other domestic animals, and to man himself. The experiments by which the connection between tapeworms and bladder worms was established, and so the means of preventing these diseases in man ascertained, depended entirely on the possibility of performing them on dogs. 3. Cats and dogs are necessary for many experiments on the action of remedies and poisons. Belladonna can be eaten by rabbits with impunity; opium has little effect on pigeons; and morphia has a very different effect in rabbits and in frogs from that which it has in man. In these and many other cases cats and dogs approach much more closely to man in their susceptibility to drugs. 4. Chloroform and chloral act efficiently, and for an almost indefinite time, on cats; and although chloroform is apt to be fatal when fully given to dogs, they take other exceedingly well.

PETS AND THE FATE OF SOME OF THEM.

BY HUON.

NO. 5. THE DOG.

He that has nature in him must be grateful;
'Tis the Creator's primary great law,
That links the chain of beings to each other."

It has been said somewhere in these papers that the pet loving characteristic is shared by individuals of other races than man. A story has been told of a horse becoming so attached to a stable-cat as to be restless and uneasy during pussy's absence! The house dog has been known to become on quite friendly, and even *loving* terms with Tabby the cat, and a modern naturalist has found in an ant's nest some well cared-for beetles which latter he tries to make us believe were the *pets* of the former! Perhaps, but may not the beetles be scavengers? Or may not the ants, like men, be superstitious, and, as with the ancient Egyptians, venerate and worship a colopopterous insect? Be it how it may, I will leave the matter with my readers, and beg their patience while I relate the fate of a Dog who was the pet of a Lion.

Twenty-five years ago there was a menagerie on Walnut St., near Ninth St., Philadelphia. The collection of animals was very large and valuable. Among other objects of interest there, were the two Elephants, Virginus and Pizarro, who were, a season or two later drowned in their keeper's endeavor to make them swim across the Delaware river. There also was the Lion "Julius," the finest specimen of the African species at that time in the country.* There too was a dog, and this is how the lion made a pet of him as well as made an end of him.

One dark, cold, November morning an under-keeper on opening a door found on the outside of it, rolled up like a ball, the most miserable looking specimen of dog hood he had ever set eyes upon—a poor shivering, starving cur that hardly resembled any animal, whatever. The keeper's first impulse was to toss the cur into the street; his second was to hand it over to the tender mercies of some lion, tiger, or wild-cat, and finally into the cage of the terrible Julius it went. Now Julius had done his share of "contrived murder." Having killed one keeper in Europe, and another one here, it was supposed he would make quick work of doggy. Not so! He merely smelt of him by way of finding out what the thing was, and for a time took no further notice of him; after several hours had passed away, the keeper finding the dog still safe, concluded he was in no more danger than Daniel was when with the lions in the Zoo of Darius the Mede, in the good old city of Babylon! It was noticed indeed, that the tail of Julius now and then as time wore on, wagged an apparent welcome to the dog. It seemed a case of "love at first sight," and that Julius had taken him to his heart as a pet, which appeared the more probable when feeding time came round. Then it was noticed that the

* JULIUS had been raised from a whelp as a pet of one of the small Princes of Africa, from whom he was purchased for Mr. Jamrach, animal dealer, of London, who sold him to a showman who had him trained for cage performances, in his traveling menagerie.

One of his "cage performances" was, while in Edinburgh, to tear his keeper into shreds before any one could interfere in the poor man's behalf! The next we hear of Julius he was a member of Van Amburg's travelling troupe, and in due time was performing in Philadelphia.

About 1860 he was the property of Adam Forepaugh, and was again shown in Philadelphia, when one day his traitor very foolishly undertook to put his head in the animal's mouth. The brute did not seem to care about that kind of work, and refused to open his mouth, when the trainer gave him a heavy slap in the face. Julius opened his mouth now, but he was very angry, and when the daring keeper had inserted his head between the brute's ponderous jaws they closed on it with a force that crushed it as though it had been an egg-shell! This terrible performance, not on the bills, was and is, the only instance of a lion having killed a man in this country. After this, Julius was only shown—not acted with—and in August, 1874, while passing through New Jersey on the way to New York, he died quite suddenly. His age was at least thirty-one years. He was the largest lion ever brought to the United States.

lion allowed the dog to nibble a morsel from the meat given him, and indeed, seemed to invite him in brute fashion to help himself, which the dog, being hungry, did quite freely. Thus passed the first day, which the keeper thought would surely be the dog's last, but on the next morning to his great astonishment lay the two, fast asleep, the dog curled up at the lion's feet, directly under his terrible jaws!

At grub-time the action of the previous day was repeated, and thus it went on from day to day, until the dog became as much an object of interest, almost as the lion, to the numerous visitors of the menagerie.

But now comes the tragedy act. The dog from being petted had grown proud, arrogant, in fact, actually insulting! He had been pampered to such an extent that he now began to think he ought to have a table to himself, and not be dependent, not even upon a lion for his food! "Was he not *one* of the show? was he not admired too by all that gaping crowd?" So one day the cur had the temerity—when invited by the lion in the usual way to dine with him—to throw up his pug nose, and disdainfully walk off in a sulk, without anything more than a sniff at the fresh beef his friend the lion had offered him.

Julius observed it, and seemed to think with Lear, "how sharper than a serpent's tooth it is to have a thankless child," and gave a growl which seemed to say, "see here, my boy, don't do that too often. I was your friend when you had no other. I spared you when you were at my mercy. Don't play off your ingratitude on me, or you may be some day suddenly taken with a *disease* of the spine." The pampered cur however heeded not the warning note, and in a few days repeated his ungracious and insulting manner. Then Julius with both EYE and TAIL said, "Just do that once more." Once more it was done, and—so was the dog—for as he turned up his pug nose as though in contempt of the lion's invitation to dine, and was about to walk away and sulk again in his corner, Julius, as quick a lightning flung out his paw, with all its terrible *razors* expanded, and drawing the miserable cur to him, gave him one crunch of the spine just behind the ears, and the "dog had had his day." For a moment Julius gazed at what was once his pet, then with a long low growl, which seemed to say as plainly as a lion can say anything—"Justice is satisfied—*sic semper ingratus*"—and lay him down to sleep as though he was not in the least on the "ragged edge of remorse and despair" for what he had done. The skeleton of Julius now adorns the Central Park Museum, and that of the ingrate cur is one of the curiosities of a barber's shop in an interior town of Pennsylvania.

ANOMALY IN NEST BUILDING OF THE ROBIN.

BY THOS. G. GENTRY.

The ornithologist seldom wearies of his voluntarily imposed task, although never done. New facts are constantly appearing as his scope of observation widens. By slow and steady increments, his stock of information grows and expands. Scarcely a year passes that he is not called upon to chronicle some new event that he has stumbled upon, unawares, or that has opened up to his mind only by dint of the closest study and the most protracted perseverance.

As facts accumulate, new editions of standard works are necessitated. But a few months have elapsed since the introduction of the writer's works on the birds of eastern Pennsylvania; yet these months have been pregnant with interest, and rendered valuable for the information which they have brought; partly, the free-will offerings of friends, but, mainly, the results of personal observations. To record a few of the many facts which have crowded this brief period, is now his happy privilege.

Few species of birds have a more pliable organization, and can

better adapt themselves to the conditions of their *environment*, than our ordinary robin. This truth is particularly exemplified in its habits of nidification. Almost any available spot serves as an appropriate building place. The hole of an upright post, a window-ledge, the inside of an unoccupied out-house, the deserted cavity of a wood-pecker, &c., have been favorite places, in individual cases. Until recently, I have never known a nest to be built upon *terra firma*. Ordinarily, the structure is placed at distances varying from two and a half to about seventy feet above the ground.

Mr. Russell Hill of Germantown, while returning from his daily business, during the latter part of May, had his attention arrested by a pair of robins which had nidificated upon an embankment along the Germantown and Chestnut Hill Railroad. The ground had an inclination of forty-five degrees. To construct a nest in such a position, with the requisite security, would necessitate no little planning and skill upon the part of the architects. Nothing short of the purest reason would enable the birds to grasp the position of affairs, and to plan with the view of a successful accomplishment of the almost herculean task. It is evident that they were equal to the performance. The nest was discovered in sited by Mr. Hill, and deposited with the writer, after its desertion.

It is well known that a typical nest of this species is furnished internally with a cup-shaped fabric of mud, which serves to bind the composing materials securely together. In the present instance, this inner structure was an unnoticeable feature. To give the nest a sure foundation, a semi-circular wall of mud was built, projecting outwardly from the embankment, to a certain height. Within the enclosure thus formed, the various leaves, roots, and grasses, constituting the nest proper, were posited with but little regard to taste and symmetry.

Having stated the facts, let us inquire for a few moments into the causes which have probably conduced to this change of habits. In primitive times, such situations may have been chosen for purposes of nidification, as is now observed in the case of Wilson's Thrush, for certain advantages which they afforded. But with the spread of mankind, accustomed sites were abandoned, and the present nesting habits acquired, as offering better security and protection against enemies of man's introduction. As both the Hermit Thrush and Fancy Thrush are now known to build upon the ground, perhaps this anomalous habit in the case of the robin may be explained by Darwin's principle of reversion.

(For Fanciers' Journal.)

BIRD ARCHITECTURE.

J. M. M'CANN.

Widely different are the habitations of men—some are only the rudest huts, others splendid palaces adorned everywhere with objects elegant and beautiful. So it is with the homes of the birds; some are wrought carelessly, and without design, others are fashioned with artistic skill, and swung like a sailor's hammock—"Where winds of summer night rock gently to and fro the green wood nest." The female is the architect—all the beauty of design and perfection of finish is due to her—the male is only a laborer, collecting the materials, and filling the air around her with the glory of song.

The purple Bower Bird of Australia (*Ptilonorhynchus holosericeus*) builds a "stately pleasure dome," of reeds, covers the floor with a carpet, and decorates the airy chambers with ornaments bright and beautiful—the painted ocean shell, the sparkling pebble, the fragrant flower, the gaudy feather from the wing of tropic bird, all are there under that arch of beauty. It is not a nest, but only an assembly room for pleasure where the artist receives his friends, and spreads before them his treasures.

The Tailor bird of India, (*Orthotomus longicaudus*), was the inventor of needle and thread, and was "doing her own sewing,"

ages before old mother Eve had commenced her famous patchwork of fig leaves. This beautiful little seamstress selects a leaf which hangs from the extremity of a slender twig, pierces a row of holes along each edge, using its beak for a needle, and when this labor is finished the bird procures the long fibre of some plant and passing this through the holes draws the sides of the leaf together, thus forming a hollow cone in which it arranges a quantity of soft white down, and the beautiful nest is finished, and the young are rocked to sleep in their airy home by every breeze.

The Fan-tailed Warbler (*Salicaria cisticola*), builds its home among the reeds, sewing together a number of the leaves, thus forming a receptacle where the nest may be concealed; but the method which it employs is different from that which is used by the tailor bird. Instead of passing its thread continuously through the holes and thus sewing the leaves together, it has a number of threads, and ties a knot at the end of each in order that it may not be pulled through the hole. Thus with little labor an elegant home is formed for the baby warblers, and this beautiful order of bird architecture has excited the admiration of the lovers of nature in every land.

The Brush Turkey (*Tallegalla Latham*). Ages ago a strange, long forgotten people built their mounds over all the prairies of the West, and along the banks of the beautiful river. The Brush Turkey of New South Wales is a mound-builder too—uniting many together, they accumulate a great heap of vegetable substances, give it a circular form, and enlarge and improve it year by year. This is the largest bird's nest in the world, and the eggs are hatched by the heat given out during the process of fermentation. The mounds are built by the hens, and the males watch over the eggs, and know by wonderful instinct, the proper temperature for them, sometimes laying them almost bare, sometimes covering them over deeply with leaves, often repeating the operations many times a day. The young on escaping from the shell do not immediately leave the nest, but often after having enjoyed the open air return again to the mound, and are covered up like the eggs only not to so great a depth. A cylindrical hole is formed in the middle of the mound—a chimney by which the heat may be moderated, and through which the gases produced by fermentation may escape.

The Loxia suspends its nest from the branches of the Indian fig tree in a manner that secures it from all injury from storms. The nest is divided into several chambers in some of which fire-flies are sometimes found, and the Hindoos believe that the bird cherishes them for the purpose of illuminating its home.

Beautiful is the song and elegant the nest of the bird—each differing from all the others—inexhaustible the study of nature.

"For so the whole round earth is every way
Bound by gold chains about the feet of God."

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"To exchange for cash" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

GEO. BROWN, 31 South Second St., Harrisburg, Pa., will exchange Game cocks and hens, foreign and domestic; also heels, all sizes, for silver watch or double barrel shot gun. Weight of cocks, from $\frac{1}{2}$ to $\frac{1}{2}$ lbs., and warrant them dead game and fast fighters.

O. S. KEENE, Box 16, Auburn, Me., will exchange 1 pair young Blue and White Dutch Rabbits, one Trio White Angora Rabbits, and three dozen stereoscopic views, worth \$9.00, for one pair Pekins, duck and drake, Palmer's stock. Rabbits, all kinds, for Fancy Pigeons. Write.

B. E. SMITH, Pottsgrove, Pa., has D. Brahma fowls, (Herr-tin's), to exchange for Red male Cardinal and cage, Stonehenge on the dog, or others.

E. K. MEYERS, 224 Chestnut St., Harrisburg, Pa., has for exchange 3 Light Brahma hens, 1 Dark Brahma pullet, 1 short-tailed Bull Dog, 1 year old. Will trade for almost anything, for want of room.

E. G. FLANDELS & CO., Manchester, N. H., have to exchange two horse pistols, for Brown Leghorns, or others. Speak quick. Write on Postal cards, or any other kind of cards.

A. K. CHAPMAN, West Hampton, Mass., will exchange pure White Cochins for a good double-barreled shot-gun. What offers.

W. B. ATTERTON, Newton Lower Falls, Mass., will exchange one Rob Roy Game, cost \$10; also White Polish cockerels, (Jennings' strain,) for White Polish of some other strain. Must be first-class.

FANCIER, Box 233, Tamaqua, Pa., wants to exchange a 10-key Accordion, 2 good Violins, 1 Show Case, 2 Parrot Cages, 1 Rabbit Hutch, 1 Electric Battery, 1 Rifle, 3 triple Fowl Coops, 4 Single Turkey or Geese Coops, 2 Double Bantam Coops, wire fronts, 6 Light Brahma hens, 1 pair Earl Derby Games, "pit stock," 1 Red Bird and Cage, White-Curriers, Red Barbs, White, and Colored Fans, Fumblers, and other Fancy Pigeons, for Grey or Fox Squirrels, Talking Parrot, or others.

BOX 368, North Attleboro, Mass., has for exchange one Rose-comb Black African Bantam cock, 1875 hatch. He is a fair bird. Somebody make me an offer for him.

J. W. MAYFIELD, Urss, Ill., will exchange thoroughbred Poland Chinas Pigs, two months old, for Light or Dark Brahmas, or others. Birds must be a No. 1. Write.

H. T. FRENCH, Holbrook, Mass., wants to exchange a Lop-eared Doe for Yellow Fans, or a Lop-eared Buck for Black or Yellow Fans. Make some offer for one or both.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering *ova Book for Sale, Exchange, or Wanted*, will be allowed at 10 cents for each and every insertion.

THE AMERICAN KENNEL AND SPORTING FIELD—by Arnold Burges. T. D. Adams, Franklin, Pa., wants the above and Cooper's Game Fowl, for G. S. Hamburgs, Black Spanish, B. B. E. Game hens, Imperial Egg Food, and Home Crock Shellers.

AUDUBON Wanted.—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

JNO. W. SHEY, New Albany, Ind., wants several pairs of Ferrets. State price, color and age.

FANCIER, Box 233, Tamaqua, Pa., wants three or four Grey, or Fox Squirrels. Must be harmonious, as they must go together in one cage, either young or old. Will pay cash, or give Pigeons, Light Brahma hens, Coops, &c. See exchange column.

HARTFORD, AUGUST 7, 1876.

No. 30.

DON'T TAKE IT TO HEART.

There's many a trouble
Would break like a bubble,
And into the waters of Lethe depart,
Did not we rehearse it,
And tenderly nurse it,
And give it a permanent place in the heart.
There's many a sorrow
Would vani-h to-morrow,
Were we not willing to furnish the wings;
So sadly intruding
And quietly brooding,
It hatches out all sorts of horrible things.
How welcome the seeming
Of looks that are beaming,
Whether one's wealthy or whether one's poor;
Eyes bright as a berry,
Cheeks red as a cherry,
The groan and the curse and the heartache can cure.
Resolved to be merry
All worry to ferry
Across the famed waters that bid us forget,
And no longer fearful,
But happy and cheerful,
We feel life has much that's worth living for yet.

Germantown Telegraph.

JAVA AND THE JAVANESE.

LIFE IN THE TROPICAL ISLANDS OF ASIA—A PLEASANT PLACE TO VISIT.

In this wonderful clime I am trying to describe, just on the verge of the equator, the soil and air alike seem to be provocative of fruits, and flowers, and verdure—verdure the greenest, fruits of mammoth proportions and of exquisite flavor, and flowers of the most captivating and gorgeous colors; though, with few exceptions, the latter lack the full perfume of our Northern roses.

I shall essay the pleasant task of attempting to give my readers some faint idea of the most luscious and delectable Java fruits, according to my estimate; and first upon the list I place the Mangusteen, which, for delicacy and richness of flavor, cannot be surpassed. It is, in color and shape and size, like a green lemon, with a thick rind, beneath which lies the creamy substance, whose luscious qualities have placed it among the most delicious of all fruits. Two, and sometimes three, large ebony pits compose the center of this most palatable delicacy.

Next in order, my gastric susceptibilities induce me to rank the Pomolo; and I think the most refined epicurean jury would endorse my verdict in this matter. Some of the Java species of this most delicious fruit are very large. I have seen those that measured 30 inches in circumference, with the cherry-red pulp almost bursting with its juicy, cool, and nectarean load. They resemble the West Indian Shaddeck, and are doubtless of the

same genus (*Citrus decumara*); but with their external resemblance all comparison must end.

Oranges, limes, and lemons are in great abundance here; and the eyes roam around the market-place, enjoying a feast over which the Goddess Pomona might have well gloried to preside.

The consignee of my ship, Mr. Alfred Reed of Boston, sent me a pressing invitation to spend a week with his delightful family at Wettevreden, the Javan Saratoga, and the "invite" was most joyfully accepted, for, as the rice crop had not been harvested, I had an abundance of leisure time—time that hangs heavily upon a home-loving voyager in these distant climes, where no Booth or Clara Morris can while away the tedium of the long, hot days, and the equally long and hot equatorial nights; where no Beecher and Tilton scandal has ever yet aroused the quiet-loving natives or adopted citizens from their unbroken apathy.

Breakfasting at the Hotel of the Netherlands, at 11 o'clock A. M., I spent an hour in a pleasant ramble through the adjacent groves of nutmeg and cocoa, beguiling the moments in interesting converse with Minna Von Hogeand, the pretty and very accomplished daughter of the landlord, after which all retired to enjoy the "siesta"—one of the greatest, as well as most necessary, luxuries of these torrid climes.

A necessary appendage to a well-appointed bed in Java is the "Dutch wife"—a stick of bamboo, or other light and highly-polished wood, five feet in length, and about two feet in circumference. This is placed in every bed, and the relief afforded to the limbs of a tired sleeper in these long, hot nights, by the presence of this innocent and unsophisticated bedfellow is almost incredible. Waking in the night, you throw your arm over it; then, moving it up, you place it beneath your neck, lifting your head from the heated pillows, and at every change you feel inclined to bless the peculiar institution, while in the morning you arise with a hearty benediction on the consoling "Dutch wife."

The siesta, the delicious interlude to a day's performance on the busy stage of life in Java, has reached its ultimatum of human enjoyment, and nowhere else have I experienced such perfect enjoyment of this midday rest as here. The siesta occupies the time from tiffin, or lunch hour (about noon) till 4 P. M., when you seek the marble bath rooms, and take out a fresh lease of life and its enjoyments.

Dressing myself soon after my bath (one day's routine will suffice for all), I called a carriage and rode throughout the shady groves—the fragrant palm trees waving over me, and the sharp leaves of the cocoa-nut trees whispering their secrets to the evening breeze.

After an hour devoted to this exquisite enjoyment, I drew up on the green plaza, close by the palace of Wettevreden, to listen to the Dutch military band which there performed each evening for an hour or two.

Many equipages were gathered on the square, containing beautiful and elegantly dressed women; numbers of equestrians swelled the throng; while the richly uniformed officers added animation to a scene that was in itself delightful.

In the center of the square is a granite column thirty feet in height, surmounted by a lion, exquisitely sculptured, from whose knotty head a green bush was growing; for, in this prolific clime, a thin layer of dust soon teems with vegetable life.

The music, which was of the highest order, having ceased, I drove to the palatial structure of my friends, the brothers Reed; and there I stood before it, completely entranced with its exquisite construction, and the magnificence and taste of its adornments.

The lofty halls and spacious verandahs; the furniture so peculiarly Oriental in its elegance and convenience; the beautifully frescoed walls and ceilings; the delightful arrangement of the grounds—the garden plot teeming with delicate flowers—the front yard filled with trees whose lofty structure and peculiar freshness of foliage made the grateful shade still more bewitching, all combined to yield the most exquisite pleasure.

I shall not attempt to describe in detail the array of exquisitely cooked meats, the soups—those pleasant *avant couriers* of an Eastern dinner—but will simply testify that it was perfect. Course after course of most delicate viands followed each other in proper succession, the wines and cordials were of the finest quality and flavor, while the desert and fruits I may not hope to describe. The mangosteen, so kindly prepared for me by the lady of the mansion (a beautiful Boston blonde), seemed to possess an additional flavor; and the coffee and tea which followed finished a repast which will long be coupled with delightful reminiscences of Java.—*Chicago Tribune.*

HOME.

That word *home* always sounds like poetry to me. It rings like a peal of bells at a wedding, only more soft and sweet, and it chimes deeper into the ears of my heart. It does not matter whether it means thatched cottage or manor house, home is home be it ever so homely there's no place like it. Green grow the houseleek on the roof forever, and let the moss flourish on the thatch. Sweetly the sparrows chirrup and the swallows twitter around the chosen spot which is my joy and rest. Every bird loves its own nest; the owls think the old ruins the fairest spot under the moon, and the fox is of opinion that his hole in the hill is remarkably cosy. When my master's nag knows that his head is towards home he wants no whip, but thinks it best to put on all steam; and I am always of the same mind, for the way home, to me, is the best bit of road in the country. I like to see the blue smoke out of my own chimney better than the fire on another man's hearth; there is something so beautiful in the way in which it curls up among the trees. Cold potatoes on my own table taste better than roast meat at my neighbor's, and the honeysuckle at my own door is the sweetest I ever smell. When you are out, friends do their best, but still it is not home. "Make yourself at home," they say, because everybody knows that to feel at home is to feel at ease.

"East and West,
Home is best."

Why, at home you are at home, and what more do you want? Nobody grudges you, whatever your appetite may be; and you don't get put into a damp bed. Safe in his own castle, like a king in his palace, a man feels himself somebody, and is not afraid of being thought proud for thinking so. Every cock may crow on his own dunghill; and a dog is a lion when he is at home. A sweep is master inside his own door. No need to guard every word because some enemy is on the watch, no keeping the heart under lock and key; and as soon as the door is shut, it is liberty hall, and none to peep and pry. There is a glorious view from the top of Leith hill, in our dear old Surrey, and Hindhead and Martha's chapel and Boxhill are not to be sneezed at, but I could show you something which my mind beats them all to nothing for real beauty; I mean John Ploughman's cottage, with the kettle boil-

ing on the hob, singing like an unfallen black angel, while the cat is lying asleep in front of the fire, and the wife in her chair mending stockings, and the children cutting about the room, as full of fun as young lambs. It is a singular fact, and perhaps some of you will doubt it, but that is your unbelieving nature, your little ones are real beauties, always, a pound or two plumper than others of their age, and yet it don't tire you half so much to nurse them as it does other peoples' babies. Why, bless you, my wife would give out in half the time, if her neighbor had asked her to see to a strange youngster, but her own children don't seem to tire her at all; now my belief is that it all comes of their having been born at home. Just so it is with everything else; our lane is the most beautiful for 20 miles around, because our home is in it; and my garden is a perfect paradise, for no other particular reason than this very good one, that it belongs to the old house at home.

I cannot make out why so many working men spend their evenings at the public house, when their own firesides would be so much better and cheaper too. There they sit, hour after hour, boozing and talking nonsense, and forgetting the dear good souls at home who are half starved and weary with waiting for them.

Husbands should try to make home happy and holy. It is an ill bird that fouls its own nest, a bad man who makes his home wretched. Our house ought to be a little church, with holiness to the Lord over the door, but it ought never to be a prison where there is plenty of rule and order, but little love and no pleasure. Married life is not all sugar, but grace in the heart will keep away most of the sour. Godliness and love can make a man like a bird in a hedge, sing among thorns and briars and set others a singing too. It should be the husband's pleasure to please his wife, and the wife's care to care for her husband. He is kind to himself who is kind to his wife. I am afraid some men live by the rule of self, and when that is the case home happiness is a mere sham. When husbands and wives are well yoked, how light their load becomes! It is not every couple that is a pair, and the more's the pity. In a true home all the strife is which can do the most to make the family happy. A home should be a Bethel, not a Babel. The husband should be the houseband, binding all together like a corner-stone, but not crushing everything like a millstone. Unkind and domineering husbands ought not to pretend to be Christians, for they act clean contrary to Christ's commands. Yet a home must be well ordered, or it will become a Bedlam, and be a scandal to the parish. If the father drops the reins, the family coach will soon be in the ditch. A wise mixture of love and firmness will do it but neither harshness nor softness alone will keep home in happy order.—*Spurgeon.*

ANOTHER PET AND ITS FATE.—A. L. King, of Suffield, caught a young crow with some white feathers on it, some time ago, and successfully tamed it. The crow was in the habit of always accompanying Mr. King from home to the depot, and then flying home again. The other day the crow perched on the sill of an open window, and pecking at the stick supporting it until he dislodged it, the heavy sash came down upon him and finished his career.—*New Haven Palladium.*

"Bathe every day!" exclaimed the widow Smashpipes, as she dropped the flat-iron upon the horse shoe with a bang, and looked her neighbor Snubs right in the eye; "why, you don't say so. I never used to think of stripping my Jeems, and giving him a right good wash, but four times a year—onst in the Spring, onst in the Summer, onst in the Fall, and onst in the Winter. Howsomever, some children ketch dirt sooner than others."

An Irishman being tried for assault and battery in Virginia City, Nevada, when asked by the judge if he had anything to say by way of defense, replied: "Well, your honor, I saw but little of the fight, as I was underneath most of the time."

POULTRY DEPARTMENT.

NAMING THE CHICKENS.

There were two little chickens hatched out by one hen,
And the owner of both was our little boy Ben;
So he set him to work, as soon as they came,
To make them a house and find them a name.

As for building a house, Benny knew very well
That he couldn't do that; but his big brother Phil
Must be handy at tools for he'd been to college,
Where boys are supposed to learn all sorts of knowledge.

Phil was very good-natured, and soon his small brother
Had a nice cosy home for his chicks and their mother;
And a happier boy in the country just then
Could not have been found than our dear little Ben.

But a name for his pets it was harder to find,
At least such as suited exactly his mind;
No mother of twins was ever more haunted
With trouble to find just the ones that she wanted.

There were plenty of names, no doubt about that,
But a name that would do for a dog or a cat
Would not answer for chickens so pretty as these;
Or else our dear boy was not easy to please.

These two tiny chickens looked just like each other;
To name them so young would be only a bother.
But with one in each hand, said queer little Ben,
"I want this one a rooster and that one a hen."

Benny knew them apart by a little brown spot
On the head of the one that the other had not;
They grew up like magic, each fat feathered chick,
One at length was named Peggy and the other named Dick.

Benny watched them so closely not a feather could grow
In the dress of those chickens that he did not know;
And he taught them so well they would march at command.

Fly up on his shoulder, or eat from his hand.

But a funny thing happened concerning their names.
Rushing into the house one day, Benny exclaims,
"Oh, mother! Oh, Phil! such a blunder there's been,
For Peggy's the rooster and Dick is the hen!"

—*Christian Union.*

FOWLS PLUCKING FEATHERS.

EDITOR FANCIERS' JOURNAL:

I noticed in a recent number of the *Country Gentleman* a little item about fowls plucking feathers from each other, in which the writer claimed that the fowls were after the salt contained in the minute globule of blood at the end of the quill, and that the proper, and *certain remedy* was to feed a small portion of salt in their food occasionally, in the following proportions: "In four parts of wheat bran to one of corn meal, by measure, a tablespoonful of salt in every eight quarts of this mixture scalded and cooled. The salt should be dissolved in hot water before mixing with the food." And as I have frequently had my attention called to fowls which had disfigured themselves in this way, and often been asked for a remedy, I will give you this for the benefit of any

readers of the JOURNAL who may happen to be troubled in this way, for what it is worth, and would also like to enquire through the JOURNAL, if any of its readers have ever experimented in this way, and with what success, and if the best fanciers consider this the true theory and solution of the trouble.

Will some experienced fancier please explain.

"DIRIGO."

A NOVEL ARTIFICIAL MOTHER.

Mr. J. J. Scott, writing from Llanstephen, Carmarthenshire, to the *Live Stock Journal*, says: "Should you think that the following expedient, which proved successful in rearing a brood of chickens, may be interesting to any of your readers, who might find occasion to resort to something of the same kind under similar circumstances, I place it at your disposal for publication if you see fit. A Cochon hen, that had hatched a brood of my Golden Polish chickens, suddenly died when the chicks were very young, and I fully expected to lose them all, they being with their mother in the coop about two and one-half feet square, in the open air night and day, when an idea struck me that I thought might give just a chance of saving them, viz.: in the corner of the coop farthest from the wired front I placed a little box without a lid, about nine inches wide, inverted, resting on the floor of the coop, with an opening made in one side large enough to admit the little 'orphans' one at a time; about three inches of perfectly dry warmed sea-sand was placed on the floor, inside the box, for them to nestle in, and a few grains of canary seed to tempt them inside. First one, then another, ventured in, till all were huddled together, closely packed, embedded in the warm sand. After the first experience of the nest no inducement was required, they regularly toddled in to sleep, and at intervals during the day, burrowing in the sand, leaving nothing visible but eight or nine little heads peeping out of the sand and each other's fluffy feathers. The sand was not warmed a second time, and the brood, with one exception, thrived well, this simple artificial mother proving all that could be required. As they began to get too large to be able to get into the little box altogether, some took to roosting on the top of it, turning out at intervals others from the inside, who were then forced to change places. For a week or so I had the front of the coop at night covered with a piece of matting; in all other respects the birds were treated exactly as if the hen had been with them, except that till six or seven weeks old they were not allowed to roam beyond a small run wired off in front of their coop. After this I think Golden Polish must be admitted not only to be pretty hardy, but to set an admirable example of making the best of things under adverse circumstances, though possibly from a moral point of view their total disregard to the loss of their mother might be objectionable."

OUT WITH IT.

Since it is the nature of man to rebel, or to oppose, for the sake of argument, gain, or principle, we are not surprised to read the several controversies in this valuable JOURNAL.

The exposures made therein, have had a tendency to protect the uninitiated, but there are *several names* which have been omitted from that list, who are *fully* entitled to be there; one Philadelphia "purp" has practiced quite extensively, and those who have been bitten will recognize the biter as a "youth of about nineteen."

The "Paris Hondan" even has had his say with "Todd," while at present we are interested in "Herron vs. Warren."

The Chicago exposure did us no hurt, and still we are not happy.

These controversies are productive of good to the general public, for an unbiassed mind readily forms an opinion, whether a redundancy of words proves the symmetry of a fowl by the Grecian, Ionic, Doric, Corinthian or Composite order of architecture or not.

The battle of the "Standard" has played an important part in the history of the "hen fever," and "Young Breeder," not content with "puffing" his graceful (?) Brahmas, must give the ball another push, to encounter "Ed. P. B."

Stick to argument "Y. B.," and you may win the day.

This controversy has recalled to my mind a little history of "Ed. P. B."

"A few years since a 'Standard' was issued, said to be unauthorized; Lewis Wright speaks of it, and we all know 'who he is.' An action taken by the Am. P. Ass'n in regard to one of its prominent members, his reinstatement, and final withdrawal by a notice in *Poultry Bulletin*, which was accepted by the Ass'n when in Chicago, has a strong tendency to point to *other* than an 'independent' motive for the course taken. Was not 'Ed. P. B.' one of the 'Young Breeders' who assisted in the construction of the new 'Standard'?"

Does he desire to cast a slur at the editorial management of said Standard? or my dear sir, does his bosom heave with jealousy? Does he harbor any revengeful feelings towards any members of Am. P. Ass'n?

It would strike the average mind, that a Poultry Magazine, controlled by Am. P. Ass'n, who chose an Editor from their ranks for said organ, should withdraw because he desired to act "independent," that there was sharp play somewhere. Doesn't the *Bulletin* pay? and who are responsible should any irregularity occur? There may be two sides to this question, if so we should like to hear them. Write this as the book-keeper says, E. & O. E.

QUILIBER.

INTERNATIONAL EXHIBITION.

UNITED STATES CENTENNIAL COMMISSION, }
PHILADELPHIA, July 17th, 1876. }

EDITOR FANCIERS' JOURNAL:

The Centennial Commission will make awards on broods of fowls, of each variety, consisting of twenty-five specimens, no charge will be made for entrance, the specimens must be bred by the exhibitor, of which he must furnish satisfactory evidence to the Commission at the time of entry.

Very respectfully,

JOHN E. DIEHL,

Sup't. Poultry Dep.

BURNET LANDRETH,

Chief of Bureau.

AN EXPERIMENT.

FRIEND WADE:

I have a few facts which seem rather confusing to those who contend eggs will not hatch well after one is broken in the nest, and as you kindly requested me to contribute the results of my experience in hen-culture, will state what has been accomplished with a hen turkey.

Gave her a few lessons in the art of sitting, as the Dutchman did his hen—in December last, and got her settled down to business the first week of January. Put twenty-four hen's eggs under her, and she broke four the first day, and continued to break until they were reduced to eight: from these, five chicks came, and one was smothered, leaving two rotten.

Her next sitting consisted of twenty eggs, of which eight were smashed in the nest; eight gave me living chicks; two smothered and the rest rotted.

Her third sitting contained twenty-five eggs, five of which I removed because unimpregnated. Sixteen developed living chicks, two were broken in the nest, and two chicks smothered.

Having satisfied myself (although but few of my neighbors) that turkeys could be brought to sit upon hen's eggs and bring forth chicks successfully, threw her off the nest. After a few weeks' resting she laid a sitting of eggs, and became broody the *old way*; gave her twenty hen's eggs, from which came fifteen

living chicks, one chick smothered, two eggs were broken in the nest, and two were rotten.

My experiment seems to prove that breaking eggs in the nest does not prevent hatching when covered by a turkey.

Hans Schneider, vat you dinks pout "dem bores" now, eh?

J. H.

(For Fanciers' Journal.)

COMMENCEMENT EXERCISES.

REPORTED BY YOUNG BREEDER.

Pedagogue. Editor of Bulletin stand up. What are your specialties?

Editor. Jackass rabbits, snow water, and Brown Leghorns.

Ped. Why do you place rabbits first?

Ed. Wall! I feel a sort of brotherly affection for 'em.

Ped. Correct! Why do you use snow water?

Ed. 'Cos it's handy in winter.

Ped. What do you know about Blue Games?

Ed. I dunno much about 'em myself, but that sore-headed feller who sits 'round the Bulletin office does, and says the Standard is out ev jint on em, but he isn't here to-day, so I can't tell nothin' about 'em now.

Ped. Why do you persist in fighting the Standard.

Ed. Oh, I had a personal row with one of the fellers who got it up, and thought I'd bust that said Standard in about a couple of weeks, but somehow it didn't bust, and that's what's the matter with Hannah! (so to speak). Them Standard fellers don't seem to care what I say, so I'm having my annual Summer's quarrel with that imp of kussedness, Young Breeder. For such biz, a monthly aint no account. Ef I let him monopolize the JOURNAL he'd get *four licks to my one*. So I've mounted the JOURNAL too, and am entertaining its subscribers with my weakly wisdom on Standards. I once heard a clown man in a circus tell a feller (who was a spec-tater, and at the same time actin' like Sam Hill, and makin' considerable noise), "that there were some object in bein' a fool, pervidin' a feller was well paid for it, but there was so many fools ready to act without pay that it worked a great injury to the perfession. Of course this wouldn't affect *me*, but the clown man hadn't no business to make such a remark.

Ped. If you do not enjoy the present Standard, why not construct one on your own hook.

Ed. That's jest what I'm doin. In the first place I'd change that outrageous clause on Brahma's and Cochins shanks. I'd have it "shanks ~~not~~ feathered down the outer sides, and the outer toes ~~not~~ feathered to the extremities."

Ped. Hum! Ah! You would have them *without any feathers* on the legs would you?

Ed. Yes sire-e! Haven't I always bred 'em that way, and don't I know, 'n didn't Burnham originally have 'em *so some*. I'm a goin' to have these things fixed to suit me.

Ped. Have you a copy of the Standard?

Ed. I had one last winter, but some feller stole my thick overcoat which I wore to shows, and I haven't seen the feller, nor the overcoat, nor the Standard since.

Ped. How do you expect to answer questions regarding poultry, without the Standard?

Ed. Them soreheaded fellers know all the pints I care about for present use, generally.

Ped. Are the Brown Leghorns you advertise bred to Standard or otherwise?

Ed. I guess I'll pass, for in this partickler case I "accept it faithfully, 'n abide by it loyally." Stamps in that box mister, which I don't wish just now to go back on. You see my folks thinks it's about time for a small dividend.

Ped. Which they now vainly hope to receive.

Ed. While I'm striking out for a little 'sessment.

Ped. Which don't you wish you may get?

Unicorn! What's the matter with you?

U. Got the cholera. Ate too much game 'n barnyard sass.

Ped. You may go out. Miner! What is your definition of pluck?

M. A Game lickin' an old Buff.

Ped. Why are you so down on Y. B.?

M. I offered him some eggs for his good name, and he said he wouldn't give a dam—

Ped. Stop sir, no such language is tolerated in this school—Is Zero here? (both Zero and the Ed. stand up).

To be continued.

BROWN LEGHORNS.

ED. FANCIERS' JOURNAL:

As your issue of July 17 contains an article headed "A New Variety," and also has Brown Leghorns considerably mixed therein, I am uncommonly interested, because I have bred nothing but B. L. fowls for several years, *i. e.*, on my farm, but have been aiding the cause, espoused by a neighboring farmer, of originating a new breed, and as the readers of this paper know, had a "clash at pens" in regard to the foolhardiness of attempting such a thing. Now first, I think I have seen very many just such cross-bred fowls as brother Welsh has, produced by natives with B. L.'s; for instance, put a B. L. cock with a native double comb hen and you will get therefrom single, double, "cup," and various shaped combs. I have seen them with three single combs united at the base, viz: one upright middle comb approaching the Leghorn, and one on either side drooping to each eye, giving to the head a very red appearance. I have seen them single in front and of this kind in the rear, but never saw the order reversed; and furthermore all these crosses lay more eggs than any native or pure bred fowls in existence. I have known of two G. S. Bantam and B. L. crossed hens to lay fourteen eggs per week through the month of November, and nearly through December, seven weeks at least, and one day three eggs came to hand, but one, however, was laid the succeeding day. This is not "guess work;" the enviable position of the owner, from whose lips I received my information, places my authority beyond questioning, and names can be given if necessary, and as these were the only two fowls the gentleman had, and as the next neighbor had none, it seems unnecessary to say that no mistake could have occurred; but when we take a year into the account, and think of getting 300 eggs, we had better "apply brakes" before we wreck the train, for "suthin" is going 't' wrong.

And a stop then,
Saves many a hen.

Now for another cross. I took a counterfeit Brown Leghorn cock (springing from native hens and a Black Spanish cock) and put him with a few B. L. hens, scoring from 80 to 92 points, the counterfeit figuring 90 points. As for the B. Leghorn standard of excellence, well it has surprised many to see the results; not a dark colored, nor dark legged chick has appeared, and but two too light, and they not so far out of the way as chicks out of many \$5 settings that I have seen. Now was not this better than having a cock imported and getting *double cup* and other kinds of combs, etc.?

I have not yet put any of these "crossed chicks," as we might say, into my best pens for fear as to the results; yet it will work untold good in keeping another strain unrelated to any B. L.'s on earth, and as I promised you Mr. Editor, long ago, I will now send in a description of the *new breed* accompanying their photograph, but will say in advance that it will be no advertisement nor have we any "axe to grind," and we should be pleased to hear

from other true fanciers who may have that interest in this pleasant work that shall inspire them to step right out of Standard rank and breed fowls such as no man ever saw; make your own standard and keep it away from the Standard "knowing what man has done he may do again."

Yours,

BEE LEG.

(For Fanciers' Journal.)

RAMBLES IN NEW ENGLAND.

BY OUR STAFF CORRESPONDENT.

In the very extreme south-west corner of the Nutmeg State lies the beautiful town of Greenwich. We think we speak understandingly when we use the expression "beautiful town." Looking at it on the map of New England, it would seem as though that after the State lines had been surveyed, or drawn, that little Connecticut was not fully satisfied, but persuaded itself that the little corner adjacent ought to belong to it, and this little corner forms the town of Greenwich. This is one of the noted towns of the Revolution, and it may not be amiss in this Centennial year to call to mind an incident connected with it. It is the scene of the bold, dashing ride of Gen'l Israel Putnam; when he was surrounded by the British on the top of a very high hill (now familiarly known as "Put's Hill"), he at once dashed his horse down the long, steep stone steps, more than a hundred in number, and safely escaped from the enemy. The town lies in a very pretty country, washed on the south by the waters of Long Island Sound. At Rocky Neck Point is the beautiful house erected by the "Americus Club," which held full sway in the days of the "Tweed Ring." Here, also, is the handsome summer residence of Tweed himself—now occupied by his family. How soon he may occupy it again himself is a matter for conjecture. The town is a noted summer resort for the wealth of New York City, it being but forty minutes ride by rail. And Greenwich is not without its "Fanciers," and some on more than an ordinary scale. A pleasant drive of a few miles through valleys and over hills, and we reach the extensive yards of Messrs. Bacon & Spinning. They have a large orchard of several acres with neat, substantial poultry houses and latticed runs, and the visitor in search of good stock will not be disappointed in either quality or quantity! They Breed Brahmas, Cochins, Leghorns, and Pekin Ducks, and can be relied upon to "do the square thing" every time. A short ride down the valley, and a sight meets our view that reminds us of a small settlement in the far west! A number of small, neat houses, dotted over a large field in regular order, at once indicate the home of a "Fancier." We inquire for "the man of the house," and are introduced to Mr. S. K. Ferris. He kindly showed us through his yards—some twenty in number. He has been breeding fowls quite extensively for years, and has a large farm devoted to the raising of various kinds of stock. A few years since he realized the fact that a fowl that would sell for ten dollars could be raised about as cheaply as one that would sell for seventy-five cents! He commenced with Light and Dark Brahmas, afterwards adding Buff and Partridge Cochins, Plymouth Rocks, Bantams, and Ducks, and for three years past he has bred for Mr. J. F. Ferris a large flock of White Leghorns, which have been so largely advertised by Mr. F., and are pretty extensively known as the "Ferris Strain" of White Leghorns! Large flocks of young birds were scattered over the meadows, and we were told he had several hundred chicks nearly mature. Though he never exhibits, his sales to exhibitors are large, and birds bred by him have carried off the honors at many of our shows.

Later in the evening, after a ride of a mile, we took the train at Stamford, and a ride of three hours brings us to Hartford, the new home of the FANCIER'S JOURNAL.

(For Fanciers' Journal.)

1916—OR WHAT IT THEN WILL BE.

BY G. O. BROWN.

"Well, well I'd never have known you in the world. Then you've been wrecked, cast away on a lonely island for thirty-five years. Lemme see—I remember that wreck, it was the steamer Hunter, in the year o' 1881. Well, Dusenberry, you do look a little *Enoch Ardenish*. Forty years; that's a life time. Who'd a thought it war so long since me and you war in the 'fancy,' as we then used to call it; but we call it *thoroughbred poultry business*, now."

"Wall, yes, its a long time since those are days, and I hev bin thro' 'nuf for ten ord'nary men—but how is the poultry biz' now-a-days, or has it all died out, eh?"

"By no means—why, I am still at it—to be sure the boys they have the management, but the 'General' as they call me, will go the rounds every day. Why, havn't you kept note on the changes since you left Cackletown?"

"Wall, no, not 'zactly—Enoch Ardening on a lonely ilen for nigh about thirty-five year, I kinder lost all 'thusalem for anything 'cept lookin' out for a sail, 'sides Mother Carey stock was all I had to note, eh?"

"Then come with me, and let us see, what we are doing now-a-days. Now this first yard is the White Leghorns. They are still the wonderful egg producers; but you notice improved in size, but now we also breed them for their combs, which command an enormous price. The quotations you see in the '*Daily Fanciers' Journal*,' of '*Spanish Steaks*' at \$5 per pound, that means Leghorn and Spanish combs. We get four crops a year, by feeding a patent comb producing food. You remember we used to keep J. Boardman Smith's strain, they stood the test, and even now 'Smith's strain' is considered the best. All eggs are now sold by the pound, excepting Bantams, and Bantam eggs are sold by the quart. You recollect, forty years ago, twelve pounds was considered good weight for a Brahma—well, now a Light Brahma cock, exhibition weight, is from 25 to 27 pounds."

"Wall that's heavy, that is."

"Yes, to what it used to be. The Cochins are about the same weight, except with the Partridge variety, and the *Edmunds* Pea Comb Strain now predominates. There are hardly any single combs among the Partridge. Their weight is rated four to six pounds heavier than the Brahmas—look out! there comes William's youngest boy down the lane, racing again. He will run that bird to death. He's the worst grandson I've got."

"What, is it an ostrich he's got hitched to that cart?"

"Why bless you no, its a bronze turkey cock. They are used now in carts and sulks, and can get over the ground lively as most horses can. That one Johnny has, weighs 250 pounds, and has been around the fair ground track, seven-eighths of a mile, in *three thirty*—a heavy track at that. Johnny has a team of Buff cochins that he has broke to draw that baby-wagon over there on the porch. They're splendid drivers. There's the Black Reds—games are games now-a-days. Come here Toby—down—don't you see—now I'll just show you how we keep up the game qualities—he will lay down that way any time to have the *boxers* put on."

"What on earth are you doing?"

"O yes—I forgot—well we found out that breeding game fowls to a feather, without ever testing their courage, that the result was they was games by *name* but *not* by *nature*, and the laws were so stringent, no cock fights would be permitted, so some one invented the boxers. These little buckskin balls go on the spurs like that. Now just wait until I get that old Duckwing from the other yard."

"Lemme hold that Black Red till you get him. This feller seems eager for the fray."

"Here he is; set yours down—now boys show yourselves—do you see that? That Duckwing strikes beautifully. Hillo, Toby's

paid him back with interest, if it had been the clean spur, it would killed him—go it Toby—bravo, first knock down for Toby."

"Take 'em apart, I can't stand it, it makes me feel like a boy. Don't you remember the time we used to look a stag, and work our way around thro' the fields to Will Barleigh's barn yard, and get over the high board fence and whistle '*Bob White*' till Will come out with his bird, and we had a set-to? That's the way I'd like to test 'em now—Old times was the best after all."

"Yes, put 'em back—that's it. This next yard is Houdans; they are as heavy as the Brahmas used to be, are considered one of the finest fowls we have. Their bones have been bred down to a mere apology. The standard crest is eight inches in diameter; the beard six inches in length and pinkish-white ear lobes."

"Why, don't you remember forty years ago, what difficulty we had trying to breed red ear lobes?"

"Yes, I know, but now they *must* be pinkish white. Them's Plymouth Rocks—thare very different from what we used to breed. They're from the original '*Dickey*' strain, noted for their size and true breeding—bred as true as Hamburgs. There is also a strain with pea combs. Now look in the next yard, what do you think of them?"

"They're nice; I spose they're Dominiques?"

"Yes, that's what they are, but look at their size."

"I allus know'd they was a good bird."

"Yes, and they hold their own with any of them to this day, and lay like Hamburgs."

"Now here are some beauties, the white crested Black Polands, not a black feather in their crests. There is also a *bearded* variety; beard and crest snow white. The White Polands—all other strains but Sperry's are bred out. The best strain of Dark Brahmas we have is known as the *Brennon* strain."

"That's not 'Jimmy' who used to manage the Sharpless birds, is it?"

"That's exactly who the strain is named after. *Bantams* must not weigh over ten ounces now."

"What's them down on that pond, gee-e?"

"No, they're ducks. Come down if you want to see *what* ducks are."

"Pekins I spose."

"Not by a pondful; they're the Bicknell strain Aylesbury, and we also keep Bicknell Rouens and Cayugas."

To be Continued.

BOILING EGGS FOR SETTING.—A guilty rascal, who tried it, writes to the *Canada Farmer*, giving his experience in boiling eggs to destroy them for hatching. Wishing to obtain chickens from the eggs of a neighbor, and failing to do so by honorable means, he took the following course; carrying six of his own eggs, previously dipped in boiling water, he placed them under a hen of his neighbor's and took, in exchange, the same number of the coveted eggs. But what was his surprise, some weeks afterwards, to learn that every one of the dipped eggs hatched out a bright, healthy chicken, all ready to swear the act of deception upon the guilty party.

The editor of the *Farmer* replies that, in France, it is a common practice to repeatedly dip eggs in boiling water two or three days previous to the time for hatching, to prevent the chick from dying. If eggs will stand such treatment, dishonest dealers had better change their "dark" ways.—*N. E. F.*

WHAT fowl is most like a carriage in the Chinese Empire? Coach-in China.

"Blessed are they who have nothing to say, and who cannot be persuaded to say it."

SPORTSMAN'S DEPARTMENT.

CENTENNIAL EXHIBITION, PHILADELPHIA.

ORGANIZATION AND DUTIES OF THE JUDGES ON LIVE STOCK.

1. Awards shall be based on written reports, attested by the signatures of their authors.

2. Reports will be based upon inherent and comparative merit, the elements of merit being specifically mentioned.

3. The judges assigned to each group will choose from among themselves a chairman and a secretary. They must keep regular minutes of their proceedings. Reports recommending awards shall be made and signed by a judge in each group, stating the grounds of the proposed award, and such reports shall be accepted, and the acceptance signed by a majority of the judges in such group.

4. The reports of the judges recommending awards, must be returned to the Chief of the Bureau of Awards not later than ten days after the close of the Exhibition, in each group.

5. Awards will be finally decreed by the United States Centennial Commission, in compliance with the act of Congress of June 1, 1872, and will consist of a special report of the judges on the subject of the award, together with a diploma and a uniform bronze medal.

6. In addition to reports on the merits of individual exhibits, the judges of each group will be expected to render a report general in its nature, summarizing the Exhibition in their group, and indicating the recent progress noted in breeding, rearing, or training.

7. Vacancies in the corps of judges will be filled by the authority which made the original appointment. No exhibitor can be a judge in the group in which he is a competitor.

8. The Chief of the Bureau of Awards will be the representative of the United States Centennial Commission in its relations to the judges; upon request, he will decide all questions which may arise during their proceedings in regard to the interpretation and application of the rules adopted by the Commission relating to awards, subject to an appeal to the Commission.

GROUP 33. DOGS—FROM SEPT. 4TH TO THE 8TH.

Class.	Class.
810 Fox hounds.	826 Retrievers and Chesapeake dogs.
811 Harriers.	827 Irish water spaniels.
812 Beagles.	828 Retrieving spaniels.
813 Dachshunds.	929 Cocker.
814 Otter hounds.	830 King Charles & Blenheim.
815 Greyhounds.	831 Spruigers.
816 Scotch deerhounds.	832 Clumbers.
817 Bloodhounds.	833 Mastiffs.
818 Imported English setters.	834 St. Bernards.
819 Native English setters.	835 Newfoundland.
820 Imported Irish setters.	836 Siberian or Ulm.
821 Native Irish setters.	837 Dalmatian or coach.
822 Imported Gordon setters.	838 Sheep dogs.
823 Native Gordon setters.	839 Bull dogs.
824 Pointers, over fifty pounds.	840 Bull terriers.
825 Pointers, under fifty pounds.	

Class.

841 Fox terriers.
842 Black and tan terriers.
843 Skye terriers.
843 Scotch terriers.

ITEMS.

A London genius has attached a whistle to the end of his dog's tail. By this arrangement the dog can call his master.

MISS ROSE—"Goodness! the fire is out. I thought it was very cold." BEAU—"Shall I get my overcoat and put it on you?" MISS ROSE—"Oh, no; but (glancing at the clock) hadn't you better put it on yourself?"

A gentleman, having an appointment with another who was habitually unpunctual, to his great surprise, found him waiting. He thus addressed him: "Why, I see you are here first at last. You were always behind before; but I am glad to see you have become early of late."

"And again," reports a committee of the Texas Legislature, to whom a resolution taxing dogs—males \$1 a year and females \$5—had been referred. "We think that the bill itself makes invidious distinction between the sexes. We are humanly, speaking, fully prepared to admit the superiority of the gentler sex; but we are not so sure that the difference is five per cent."

SIGNOR BLITZ had a bright little fellow on the stand to assist him in the "experiments." "Sir," said the signor, "do you think I could put the coins which that lady holds into your coat pocket?" "No," said the boy, confidently. "Think not?" "I know you couldn't," said the little fellow, with great firmness. "Why not?" "Cause the pocket is all torn out."

An eastern paper having had considerable to say about "raising chickens by hand," the Galveston News responds: "Such information is not needed at the south. The whole colored population know how to do it, and an enterprising freedman can raise more pullets in a single night, on his way home from prayer meeting, than that eastern editor could raise in a year with all his science."

LIES OF THE DAY.—A lie has no legs, and cannot stand; but it has wings, and can fly far and wide.—WARBURTON. With the adaptability of a lie, sin has many tools, but a lie is the handle which fits them all.—LORD BROUGHAM. A lie begets others; one lie must beatched with another, or it will soon rain through.—LORD THURLOWE.

"And the Parson made it his text that week, and he said likewise, That a lie which is half a lie is ever the blackest of lies; That a lie that is all a lie may be met and fought with outright, But a lie which is part a truth is a harder matter to fight."

EDITORIAL DEPARTMENT.

FOWL AND PET STOCK TRANSACTIONS.

It is well known that for the past twenty years a deep and increasing interest has been taken in what is termed Pigeon and pet stock generally; and as this interest continues to widen and enlarge, transactions in fur and feathered stock must proportionally be augmented, and with such a volume of business done, not merely in a state, but all over the civilized world, nine parts of which are prosecuted by letter, and by parties who are entire strangers to each other, it is surprising that more misunderstandings do not occur.

It is, however, palpable to all honest fanciers, that much chaff follows in the train of the wheat, who avail themselves of the temptation to impose upon the unwary for a season. Now the grand question arises, how to prevent or mitigate this evil. In cases of grievance or rupture between recognized brother fanciers, where is the talisman to adjust and reconcile? We know the press does what it can in exposing the delinquents, but the dishonest may reap a harvest by advertising before his character is known and his name entered upon the black list. This is a serious subject for the contemplation of our local and national poultry associations. We might here venture, as remedies, two propositions or suggestions for their consideration. In the first place, when there is a difference of opinion between two parties over a purchase or exchange, and the two parties cannot arrange a settlement, then let the case be referred to an umpire or commission, appointed by any poultry society they may agree upon, who shall adjudge the animals and the circumstances of the case and give a final decision, which shall be binding upon the persons concerned. Secondly, some system of permits or license to sell pet stock might be issued by the local poultry society of the town or city, or the nearest society to the place where the fanciers reside; and such a permit shall be considered a guarantee from such a society, or recommendation, we might say, that such person is honorable and safe to purchase of by letter, by any one at a distance, and the public generally. And subsequently, should such a member, in possession of such a license, be guilty of an alleged fraud, and he refuses to make an honorable adjustment, then the case might be referred to the president of the society that issued the license, who, after due consideration of the affair, finds the said member guilty, he shall forthwith degrade him from membership, and pub-

lish his name in the poultry journals of the United States and Canada, in a list which shall be denominated the "Black Roll," for a year; but should such a member earlier repent and pay all fines and dues contained in his sentence, then he may be restored to an honorable footing, as before. Of course, if this plan was inaugurated, parties not having such permits would be shunned.

But, to give a reasonable and candid view of this subject, we are far from looking upon it as a one-sided question. The honorable and square dealers everywhere know that the purchaser is not always the wronged party. The fancier frequently sends a second setting of eggs, worth from \$3 to \$5 per dozen, to appease the demands of a churlish or dishonorable customer, although he cannot ensure the eggs from the trials they pass through on the way. We knew of an instance that occurred where a superior trio of fowls was sold for something over \$100 to a gentleman living at a distance, who, upon their arrival, rejected them before removing them from the crate. The birds were promptly returned, and so was the money. Shortly afterwards, the would-be purchaser saw the identical trio on exhibition, fell in love with them, and begged to re-purchase them, but without success. Then again, the fancier is daily and weekly bored with all sorts of letters, half of them trying to get twenty-five dollar birds for three or four dollars. The following may be taken as a sample of some of them:

"Dear Sir: Have you got a trio of your — for sale? If so, scale me a trio that will reach 95 or over, and send me the lowest price."

And truly \$25 by some persons would be considered an exorbitant sum for such birds, and should any accident occur to them on the way, the purchaser wishes to send them back, while the fancier spends frequently immense sums to import the best birds from Europe that can be had there, and bears any loss, that not unfrequently happens, with patience and resignation. He goes to the expense of introducing fresh blood into the stock, from which not only he but others derive the advantages. We are not hasty to condemn a well-known fancier of honorable standing, but we do desire to see some means adopted whereby brother fanciers can amicably settle their differences without brandishing them to the public. "A good name is rather to be chosen than great riches."

CORRESPONDENCE.

HANOVERVILLE, PA.

MR. WADE:—

Would be much obliged if some one would give a short description of Creve Coeurs in JOURNAL, as they are something new in this vicinity.

PIGEONS.

MR. EDITOR:

My Pigeons, especially my White Fans, are covered with little lice; their flight and tail feathers completely infested. I have tried kerosene oil, but that does not do the business. They have plenty of water for bathing, and my place is whitewashed thoroughly, and they have good, clean, coarse sand in abundance. What would you advise me to do?

AMATEUR.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—**ANEMONE.**—We have in Wisconsin the pasque anemone; anemone patens which resembles the yam pasque flower. After a few warm spring days, it sends up a downy bud so covered with thread like leaves, that one would never suspect a bloom until the pale purple tulip-shaped flower appears. After blooming, its finely cut leaves grow. Its root is large and coarse, and loves a poor sandy soil. It bears transplanting well and makes a pleasing border, blooming with the earliest spring flowers.

Mrs. M. E. DOANE.

—**A CELTIC BATTLE-AXE.**—Recently, while Mr. W. H. Hood, artist, of Wigton, Cumberland, was engaged in sketching in the neighborhood of Canonbie, Dumfriesshire, he discovered in an open drain, half buried in soil, the stone head of a Celtic battle axe, composed of green stone, measuring $11\frac{1}{2}$ inches long, 4 inches broad, and $3\frac{1}{2}$ inches in thickness. This is half an inch thicker than the stone Celt found some years ago at Woolton, in Nottinghamshire, considered to be the largest Celt hitherto found in England or Scotland.

—The Newark and Clinton Horse Car Company have introduced an invention on the road whereby horses can be supplied with water while traveling. The arrangement, which is very simple, consists of a reservoir of water on top of the car, with rubber tubes leading therefrom to the bits in the horses' mouths, the bits being hollow and perforated with small holes. The driver can at pleasure open the tubes and cause the water to run into the mouths of the animals. Camels do better; they have reservoirs inside of them.

—The origin of the name "Kangaroo" is thus described in a recent work of Mr. F. Buckland: "When Capt. Cook first discovered Australia he saw some natives on the shore, one of them holding a dead animal in his hand. The Captain sent a boat's crew ashore to purchase the animal, and finding on receiving it that it was a beast quite new to him, sent a boatswain back to ask the natives its name. 'What do you call this 'ere animal?' said the sailor to the naked native. The native shook his head and answered, 'Kan-ra-roo,' which means in Australian lingo, 'I don't understand.' When the sailor returned to the ship the Captain said, 'Well, what's the name of the animal?' The sailor replied, 'Plaise, sir, the black party says it is a Kangaroo.' The boat has kept this name ever since."

—**A SPITTING SNAKE.**—There is a dangerous snake, not uncommon about Benjuella, West Africa, called by the natives *noja neje*, and by the Portuguese *cuspeira*. It is small in size, and remarkable from its habit of spitting when interfered with. The saliva is ejected to considerable distances, and is said to cause blindness if it touches the eyes. One of the snakes was captured by the natives and brought to where some English miners were at work. It was teased by a miner who was standing over the cage, which was on the ground, and retaliated by a discharge of spittle.

Some of the liquid entered one of the miner's eyes, and though the eye was immediately washed out with water it was very much irritated for several days. The snake was killed before any experiment could be made with it by the scientific superintendent of the mine; he has, however, no doubt of the miner's statement and that of his companions, corroborated as it is by the testimony of the natives and the Portuguese.

—**WILD ANIMALS.**—A correspondent of the *N. Y. Herald* recently states that the decks of the great ship which did duty as royal yacht were crowded with people, who displayed as much curiosity as though they were in the Zoological Gardens in Regent's Park. But few of the collection succumbed to the effects of the voyage. The tigers, indeed from all accounts, were particularly lively passengers, one of them, a young one, having given proof of its incapacity to appreciate confinement by biting off the hand of a midshipman. The visitors were conducted over the menagerie by the sailors, who took especial delight in showing off the proclivities of their pets. The snake killing mongoose was exhibited by one Jack tar, while another rumped around with a large black bear. The elephants were made lions of, and reaped plenteous harvests of cakes and oranges in return for the incessant salutations with which they greeted the visitors. Two little buffaloes, intended as a team for the carriage of the Prince's children, were objects of much curiosity, and they would no doubt make a sensation if "tooled" down the "ladies' mile" by the royal boys. The Osborne had on board the most interesting members of the show, in the shape of two baby elephants, of wonderful sagacity and gentleness, which, during the voyage, have been accustomed

to roam at will about the ship like big dogs. Their names are "Rustom" and "Omar" and the resemblance between them is so close that they can only be distinguished by the names on their collars. They worked their passage home by acting as ash hoisters, and when the Osborne entered the harbor on Thursday they took up their station with much gravity and decorum upon the paddle box beside the Captain, keeping up an incessant salaam in the direction of the chilly land for which they have changed their sultry clime.

Antelopes, Cashmere sheep, four-horned sheep, wild dogs, musk deer and an immense panther are among the remainder of the collection, which consists altogether of 134 animals and birds. They will find a temporary resting place at the Zoological Gardens, where a new tent has been erected for them. Tickets for the "Zoo," on Sundays, will doubtless be in great demand, for ever since the day when the royal menagerie at the Tower of London ceased to be one of the London sights, English kings and princes have not indulged in this ancient appendage of royalty.

A **FUNNY FELLOW.**—With body pertly erect, and its queer little eyes looking in opposite directions, the sea horse is the most grotesque little creature in marine life. It is only three or four inches long, but has more character and dignity than any animal I have ever had in my aquarium. Its head is shaped much like that of our common horse, the resemblance being made greater by the fins which project from the sides of the neck like ears. The general color is ashen gray, with almost in discernible spots of blue, and in certain lights various hues play over the body. The peculiar corrugated appearance of its body, together with the silvery metallic spangles with which it is studded, re-

Sea-Horses and Serpula.

mind one of the tiniest of knight-errants clad in a suit of mail. The dorsal fin, fringed and bordered with yellow, is a marvel of beauty; and the prehensile tail, with which the owner attaches itself to a fixed object, is used in wonderful fashion. The little fellow tires easily, and is obliged to rest often. The female sea horse is the most fortunate of mothers, the question of "Woman's Rights" having been settled centuries ago, for the model husband is furnished with a pouch in which he carries the young. When the eggs are ready, the female deposits them in the pouch without the least ceremony, and swims away, free from further responsibility. One would think it sufficient that the male should have to hatch the eggs; but his duties do not end here, for he is obliged to find nourishment for the young. The pouch contains a thick lining of fat, and upon this the little sea-horses feed until the parent concludes they are strong enough to take care of themselves, when they are unceremoniously forced out of his pouch into the water. They seem very bewildered at first, and do not appear to make comfortable use of surroundings, but after struggling for a moment or two they clasp each other's tails, and float about in a mass. The male sea-horse makes ready to expel his offspring with apparent deliberation. He will often attach himself to a piece of coral and make careful investigation, then glide to a piece of dead *Serpula*, and examine wisely; not being satisfied here perhaps, he will find an attractive rock, and conclude it is a proper place to introduce his children. He first fastens his tail firmly to the lower part, then presses his pouch against the side of the rock, and the little ones come forth.

The sea-horse is ridiculously curious, and examines carefully every new object placed in the tank. He does not turn to one side when particularly interested, like many of the finny tribe, but has an intent direct gaze. The eyes of a sea horse look in different

directions, and it has appeared to me that he can examine two objects at once without confusion of vision.

I have seen a shrimp nibble the tail of a sea-horse, and the deliberate and important manner in which he turned his head and looked down upon the shrimp, was very amusing. They can show quite an amount of indignation when imposed upon. A shrimp often settles upon the back of a sea-horse and rides about a tank, and the sea-horse will drive about in all directions to get him off. When not succeeding, I have seen them swim against the plank with all the violence of their little bodies, and thus free themselves.

Six sea horses have lived successfully in my tank at once. They were caught at Princess Bay. They were very shy at first and eager to hide among the green sea-lettuce, but were soon sufficiently tamed to feed from my fingers. I fed them with live shrimp at first, by breaking open the backs and presenting the exposed flesh. They would suck this all out at once, with a quick, sharp noise.

But this process of feeding was troublesome. I thought of *serpula*, and imagining how easily the sea-horse could suck the animal from the tube, resolved to make a trial of it for food. Remembering, too, that there were quantities of it where my sea-horses were caught, it occurred to me that it might be their natural food. I placed several large pieces in the tank, and from the knowing movements of the sea-horses, concluded that they recognized friends.

The *serpula* did not enjoy transportation, and for several hours kept hidden in their cells. The sea-horses seemed acquainted with their moods, however, and kept swimming about them and watching them carefully. After a time the feathery heads began to appear; but as soon as one came out it was devoured in an instant. I have since fed the sea-horses upon *serpula*, being obliged to replenish occasionally when animals would be all eaten out of the shells.—*Ida B. Roberts.*

PETS AND THE FATE OF SOME OF THEM.

BY HUON.

No. 6. THE PET OWL.

[Newly arrived Missionary in the Cannibal Islands to Native.]

M. "Did you know my friend, the late Missionary who died among you?"

N. "O yes, me knew him welly well."

M. "Know him intimately did you—Did he agree with your people pretty well?"

N. "O yes, me knew him welly well—me help eat him. Him agreed with me welly well."—*Report of a Missionary.*

A friend has imparted to me the following account of a "Pet and its fate," which I give as it was told me "nothing extenuating or setting down aught in malice."

"Some years ago," said my friend, "having some literary work I wished to finish without fear of interruption I took up my abode for the Summer months at an out of the way, country tavern, several miles remote from the busy city's noise.

My landlord was the owner of quite a number of pets, ranging from bears to canaries, and among others a long-eared owl (*Otus wilsonianus*), which had but one leg, and on that one the poor bird of wisdom went hopping about in such a ludicrous manner, that the creature became to me, at once almost, an object of interest. Inquiring into its history I learned how it lost its leg. My landlord informed me that as he was sitting on his porch one evening just after a storm, something suddenly cast upon him a flitting shadow, and in the next instant he heard the crash of breaking glass, which, upon inspection proved to be a large light splintered into many pieces by an owl, which was prostrate in the dining room, unable to fly further. The owl had evidently been attracted by a canary which was singing in its cage within the room, hence the intrusion. The canary was unhurt and safe, but the burglarious owl had, in contact with the glass cut one of its legs nearly off. "My first thought," said the landlord, "was to take the would-be robber and murderer (for I had no doubt it had come for my canary), and wring its neck—my next was to remember that the bird was but following out the law of nature—seeking its food where it could be found—and so in pity for its fearful mistake and its results, I determined to save its life, if I could, and place it among my pets.

Amputation, so nearly performed by the glass, was soon completed, and with some healing remedy and bandages you see the result; but I must say in conclusion, that "Burglar"—that's the name I gave him—has been more trouble, annoyance, loss, and plague to me than all my other pets put together. Sometimes I wish I had wrung the rascal's neck as I had at first intended." "Such was my landlord's story," said my friend, and he continued; "having but little to see or interest me in the few moments of leisure I could spare from my writing, I fraternised with this one legged pet owl which soon hopped after me in its ludicrous fashion, and became to me a most affable companion, as well as a great source of amusement in a place, which, as I have intimated, was not overstocked with that material.

Well, time went on, my work was nearly done, and so one day I told my landlord I should leave him after next day's dinner, at which time I requested him to have my bill ready, that I might pay and take my departure.

When the morning of my last day came, I missed my feathered friend, and for some time I searched for him, or her, I know not to this day to which gender my pet belonged—but all in vain,—I found him, or her not; though I hunted up and down. Finally the dinner hour came, and the dinner with it. I should have told you that I had my meals served me in my room, and when my dinner was brought up by Katy the neat serving maid, I found among the things a curious morsel of game, nicely cooked and

sauced, but which struck me as something strange inasmuch that it had no legs.

What kind of bird is this, Katy? I enquired, but just then she was suddenly called away, and I received no answer; and in the next moment, as requested, in came my landlord with his bill, and a bottle of currant wine (home made and excellent,) which he had brought to me as a parting present. Of course I invited him to help me drink it, and when he was seated on the opposite side of the table the following conversation took place:

Myself. Landlord—by the way, what has become of that pet owl which I was so fond of? I have been looking for it all the morning and can find it no where!

Landlord. (interrupting.) "I hope you have been satisfied with your accommodations while here?"

Myself. "Quite so. But the owl?—I am sorry I couldn't find the poor lame thing—I got quite attached to it."

Landlord. (still dodging the question). "We have endeavored to give you a soup, a stew, a roast, and some game every day, sir, and I hope you will find your bill correct; and the charges satisfactory."

Myself. (glancing at the sum total). "Quite so. But about the owl?" [You see a horrid suspicion came over me]—What could have become of it? Cats, you know will!"

Landlord. (still ignoring the questions). "I was much afraid that I would have no game for you on this your last day with us, and it seemed to me with all my efforts, I was likely not to have your favorite game dish for you, which you have just now finished with apparent relish, when fortunately—"

Myself. (horrified at the thought). "I have not eaten my pet? You did not kill that dear, one-legged, ludicrous owl for me?"

Landlord. "Kill it? Oh no, sir! I assure you I did not kill it!—I was about to tell you that, fortunately, it died some time during last night!"

"I paid my bill and departed from hostelry, never more to enter its doors, but since that time, I can eat anything set before me."

Such was my friend's story, and such the fate of the pet owl with one leg.

"To what base uses may we come at last."

A SPIDER CAPTURES A MOUSE.

The wonderful little spider which captured the mouse, and is elevating it into its parlor at Mr. Michael Gross's carpenter shop on Greatmen, between Elysian Fields and Marigny streets, of which we gave an account yesterday morning, is still busily engaged in its herculean task, and filling the numerous persons who visit it with amazement. This astonishing little insect is of the black species, and very small, a fact that renders the feat which it now performs the more marvelous. The mouse was accustomed, when on a predatory excursion, to emerge from a hole under the bench where the spider dwells, and pass into the carpenter shop, where the bench stands. The enterprising spider, who had no doubt watched for a long time the movements, laid a trap for the unsuspecting young mouse, and Monday morning, when it started out on its daily rounds, the little spider, who was on the lookout, tightened the thread which she had prepared for her victim, whose hind legs had been entangled in them as it passed out of its hole, and soon secured it. Immediately after the legs had been caught, the spider fastened another thread to the mouse's tail, and after several hours constant work, succeeded in raising the prey's hind quarters, and continued so doing till the tip of the mouse's nose only touched the floor. Having thus rendered it helpless, the little spider industriously set to work multiplying its fastenings. After a few more hours' labor, the mouse was raised an inch from the floor, the spider working as if with a pulley. In its terrible contortion to release itself, the mouse managed to sever the fasten-

ings around its hind legs, but so strong were the threads which suspended it in the air, and so securely were they attached to its tail, that all efforts to break them proved fruitless. Mr. Gross, taking great interest in the proceedings, left the spider undisturbed, and during almost the whole of Monday night, with several friends, watched its workings attentively. The little insect, after taking her position on her victim's tail, commenced manipulating the threads and working. Gradually could the astonished witnesses of this wonderful feat see the mouse creep up, and the threads, descending from their fastenings under the corner of the bench to the mouse's tail, increased in number, and during the twenty-four hours ending yesterday evening the threads had so increased that it became impossible to count them, and the mouse, which was still alive, though quite weakened, had been raised from one to three and a half inches from the floor. The spider, during the whole time of its work, sat on the mouse's tail, only leaving its position at long intervals, when he would cautiously creep down the tail to its roots and there feed upon the blood of the mouse. Then, resuming its position on the end of the tail, it would again begin its work. This unheard of capture of a mouse by so small an insect, and its ingenious manner of elevating it, has excited the wonder and admiration of thousands of visitors, among whom may be mentioned several scientific men and physicians, who assembled in large crowds at Mr. Gross's carpenter shop to witness the progress of the gigantic task which the little spider has undertaken and is successfully bringing to an issue. Mr. Gross will leave them undisturbed and carefully watch the result, as every one is anxious to see what the spider will do with his captive after it dies, and how far it will elevate it.—N. O. Picayune.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words descending and offering for exchange only, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"To EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the Exchange or Want column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

W. H. RATHBONE, Uncasville, Conn., has some choice Light Brahma chicks, hatched March '76, which he wishes to exchange for Black Hamburg or Brown Leghorn pullets, or young fowls; has also some choice White Leghorn cockerels to exchange.

W. C. EATON, Newark, N. J., will exchange a Magic Lantern, 125 slides. (cost \$200.00); also a Graves Incubator, for P. C., B. L., and Houdan chicks. Fancy points no object.

B. HULSE, Box 23, Allentown, N. J., will give Shepherd pups and Fancy Pigeons, for Golden Sebright Bantam Cock, or White Crested Black Poland fowls or chicks.

F. PEPPARD, Basking Ridge, N. J., will exchange 1 scroll saw, (Wallace), 1 press, \$100 worth of Type, also White Cockerins, for a good key, check, outfit, or learners' telegraph instrument. Write, stating what you want.

W. D. HUMPHREY, JR., Tarrytown, N. Y., would like to exchange a trio of Dominique Leghorn chicks, March birds, (Aaron Low stock), for a pair of Java Games, or Cooper's Work on Game Fowls.

E. M. BIDWELL, Natick, B. I., will exchange 1 pair Blue Owls, value \$6; 3 pair Black and Blue Tumblers, at \$3 per pair; and 1 pair Black and White Fans, value \$5, for a pair White Crested Fans, not akin, good breeders, and worth \$20.

WILLIAMSON, care of 64 E. Eager St., Baltimore, Md., has a beautiful Gordon and English Setter Bitch, (sire imported), stands well, sixteen months old, to exchange for a good cartridge revolver, White Barbs, Black African Bantams, or offers. Write and give full particulars.

J. E. WILMARTH, Lock Box 95, Taunton, Mass., would like to exchange Light Brahma fowls, or White Leghorns, for Fancy Pigeons. My stock is good. I want the same. Speak quick.

M. V. RLYENBURGH, Bay Shore, Suffolk Co., L. I., will exchange Imperial Pekin Ducks for a thoroughbred Beagle Hound, about one year old, or offers.

FANCER, Fox 233, Tamaqua, Pa., wants to exchange a 10-key Accordeon, 2 good Violins, 1 Show Case, 2 Parrot Cages, 1 Kitten Hutch, 1 Electric Battery, 1 Rifle, 3 triple Rowl Coops, 4 Single Turkey or Geese Coops, 2 Double Bantam Coops, wire fronts, 6 Light Brahma hens, 1 pair Earl Derby Games, "pit stock," 1 Red Bird and Cage, White Carriers, Red Barbs, White, and Colored Pans. Tumblers, and other, Fancy Pigeons, for Grey or Fox Squirrels, Talking Parrot, or offers.

CHAS. F. FREEMAN, 1914 North Fifth St., Philadelphia, Pa., breeder of Swallows, Turbids, and Owls, will exchange some of the finest Blue-winged Turbids, Solid Black Turbids, Black-tail Turbids, and fine bred Owls, for Red Swallows or Blue Swallows. They must be perfect birds in every way. Here is a chance for anybody to get good Turbids for good Swallows.

W. G. TODD, Concord, N. H., has six odd Turtle Doves—cocks—and would like to exchange three of them for hens of the same variety.

EZRA B. DIBBLE, New Haven, Conn., will exchange Light Brahmas, (see Advertisement), for a fine copy of Webster's Unabridged Illustrated Dictionary, or a Smith & Wesson Pocket Revolver, No. 32 cartridge, or others.

T. J. McDANIEL, Hollis Centre, Me., has extra high-bred Brown Leghorn chicks, to exchange for Corn, Wheat, Barley or Oats; chicks are fine young birds, and will be warranted to mature right. Write immediately.

W. D. BALL, Box 677, Plainfield, N. J., will exchange 2 fine crested White Fan hens, 3 Red Tumbler cocks, for an extra pair of Black or Blue Fans or Swallows, birds, or Ferrets.

H. S. CHAPMAN, Saybrook, Conn., will exchange 2 pair P. Rocks for 1 pair S. S. Bantams; 1 pair P. Rocks or 1 pair B. A. Bantams for Black Fans, Golden Schrigles, or Dutch Rabbits; Bee Keeping by Quimby (new), for Work on Pigeons or Rabbits.

W. J. EVENDEN, Williamsport, Pa., will exchange 1 trio of B. B. R. Game Bantams, and 10 chicks; 1 pair Silver Duckwing Game Bantams, and 4 chicks; 2 pair Red Carriers, 2 pair of Black Priests, 2 pair Runts, 3 pair of Blue Antwipers, 2 Black Carrier cocks, 1 pair Red Jacobus, for offers of anything that won't eat, or will sell.

R. F. FAIR, Clifton, Passaic Co., N. J., will exchange a Planet, Jr., Seed Drill, in perfect order, (used only half day), for first-class White Leghorn Hens or Pullets.

E. G. FLANDERS & CO., Manchester, N. H., have to exchange: two horse pistols, for Brown Leghorns, or others. Speak quick. Write on Postal cards, or any other kind of cards.

GEO. W. SCHEFFER, No. 21, South Second St., Harrisburg, Pa., will exchange stuffed calf, with 8 eggs, 2 tails, and 1 head, in glass case, for either Yellow Pouters, or Carriers, or Fantails, or good Water Spaniel with long ears.

FRANK R. HOWELL, Lancaster, Pa., will exchange Buff Cochins, three hens and one cock, 74 hatch, (Hester's stock), for White Leghorn hens. None but good stock wanted, same as mine is. Speak quick.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

DOYLE'S ILLUSTRATED BOOK OF POULTRY.—W. H. Rathbone, Uxessville, Conn., wants the above for two choice White Leghorn cockerels, Smith strain.

AUDUBON WANTED.—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

FANCIER, Box 233, Tanawqua, Pa., wants three or four Grey, or Fox Squirrels. Must be harmonious, as they must go together in one cage, either young or old. Will pay cash, or give Pigeons, Light Brahma hens, Coups, &c. 200 exchange column.

TIRED MOTHERS.

A little elbow leans upon your knee,
Your tired knee that has so much to bear;
A child's dear eyes are looking lovingly
From underneath a thatch of tangled hair.
Perhaps you do not heed the velvet touch
Of warm, moist fingers, holding yours so tight;
You do not prize this blessing overmuch,
You are almost too tired to pray to night.

But it *is* blessedness! A year ago
I did not see it as I do to-day;
We are so dull and thankless—and too slow
To catch the sunshine till it slips away.
And now it seems surprising strange to me,
That, while I wore the badge of motherhood,
I did not kiss more oft and tenderly
The little child that brought on me only good.

And if, some night when you sit down to rest,
You miss this elbow from your tired knee—
This restless, curling head from off your breast,
This lisping tongue that chatters constantly;
If from your own the dimpled hands had slipped,
And ne'er would nestle in your palm again,
If the white feet into their grave had tripped,
I could not blame you for your heartache then!

I wonder so that mothers ever fret
At little children clinging to their gown;
Or that the footprints, when the days are wet,
Are ever bleak enough to make them frown.
If I could find a little muddy boot,
Or cap, or jacket on my chamber floor;
If I could kiss a rosy, restless foot,
And hear its patter in my room once more;

And hear its patter in my room once more;
If I could mend the broken cart to-day,
To-morrow make a kite to reach the sky—
There is no woman in God's world could say
She was more blissfully content than I.
But, oh! the dainty pillow next my own
Is never rumpled by a shining head:
My singing birdling from its nest is flown—
The little boy I used to kiss is dead! —Ex.

(For Fanciers' Journal.)

DEVELOPMENT OF A NEW FEATURE IN CHELONE GLABRA.

BY THOMAS G. GENTRY.

Nature is ever exhibiting new phases of her wonderful character, which to the scientific mind are fraught with peculiar interest. Evidences of this fact meet us at every step, and invite our willing efforts to shape them into form.

While thousands of discoveries are annually made in botany, and recorded in the literature of the day, it is gratifying to know that there are inexhaustible treasures still in reserve, waiting to reveal themselves to the patient interrogator of nature. There are laws yet to be discovered, and effects to be associated with their proper causes. There are rudimentary appendages to be accounted for, irregularities of plant development to be considered, together with the peculiar combination of circumstances conducive thereto.

While studying the morphology of the floral parts of *Chelone glabra* which is in bloom with us in the months of August and September, a rather curious anomaly came to notice. Growing upon a single stalk were five flowers, three of which in addition to the four perfect stamens, and the single rudimentary stamen so eminently characteristic of *Scrophulariaceae* plants in general, were possessed of a fifth perfect stamen. These are remarkable occurrences, since they evidence a tendency upon the part of certain plant species, under favorable conditions, to assume new lines of growth in preference to existing channels.

Why this tendency upon the part of the plant to produce outright new stamens, instead of expending its excess of growth force, the inevitable result of increased nutrition, in the perfecting of the rudimentary stamen? If the rudimentary stamens in *Chelone* are organs in process of development, how does it happen that the increased vigor which the plant has newly acquired, is not applied to the part which has apparently been determined upon in the secret workings of its economy?

No fact is better established than that rudimentary organs in some cases are evolved in obedience to an acceleration of growth force, and that this remains constant for a greater or less period of time, until changes introduced into their environment, form an increase of plant vigor which is utilized in their perfecting.

Numerous facts might be cited to sustain the above position, but time will only allow the barest recital of two. In the summer of 1872, while perambulating the rural districts in quest of botanical specimens, the writer met with a few plants of *Ranunculus fascicularis*, one of our common buttercups, in which the corolline series of metamorphosed leaves was double, similar to that condition which prevails in the double buttercup of our gardens. In double specimens of flowers, this serial repetition is mainly due to staminal metamorphoses. In the *Ranunculus*, as is well-known, a normal corolla is formed of five petals with *nectariferous* scale at the base of each. In the opinion of Prof. Lindley these appendages are but barren stamens.

In the buttercup under consideration, instead of cases of genuine staminal metamorphoses, the writer observed for the first time, double flowers, the evident results of scale transformation. These scales being stamens undeveloped and open, or petals in a rudimentary condition, an excess of growth force would certainly be directed towards bringing them to a state of perfection.

As a second proof I might quote the observation of Thomas Meehan upon an orchidaceous plant, *Bletia Tankervillea*, which is chiefly found in greenhouses and conservatories. Mr. Meehan discovered on the outside at the base of the three exterior petals of a flower of the above species, a liquid exudation from a small gland. He thought it was highly probable that these glands were rudimentary spurs, which a more vigorous nutrition would tend to develop. In this connection it might be further remarked that a few weeks subsequent to this announcement, an English scientific periodical reported the discovery of flowers of this identical species with perfect spurs; another striking proof of the accuracy with which scientific predictions are often made.

It is plain from the foregoing statements that in some cases, rudimentary organs are only the stages by which higher development is attained. When it is remembered that every organism or part of an organism, is only reached gradually in the majority of cases, although there do seem to be some exceptions to it as a rule, common sense should not revolt at the idea even though it conflicts with the doctrine of teleology. It is time that creation, or rather evolution, is not a "dead letter," but a real substantial agent, ever reaching to higher progress.

If rudimentary parts are organs on the road to higher development, it seems just to conclude that in the case of *Chelone*, we have a clear demonstration of the truth.

But facts are stubborn things, as they prove to be in the present instance. The increase of growth force in the plant's economy, instead of being directed into the old tracks, marks out a new channel for the exhibition of its powers.

If rudimentary appendages are "organs in process of development," according to the theory of Prof. Cope, it is equally true, as the same authority testifies, that they are "organs in process of extinction, occasioned by absolute or complementary loss of growth force." Examples might be given by scores to prove the truth of this theory, but I forbear. The question that concerns the writer at present is, does the rudimentary stamen of *Chelone glabra* come under this category? If so, it is the part of wisdom to conclude that in some of its remote progenitors, it performed an essential function in the flower's economy, and that having served its time and purpose under the old regime, it is now no longer necessary, and through lack of vitality has dwindled down to its present status.

But do the facts countenance such a theory? I apprehend not. If through lack of growth force the stamen has reached its present degradation, methinks under a better condition of affairs approximating that under which its remote ancestors flourished, it would cease to deteriorate, and under the ameliorating influence of increase of growth force, would tend to retrace its backward steps. But we find a different aspect of the case. The rudimentary stamen remains as it was, and the plant expends its augmented vigor in the development of a fifth stamen which is perfect in the minutest details of structure.

There appears to the writer a choice between two theories wherewith to account for this anomalous circumstance, in anything like a satisfactory manner:—Firstly—To assume that the rudimentary stamen has so far deteriorated in its character as a stamen, as to render it utterly impossible for vitality to operate upon its structure in the line of development. Secondly—That the imperfect stamen is intended to play a role in the flower's economy, which a perfect stamen cannot assume.

SPARE THE BIRDS.

"The way of the transgressor is hard," is a text on which few of us have not heard sermons. Although generally, if not always, applied to crimes against morality and spiritual life, it has a wider range, and is equally applicable to offenses against the laws of nature.

Avarice, greed, and selfishness in various forms have depopulated our streams of fish, and are even now at work with similar results in the bays and inlets of our Atlantic coast. To repair the loss of food of this kind, thus entailed upon us, governmental Fish Commissions have been appointed, with large expenditures of money, to restock the streams, and laws with heavy penalties are passed to prevent obstructing the water ways by dams, and poisoning them by the waste from the manufactories. The same evil is going on with our birds, which are rapidly disappearing, and in their stead come woeful insect plagues, the natural consequence of man's disregard of that law of equilibrium which exists every where in nature.

We need no better illustration of this than the present locust or grasshopper plague of the West. We confess to but little sympathy with the sufferers. It may appear hard-hearted to say so, but they largely deserve the losses they suffer, for such of them as have

not been active participants in the willful slaughter of the grouse have rendered themselves scarcely less guilty by their apathy and want of public spirit in not providing proper legal remedies and restrictions. Do not think that we speak too harshly on this matter. It is a well-known fact that these locusts come from a section of country in which grouse abound, the eggs and larvae of the locusts forming a large, if not the main, supply of food to the birds during the spring and summer months. Professor Riley, of St. Louis, the State Entomologist of Missouri—than whom there is no closer observer or better authority upon the habits of insects—estimates that one grouse will in one season consume the eggs and larvae of locusts enough, if hatched out, to destroy one hundred acres of crops. When, therefore, men are allowed to trap these birds to the extent of hundreds of tons weight every season, is it any wonder that people are plagued with locusts? They have their choice—grouse or locusts; if they choose the latter, they should not complain.

It is stated that nearly nine hundred tons of these birds were received in Chicago last winter, and such was the glut in the market that immense quantities were fed to the hogs or thrown into the lake. Allowing that all that were killed amounted to nine hundred tons, the average weight of each bird being two pounds, there were 900,000 of them, which, according, to Professor Riley's estimate of their insect feeding, would have consumed the eggs and larvae of locusts sufficient to have destroyed the crops on ninety millions of acres, or three times the area of the State of Pennsylvania.

In proportionate extent is the damage done by the destruction of other birds. All over the country men and boys may be seen stalking about with guns in their hands, ready to shoot any bird, however small, even though it be but a wrn. Is it any wonder that we are afflicted with curculio, currant worms, rose slugs, cabbage worms, cock chafer grubs, and other insects that destroy our fruit and other crops? Plums, apricots, nectarines, and cherries, which were formerly raised in abundance in and around New York island, now can hardly be grown at all.

Many stupid and foolish prejudices exist against some birds. Take the robin, for instance, which is almost universally charged with stealing cherries. We have watched him closely, and found that in nearly all the cherries which he had bitten were the marks of a worm or grub, which he had extracted. If he occasionally takes a few perfect fruit, it is little compared with the good he does. Now an outcry is raised against the English sparrows, which are accused of all sorts of wrong-doings, but whose peccadilloes are nothing when set against their services. Most of our readers can recollect when every large city in the country was so infested with span worms or caterpillars as to render the streets almost impassable that were shaded by trees. Now they are scarcely ever to be seen, thanks to the sparrows, which destroy the eggs of the moth or butterfly almost as soon as laid, their microscopical eyes enabling them to detect them in the deepest crevices of the bark. It is in this way that most birds are such destroyers of insects; they are all passionately fond of eggs, and eagerly devour them. They eat comparatively few caterpillars or butterflies, but are fond of such larvae or grubs as are found in the soil; hence frequent stirring or hoeing the earth has the advantage among others of exposing the larvae of any insects that are in it to the birds.

In our own little garden we never allow a bird—not even a crow—to be molested, and do all we can to encourage them to visit us; and although we are close to the city (we might say in the city, for there are close blocks of houses within a few hundred feet) we are visited every season by robins, cat-birds, woodpeckers, kingfishers, bobolinks, yellow-birds, cedar-birds, wood-doves, wrens, snow-birds, crows, sparrows, and others, so that there is scarcely a caterpillar to be found on the premises, and but few other insects, and these to no troublesome extent. The birds seem fully to understand that they are welcome, and often amuse us by their apparent assertion of their rights of proprietorship, among other things often driving our pair of cats into the house or other place of shelter, flying at their heads and pecking at their eyes until the cats are glad to retreat.

We therefore urge our plea on behalf of the birds, for we feel certain that are long, if their present wicked destruction goes on, we shall be so plagued with insects as to make the cultivation of many crops, especially fruits, almost impossible. The evil will become so great as to require legislative action to protect them, and we shall have to appoint ornithological commissions to restock the country, as we now have fish commissions to restock our streams with fish.—*Harper's Bazar.*

POULTRY DEPARTMENT.

WILD TURKEYS.

A subscriber to your valuable paper desires me to give its readers my experience with "wild" turkeys, and wishing to aid my fellow farmers by any means in my power, I gladly give my experience, limited though it is.

Several years ago an uncle brought from the far West a pair of turkeys, which had been captured and tamed. Their offspring proved very hardy and prolific. Last season I secured a trio, and this year gave them a trial. I found them better than I expected. The severe cold and wet weather of last spring destroyed many flocks of common turkeys, but, with one exception, which I think was owing to gross mismanagement, all the flocks (several in number) of "wild" turkeys endured the storms, and came through in good condition. They are blue-black, tipped with white, and are a handsome bird to look at. Having a rich gloss, they make as beautiful an appearance as the peacock. Their most valuable characteristics are hardness, large increase, fineness of bone, and last, but not least, quietness. Strange to say, they have not the wandering habits of common turkeys. The failure alluded to above, was this: We had some very fine wild turkeys that would weigh about five pounds each; the supply of corn meal failing, we gave them a few feedings of corn, oats and rye ground together, equal parts of each. Two of the lot soon died. Do you think it was the rye that killed them? Will ground rye kill turkeys and chickens?—*Country Gentleman*.

THE PEACOCK.

Nobody ever passed by a farm-yard where this domesticated bird is spreading his plumage, without admiration. Nor can we pass him by in our own description of the feathered tribes, without loss.

There are four species of the peacock. Two are found in Asia, one in Africa, and one in China. Our domestic peacock came originally from Asia. All these species are of large size and of great external beauty.

The crested peacock measures about five feet, including body and tail. The body is only a foot and a half long, while the tail is three feet and a half—"more sail than ballast!" Common prudence would require that this animal should keep near the harbor in stormy weather! Its head is very small, but plumed and crested; the neck is long and small, tapering most gracefully from the breast upward; the wings are short and rounded, with the sixth quill the longest; the tail is composed of eighteen feathers long and rounded, which in the male is concealed by the greatly lengthened coverts. This beautiful bird is elegant in form, graceful in movement, and clothed in a plumage resplendent with tints of green, golden, bronze and blue. Its long tail coverts, which it often spreads like a fan, are brilliant beyond description, with their metallic hues, white shafts, velvet black center, and bright terminal eye spots. Who has not seen the peacock display itself in public or private parks. And the wild species are said to be even more beautiful than the domesticated.

Griffith says of these birds: "We find in their incomparable robe all that glitters in the rainbow, and sparkles in the rivers, the azure tints of the heavens and the emerald of the fields." Some are more or less variegated, and occasionally one is found entirely white.

The peacock weighs about the same as a turkey. His flight is low and heavy. The female lays from twelve to twenty eggs once a year and no more. But we find illustrated in the peacock the old proverb: "That all good things are not given to one." He is beautiful beyond comparison in plumage, but horrid in song.

A dismal and even shocking scream is all he can utter. His legs are black and homely. He is a voracious eater, devouring plants, seeds and insects without distinction. In the neighborhood of gardens and planted fields, the peacock is an intolerable nuisance. So disgusting are his habits and bad his conduct that he finds but one companion (the turkey) in the farm-yard.

We can trace the history of the peacock back as far as the days of Solomon. He was imported from the East, in order to gratify the taste of that monarch, for the beautiful in nature. In the days of luxury and extravagance among the Romans, the peacock was held in the highest estimation as an article of food. He was so popular among kings and princes that he became a royal bird. There was a time, when in Greece, a pair of peacocks cost more than a hundred dollars in our money. It is said that when Alexander the Great was in India, he was so struck with the beauty of this bird that he laid a heavy penalty upon those who should in any way injure him.

Like the votary of fashion and folly who seeks her chief enjoyment in the public streets or giddy throng, the peacock is fond of display and admiration. But let us remember he wears more stars on his spangled train, than he carries brains in his head.—*Vermont Farmer*.

A DEMOCRATIC HEN AND A REPUBLICAN CAT.

Our County Treasurer, Capt. Fry, has a pair of pets which have lately developed alarming political tendencies, and which should certainly be investigated by a committee of the House. The first, is a hen which has existed in a state of comparative happiness until a short time since, when she became a victim of misfortune, and her happiness was wrecked. She hatched out a brood of chickens, and three of them were of an unmistakable black. From the very first, Biddy was disgusted with her dusky offsprings, and would have nothing to do with them; she was a hen of the purest Caucasian blood, and evidently considered this a case of involuntary miscegenation. Whenever the unfortunate Africans came near her, she would cackle in noisy protest, and her face, as far as a hen's face is capable of expression, would take on a look of deepest disgust. At last, regardless of the majesty of the law, as evidenced in the Fifteenth Amendment to our Constitution, she kicked them out of the home nest, and turned them adrift upon the mercies of the cold world. And this is where the Republican Cat comes in. Capt. Fry has, in his second pet, a large male cat, who, previous to this time, has taken no part in politics. Thomas is a quiet, stay-at-home bachelor cat, and his musical voice has never been lifted at the midnight caucus from the tops of woodsheds, in noisy protest against some feline Ben Hill or Proctor Knott, no it has not! It is evident that Thomas has a mission in the world, and for this mission he has been keeping himself, his mission is to father the hapless chicks which the Democratic hen refused to mother. Strange as it may seem, no sooner had the mother discarded the chickens altogether, than this intelligent cat noticed it, and at once took them under his protection. He seems entirely bound up in them, sees that they are fed, and at night he lies down and gathers them with his paws closely to his soft, warm fur, where they sleep contentedly until morning.

This is contrary to all cat traditions, and is a singular but well authenticated case. Capt. Fry is living in our midst, and the facts as given above will be vouched for by hundreds of the citizens of York, Pa.—*Evening Dispatch.*

(From Journal of Horticulture.)

THE EXHIBITION DORKING—NO. 12.

BY T. C. BURNELL.

SILVER-GREY DORKINGS.

THE SILVER-GREY DORKING is really a beautiful variety, and combines the useful points of the Dark Dorking with most attractive plumage. It is to be regretted that this breed is so little patronized, as I am sure no other purely fancy breed can compete with it where fowls have to find their own food; nor do they ever look to greater advantage than when working hard for their living in a hodge-podge or homestead.

The shape of the *Silver-Grey Dorking cock* differs in no respect from that of the Dark Dorking: the difference is solely in the color; and as this is a fancy breed, color is of greater importance than in the Dark variety. The comb of the Dark Dorking may be either double or single, but the comb of the Silver-Grey should be single. This is well recognized, though I have never seen it mentioned. The plumage of the Silver-Grey cock must be solely of black and white feathers, any red or parti-coloured feathers being a disqualification. The neck hackle should be a clear white, but a slight pencilling of black down the center of each feather is allowed, provided it does not produce a dark appearance. The back, shoulders, saddle, and saddle hackles should

DARK DORKING HEN.

also be of a pure white, while the breast, tail, and thighs should be black, any white in these parts being a disqualification, except on the thighs, where a little grizzling in an old bird will pass. The black wingbow should be cleanly cut, and this makes a pleasing contrast to the white of the remainder of the wing.

The plumage of the *Silver-Grey hen* is exceedingly pretty, the whole of the body, feather, and wings being of a clear silver grey color, while the breast is a rich robin red. As in the Dark Dorking, the shaft of each feather should be distinctly white; only, in the Silver-Grey variety, this should not extend to the wings and shoulders, or it rather spoils the general appearance. The neck hackle should be white, with a narrow and distinct black stripe down each feather.

Although good Silver-Grey hens are by no means easy to breed, the cocks are far more difficult to obtain perfect; and I often think when I see judges withholding prizes in the Silver-Grey

SILVER-GREY DORKING COCK.

classes while they give prizes to Mealy Cochins and White-throated Brahmas, that they do not make due allowance for the very great difficulties which Silver-Grey Dorking breeders have to contend against.

By far the worst point in a Silver-Grey cock is a yellow hackle or saddle: it spoils the whole beauty of the breed. The smallest speck of white in the breast of the cock or in the tail is considered a disqualification, though I would far rather see this than a yellow hackle. The back and shoulders must be free from red or chestnut feathers: this is positive. The ear lobes should be red.

The defect most difficult to avoid in breeding the Silver-Grey hens is a rustiness or dullness of the plumage, especially on the wings. Birds showing this defect should be avoided either for breeding or the show pen, as cocks bred from them would be sure to breed rusty-winged pullets. I should not discard a hen altogether if large and only slightly ruddy on the wing, as this will wear away a little with age; but a white breast or tail in a cock will infallibly become worse with the moult, though in the cockerels the hackles become lighter up to about seven months old.

The Silver-Grey Dorking seldom or never attains the size of its darker brother; but cocks of 10 lbs. in any breed are quite large enough for all useful purposes, and I should be glad to see the judges look more to feather, shape, comb, and feet than to mere size. "Sooty feet" are not uncommon, and they must be carefully avoided. I have seen it remarked that the "sooty" feet now so common in Dark Dorkings have been caused by the over-breeding for dark feather; but if so, how is it that dark feet are quite as common with the Silver-Greys?

To breed Silver-Greys, perfect birds must be obtained, though they be small; and the importance of obtaining cocks of a good strain cannot be over-rated. Birds of different strains sometimes produce very badly-colored chickens if the two strains do not amalgamate or "nick," as it is called; and in commencing a strain it will be far better to procure the cockerels and pullets from the

same yard, and afterwards to buy hens of the correct color to cross with, as by this means size may be kept up with less danger of the whole yard being spoilt.

To obtain early chicks it will be necessary to breed from cockerels, as I have found from painful experience that two-year-old cocks are not to be trusted till the warm weather appears.

The RED-SPECKLED DORKING is now almost obsolete, having given way to the more fashionable Dark and Silver-Grey varieties. Specimens may still be seen in the farmyards of Surrey and Sussex, but of no great excellence.

The principal peculiarity is found in the hens, which are of a brown or chocolate color, spangled all over with distinct white spots of the size of a large pea, giving them the appearance of having been out in a fall of snow. This color is, I think, more curious than attractive. Cocks to match such hens should have a good deal of red and chestnut on the back and shoulders, their breasts should be spotted with white or red, and white in the tail is not objectionable. I believe they are a hardy breed and very readily fatten.—*Country Gentleman.*

(For Fanciers' Journal.)

COMMENCEMENT EXERCISES.

REPORTED BY YOUNG BREEDER.

[Continued from No. 30.]

Ped. Well! I declare, you two are so nearlly alike, I can hardly tell you apart.

Zero. *We's twins.*

Ped. Well! If there's really two of you, please bear in mind when I call Zero you need not rise Mr. Ed., and when I order the Ed. to rise, Zero must remain seated. Zero! take your fingers from your nose, and tell us who is this Y. B. you are quarreling with.

Z. He is the most provokingest little cuss in the bizness. "My clerk," "Uriah Heep," (who does all my writin' for me) says Y. B. has got a red head, "in some others says it's only well re-(a)d 'n hair thin, perhaps he wore it off carrying the Standard in his hat.

Ped. What makes you look so collapsed to-day Zero?

Zero. Y. B. stuck a pin inter me, an' it was all Uriah an' me could do to "hold myself together," the time we "set up all night" to git that last article ready for the *Bulletin*.

Ped. One more pin-hole would finish you, we should then be obliged to bury you, with military honors, and inscribe on your head-stone—"So old, so tough, but so loyal."

Zero. Don't let them soldiers fire off any guns round there, tell 'em to snap caps, for I'm a hum guard, and don't know nothin' about powder, except the kind my Sal an' the barber uses, an' have put on Y. B.'s. "So young and yet so (un)fair." I'm one of the faithfulest an' loyalest fellers you ever seed. When I was a hum guard I didn't leave town till the rebs came, then I only visited my uncle a few days.

Ped. Are you of the opinion that it is a very easy thing to ask questions?

Zero. Yes sir, an' what a soft job the feller must have had who writ the cattykism.

Ped. What is your definition of loyalty?

Zero. It's an old saying that "a hoss can be led to water, but can't be made to drink." I call such a hoss disloyal; now I'm the hoss which *can't* be led to water but *can* be made to drink. So I'm a loyal hoss, and who ever heard of a hoss which was both loyal an' willin'. It's money to drink of that Standard just now. Heep too says, "we ought to be humble," and that's what we call bein' loyal, and if ever a time comes (don't s'pose it will) when the old Standard wants me for a friend won't I give it some more loyal kicks?

(Chorus! "Oh, dont we seem to like it?")

Ped. Zero! you have been occupying valuable space in making personal explanations over an assumed name, also taken particular pains to deny things no one has accused you of. No one has intimated you were a judge at Brooklyn Show or any other show, or an exhibitor at Brooklyn, and what is it? no grudge against the Standard? Do you want a taste of this lath? If not, be more careful in your assertions.

Zero. Well! It aint much of a grudge anyway, an I *ain't hurt nothin'*. The trouble with the Standard an' me is it *don't fit my flock*, and Uriah thought as we were a drawin' up papers we'd better put in a "ginerall denial." Another trouble with the Standard is it's too little, don't cost enough, and is too plain, and when as Ed. says, "they have succeeded in makin' it as plain as 2 and 2 make 4," how in thunder's a feller to git any premiums at Scrubtown shows? Time was, when a feller could help a friend, but now with their scalin' cards, which they insist on tackin to the coops, a judge has got to understand his biz an' tend to it. We can't have no private understandings with anybody, but what some specimen of trundle bed trash like Y. B., (an there allers plenty on um watchin' a feller,) comes up and *wants to know* what we cut them pints off fur? and we have to tell 'em *if we know*. Oh! that Standard is a bad egg. It should be more scientific. Somethin' these fellers couldn't understand without a dictionary; and as a muddler it's a complete failure.

Ped. Zero! if you wish to know what "color" means when spoken of in connection with Light Brahmas, look on page 98 of Mr. Wright's "Brahma Fowls," there he says: "In breeding Light Brahmas it is very necessary to secure a sufficient amount of *color* in the parents," &c., &c. And is it possible after swallowing the amount of "nigger on toast" you have for the past fifteen years, you have not yet discovered it? As to whose offering you are, I presume it's the only thing on earth you are not fairly booked up on. You say you *paid* for two copies of the Standard; why did you do this?

Z. I sent "my clerk" Uriah for 'em an' the man told Uriah that he wouldn't trust us.

To be Continued.

THE CHICKEN BUSINESS IN FRANCE.

A French paper publishes some interesting statistics about the profits of chicken raising in that country. There are 40,000,000 hens, valued at \$20,000,000. This is the main capital of the business. One-fifth are marketed yearly for the table; bringing \$4,000,000. The annual production of chickens is 80,000,000. These are worth in the city markets, \$24,000,000; and \$2,000,000 are added for the "extra value of capons and fatted hens." The production of eggs is estimated at \$48,000,000; and the total value of eggs, chickens, capons, and hens sold every year in the market, is reckoned at \$80,000,000. This is equal to \$2.22 cents a year to every man, woman, and child in France. At 25,000,000 of bushels, as the average wheat crop of California, worth \$1 per bushel, it would require three crops and a half of our wheat staple to equal in value one year's production of eggs and chickens in France. From these facts the reader may learn why the French were able to respond with such alacrity to the demand of that nation on its people for a loan of \$800,000,000 two years ago. They are frugal and have learned the high art of turning trifles to great account. No country in the world presents equal opportunities with California for immense profits in this same business of producing eggs and chickens for the city and town markets. They always command a very high price and sell for cash on the nail. The popular objection to it is that it is a small business; but the man makes the trade respectable, and not the trade the man. Diocletian, the gardener, was quite as respectable as Diocletian the Emperor.

(For Fanciers' Journal.)

1916—OR WHAT IT THEN WILL BE.

BY G. O. BROWN.

[Continued from No. 31.]

"Lemme see; we used to deal with Bicknell—is he still living?"

"Oh yes! and still breeding chickens, with the same splendid reputation he used to have. You know now we hatch no chicks with hens—all hatching is done with a *Halsted Success Incubator*. There are also firms that make it a business of hatching, for the trade, with these incubators. You give them a dozen eggs, and pay seventy-five cents, and they put them in a box made of wire, lock it up, and give you a key that has the number of the box on it. When they are due, you call, state your number, and take the chicks from the box yourself, and they are generally raised by Williams' Artificial Mother."

"That's something new again!"

"Oh, no; Mr. Williams invented the best artificial mother, I believe in 1882, but would not get it patented, and established a manufactory and placed them in the market at cost of production. They burn carbon gas."

"What's that?"

"Carbon gas, why that's gas made from water. We have to pay seventy-five cents for a thousand feet. It's taken the place entirely of coal gas."

"My old favorites, the Light Brahmas, what is the strain now most noted?"

"The Melrose Centennials, introduced in 76 and 77 by Burnham."

"Not by Geo. P. that used to be so renowned, and whose success everybody was jealous and envious of?"

"Yes, the same George, but before he passed away the fancy had to acknowledge that he was not only one of the most genuine fanciers, but that his knowledge of the chicken world was greater than any other known in the fancy. All the honors—that many tried to wrest from him—were at last acknowledged as duly merited."

"I allus know'd he was doin' more in his quiet way, to elevate the fancy, than a host of breeders that paraded their names with everything they could write up—what's that a balloon going up there?"

"Oh! my, no, that's a *Pouter* pigeon. The Pouters have improved wonderfully since you saw them. The best we now have are the 'Becker' strains—many of them are 40 inches long. When they blow up, they contain sufficient air to float themselves up like a balloon—same as you see that one of Slimuns' there going up now. Now he'll go up a long distance, blow off a little, and let himself down gradually, without even unfolding his wings."

"Wall! but that's an odd looking thing anyhow."

"It may seem so to you, but we are so accustomed to it we don't notice the change."

"Have the Tumblers changed much?"

"Come in and see ours." There, pull the door to after you. You notice what perfection they have been brought to; they are no larger now than robins, and their plumage is perfect as Hamburgs. Those brilliant beauties there on that soap box, are from the celebrated Gaddess strain of Almonds—considered the finest strain of Almonds in the world. There—now just see, aint there style—perfect?"

"Those little half-grown owls—those white ones, and full feathered too, they're nice."

"Half-grown? why Dusenberry, they're three years old, and I consider them too large. What I call *owls*. They're the genuine Mordecai strain, perfect in points, and smallest in the world."

"They're wonderful. I don't see any Barbs in your loft."

"No, I don't breed them since they got to breeding them with

wattles so heavy, the old head beauty is lost entirely. The Trumpeters are now very perfect, have been bred down in size a little. The leg-feathering, and rose are now bred in great perfection. The wattled Carriers are larger, with immense wattles, and iris very large. The Antwerp Carriers are the wonderful birds of the fanciers now. All poultry publications own lots of them, and the reports of all the exhibitions are forwarded by Antwerps—so the reports of the shows are out generally in the next day's publication.

The first great flight was made by John Van Opstal, from Chicago to New York on June 21st, 1878, his Antwerp cock, "*Buffalo Zephyr*," having performed the unprecedented flight of flying it *between sun rise and sunset*. The greatest flyers we now have are yet known as Van Opstal strain. You used to be a great admirer of good Jacobins. I haven't seen any as good as we used to have, in thirty years, they've kind o' run out."

"How about the other toys? You've got my curiosity excited."

"Well, they're not much different from what they used to be. How many feathers did a good Fan used to have, when we were together?"

"Twenty-six to thirty-two I think, if I remember true."

"Yes, now I remember. Well now they should have fifty-four to sixty. The handsomest toys we now have are the '*Colells*.'"

"The '*Colells*!' why I never heard of them before."

"Didn't you, lemme see. I guess they were introduced since you left; they were first known as *Berlins*: but Mr. Colell in New York city, one of the most enthusiastic fanciers, imported some, and managed to breed to so much more perfection and beauty than the original importation, that he established a distinct variety which were soon after called in honor to him the '*Colells*.' But come in the house, and look over the 'new Standard'; that will give you an idea of the great changes both in fowls and pigeons."

"Go to thunder, as I used to say, *new standard*; you was fighting about that book forty years ago when I left, and the idea of a pigeon standard, too."

"Why, bless your ignorance, this I mean is the *International Standard*, and gives the full points on fowls, pigeons, dogs, rabbits, &c. Now, to show you how improved some of your *old* expressions are, notice the different language used; for instance your '*go to thunder*': now instead of *simply* saying go to thunder, we say: "Take your departure to the abode of the reverberating echoes of heaven's artillery," and "never enumerate your juvenile fowls until the period of incubation is fully accomplished," is 'Don't count your chicks till they're hatched,' another favorite expression of yours, 'he knows which side his bread is buttered on' is now rendered thus: 'He is perfectly cognizant on what particular locality the farinaceous concoction designated the staff of life, the oleaginous product of the dairy is dispensed.'"

"Wall, things are changed—how about the dishonest fanciers, are they as plenty as they used to be?"

"Oh, no; the Fanciers' Protective Association hunts them all up, and all cases are speedily investigated."

"Wall, that's the way it should be. Let me read the *International Standard*, and I am ready to die."

July 25, 1876.

THE GOOSE NUISANCE.

It is easy to make everlasting enemies of millions of careful and worthy housewives by telling the exact truth about the unprofitableness of keeping geese. Most of the men folk would agree with me, and that is some comfort, for I propose to oppose the impolicy of growing geese, either for their feathers or carcasses. I do not know whether the old superstition that "a goose's foot poisons land" has any foundation. It looks very much as if it had, for it is certainly impossible to grow any crop successfully where

geese are allowed to run. They eat down the tender blades of young wheat, and it does not come up again vigorously, as it does when pastured by other animals. I have often known one or two acres thus destroyed near the barn, and when a flock of geese only occasionally visited it. Corn, oats, and barley are equal sufferers. Clover is injured worst of all. A year ago I got the geese where I thought they could do no damage. They were pasturing and fattening in fall on a piece of young clover, fed liberally with corn and having plenty of water. Last spring two acres around the shed where they kept mostly, were eaten down as bare as the middle of the road, and have been only covered by weeds the past summer. I might about as profitably have turned them on the crops during the growing season.

If there is any profit in geese, it must be in keeping them shut up in some enclosure where there is plenty of water, and feeding them whenever needed on grain. Letting geese wander over the farm, living on what they can pick up, is an intolerable nuisance, unless a farmer chooses to make geese his only crop. There may be locations where nothing else can be grown, and there it will pay to keep geese. In a recent work on English Agriculture, I notice one note-worthy sentence: "The raising of geese and growing of feathers for market has lately much decreased, owing to an improved system of farming, which makes them less profitable than other crops." This I think tells the whole story. With a careless, slipshod agriculture geese may pay as well as anything, because nothing pays very well; but when farmers go in for thorough culture, high manuring and the largest crops, geese have to be dispensed with.

Does goose dung "poison" land? That it injures vegetation I know. Does it do this because it is too poor or too rich? Geese live mainly on grass, and their dung thus fed is presumptively of little value. Even if fed on corn, I presume that their very strong digestive apparatus takes most of the virtue from their feed. Is there besides this any specific quality in their manure which is injurious to vegetation, and if so, what is it? Will some one who has facilities for chemical analysis rise to explain? Thousands of practical farmers will testify as to the facts. What we want of science is to give us the why and wherefore.—*Country Gentleman.*

ITEMS.

He that once is good, is always great.

Mr. C. G. Earnest of Stockton, Cal., engrafted the slip of a dark red rose into an oak tree; the dark sap of the oak effectually colors the rose black. In endeavoring to transfer the slips to the ground they invariably died. Slips of roses grafted into locust trees lived for two years, bearing brown blossoms.

A little girl in Westfield, N. J., while playing, dropped her mother's silver thimble into a chicken coop. Searches were made for it but it could not be found. Some days afterward two of the chickens were killed, and in the gizzard of one of them was found the lost thimble, finely polished but not injured.

A raven saw a swan, and desired to secure for himself a like beauty of plumage. Supposing that his splendid white color arose from his washing in the water in which he swam, the raven left the altars in the neighborhood of which he picked up his living, and took up his abode in the lakes and pools. But, cleansing his feathers as often as he would, he could not change their color, while, through want of food, he perished.

Change of habit cannot alter Nature.

A thoughtful person thus muses on the story of Daniel in the lion's den: "How sad it was for those poor lions, when Daniel was dropped into their den, to be compelled to go sniffing about

him, and think how nice a small chop from the calf of his leg would taste, and be denied the luxury. It was rough on them lions, but it taught them self-Daniel."

WASHINGTON'S DOG.—General Washington, it is stated, was out hunting in the Virginia forests, accompanied by his favorite hound, Governor. A heavy storm of rain and mist coming up, he lost his way; his powder was rendered useless, and, to add to the perils and inconvenience of his situation, he found that he had not his pocket compass with him. In this sorry plight he wandered in circles, as people do when they are lost in the bush, wet, weary, hungry, for he had no food save wild berries. He was almost exhausted when a happy thought at once occurred to him. Tying his pocket flask and his powder flask to his dog's tail, he fastened his long sash around the animal's neck, holding one end in his hand. Then he gave the dog a tremendous kick. The animal was so completely surprised at this treatment that he stood for a moment paralyzed; then, wheeling about, he struck a bee line for home. It is a curious but undoubted fact that any sudden alarm will quicken a dog's perceptive faculties, render more subtle his scent and powerful his memory, and induce him to strike for his home. So the dog fled and Washington followed, over stumps, through bogs, into briers, until the sash gave way. With one tremendous yell Washington scared still further the frantic animal, the terrible banging and clattering of the flasks at his heels added to his speed, and in a moment he was out of sight. After a hearty laugh at the incident, Washington leisurely marched in the direction the dog had taken; it was easy to do so observing the mossy sides of the trees, the direction of the longer branches, and the other signs with which an experienced hunter is acquainted.

It was not long before he reached a clearing, and was once more in safety. But the dog, once so faithfully attached to him, could not to the day of his death endure his presence, or even hear his voice without relapsing into an agony of terror.

TOADS.—There is a very common prejudice against the toad. By many he is looked on with loathing and disgust. He is regarded as an ugly, uncouth and worthless nuisance, that should be abated at sight. But this prejudice is ill-founded and unjust, as the toad is not only harmless but quite useful to farmers and gardeners. They should therefore be regarded as friends instead of being treated as enemies. The eggs of the toad are usually laid in the water, but at times, when this is not accessible, they are laid in damp dark places, and in such cases they do not pass through the tadpole state. While in the tadpole state they live on vegetable food, but as toads they live on insects, spiders, &c. They are exceedingly well adapted to catching insects, having a tongue of marvelous construction. It is quite long, and may be projected six or eight inches, the tip of it being so directed as to just reach the object, and being covered with a viscid, gummy substance, that causes the insect to adhere to it, it is thus quickly conveyed to the mouth of the toad and buried alive. The movements of the tongue in thus taking in a fly or a bug, are so rapid that they cannot be followed by the eye. The number of insects that a toad will eat is almost incredible. A few of them in a garden will keep it well rid of bugs, plant-lice, &c. They generally spend the day in some dark, secluded spot, often a hole under a sod or clod or the side of a rock, and in the evening they come out and hop about in search of a supper of live insects. They may be induced to take up their residence in the garden by confining them for two or three days to the place, when they will become quite well contented. A board laid about two inches from the ground is just the kind of hiding place that suits them. They are long lived, being often known 12 to 16 years old, and it is said that one lived to be 36 years old. On account of their propensity for destroying insects, toads should be encouraged to become permanent residents of our fields and gardens.—*Practical Farmer.*

EDITORIAL DEPARTMENT.

It is impossible for us to guarantee the honesty, or reliability of persons answering advertisements, but we endeavor to use diligent precaution to prevent dishonest fanciers from using our advertising pages. In cases where an advertiser may be in doubt as to the integrity of persons replying to exchanges and advertisements, a line dropped to us inclosing stamp will receive immediate attention, and the standing of the party in question given as far as we are informed, but in no case can we be held responsible.

A GENUINE FANCIER.

William McAnally of Newark, Delaware, is according to our way of thinking a thorough fancier. Isolated as it were, from all other fanciers, he has pursued the even tenor of his way, breeding White Leghorns for at least ten years past, annually exhibiting at Philadelphia, and often taking a liberal share of the premiums, and it is only at the annual show that Mr. McAnally really has a chance to compare notes with other fanciers, as there are none in the immediate neighborhood where he lives. It is needless to add that he is a subscriber to, and advertiser in the JOURNAL, and promptly pays his bills.

CORRESPONDENCE.

HARRISBURG, Aug. 4.

MR. J. M. WADE: Can you or any of your readers tell me how to remove a wart from a dog's eye. AMATEUR.

PRINCE EDWARDS ISLAND, July 3d, 1876.

Received from Oliver D. Schock, Hamburg, Berks County, Pa., May 10th, one setting (13) Light Brahmas, and have hatched 9 little chicks. The distance the eggs were shipped was 2,000 miles. I recommend Mr. Schock's eggs as genuine, can be shipped any distance. J. E. Wood.

WILMINGTON, DEL., Aug. 3, 1876.

The advertisement of telegraph machine, in exchange column of THE JOURNAL, brought me within a week, four inquiries. With one of the parties I made an exchange that resulted satis-

factorily to both of us. So much for 25 cents worth of advertising in a good paper.

Very respectfully,

J. W. TATUM.

PIGEON FLYING.

HAMBURG, PA.

FRIEND WADE:

Preliminary trials of speed of Antwerp carrier pigeons take place between Hamburg and Philadelphia frequently. The distance is 75 miles, and a grand race is *on dit*. Parties desiring their birds well cared for, and let fly any designated trial, may send them to my address, prepaid, and they will receive prompt and careful attention. I reside at the depot, and am ready to receive birds at any time, or from any train. Have had experience in handling pigeons for many years.

Fraternally,

OLIVER D. SCHOCK.

EGG IMPORTATION.

IRWIN STATION, Pa., July 28, 1876.

DEAR SIR:—

I think I can claim the "boss hatch" of imported eggs this season.

I received per steamer "Anchoria," June 9th, from Dunfeunline, Scotland, 15 Bro. B. Red Game, 15 Blk. B. R. Bantams, and 15 Houdan eggs. Set them same date under 2 Jap. Silkie, and 2 B. B. R. Hens. On the morning of the 30th, I took off the 4 hens with 37 chickens, only 8 eggs being rotten. 32 are now living, and doing well.

This was my 4th importation of eggs, and out of the 3 former, (48 eggs) I raised but 2 chickens.

Very truly yours,

W. H. JEFFRIES.

ABOUT AN EXHIBITION.

PLAINFIELD, N. J., July 30, 1876.

EDITOR FANCIERS' JOURNAL:—

Why is there no Poultry Society in New Jersey? It has superior facilities for an exhibition. The state is not large, it has a number of railroad centers, such as Newark, Camden, Jersey City, and other smaller ones which are accessible from all parts of the state, and from Philadelphia and New York City.

Last Summer I received a letter from some gentleman at Orange, requesting me to communicate with him regarding an exhibition; at that time I was unable to do anything about it, and therefore did not answer, but now I am willing to do all I can, if allowed (being under age).

Let some fancier take hold and put this through, and let us have an exhibition. JERSEY.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—Squirrels may be shot after Saturday.

What is Saturday to be shot for.

—Kinsey's coal can be had by postal card.

An easy way to get coal—it generally comes to us in carts!

—Sawyer's Observatory, at Belmont Mansion. Time at top unlimited.

What a splendid place to give promissory notes!

—Decorate your houses with red, white and blue.

That's what the monkey did with his tail—He said it was "neat and not gaudy."

—The 500,000 gallons of sea water required to fill and supply the Westminster aquarium has been delivered, and the importation of marine specimens is now going on rapidly.—N. Y. Times. Are they collecting any from the Navy yards?

—They say women and music should never be dated. When age is in question a woman says scornfully—"a fig for dates."

—Six Baltimore policemen have been dismissed for abetting robberies.—*Sun*.

A betting on Blaine would not have been any better.

—If we escape the hog cholera this season, there will be a large surplus of pork next winter.—*Intelligencer*.

So! How much, Mr. Editor, do you expect to weigh?

—8 Furlongs make one mile.

"Say Bill Furlong! Your father's got a mile of children."

"How so?"

"Why aint there eight of you?"

—Nine of the girls at Wellesley Institute, Mass., rowed Dom Pedro on the lake.—*Boston Post*.

More than that number rode Dom fast, round Barnum's Hippodrome!

—A story is told of an elephant in Calcutta which had a disease in its eyes. For three days it had been completely blind. Its owner, an engineer officer, asked the doctor if he could do anything to relieve the poor animal. The doctor said he would try the nitrate of silver, which was a remedy commonly applied to a similar disease in the human eye. The large animal was ordered to lie down, and at first, on the application of the remedy, raised a most extraordinary roar, at the acute pain which it occasioned. The effect, however, was wonderful. The eye was in a manner restored, and the animal could partially see. The next day when it was brought and heard the doctors voice he lay down of himself, placed his enormous head on one side, curled up his trunk, drew his breath just like a man about to endure an operation, gave a sigh of relief when it was over, and then by trunk and gesture evidently wished to express his gratitude.

—HABITS OF THE WHITE PELICAN.—Thomas H. Estey sends us some interesting notes from Nicasio, Marin County, Cal., on the habits of the white pelican (*Pelecanus erythrorhynchos*). These birds are to be seen in immense numbers circling about in long irregular lines, and the question arises as to how they manage to obtain sufficient food, as they do not, like the gray pelican, (*P. fuscus*) dive for it. In the shallow lakes below Sacramento, after alighting in the center of the lake they spread out in the form of a half-circle, just as a fisherman would fix his seine. After approaching within ten or fifteen yards of the *tule*, each bird beats the water with its wings until the line has driven all the fish before it into water only a few inches deep. Then a number swim inside the circle and feed, catching the fish easily in the shallows, until they are satisfied, when they fall back to stand guard and others take their places, until the whole flock has had its meal. Mr. Estey says he has many times seen them feed in this way on Mead Lake, twenty-two miles south of Sacramento, where he shot from 1849 to 1861.—*Forest & Stream*.

—THE BEAUTY OF MEN OF GENIUS.—Not satisfied with endowing her favorite sons with the sublimer gifts of genius, nature has also in many instances lavished upon them the charms of personal beauty. Alexander, the hero of the ancient world, and Napoleon, who has had no peer since then, were remarkable for beauty of features. Edward I, Frederick the Great, the Duke of Marlborough, and Murat, the most brilliant chief of cavalry the world has seen, were all very handsome men. Shakespeare was exceedingly fine looking, and Milton possessed in his youth an almost feminine beauty. Goethe and Lord Byron were the handsomest men of their time. Henry Hart Millman and Edgar Allan Poe were two of the most beautiful men that ever lived. Chatterton and Burns had eyes of wonderful brilliancy, "under such brows as the laurels love." Raphael and Rubens, Murillo and Salvator Rosa were singularly handsome. Columbus and Sir Walter Raleigh, "the Shepherd of the Ocean," were marvels of manly beauty and grace.

Cæsar, Washington, Wellington and Cromwell, all greatly resembled each other. Most men of genius have been medium sized, or small—have had black, or brown hair and eyes, and a "pug" nose never yet decorated the face of any of them. "The features being based on bone and muscle, will a certain class of mind be connected with a certain class of features?"

J. M. McCANN.

—REMARKABLE SUCCESS IN TAMING WOODCOCKS.—It has heretofore been found extremely difficult, in fact apparently impossible, to keep woodcocks long alive in confinement, although they have frequently been captured, and have seemed to become tame. A letter upon this subject from T. R. W., of New Brun-

wick, N. J., is therefore of great interest. He describes a case where several of these birds had been brought up from the nest by a farmer, and had become well domesticated. These birds (four in number) their owner said he had found in a nest and brought home with him, not expecting that they would live. But he found that by holding worms before their bills they would swallow them although they would not pick them off the ground. In a few days they became very tame, and as they grew older and acquired their full plumage, they would take short flights about the farm, but always returning to the house and roosting beneath the stone slab forming the kitchen door-step. When the tamer and our informant went into the garden, the birds, attracted by their owner's voice, came hopping out of the brush and flew upon his shoulders, manifesting not the slightest fear, but not permitting his companion to approach them. After taking food from his hand they again flew away. Watching the birds feeding, it was observed that they would rapidly drive their bill into the soft ground, constantly boring until they found their worm; they would then give a peculiar twist, draw it out its full length and gulp the worm down.—*Forest & Stream*.

—MATERNAL INSTINCT.—A few weeks ago I bought a pair of Indigo birds. They were not mated, and had evidently been caught since their early life in the west, for they were very wild. I put them in a large room with other birds, among which were a young sparrow, and two young red-wing black birds. These young birds were being fed by hand, but it was not many days before I noticed that the call of the little sparrow had touched a tender spot in the motherly heart of the Indigo bird. It would eat well from the hand, but, evidently pleased with the notice given by Mrs. Indigo, it called to her for food and she responded with all her heart. No sooner was the food dish brought into the room, than she became uneasy, and when the attendant retreated, fell to carrying food to the little orphaned companion. But she was not satisfied with this amount of work, and soon began to feed both of the young black birds. The young sparrow has since died from roosting at night near the window screen where it was drenched by a sudden storm, but this motherly bird still continues to feed the other two, and apparently takes great delight in her charge. These young birds, at the present time are able to pick up their own food, but still their foster mother persists in offering them her nicest bits. It is very amusing to see this family when the contents of our fly traps are emptied into the room. The windows are screened with fine wire netting, and the liberated flies start for them pursued by the zealous foster mother, while the young black birds sit screaming in the green bushes near by. There is generally a lively time until the flies are all gone. W. G. TODD.

—HOW A SPIDER BUILDS ITS WEB.—W. C. Richmond, of Geneva, Ohio, sends to the JOURNAL the following curious account of how a spider builds its web: "While at work one day in the field, I accidentally destroyed the web of a common spider. Curious to know what the little creature would do in its great calamity, I made myself comfortable and awaited results. The spider, not in the least disheartened by its loss, immediately commenced building another web. It first described a circle, not regular, but agreeing with the irregularities of the spires of grass on which it was suspended in a vertical position. Having strengthened this outer line (which may be likened to the felloe of a carriage wheel) by passing around it several times, adding each time a thread, it proceeded to form the spokes. It ascended to the upper edge of the circle, and, securing its thread, 'swung off,' slowly descending until it reached the lower edge, where it fastened the other end. As ending this last-formed line to about the center, and, fastening its thread, it proceeded again to the circumference, thus forming another spoke in the wheel. It continued this operation until enough spokes were made, then, beginning at the center or hub, it passed round and round in enlarging circles until it had formed some six or eight threads, about one-fourth of an inch apart. This, I noticed, was not done with that care which marked its subsequent work; but it was only intended (as I afterward saw) to be a sort of stay-lath, and not a permanent affair. It now darted to the outside of the web and commenced to weave in the web, which was done by passing a thread from spoke to spoke around the wheel in diminishing circles, the distance between them being determined by the length of the spider's *hind-leg*, for it walked on the line spun at the previous revolution, and guided the new thread with one of its hind-feet, holding it toward the center as much as possible, and allowing it to run between two of its claws as around a pulley. As it passed over each spoke it would, with its hind-foot, press the newly-formed thread to it, thus firmly uniting it. In the same manner it proceeded on until it came to the stay-laths, when it fell to work, and, in a twinkling, tore them away and

soon finished its work, and retreated to its corner to await the approach of some luckless fly. Twice during the operation its thread broke, but, not noticing it until it got to the next spoke, it did not retrace its steps, but fastened it where it was, thus leaving a break. Nearly all of the webs that I have examined have the same defect. That which surprised me most was the extreme rapidity of the spider's movements, as it was not probably more than ten minutes from the time of destroying the web before another was completed."

—LEGAL PUNISHMENT OF ANIMALS.—Throughout Europe until a comparatively recent period all the animal kingdom was considered amenable to the laws, as well as man. The domestic animals were tried in the Common Council courts of the country, and their punishment on conviction was death. Wild and noxious animals—the wolf, the serpent, the locust, and the leech were turned over to "Holy Church," to be tried by the ecclesiastical courts, and their punishment if found guilty was banishment, or death. In every instance advocates were assigned the animals, and all the proceedings, trial, sentence and execution were conducted with the strictest formalities of justice. The records of the courts of France show that from 1120 to 1740 ninety-two processes against animals were tried—the last execution being that of a cow for murder, in the year last named. A law-suit between the inhabitants of the commune of St. Julien, and a coleopterous insect, known to naturalists as the *Eynchitus aureus*, remained in the courts for more than forty years. All the wild animals of the district were summoned where an offense had been committed and judgment was given by default, on their non-appearance. It was considered necessary, however, that some of them should be present when the *monitoire* was delivered, in order that the proceedings of the court might be conveyed to those who were absent. At Basle in 1474, a cock was tried for having laid an egg—the wise men adjudged him guilty, and he was burned to the stake. In Switzerland and Savoy the lower animals were received as witnesses in court, and on their testimony depended the death or liberty of the human prisoner. In those countries if a man's house was broken into between the hours of sunset and sunrise, and the owner killed the intruder, the act was considered justifiable homicide. But as he might have enticed the person to his house for the purpose of murdering him, it was necessary that the householder should, in default of human witnesses, produce in court a dog, a cat, or a cock that had been present at the death of the person killed, the owner was compelled to make his declaration of innocence on oath, before one of these animals, and if it didn't contradict him, he was considered guiltless. 200 NOTES, NO. 26.

BY HUON.

STRANGE FOOD.

Sauntering through the Philadelphia "Zoological Gardens," on one of my late idle days, and seeing the birds, beasts, and reptiles at their "feed," and what many of them were feeding upon, I fell to thinking how one animal eats up another, and what strange bills of fare are presented in different parts of the world.

I am not certain whether it has been positively determined whether the locusts John the Baptist fed upon in the wilderness were of the vegetable or insect order, but we do know that the insect locusts have been eaten by the Arabs from the earliest recorded times, and that they are by them eaten to this day—served up in a different manner however, from those eaten by John, whatever they were, as they are first roasted, then pounded up fine and made into cakes, which are said to be excellent. From the locust's eggs the Hottentots prepare a savory soup, and it is upon that dish the Hottentot women get so enormously fat. In the Malhrratta country locusts are salted down for future use, while in Barbary, Othello's people prefer locust to pigeon! (think of that fanciers.) There they (the locusts, not the Moors,) are boiled for a half hour, the heads and wings are thrown away, and the bodies—are then fried in salt, pepper and vinegar; when the dish is said to be very palatable.

At Natal, the locusts by millions are gathered in bags, or sacks, and after being steamed in close vessels they are dried in the sun; the wings and legs being taken off, they are stored away in granaries like corn, and when ground, made into a porridge which is said to be quite as palatable as that made of oat meal ground at your "Keystone Mills," brother Bennett. Dr. Livingston tells us that for want of other food he was compelled to eat locusts prepared by the Kafirs, and he says when roasted he found them better than shrimps, which they much resembled in taste.

In several different parts of the world spiders have been relished as food! In the Kafir country there is a spider nearly an inch in length, which is eaten in great quantities by the natives, also in the French Colony of New Caledonia are the spiders used as food. Reaumur tells of a man who never saw a spider without catching and eating it, and Anna Maria Schurman used to eat spiders as she would nuts, and excused her strange taste by saying that she was born "under the sign *scorpio*." Laland, the famous astronomer, was particularly fond of spider-food; and a German is mentioned by Rozel who used to spread spiders upon his bread and butter! He said "he found them very useful!"

Humboldt tells us that he saw Indian children in South America drag centipedes 18 inches long out of the earth and greedily devour them! Insects' eggs are eaten by both Arab and Mexican; Grubs of insects are eaten roasted, by both white and black in the West Indies, and the native Mexican gets a "brick in his hat," on a kind of "crooked" made of distilled beetles.

The ancient Greeks were very fond of grasshoppers, which is only another family of locusts—and the native Australian used to relish them quite as well, eating them raw; first divesting them of wings.

John Chinaman eats the chrysalis of the silk worm after making use of the silk—nothing lost you see—and much does the Chinaman love the larvæ of the hawk-moth! In Jamaica, the blacks dry, smoke and pound butterflies for food, and the Hottentots eat large quantities of white ants, both raw and boiled. The female ant is said to be the most nutritious! One way of preparing ants is to mix them with flour, and parch them as you would coffee; after which, they are eaten by handfuls, with much the same relish with which I saw you, dear reader, eating pop corn the other day in the centennial buildings. The taste of ants thus prepared is said to resemble sugared cream or sweet-almond paste. Dr. Livingston says "the white ants when roasted, are good, and somewhat resemble grains of boiled rice." "Did you ever eat any white ants?" enquired one of the chiefs of the Dr.—"No!"—"well," said the chief, "If you had, you would never ask for any thing, or desire any thing better!" Humboldt also found ant-eaters among the natives of South America.

In Ceylon bees are eaten as common food, and in some parts of India the great palm-weevil, which is about the size of your thumb, is a favorite dish. I have read somewhere of an Indian King who at one of his feasts, for dessert, instead of fruit, set before his guests roasted worms! which were thought by the monarch to be most delicious. They were doubtless the larvæ of the palm-weevil.

Sir Francis Drake says the Patagonians ate seal flesh nearly raw, and Davis, on his voyage to Greenland in 1589, found the natives eating their meat raw, mixed with grass (a Greenland salad?) washing it down with salt water as seasoning.

Captain Hall in his recent visit among the Esquimaux, found that people eating hot seal-blood, which he tasted, and declares it was excellent. The way of luncheon on hot seal-blood, was to stand in a circle, each man taking a spoonful, and passing the bowl to his right hand man until the round was made.

The native Sandwich Islander eats his turtles and fish raw; and the richest possible treat one of them can enjoy, is to haul a turtle from the water and eat it to death!

In Paris, and other parts of France, snails are a favorite dish,

millions of them being sold every year in the Paris markets. Frenchmen residing in America are not without them either, as hampers of them fresh from the vineyards of Southern France, every season cross the Atlantic, and the writer has enjoyed a very palatable dish of them sent to him through the kindness of a French friend. During the months of Jan., Feb., March, and April, present year, Paris ate no less than two thousand three hundred and seventy horses! At that rate about one million horses per year would be wanted for that city. How much has America eaten under the name of beef?

"Glad you live in a country where christian food alone is eaten?"

Not so fast, dear reader,—some rattlesnakes are eaten on our Continent, and frogs have become so delicious and expensive that a poor man can't eat the "sarpint" any more; for the same reason Jack would not eat his supper. In the sunny south there are whole communities of clay, or dirt-eaters, who dearly love that kind of food, while you know more than one "party" who prefers a cheese which is *lively*—spreading the *lively* part on his bread, the same as our German friend did the spiders. Could one point at the other, do you think?

I have not catalogued half the strange food to be found it use, but space will allow of no further mention. With an instance of strange taste quite near home, I conclude the present paper; for a late *Oneida Union* (N. Y.) I clip the following: It may be of use when potato bugs get too thick, food too scarce, or children have nothing else to do:

"**POTATO-BUGS EATEN.**—A little daughter of Smith Hubbard of Oxford, was in the garden picking and eating potato-bugs. This greatly alarmed her parents, who had been told that they were rank poison. The girl expressed her liking for them, saying they "cracked like pea-nuts." The bugs did the child no harm. As our German friend said of the spiders, the potato bug may be found *useful* at last."

THE CATFISH FAMILY.

From the bull-ponds of the brook, up to the great wolf fish, says the New Orleans *Times*, a compact chain, with no missing link, connects the great family of the catfishes. Why catfish, we shall presently see. His favorite seat and homestead is, undoubtedly, the inland sea of the Mississippi, but he can live anywhere, and, in the point of fact, does live everywhere. His services are indispensable and his adaptation to his business perfect. He is found in the rivers of Asia, and has relatives living in the North seas. He ranges the waters as widely as man ranges the land.

Pimeodus Catus in a true cosmopolitan—in fish society. He is the slyest of all the fishes. He delights in still waters, deep holes, eddies, and the cover of drift wood—except that pale, lean fellow who frequents the brackish waters of the coast, he is a bold rover. He is as omnivorous as a shark, cruel as fate, soft, slow, oily, undulating in his motions, cunning, crafty, and greedy. Garbage of any kind forms his diet, and doubtless his little beady eyes sparkle with delight when he chances upon a peculiarly odorous bit of it.

The first rule of catfish philosophy is, that there is nothing which it is impossible to swallow. No catfish is in good standing among his fellows unless he can bolt his own weight in meat and bones without winking or stretching his neck. He is impudent and brave, resisting capture with the greatest determination, dies slow and dies game. He never takes his prey with any of the swift, fierce eagerness of the trout, pike or bass; there is no dash, no elan about him.

He approaches the bait deliberately, clasps it in his vice-like jaws, and moves away so gently at first; with such a soft strain upon the line, that you are in doubt whether he is fastened or not. He is loth to exert his immense strength, and will not do so until he finds himself firmly hooked. Then he rouses himself, and

struggles with a stubborn, angry courage, quite in contrast with the fright and terror of other game fish.

He is, among fish, what the owl is among birds, very wise, very still, very independent, and always hungry. Though a night prowler by profession, he is very much in the habit of lunching at all hours of the day. He has no scales, his skin is softer than satin, as smooth as ivory, and his whole organism the perfection of elasticity, compactness, and strength. You never see him idly frisking about nor spending his time in foolish gambols. He never flirts himself out of the water, even when seeking his food, much less from any nonsensical ambition to show his agility.

He hugs the ground closely, avoids swift currents, or, when in them, seeks the eddies and the shelter of the rocks on the bottom, winds in and out along the shore, solemnly, mysteriously, stealthily, always on the qui vive for something to swallow, yet never disappointed if he finds nothing. Though always graceful in his movements, his general appearance carries with it the impression of a laughable mixture of cunning, malevolence, and droolery. He is a wag, a rogue, a tyrant, a glutton.

He sometimes attains the weight of 200 pounds, and then he is as ugly a customer as one could wish to see. His head is as wide as a road-scraper and pretty much the same shape. His ponderous jaws set together like a steel trap and, when out of the water, his eyes have a vicious, metallic lustre which they retain until he has breathed his last gasp. The poetical justice of being swallowed by another fish has never been meted out to the catfish. The three poisonous thorns that stand out from his body, one at each side and one above, afford him ample protection.

Altogether the catfish is a very queer fellow, a fellow of infinite originality and humor. If you ever have an opportunity to observe him in his native element you will find him an interesting study. You will never find the great leviathans of the fish market in water clear enough for an observation, but the smaller members of the family, the horned pout of the brook, for instance, you may often see. His palpi droop gracefully over his muzzle, not unlike a mustache, and as he moves leisurely about the almost incredible phenomenon of "the tail that wags the dog" is clearly illustrated, for the tail of the catfish certainly does wag his body.

He seeks no companions, is the most self-contained of all the fishes, yet is no misanthrope. He delights in punching his broad nose under chips and sticks, and sometimes a merry freak will seize him all at once, and he will double himself up, seem to touch his nose with his tail, and bend himself into scoliops in the very exuberance of his muscular elasticity. Then away he goes again, wagging his head at all the other fishes, seeking, with all his wonted and industrious solemnity, for something to swallow.

As an article of diet, catfish meat is popular in Western hotels, where it figures as "baked trout." It is dauby, but then it is cheap—nothing so cheap. The supply is inexhaustible, and the price uniform—never any cheaper or any nastier at one season than another. Boiled, it makes a very good saive or poutice. His general-utility in life detracts from his acceptability in death—with many people.—*Phila. Evening Star.*

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

☞ "To exchange for cash" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

☞ No Exchange or Want will be inserted unless accompanied with 25 cents.

E. M. BIDEWELL, Natick, R. I., will exchange 1 pair Blue Owls, value \$6; 3 p-p Black and Blue Tumblers, at \$3 per p-p; and 1 pair Black and White Fads, value \$5, for a pair White Crested Fads, not akin, good breeders, and worth \$20.

J. M. PERRY, Cuyahoga Falls, Ohio, has for exchange Lt. Brahmas, P. Cochins, White Cochins, Brown Leghorns, S. S. Hamburgs, and Game Pitt fowls. All a No. 1 stock. Speak quick.

S. D. R. SMITH, Williamsport, Pa., will exchange one trio Dark Brahmas, one trio White Cochins, one trio Light Brahmas, one trio White Guineas, one pair White Frizzles, two Partridge Cochins hens, five Black Cochins hens, three White Sultan hens, one Jap. Silky cock, one female Canary, one French Arcordian, one fancy pigeon and bantam Snow Geese (eight departments), for gun, revolver, window shades and fixtures—anything but live stock. Make offers.

W. B. COCHRAN, 19 Commerce St., Baltimore, Md., will exchange first premium Antwerp, two pairs Yellow Crested Tumblers, Blue Swallows, White Ruff, White Turbids, Short-Faced Tumblers, Blue Quakers, one pair each. What offers? Speak quick.

R. M. BAKER, 56 Michigan Grand Avenue, Detroit, Mich., has a few Pointer whelps (bitches). The mother took first prize in Detroit in 1874. Will exchange for Hamburgs, Leghorns, or Houdans. Fair birds are all that I require. Make other offers.

CHAS. F. FREEMAN, 1914 North Fifth St., Philadelphia, Pa., breeder of Swallows, Turbids, and Owls, will exchange some of the finest Blue-winged Turbids, Solid Black Turbids, Black-tail Turbids, and fine bred Owls, for Red Swallows or Blue Swallows. They must be perfect birds in every way. Here is a chance for anybody to get good Turbids for good Swallows.

ELIZA B. DIBBLE, New Haven, Conn., has to exchange my Poultry Library (see advertisement in this number). I will exchange for anything useful or ornamental, except agricultural implements or live stock. What offers?

JOHN D. WHITE, Chicopee, Mass., will exchange one pair solid black Inside Tumblers, first premium birds and warranted first-class, for a pair of Yellow Jacobins, or young Carriers of any color, but must be good.

IRVING H. ELMER, Chicopee, Mass., has Brown Leghorn Cock-erels, of various strains, to exchange for off-ers. Write.

ABRAHAM PERRY, Monroe, N. Y., will exchange about twenty nice Rose-comb Dominique Chicks; also, one cock and four hens of Partridge Pigeons, for Light Brahma or White Leghorn Chicks. Must be good.

N. S. CORNWELL, Northampton, Mass., has six nice breeding hens, Dominique Leghorns, from Aaron Low direct, to exchange for Rose comb Am. Dominiques, Black Spanish, or off-ers.

JOHN HOGAN, Newton, N. J., will exchange one Black and Tan Dog, White China Goose, Clay borne and Irish Gray Games, for Silver S. Hamburgs, Colored Dorkings, Plymouth Rocks, Duckwings, Black Reds, or off-ers.

LOH. HARDMAN, St. Joseph, Mo., wants one Yellow Barb Cock, three White Jacobin Hens, one Red Jacobin Hen, one Cal. Fantail Cock, in exchange for opposite sex or same varieties, or Fulton's Illustrated Pigeon Book. Will pay cash for Jacobin Hens.

HENRY WISE, of Pillow P. O., Dauphin Co., Pa., wants American Cattle, Their History, Breeding, and Management, by Lewis F. Allen, for Light and Dark Brahmas, Partridge Cochins, other hens or pullets, or a pair of Brown Leghorns, April hatch, '76.

R. M. BAKER, 56 Michigan Grand Ave., Detroit, Mich., has for ex- change a few Beagle whelps, parents 12 and 13 inches tall. Want Houdans, Hamburgs, or Leghorns. What other offers?

ELLSWORTH G. MOYER, Rehersburg, Berks Co., Pa., will exchange 10 pair Fantails, Red-wing Turbit, Mottled Trumpeter, Carriers, White Pouters, &c., for Brown Leghorns and Rose comb Black African Ban- tams.

G. J. BAKER, Postville, Trafalgar P. O., Ont., will exchange any of the following thoroughbred stock—Cottswold Lambs, Berkshire Pigs, Black Cochins, Coach Sled, in pup, Black and Tan Dog Pup, and Hunting Rifle—for Jersey Heifer, in calf, or Bull Calf.

W. F. MUCHMORE, Basking Ridge, N. J., will exchange one trio Partridge Cochins (William's strain), one trio Lt. Brahmas, four hen Canary birds, one Setter bitch pup, 3 months old, noted strain and pedigree, for American Kennel and Sporting Field Books, and off-ers.

GEO. M. WOSNON, East Gloucester, Mass., has two pairs of Pea- cocks, one pair three years old, full plumaged, Twenty-seven first-class Ayles- bury Ducks and four Drake—the ducks are laying nicely—to exchange for Poland China Pigs, Hamburgs in varieties, Bantams in varieties, Lop-Eared or Angora Rabbits, or off-ers.

CHAS. O. MCIXELL, Milton, Pa., will exchange one trio B. L. Hens, five Dark B. Hens and two Cocks, four Partridge Cochins Hens and one Cock, one pair Canaries and Cage, one Ground Hog, one pair Black Barbs, old birds, one Air Gun, one pair Rouen and one pair Pekin, 1 Drake and four Hens Aylesbury Ducks, for old mated Fancy Pigeons, or off-ers.

W. D. HUMPHREY, JR., Tarrytown, N. Y., would like to exchange a spring bird Trap, four Game Hens (pit stock), Taxidermist's Man- ual, new book, three jointed fish Pole, two Pictures of Washington and wife, and a flat-headed Alder, 3½ feet long, alive and well, for a Double-barreled Shot Gun, or off-ers. All letters answered.

M. VAN CULLEN, Delaware City, Delaware, has to exchange two pairs white Carriers, two pairs Pouters, one pair Barbs (cock red, hen dun), one pair White Crested Fans, one pair Black Balts, two pairs Tumblers, one red Carrier Hen, one white Carrier Hen, one Black Bald Hen, one White Fan Hen (crested), one Yellow Barb Hen, eleven Brown Leghorn Cockereels, one White Leghorn Cock and six Hens, five White Leghorn Cockereels and six Pullets, one G. S. Hamburgs, Cocker Spaniel Bitch, Setter Puppies, from imported parents, for Webster's Unabridged Dictionary, Works on the Horse, or Dog, or Natural History, Brown Leghorn hens or pullets, tools of any kind, poultry, or pigeons, or off-ers. Send along your postal cards.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

J. F. HICKMAN, Traders' Point, Marion Co., Ind., wants one or more Maltese Kittens. State age, sex, and price.

HARTFORD, AUGUST 21, 1876.

No. 32.

THE DREAMER.

All day the white-haired woman sits
Beside the open door, and knits;
No living thing her dim eye sees,
As busy with old memories,
She dreams her dreams of what has been,
And knits her old-time fancies in.

She thinks of those who long ago
Went out across the threshold low.
How many times her listening ear
Has thought familiar footsteps near,
And she has started up to find
A dead leaf rustling in the wind.

But never as of those who lie
Beneath the wide and tender sky,
With folded hands on quiet breast,
All wrapped about with peace and rest,
She thinks of them. For her they tread
The green earth with her. None are dead.

Though years have fallen like the leaves
Above the graves where Summer weaves
Her grass-fringed coverlet, to keep
Safe hid from us the ones asleep,
She sees them all. Not grass nor mold
Can hide the ones she loved of old.

She talks with them. When brown-winged bees,
Make merry in the locust trees,
She thinks *he* comes and sits with her
Whose voice was love's interpreter,
O dreamer! young again to-day,
What matter if your hair is gray?

Sometimes she thinks that round her knee
Her children play in happy glee,
And when they tired and sleepy grow
She sings some song of long ago,
And on her loving mother-breast
She rocks her little ones to rest.

O dreamer, knitting all the day,
Your dreams in with your stitches gray,
Yours is a happy, happy heart,—
A haunted world from ours apart.
The years that turned your tresses gray
Have given you back your youth to-day.

—Advance.

THE CENTURY PLANT

Which Messrs. Calder & Wiswall, florist, of Hotel Boylston, have placed on public exhibition at the Old South Church, coming into bloom as it has after its long existence, in this Centennial year, may truly be considered a national curiosity, which every one should see.

The plant with its stately appearance, its gracefully curved branches expanding like beautiful candelabra and sustaining such an immense number of blossoms and buds,—the flowers, which are of a sulphur yellow color, succeeding each other in quick succession,—presents a spectacle highly interesting to the student of nature, and gratifying to all.

This plant was formerly growing on an old plantation, at one time belonging to the late Hon. John C. Calhoun, on the St. Johns river, Florida, about 125 miles above Jacksonville. It was brought north on the deck of a steamer in April last, since which time it has been growing at the greenhouses of Messrs. Calder &

Wiswall, in Boston Highlands. The stalk at that time was 8 feet in height. Since May 1st, it has grown to a height of 20 feet, and has thrown out 19 lateral arms or branches and produced 1000 buds and blossoms. As the flower stalk grew and the flowers expanded, the plant became exhausted and the leaves drooped and rapidly withered.

It is on exhibition every day (Sundays excepted) at the Old South Church, in Boston.

The above circular is given to those visitors at the old South Church in Boston, who pay twenty-five cents for admission to a small room made inside the edifice by suspending canvas from the ceiling, within which is exhibited a century-plant *in full bloom*. Though the plant and flowers may at first disappoint the person whose vivid imagination has pictured the promised thousand of blossoms to be flowers which, for show, shall surpass the peony, and who has anticipated fragrance excelling that of the rose; yet, if he be at all susceptible to sentiment, he will come away highly gratified. There is something peculiarly appropriate in an exhibition of a plant in its final perfection, which is known to be eighty years old, and is probably one hundred, in an edifice which has stood for about that period since the time when the incidents occurred which rendered it noted throughout the civilized world, and,—we hope we may say with truth,—sacred to the people of this country. Little did those think who saw the plant as it grew in Florida, in its youth and middle age, that, after surviving a great civil war, in its very neighborhood, as it were, it was destined to come to perfection in order that its influence might help preserve the Old South Church in Boston.

Its bloom is its death. It prepares itself for its life's work through a long, dreary, and change-working one hundred years, by a slow, patient growth, silently storing up within itself the vital force which, at the expiration of that time, shall enable it to shoot up a high stalk from the heart of the bunch of leaves, which have grown near the ground so long, and to burst forth into blooming beauty; a sight to inspire the beholder with feelings of wonder and admiration. It is only about nine months previous to the time of blossoming, that the stalk begins to form. Before this time the plant has much the appearance of the tuft of leaves upon a pine apple, very much enlarged. But afterward, the growth of the stalk, which, in the case of the plant in question, is twenty feet high, and perhaps four or five inches in diameter at the base, is amazingly rapid, as the reader will have perceived from the circular. This particular plant has been known to grow in one day, when at the greenhouses of Messrs. Calder & Wiswall, in a temperature of 102°, the astounding space of *six inches*. This is the more wonderful, when it is known that the stalk is so hard as to give out a sound, when struck by a hard substance, as loud and smart as if it were a young oak tree, and cannot be impressed by the hand. The trunk, (for it is worthy of the name,) is of a light green color, marked at intervals by drying leaflets or scales, and has a similar appearance to that of the trunk of the palm tree in pictures; but, unlike the palm, there are no leaves at the top, these being all clustered about the foot, many of them dried and brown, others green but shrunken. I

have no doubt that all the sustenance for the flowers, indeed all the vitality of the plant, is now in the stalk. There are no branches until within a few feet of the top, where the general appearance is that of an inverted chandelier, the flowers being quite small, in large clusters, each cluster containing I should think, forty or fifty single blossoms, perhaps more. I am unable to describe the flowers, for, as yet there is no platform from which to obtain a nearer view of them; though, I believe, one is to be built. The flowers in the top clusters look quite fresh, with their small yellow leaves, (petals, I suppose,) but those on the lower branches are fast losing or have lost their beauty. The still, close air of the church is not favorable for the growth of the plant,—or rather, for the continuance of its present short life. The sight of this wonderful plant is well worth the expenditure of twenty-five cents worth of patriotism. The historian will find a friend in the vegetable kingdom; the poet, food for fancy; the botanist, a subject for study; the merely curious will see what he probably never saw before, and will not be likely to see again.

P. B.

SMOKE.

An Irishman who had a tergitant wife quieted an outbreak of ill-humor by presenting the lady with a short pipe, of which the cost was one half penny; and as he did so he remarked with Quakerlike simplicity, that peace was a good thing at any price. There is much peace in tobacco. A legend even relates that it was introduced to Europe by a man whose professional business was peace-seeking. It was, or was not—for doctors differ—a certain M. de Nicot, French Ambassador at the Court of Portugal, who brought tobacco under the notice of Catherine de Medicis in the year 1560, or thereabouts; whereas it was probably known in London in 1585. In France tobacco was therefore called *nicotiane*, or “the Queen’s weed;” in England it got its more enduring title because, says tradition, Francis Drake carried away the first samples from Tobago. It was the wild man who taught his civilized brother the calm delights of smoke. The best tobacco in the world for cigars is perhaps that found in Cuba, and the best tobacco in Cuba is grown at Vuelta de Abajo. The best snuffs come from Macouba, a village at Martinique, where the Empress Josephine was born. The best Turkish tobacco is that raised in Macedonia. Tombeki, which is exclusively smoked in narghilehs, comes from Persia. When good it looks like new shoe leather used for soles. Tombeki should be washed at least three times before smoking. It is difficult to understand the source of the pleasure derived from tobacco. If it came from the sense of smell we might engage servants to smoke for us and preserve the whiteness of our teeth as well as the inoffensiveness of our hair and clothes. If it depended on taste we should get more joy out of a quid than out of a cigar. It cannot belong to the touch, because chocolate pastilles and some needle-cases feel like cigars in hand. The sight seems to have part in our delectation, because tobacco is almost deprived of its perfume by darkness; yet if its savor depended wholly on light, suggests a sage who has lost all yet mental coherence in smoky thoughts, tobacco would give more pleasure in the sunshine than in the shadow, and no true smoker has ever piped assent to such a statement.

Van Helmont, traveling in desert places, avers that tobacco protected him for long periods against hunger or fatigue, and he declares that he could make immense journeys on foot with no other sustenance. Dr. Stephenson, an American physician, observed that tobacco may be almost counted on as a specific in certain forms of inflammatory erysipelas. He covers the inflamed surface with wet tobacco leaves, and keeps them there till nancea supervenes. A member of the College of Medicine at Stockholm avers that the dried leaves of the potato plant would answer the same purpose, and that far better smoking ingredients may be

made from them than from the coarser kinds of tobacco in common use. Much of the tobacco sold at Hamburg and Bremen is mixed with potato leaves. The tobacco which comes from Maryland is the only sort which can be smoked in short pipes without danger to the mucous membrane of the mouth. It mingles imperceptibly with the potato leaf, and the adulteration can hardly be detected. A learned man declares that we are grievously in error who talk of “Meerschäum” pipes; we should say “Kummer” pipes, and commemorate perpetually our obligations to the discoverer of a compound which has nothing to do with the sea nor with its foam. Anselm, who has written a profound work on pipes, instructs mankind that they should be of the simplest form, so as to be easily cleaned, and that there should never be any wood, metal, caoutchouc, or horn, connected with them. Kummer pipes may be discreetly cleaned by pouring streams of boiling coffee through them. It is a wise course to bake clay pipes in a hot oven—after the dinner has been taken out of it. Pipes have had names, I ke swords—names born of love or glory and one is known to history as “Anastasia,” one as “Paradise.” The first belonged to a poet, the other to Omer Pasha, who had a name to conjure with among the Turks. Tobacco is believed to have destroyed the art of conversation; but perhaps it has only improved it. Smoking does not render talk impossible or even difficult; but it condenses it and makes it sententious. Tobacco compresses a long winded discourse into an epigram. It is at the bottom of the difference between the Welshman’s prayer and that of Mawworm. “Good night, sir,” he remarked to his patron saint, “few words are best;” whereas Mawworm has never done with words, and would let his pipe out in more ways than one, while that of the more ancient and acute Briton would keep alight. The smoker wants no other furniture than some German tender. If he begins to burden himself with amber mouthpieces, clips and pinners, he ceases to be a man, and becomes a cupboard. Directly the first ash falls off it the flavor is impaired, and the smoke becomes hot, acrid and unwholesome. Smoking, which has greatly increased in recent years, is, at all events, much better than taking snuff, which disgraced the very waistcoats of our forefathers. “Had our noses,” mused a philosopher, “been intended for dustholes they would have been turned the other way.” Possibly. And it is by no means clear to logical intellects that our mouths were intended for chimneys, or they might with more fitness have been opened at the top of our heads, and every man might have served as a barometer to his neighbor, who could have foreseen the state of the weather by noting whether his neighbor was blinded by his own smoke or otherwise. Youth and love depart from us. Tobacco remains, and perhaps it consoles us. It is the only form of happiness which is left to some whom the world has treated unkindly. “*Je te laisse ma femme et ma pipe; je te recommande bien ma pipe*,” were the last words of Gavarni’s vagabond. The dying good-for nothing was not ungrateful. No man has ever laughed in smoking; we are rather grave, with glad thoughts, over our tobacco, and the moralizing, or demoralizing weed seems silently to convey to us the great truth of life, with which we do well to grow familiar, “*Tu quoque in pulcerem reverteris*.” That is, all of us but the odor of good deeds.—*Pall Mall Budget*.

A NOBLE THOUGHT.

Young men! It was like the song of some wonderful bird, and it made the shine after the sound had died away; and yet it was just the remark of a brave young man who walked past me one day, arm in arm with a companion.

“Depend upon it, Tom, old St. Edmund, of Canterbury, was about right when he said to somebody, ‘work as though you would die to-day.’”

Tom nodded and the two walked on.—*St. Nicholas*.

POULTRY DEPARTMENT.

(For *Fanciers' Journal*.)

TASTE.

THE FANCIER AND THE FOWL.

Firstly.—The old maxim, That the way to a man's heart is through his stomach,—would be more applicable to savage than civilized life. The animal that subserves man in a large degree by its flesh, seldom renders a higher service to mental taste and gratification. In one sense, the fattened fowl may be considered, like the fattened calf, in a civil and political respect, a civilizer to races, where the animal propensities predominate, the larger and fatter the birds are for this purpose, the better, be they Cochins, Plymouth Rocks, Dunghills, or Brahmas—all the same, provided they have a large carcass and well-developed thighs; pedigree is of no account whatever in the poultry world, for this use especially, whether the legs are red, yellow, or blue (tough yellow-legged Leghorns only excluded).

One hundred years ago, or less, Capt. Cook and other explorers never failed to take out large quantities of fowls as well as other live stock, on their voyages, with which to create friendly relations with the uncivilized natives of the countries they discovered.—Australia, New Zealand, Tahiti, Sandwich Islands, &c., as well as to teach them habits of industry.

History does not tell us what breed of fowls had the honor to first propagate those new settlements, but we may reasonably presume they were a corpulent lot of the nondescript class. But as we read that some of the tribes were so intensely in love with fine feathers and pretty plumes, we think if Capt. Cook and his compeers had had a few Polish fowls with them they might have been able to purchase a kingdom with a pair of them, from some of the chiefs; from which we infer that there is some admiration for the beautiful amongst a few of the uncivilized, and as they rise higher in the scale of humanity and knowledge, this taste for the sublime and the beautiful gradually assumes superiority over the sensual, and his contemplation of nature's varied storehouse soon conduces to a continual feast.

If we rest the principal merits of the *Asiatic* fowls upon the large amount of *flesh* which they yield, all must admit that they are far superceded by another bird of longer ears, and which commands a greater number of consumers, if *not* admirers, in an æsthetic point of view, for, although it may, like the drake, have the sweet curl on its caudal extremity, we hardly ever see its likeness decorating the parlor or drawing room. We oftener see its parts presented on the table of the dining room. Cincinnati and Chicago have the palm of furnishing more hog-flesh than any other cities of the world, and the fact of their having such an enormous demand for this species of merchandize, demonstrates overwhelmingly, that it has an even if not a better chance than the *Asiatic* fowls, with regard to taste, and as we are accustomed to viands that are both red, yellow, and blue, with the secondary and tertiary colors thrown in, I am not at all disposed to test the delicacy of the meat by the sense of seeing alone—as to whether it is

deer, lamprey eels, salmon, blue-fish, mackerel, mushrooms, frogs, re-l-herring, oysters, cabbages, or squash, &c. Of course at this season we will politely ask you to a dessert of huckleberries, blackberries, or raspberries; as to drinks to wash these wholesome luxuries down, any color may be chosen that pleases the eye or taste, from a bowl of buttermilk to a pewter mug of brown stout. Variety is the spice of life, not to one sense alone, but to all the senses, and the more these senses are exercised in conjunction with each other, the greater the enjoyment of nature's horn of plenty. There are persons occasionally to be met with, who allow the sense of seeing to be prejudiced against certain colors of meat, seemingly to the detriment of taste, and the palate; but this, like the taste for music, or flowers, comes from lack of education and proper training. Curiosity stirs all the senses into activity—but like an army in the field, to little purpose except they act in concert with each other.

All agree as to the peculiar tastes of honey, sugar, vinegar, wormwood, aloes, &c., but it will be acknowledged that all have not the same fondness for these sweets and bitters. Some habituate themselves to the former, while others train their palates to the latter. Some particular circumstance will often occur that will change a person's preferences from one to the other. We had occasion once to converse with a man who had always detested anything bitter, but being threatened with consumption or dyspepsia, he was advised to make a decoction of certain bitter herbs, which he took to that extent that he became passionately fond of them,—one reason, probably, was of their curative effects, for he looked the type of good health. We knew another person, who when in his youth was very fond of shrimps, (a diminutive crab-like fish, large quantities of which are eaten in England,) but at one time ate so many that afterwards he became perfectly disgusted with them. A great many people prefer the oleaginous flesh of the goose to that of the best Polish or Asiatic fowl that was ever hatched, while to present some others with a plate of sardines, would be sufficient to capsize their stomachs. The greatest luxury to the Esquimaux in the Arctic region, is a goblet of train oil; while in the torrid, juicy fruits are the staple of life. Therefore it may be certainly inferred that the inhabitants of either of the two extremes would not quibble about the color of a fowl's legs, nor whether the flesh was light or dark; the one would accept it gladly, asking no questions for conscience sake, while the other would despise it altogether. Choice of food, therefore, depends upon individual condition, education, and temperature of the climate. While all concede the acerbity of vinegar, the bitterness of aloes, the sweetness of honey, we do not all take equal delight in the taste of them. How absurd then for any fancier to set up a standard as to the delicacy of a fowl's flesh by its peculiar tint, or by the color of its legs. The sense of seeing, in man universally, acknowledge fire to be red, snow to be white, the heavens to be blue, and grass green, but some people have the greatest aversion to snow, while others cherish it as the type of everything that is pure and happy, and consequently look forward to winter as the season of unmingled joy and pleasure, while others revel in the gorgeous show of flowers, with the background of green, in summer, and be it said much to their credit.

It is therefore probably well that our tastes differ, mentally and physically, or we might all fall into the terrible temptation of partially preferring the gormandizing Asiatic, to the pretty plumed Polish fowls.

BAIRS.

(For *Fanciers' Journal*.)

PEREGRINATIONS OF UNICORN.

Conceiving the idea that I would imitate the example of so many who have been "rambling" about the country, among the prominent fanciers, reporting to you the high-toned quality of their stock, &c., &c., I took the early train from home one fine morning,

and thus commenced my intended journey, to see what I could see, and hear what I could hear. At noontime I had alighted at a small country town, and inquired for the Parson and "Kernel," but found they had gone to the "Continental," and the little "yaller" dog with them. Upon asking the whereabouts of "Young Breeder," I was pained to hear my informant say:—"Bunged up,"—ate too much "corn" with clean, pure water; the Dr. says he's afraid he will have "stoppage of the intestines" for good this time, for he had neglected his advice so often, that he feared *grave* results; but he had been habitually addicted to eating so much four year old Brahma cock meat, that its toughness had permeated his system, and under these circumstances he might possibly convalesce; hoped to get two or three Blue (game?) pills down him, and should then feel confident of his speedy recovery.

I believe he keeps fowls, said I. "Wall, yees, he's got a few of them newfangled kind, that's got so many feathers that the Lord didn't know where to put them all, so he just stuck some down their legs to the egstreime toenail of each toe, on both outer legs, and said that those who didn't have 'em that way, would be disqualified from holding any office, or could get up a standard to suit themselves, and others, if they could only *make* them *think so*." Believing this to be a most remarkable breed, and worthy of more than a passing notice, I intimated that I would stop on my return, when I hoped to find Y. B. alive and hearty, and "sassy" as ever. Before leaving my informant, I learned that Y. B. was hoping to be sufficiently well to attend a prize spelling-school before long, for he was one of the large N. Y. dailies. Reaching the depot just in time, was soon on my journey.

POULTRY EXPERIENCE PURCHASED.

However gratifying it may be, when we have climbed that steep hill called Experience, and have at length reached the delightful summit of Perfection, still to come to grief so often on the journey (and we invariably do so just as we appear most certain of success), is very trying to the best-regulated temper.

For the benefit of any amateur whose knowledge of poultry lore may have been as limited as my own, let me tell how I "purchased experience," with a splendid White Cochin pullet, that grew and prospered so well that in my fertile imagination I was already the happy possessor of handsome cups, and first prizes innumerable. But one morning while feeding them, I noticed that the bird "on whom my hopes were built," had an unusual protuberance in the breast, and on closer inspection found it was decidedly crop-bound. I gave it several doses of castor oil, yet as day by day went on, it got no better, and I said to myself, "J. K. L., I charge thee 'fling away ambition,' for you never did, and you never will get so much as an 'H. C.' towards the realization of all your brilliant visions." Now I never had the pleasure of a *tête-à-tête* with a learned poultry-keeper, since I am not acquainted with one, or I should have listened with reverence to his advice, and I obtain no sympathy from the "head of the family," who considers the study of hens and chickens very tame and insipid. "Better study flowers, and Ferns would be a far more lady-like occupation," and ends his advice with a parting shot (very much *sotto voce* I admit,) something about "little things." And really I consider, since my poultry cannot get "highly commended," the judges ought to award something to my unwearied energy and perseverance, because for the last five years, with nothing to back me but my purse and my enthusiasm (and I positively affirm that the two are inseparable,) I have slowly learnt my lessons in experience. Again, my invalid neighbor complains of the perpetual cock-crowing, the servants of the extra work "them dirty brutes" make, and I am periodically informed by the "head" that those horrid pets of mine have got into the

garden, and for the third time have eaten all the young plants; and all these little drawbacks are calculated to damp the ardor of their warmest friends. But I am digressing; *revenons à nos moutons*, my crop-bound pullet.

On referring to "our Journal," I found you had advised "AN ANXIOUS READER," apparently in the same difficulty as myself, "First to secure the bird firmly, clip away the surrounding feathers, cut open the crop, and remove all the food there, carefully sew up the wound, and for a few days feed the bird on soft food only." These directions I followed to the letter, and I was so deeply impressed by my own skill and ability, that I felt confident I had only to receive a few lessons at the school at Edinburgh to become a very formidable rival to Messrs. Jeg, Blake & Co., but my proposition to that effect was so hopelessly quashed by the "head," that I gave up the idea on the spot.

Well, my patient seemed to progress favorably, and my hopes were again in the ascendant; still I noticed she could not hold up her head as formerly, so I imagined the wound must still be very stiff, and that time would restore it; but time did not, for at the end of three months she still walked about with her neck very much contracted, and we both seemed to lose heart together (only she lost flesh as well,) and one day while carelessly looking over a stray number, I discovered the cause of my unsuccessful surgery. "Be careful not to sew the two skins together," and making this moral I will end my letter.—J. K. L., in *Journal of Horticulture*.

HERRON vs. WARREN.

WORCESTER, August, 1876.

JOS. M. WADE, ESQ., *Editor Fanciers' Journal*:

My Dear Sir: In reply to Mr. Herron's communication in No. 28 of your JOURNAL, allow me simply a few words. Any one who will take the trouble to read this last effusion, if he be intelligent, would denounce the writer. This billingsgate style of writing must be natural to him. I should be satisfied if every respectable breeder and fancier in the country could read it, for I am satisfied he has made no impression, excepting a bad one for himself. My letter in your JOURNAL, No. 25, gives the exact truth of this matter, in every particular. Were I to spend days on it, I could not more clearly or truthfully define it. I desire to refrain from anything which may lower myself in the estimation of the fraternity. If Mr. Herron will take but a slight step in advance of that already taken by him, I will be obliged to him. His allusion to thief, burglar, and scawlag, are nearly overpowering. I am not sure but that had I known of this terrible blow and exposure, that I would not have given the twelve dollars. Yet I am sure, had I done so, I should have always felt worse in my feelings than I possibly can now imagine! Now who are the guilty factions? The devil must be one, while conscience the other. A thief and burglar are tempted by the devil; yet may have a conscience. A scawlag is too low for the devil; yet I doubt not he has a conscience. Directed by conscience, I endeavored to select for this man a fine bird. I had an able and competent assistant to help me, and I can do no better hereafter. The bird, if living, will be shown at our fairs this winter, and the public may judge for themselves. His allusions to Messrs. Geo. C. Barker and E. Hindekoper are satisfactory to me; the former has tried since to duplicate his order, and the latter I believe to be a gentleman in every respect, who had bad luck with a bird that unfortunately had what I judged to be rheumatism, what no breeder is responsible for. I feel ashamed, and think it beneath my dignity to appear in this so-called controversy; but this ends it, so far as I am concerned. I can simply say for Mr. Herron's benefit, if benefit it be, that my orders have increased three-fold over last season. This he might have known. I care very little for money, as those who know me can testify. So far I suppose the thief, burglar, and scawlag, may be appropriate. Yet, had Herron

been successful and stopped my business, I should still have continued and bred my favorites, and still with gold bands sent them to our exhibitions to be judged. My little girl sings to her mother at night, "I want to be an angel." So do I, but *first I want to be honest*. One of Mr. Herron's neighbors, who stands unquestioned in reputation—an entire stranger to me—of his own accord writes, under date of July 4, 1876, that a certain bird was shipped Herron. Herron claimed the bird was terribly sick and worthless, upon which the express charges were refunded, the owner saying the bird was all right when shipped, and probably would be right after a little. Herron soon after reported that the bird had died. The writer of my note says Herron still has the bird, if he has not disposed of him. I ask (with all fairness, with no desire to injure the character of *any*) is such a man entitled to credit? Am I to be denounced by such a character? When I shipped this *poor, miserable, worthless, rumpy, wry-tailed*, male specimen of poultry, it was addressed to another party. Herron did not wish his name to be used in order, as he said, that the bird should go "dead-head" through. Not quite so liberal then, as since, when he proposes to visit every show in the country and if necessary to expend money to show me up. Such fellows ordinarily are not very heavy, and soon leave us, and their burial *private*. A man who gives must take a joke, and not get angry. I will not. Thomas Ingoldsby, the English parson, in his legends, gives many very funny characters. Methinks I see the devil, with his horns, his hoof, his tail and sack, trailing the sand on the Red Sea shore. He goes for all he can find, and bags a Maitre de Danse, a Maitresse en titre, Grisettes, an English Roué, a York Jockey &c. He suddenly comes on a singular looking character which at once startles and frightens him. With an effort to speak he gasps, Who are you? Ans. My name is Herron, from Indianapolis. Go, get thee gone, says the devil, who immediately makes tracks for his unknown home with his victims, glad to escape from our Indiana gentleman, who has so admirably proved that I am a thief, a burglar, and a scoundrel.

Very truly yours,

A. D. WARREN.

(For Fanciers' Journal.)

COMMENCEMENT EXERCISES.

REPORTED BY YOUNG BREEDER.

[Continued from No. 30.]

Ped. Dickie! are you a regular attendant here?

Dickie. No sir, I am not. I don't belong to this crowd; they are what I must call "mud slingers." I just dropped in in hopes to get a few new ideas on that most excellent mongrel, the Plymouth Rock. They must never for a moment be forgotten, and may be forgotten by the intermingling of several different breeds as their four-fathers and eight mothers, who all came over in the Mayflower give evidence. This variety is now being bred at my yards with the most redundant success, and the identical fowls now in my possession, I propose to show to the world "in the course of ten years," as spring chickens of undoubted ability. Sir! (warming up and putting a foot forward) Sir! The science of medicine when applied to hens, produces a most glorious field for thought and imagination. Doth not the aggregate production of poultry papers on this continent ring monthly, yea weekly with words from the gifted pen of Dr. Dickie? For the present we cannot forget that "truth is mighty and must prevail," being now engaged on a work of 7,000 folios on the rise and ultimate destiny of the Plymouth Rock, which I hope, with the assistance of all the poultry editors, to see in print, and my yards being adjacent to the natural gas regions of Pa.

Ped. (groaning) I should say so.

Dickie. And I must firmly decline on account of time to answer any impudent questions. One case regarding my

specialties I must not fail to relate. A worthy and aged couple (to whom I have often administered large doses of jalap and brown bread pills) seemed to delight in a flock of fowls which were of all colors of the rainbow, and not up to my ideas of excellence in any respect. I left off the jalap and pills, and labored with them day after day on the folly of keeping such mongrels when better mongrels could be kept on the same number of bushels of corn per year.—Mark the result. *The old man died.* But the widow now rejoiceth

In a large flock

Of Plymouth Rock.

And wishing you all a good morning and hoping to receive the \$3.00 draft for the 13 eggs, I must leave. (Exit.)

Ped. Tell the boy to bring the pin along when he again comes. Greenhorn. Wat's a Game?

Mike. (who has been reading the papers) I should say an insect wid a crooked tail an' the r-o-o-p; och! Look at 'em with their snake heads an' peacocks' tails. Begorra I've some mi cousin sint me from the ould country, ringed, straked, an' speckled, with short ligs an' long spurrs, an' if I lit one out you wouldn't hear of a black brested red in the village.

Enter Pro Bono Publico.

Ped. Good morning my old friend! Sit down and make yourself comfortable.

Pro. "Let dogs delight
To bark and bite."

I have been hit myself by these missiles the boys are slinging round promiscuously, and I meekly ask what is the good of this controversy?

Mike. An' wots the ha-r-m you ould hiretic? If there is anything I admoires it's a frae fight wid nobody kilt entirely.

Ped. My friend, as a fancier have any interest in the American Standard of Excellence, and if so, would you allow your spirit of kindness to see this Standard abused, ill treated, misquoted, maligned, and transformed to suit yards and tempers on account of one or two sore heads, who imagine themselves "called" to write for the papers, and a literary — who evidently does not know an Asiatic from a Gazelle, but establishes himself from the heat of the summer's sun under the shadows of his own cave, and thinketh himself secure because he editeth a poultry paper? Is the Standard worth speaking a good word for? If not, there are millions of hours and millions of dollars being wasted this very season. Is supreme selfishness to pass unrebuked, and such jobs put up on the boys without giving them a hearing? Have young breeders no rights which old breeders are bound to respect? If this young one's scribbling amuses you, well and good, but if he is a detriment to the Standard and general poultry interests, let the *fraternity speak*, and no more shall be heard from Young Breeder.

Here comes the little fellow now. Wipe your nose sonny, and tell us what makes you so late.

Y. B. (rubbing his nose on his sleeve) I kinder stayed awhile to see my old Brahma rooster clean out a Game.

Ped. My son, your excuse is accepted. Such a sight is a grand but not an unrequited one. Little boy! what is the foundation of your hopes on your flock of chickens this season?

Y. B. The American Standard of Excellence.

Ped. Right! The Standard is *law*, and there is *none other*. Boys what are you whispering about?

Several. We was arrangin' to lick Y. B. to-morrow, when Burleigh comes.

Ped. School's dismissed.

SECTARIANISM.—Little, narrow prejudices, that make you hate your neighbor, because he has eggs roasted, when you have yours boiled.

MANAGEMENT OF CHICKENS.—No. 1.

However bad the season hitherto has been for many of us, there are many broods in a growing stage, and consequently a few hints upon their management and feeding may be useful. We shall not attempt to write anything new, knowing that the subject has been ventilated thoroughly from time to time; still we know that we have even since last season many fresh poultry keepers among our subscribers who will be glad of any ideas which are new to them though old to us; and even amateurs of two or three year's standing will not object to have their knowledge refreshed, for this and the two coming months are not only very important but frequently very critical. There is no doubt that good chickens are scarce—we mean good early birds—and we are quite sure that this will be realized soon enough. So it is more than ever important, then, to make the most of our broods now, even though they may be lately hatched.

To begin then. Those who have only enclosed yards and no grass field or orchard for their chickens to run in, should dig up those yards at least twice a-week and raise up mounds with the soil. The hen and her chickens will delight in jelliving them, and find innumerable edible morsels in them at every time; and if grains, or ants' eggs, or maggots can be buried among the soil of these miniature mountains so much the better, for to keep young chickens continually on the scratch is most important. Once they are allowed to be idle hour after hour on a dry and hard run, and only their proper feeds at certain times to daintily pick at, they will never do well. They will lose brightness, and look mopish and droop their wings, and then we know all is over with them. Chickens must be continually employed. A handful of wheat or hemp in a lump of straw will do them, when confined, as much good as two feeds of the best ground oats when thrown down on a hard and bare run. Chickens must never be allowed to mope or be idle, for they should be kept continually exercised. Then, again, for chickens in confinement the meals must be varied and various. The menu cannot be too much changed. Boiled vegetables with the meal mixed up dryly makes excellent feeding stuff; bread crusts and broken biscuits soaked in skim milk make chickens grow wonderfully fast. We always like to use soft foods in the daytime. A handful of some good grain at noon will not hurt them, but if allowed to feed too heartily before it they are apt to lose their appetites. Green food we believe immensely in for chickens in confinement. Lettuce leaves and lawn mowings finely minced up and mixed with some soft food, with a sprinkling of Spratt's food will often induce chickens to eat when nothing else seems to tempt them. Spiced foods and aromatic compounds we do not at all care for for young stock. We think they do more harm than good, however useful they may be for stimulating laying in adult birds. Chickens so fed seldom make fine specimens, but become matured when they ought to be growing, and develop combs when the birds ought to be making flesh and bone. Now is the time to choose out any imperfect specimens—birds with evident malformations of comb, legs, or shape—for more harm is done with overcrowding in small yards than is ever done by anything else. We feel quite sure if fanciers with limited space tried to produce ten chickens where now they endeavor to get thirty, not only would there not be so many miserably grown objects in every small establishment, but the prices generally would be better and the runs sweeter and more wholesome into the bargain. The prices birds are now fetching, save in rare instances, are very meagre, and we do not hesitate to think one of the principal reasons is that so many half-grown, weazen-faced-looking chickens are annually allowed to live and are daily offered for sale, so the market becomes overcrowded and choked with perfect rubbish. Now, we repeat, is the time to thin before the runs are contaminated, diseases are bred, and the corn bill is run up.

Water, too, is as important an item in the chicken's menu as

ever the best wines are at our own great feasts. Chickens must have clean water, and they must have fresh water. We do not mean that stale water would kill a chicken, but when birds are wanted for the exhibition pen no pains must be spared to produce them up to the mark. Water which stands from morning to morning does them harm. Rain water which is allowed to stand in the water-tub does them harm. Water which can be found by the chickens in stagnant puddles, or which drains from farmyards does them harm. We like no pans so well as the circles of rings; they hold but little water, are easily cleaned, and afford no fear of the tiniest baby chick being drowned in them. We like when we can possibly afford the time to fill these pans and wait till the chickens have satisfied themselves, and then empty the pans again. This entails trouble, but we believe it would amply repay for it, and without trouble no real and permanent success can possibly be expected.

Some recommend meat very highly, and we believe many of our breeders do use it, but we would never give it to the birds as meat. We like to make a good soup of it and then mix up the soft food with it. We are sure this is a better way than cooking the meat and giving it to the birds in pieces. Pot liquor in which mutton or veal has been boiled when used to mix up the soft food makes the birds grow rapidly and thrive well.

Next as to the time of feeding. This must depend upon circumstances. For instance, the size and material of the runs, the breed of the birds, and the quality of the ground where there is plenty of space. We can lay down no definite list of hours, but we can only emphatically say, the best rule is "little and often." We have now two grass runs with only a hedge between them, and yet in one of them a brood of chickens would almost find their own living, while in the other they would shortly starve. Some grasses and herbs seem especially suited for insect life, which after all form the most natural and best food for young chickens. —W. in *Journal of Horticulture*.

REPLY TO QUILABER.

"*Quilaber*" in the *Journal* of Aug. 7, in the last paragraph of his article, has fallen into some errors which he will doubtless thank the writer for correcting.

"The Poultry Magazine," i. e., *The Poultry Bulletin*, is not controlled by the American Poultry Association; neither is the paper their "organ"; neither was its editor chosen by the Association or from their ranks.

The President, Secretary, Business Manager, and Editor of the *Bulletin* are none of them members of the American Poultry Association; and but a very small portion of the Association *Fanciers'* stock is owned by members of the American Poultry Association.

It is, however, owned by the parties who are amply responsible for any irregularities (?).

"COGNOSCENTE."

FOWLS prefer, as well as need, good, pure, cold water, especially in warm, sultry weather.

KENNEL NEWS.

Our friend S. J. Bestor, of Hartford, is in luck, it would seem, dog-wise. His imported "Juliette" has favored him with another increase of canines, again whelping nine (9) pups, under date August 8. The sire was his imported "Snip." Both "Snip" and "Juliette" were the premium winning Cocker Spaniels at the great Bench Show at Springfield, Mass., last spring. Mr. Bestor informs us this is the fourth litter which Juliette has brought forth—in total, 42 pups, and all sold heretofore at \$25 each. Most of the present litter are already engaged. "Juliette" is a profitable little beauty, it would appear.

PIGEON DEPARTMENT.

PIGEON RACE.

MR. EDITOR:

Our second race, between Mr. Waelelaer's and my birds came off on the 1st of this month, from the City of Tamaqua, about 150 miles from New York. Our birds were consigned to Mr. John Hendricks, of the above city, who kindly kept them over for two days, and cared and provided for them during their stay. As it was raining for two days without intermission, our birds might have been lost, if they had been tossed in such bad weather. Tuesday, on the 1st, the morning was bright and fine, only the wind was blowing at Tamaqua, and also at New York from the northeast, or nearly in an opposite direction for our birds to fly to New York. Three of Mr. Waelelaer's birds came home in about four hours, being good time considering the unfavorable wind. The two other pigeons of Mr. Waelelaer, and my two came home shortly afterwards.

Our pets are making quite a sensation in every town they are tossed, and did so particularly at Tamaqua, where, according to Mr. Hendricks' writing, the newspaper men, the doctors, the lawyers, the ministers, and the citizens generally, without mentioning the crowds of ladies, turned out in full force to see our birds go off for New York.

Next Thursday our birds will fly, weather permitting, from Danville, Pa., which is about 200 miles from New York, and the week following, they will fly from Lock Haven, in which town they will be tossed and cared for by Professor Raub, he having kindly offered his services to take good care and toss our birds.

Yours truly,

JOHN VAN OPSTAL.

NEW YORK, August 4th, 1876.

(For FanCIers' Journal.)

DOUBLE ENGLISH, BELGIAN HOMING BIRDS RACE.

A HOME AND HOME MATCH BETWEEN THE ENGLISH AND BELGIAN PIGEON FANCIERS.

MR. EDITOR: This friendly contest took place on the 20th of July; 444 Belgian birds were sent to London, and 27 English birds were sent to Brussels.

The *Epervier*, commenting on this race, in its number of July 2d, says:

The Belgian Society Abeona of Brussels are organizing a race for the 20th of July, from the city of London. No doubt but that this race will attract the attention of all the fanciers who love the "voyageurs," or homing birds. The winning birds, if for sale, will no doubt find purchasers at good prices, and we are sure that this race will attract a good deal of competition in both countries.

The same day both the Belgian and English birds will be set free—that is to say, in Brussels and in London, to fly in opposite directions.

Although we do not pretend to advise our English friends, still a little advice may be of great value to them. The flying of the English birds should not be done at an early hour, because the sea coast in the morning is generally cloudy and foggy, and birds being in such an atmosphere may lose a great deal of time before finding their direction. This is the reason we advise our English

friends to let their birds fly when the fog is cleared away from the sea coast. If we were to take care of the tossing of the birds we would be proud to arrange things in such a way as to secure a success for our British fellow fanciers, and here is the way we would go to work: We would send one of our friends to Ostend (a city on the sea coast), and would charge him to telegraph us the moment the atmosphere should be clear enough to toss the birds.

We would be reproached, perhaps, that we would take too much precaution, but to those we will say that the English fanciers are only making trials with their birds, and that trials should always be made under the most favorable circumstances.

Repeated failures are breeding discouragement.

The *Epervier* of July 9th gives the conditions of the race as follows:

City of Brussels.

Anglo Belgian Concours.

Under the auspices of the Alexandria Palace and organized by the Society Abeona.

From the city of London, July 20th.

700 francs "of Prizes of Honor." 700 francs.

Two silver bowls of 125 francs each, and eighteen prizes of Honor, of twenty-five francs each, in cash. The first one hundred returned birds will be bought by the English fanciers at fifty francs each (\$10), and the others at twenty-five francs each.

The English fanciers will also commence to train their birds towards our country, in view of a simultaneous tossing of the English and Belgian birds.

The paper of July 23d says:

"The Society Abeona has shipped, last Tuesday, 444 pigeons to London, and have been tossed there at 11.10 A. M., July 20th, with a slight northeast wind.

"The English fanciers have also sent to Mr. Charles Mills twenty-seven birds, who have been tossed the 20th of July, at 8.15 A. M., at Palace Place, opposite the palace of the king. All the English birds have taken the direction of the northeast. The moment we are going to press we have not received any news of the arrival of the travelers from the other side of the sea. We trust that we will be able to announce in our next number the happy return of a number of the English birds."

The Belgian birds did not make good time, having been set free at 11.10, the first bird arriving at Brussels (a distance from London of about 230 miles in a straight line) at 5.43, and at 7.01 thirty-five birds had arrived at the Society. So that the first arrived bird made the distance in 6 hours 33 minutes, and the thirty-seventh in 7.51. As only thirty-seven were home at 7.01 P. M., there is no doubt but that at least one quarter of the birds will be lost, as they seldom come home the second day when they fly from over the sea. As soon as I receive the *Epervier*, which gives an account of the arrival of the English birds, I will inform you immediately, as no doubt our English fanciers here will wait with anxiety to know the time the birds made.

On Thursday last Mr. Waelelaer and I had another race from Danville, Pa., about 200 miles from New York. Five of Mr. Waelelaer's birds flew there and two of mine. Mr. I. W. Sweisfort of Danville had the kindness to take care and toss our birds. About 9 o'clock I received the following telegram: "Birds tossed at 8 o'clock. Weather fine." My bird Andrew Jackson did very well again, flying the distance in 4 hours 8 minutes, Danville time. My other bird, Jupiter, Jr., came home about half-past two. One of Mr. Waelelaer's birds must have come in about the same time as my first; his second came about one o'clock, and his three others during the afternoon. So that the original seven with which we started from Easton, and who flew, first, twice from Easton, once from Tobyhanna, twice from Scranton, back again from Easton, as we were going to go in another direction, then from Tamaqua, and lastly from Danville. Next Thursday our birds will fly from Lock Haven, Pa., about 240 miles by rail from New York. Professor Raub has kindly volunteered to look after them. The performances of our seven birds have proven the superiority of the Belgian birds, as I don't think that ever such races have been flown by other birds in the United States. When our birds return from Lock Haven we will rest them till next year, and we propose to fly them next 4th of July from the city of Buffalo, which must be about 600 miles from New York. Any other fanciers wishing to participate in this race will please address the undersigned.

A prize of honor of \$100 in gold will be offered for the bird who will make the fastest time, if back inside of three days.

Yours truly, JOHN VAN OPSTAL, 4 Lewis St., N. Y.

EDITORIAL DEPARTMENT.

SALE OF GAMES.

We learn from Mr. P. W. Hudson, of North Manchester, Conn., that he has sold his entire stock of yellow legged Red File games, to Mr. W. G. Bockus, Jr., of Pittsfield, Mass.

We call particular attention to S. J. Bestor's advertisement of his stock of White-Crested Fantails; we can endorse Mr. Bestor as a gentleman, an honorable business man, and as a thoroughly experienced fancier. He was for some years President of the Conn. State Poultry Society, prominent in the A. P. A., and held in high esteem by the leading poultry and pigeon fanciers of the country.

His collection of Fantails is unquestionably the finest in America, and we believe he will find some appreciative fancier to succeed him in the ownership of his beautiful stud of birds. Mr. Bestor's yearly demands have rendered it quite unnecessary for him to advertise for years past, and he wishes now to sell the collection together instead of retailing them, and has special business reasons for so doing.

CORRESPONDENCE.

EGGS.

I wish to state to you that I have a Partridge Cochon Hen that has on three different occasions laid for me a remarkable egg, viz.: weight 6 oz., $7\frac{1}{4}$ inches around by $9\frac{1}{4}$, and inside of this egg a full size, hard shelled egg, of ordinary size. I took one of them to the printing office and bank, these they thought quite a curiosity.

Yours respectfully,

W. H. TOWNSEND.

MISSOURI VALLEY POULTRY AND PET STOCK ASSOCIATION.

St. Joseph, Mo., July 26, 1876.

Jos. M. WADE, Esq:

DEAR SIR:—The executive committee of the Missouri Valley Poultry and Pet Stock Association have decided to hold their third annual exhibition at St. Joseph, Mo., December 12, 13, and 14. The premium list will be prepared shortly. Look out then for the grandest show the West has ever held.

Yours truly, LON. HARDMAN, Cor. Secretary.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—An Illinois Judge has decided that a washing bill cannot be collected.—*N. Y. Sun.*

Yes, and we have known cases where the wash could not be, either.

—Of the 117 young women in the Michigan University only four have taken to the legal profession.—*Phila. Times.*

Bad for the variety theatres—What will their patrons do without the leg al profession!

—A foreign newspaper, in giving an account of Toulouse, remarks: "It is a large town, containing upwards of sixty thousand inhabitants built entirely of bricks."

Sixty thousand perfect bricks walking about must be a pleasant sight!

—The first prize in English composition at the Hopkins Grammar School in New Haven, Conn., has been taken by Spencer Laisan, a Chinese lad.—*Press.*

The young man belies his name. He's not been a *laz-y-un*, by a long shot.

—James Lucky was run over by a train of cars at the Market street, Newark, depot of the Pennsylvania Railroad yesterday, and his legs were so badly crushed that they were amputated.—*N. Y. Sun.*

James may have been "lucky," but we don't think so.

—A young man committed suicide in Reutlingen, Germany, because his parents compelled him to study theology when he wanted to be a carpenter.—*Herald.*

It could not have been Beecher's theology. He wanted something more *plane*.

—A young girl listened in Owensboro, Ky., to a sermon on the horrors of hell, and was made a raving maniac. She imagines that she is enduring the tortures of the damned, and it is necessary to keep her tied.—*N. Y. Sun.*

There would be many more such cases but that the people go to the orthodox churches for fashion—not to listen.

—"The treatment of persons immediately killed by sunstroke should be, in the first instance, of cold water dashed on the head and chest, followed by friction or rubbing of the back and limbs; draughts of cold water, if it can be swallowed; spirits of hartshorn, diluted with water, laudanum, and camphor water, if there be cramps or pains; light restoratives, such as coffee and broths."—*Phila. Ledger.*

The *Ledger* does not often kill any thing, but when it does the above is the manner in which its victim is again brought to life.

—Oatmeal in water, in the proportion of a quarter of a pound of oatmeal to three quarts of water, is recommended as a refreshing drink. The meal should be well boiled, the mixture cooled, and water added to keep up the proportion. With a bit of ice, this is said not only to quench the thirst, but to keep up strength. Without ice, when ice cannot be had, it is still palatable, if entirely cool. It is said that it is used in many iron foundries and manufactories in England. The meal should be well shaken through the water before drinking.

—A CHALLENGE.—Me play billiards muchee long time evly day. Me wantee play Hop Ling Dion Cylille belly muchee to mollow, evly day alee same so. Me lkeee play Melican man belly good play. Hi Ling Sexton preferred alee same so. Me play muchee Melican money alee same so as Hop Ling Dion Cylille, five thousand dollars. French caloms, 600 points up evly day. Me putee five hundred dollars in Melican's man's hands Hally Hill. Me Mean business alee time evly day.

LING LOOK SULLIVAN,

Champion of China.

—*N. Y. Herald Adv.*

Ling Look is brother to Ching Lee, who the other day, at the Centennial grounds tasted ice cream for the first time. He said "no goodee! Melican man have too much cold grub—no cookee enough—make China man's belly feel like ice-wagon."

—THE ROSE OF SHARON—COMMON ALTHAEA.—The rose of Sharon is one of the most exquisite flowers in shape and hue. Its blossoms are bell-shaped, and of many mingled hues and dyes. But its history is legendary and romantic in the highest degree. In the East—throughout Syria, Judea, and Arabia—it is regarded with the profoundest reverence. The leaves that encircle the round blossom dry and close tight together when the season of blossom is over; and the stalk withering completely away from

the stem, the flower is blown away at last from the bush on which it grew, having dried up in the shape of a ball, which is carried by the sport of the breeze to great distances. In this way it is borne over the sandy wastes and deserts, until at last, touching some moist place, it clings to the soil where it immediately takes fresh root, and springs to life and beauty again. For this very reason the Orientals have adopted it as the emblem of the resurrection. The dried flower is placed in a vase of water beside the beds of women in labor, by the Judeans; and if it expands by moisture the omen is considered favorable. If it does not, the worst is at all times feared.

—**Jamrach**, the great animal dealer of London, has succeeded in landing safe and sound a male gorilla in the Berlin Zoological Gardens. He is a splendid specimen of his uncouth tribe, is one year old, and as large as a boy 14 years old! In color he is quite black, and the palms of his hands as well as the soles of his feet are as soft as kid. He is very gentle, is easily managed, and altogether tractable, showing in his daily conduct that the gorilla can be tamed. His poor mother had to be shot by the hunters that he might be captured. **HUON.**

—**THE BAY LYNX** (*L. rufus*), commonly called in America the Wild Cat, is quite numerous all through the mountain districts of West Virginia, and is also found in most of the eastern and middle States. Living in dens under the rocks, and prowling through the forest day and night, always having a ravenous appetite, and feeding only on the blood and flesh of animals, it is the scourge of the inhabitants of the mountains where it abounds. It can climb trees with the greatest facility and ease, and is very destructive to the game birds and small quadrupeds in the wooded districts where it makes its home. It also places the lambs and poultry of the mountaineers under contribution, and renders the keeping of them in some of the wilds of the Alleghanies an impossible liability. Though usually timid and cowardly, it becomes aggressive and dangerous when wounded, and many a hunter will show you with pride, the marks of the claws of the lynx on his bosom. It is chased with hounds like the fox, and the sport is very exciting. When pressed too closely by the dogs it climbs a tree, springing to the ground again on the approach of the hunters. Thus the chase is kept up sometimes for miles, the lynx all the time endeavoring to effect a retreat to his cave in the rocks. **J. M. McCANN.**

—**AN EAGLE SHOT.**—Great interest was excited on Washington street, Highlands, about seven o'clock last evening, by the appearance of a large bird circling in the air but a little way from the ground. It was first seen hovering over the Eustis street burying-ground, and some thought it was a centennial eagle, visiting the former burial-place of the patriots Warren and Heath; while others, less sentimental, thought it was a belated fish-hawk from the beaches, in search of a neighboring fish-market. The republican politicians looked upon the strange bird as a good omen, for it was evident to them that it was a harbinger of success, and an eagle on his way to a Hayes ratification meeting. The democrats asserted that it was a carrier pigeon on his flight south from Albany, with Tilden's letter of acceptance. Some thought it was an owl, waiting for dark to come that it might see its way back to the woods; but no further time was allowed for these and similar conjectures to be indulged in, for the bird soon alighted on a tall chimney on Webster hall, the highest building in the street. By this time hundreds of people had gathered, and the bird calmly looked down on the multitude below. One or two rifle shots were fired, without disturbing it in the least. At length, John L. Bragg, expressman, fired a charge of buck-shot, which brought the bird down, though it dropped into the flue of the chimney, and it was with difficulty got out. It proved to be a young eagle, or osprey, with strong, ring-like talons, a white head, with a powerful beak. His wings measured 4 feet 10 inches from tip to tip. He was about three years old, and a fine specimen of his kind. He will be taken to a taxidermist to be stuffed. —*Boston Daily Advertiser.*

—An English chemist has published the results of his observations of flies, with which he has experimented. If what he reports is true, we should be more kind-hearted to these little insects. It is interesting to watch a fly which has just alighted after soaring about the room for some little time. He goes through a series of operations which remind you of a cat licking herself after a meal, or of a bird plucking its feathers. First the hind feet are rubbed together, then each hind leg is passed over a wing, then the fore-legs undergo a like treatment; and lastly, if you look sharp, you will see the insect carry his proboscis over his legs and about his body as far as he can reach. The minute trunk is perfectly retractile, and it terminates in two large lobes, which you

can see spread out when the insects begin a meal on a lump of sugar. Now, the rubbing together of legs and wings may be a soothing operation, but for what purpose this carefully going over the body with the trunk, especially when that organ is not fitted for licking, but simply for grasping and sucking up food. On placing a fly under the microscope, to the investigator's disgust, it appeared covered with lice. The chemist concluded that here was something which at once required looking into. Why were flies lousy? The fly seemed to take his position very coolly, and extending his proboscis, began to sweep it over his body as if he had just alighted. A glance through the microscope, however, showed that the operation was not one of self beautification, for wherever the lice were there the trunk went. The lice disappeared into the trunk and the fly was eating them. He took the paper into the kitchen and waved it around, taking care that no flies touched it, went back to the microscope and there found animalcules, the same as on flies. He had now arrived at something definite; the animalcules were floating in the air, and the quick motions of the flies gathered them on their bodies, and the flies then went into some quiet corner to have their dainty meal. The investigator goes on describing how he continued the experiment in a variety of localities, and how, in dirty and bad smelling quarters, he found the myriads of flies which exist there literally covered with animalcules, while other flies, captured in bedrooms or ventilated, clean apartments, were miserably lean and entirely free from their prey. Wherever flies existed, evolving germs which might generate disease, there were the flies covering themselves with minute organisms and greedily devouring the same.—*Ex.*

—**THE WAY ANTS FIGHT IN SOUTH AFRICA.**—During the months of September and October, 1873, I was living in the dense bush, about six miles from Cape Coast Castle. Having much time at my disposal, I utilized it by noting the habits and natures of the various creatures inhabiting that beautiful, though deadly, country. I was particularly attracted by the vast hordes of ants which were to be seen every day marching over the narrow roads through the bush, and I determined to notice their habits as closely as possible. Perhaps it may interest those of your readers who have a taste for natural history, if I extract from my notes all that refers to these insects, for these particulars I have not yet seen noted in any work yet published. In the first instance I would mention their migratory habits. I was unable to discover the cause of the changes of abode they made, or what it was that induced them to take up their new quarters in any particular spot; but this was certain, they were constantly on the move, traveling along a sort of cutting or groove, made by their own countless footsteps. I observed that besides the ordinary ants, not much larger than our own English insects, there were others, of about twice the size of their smaller brethren, and armed with a huge horny pair of "pinchers" on the head. These insects always stationed themselves on the brow of the cutting, occasionally patrolling up and down, and evidently surveyed the movements of their friends below. I never saw those larger insects carrying a burden, or in any way assisting in the labors of the common ants, they seemed to me to act as a sort of leader, to direct the march of their brethren. I once placed obstructions in the trench to observe the conduct of the insects; I noticed that if the material was soft enough, the ants broke it up and carried it clear of the trench, by morsels, but a stone too heavy to move, and too hard to break up, they left alone, simply *tunnelling* under it! While some of the insects were thus occupied, the column left the trench for the time, and as soon as all was clear, returned to the old course. I may as well mention that on these migratory marches the ants do not carry any burdens, either food or pupae, as we see them do in England. I found by experiment that if the few leading ants were destroyed, the whole column turned back and retired; that if some of the insects in the center were killed so as to break the column, those in front went on, those behind retired. Here, it is evident that some means of communication must exist between them, for these advances and retreats were simultaneous and without confusion. With an anecdote of what remarkable organization these minute creatures are capable, I will conclude this somewhat protracted letter. One morning a friend and I watched a column of ants starting from their home in the mud walls of a hut in our camp, and determined to follow them to their destination. They marched straight to the parapet, mounted its inner face, descended into the trench, and then mounted the opposite side and proceeded to the open ground there. They directed their course to a small mound of fresh earth, and there the leading insects halted, remaining at the foot of the hillock until the whole force was present. I have calculated the number of this Lilliputian army, by the distance their column extended, allowing an average of four abreast, and a length of one-eighth of an inch to each section of four, to be about 13,824, exclusive of the larger insects. When the whole force was assem-

bled, the little army divided; one part remained at the foot of the mound and ran round and round it, the rest mounted to the top, and some of them entered the loose earth and speedily returned, each bearing a young grasshopper or cricket, dead, which he deposited upon the ground and returned for a fresh load. Those who had remained on the outside of the mound, took up the crickets as they were brought out of the earth, and bore them down to the base of the hill, returning for a fresh load. Soon the contents of the mound seemed to be exhausted, and then the whole force returned home by the same route as before into the trench and over the parapet, each with his burden of cricket food for the community. I must confess that had I not seen this with my own eyes, I could not have believed it, for here was a regular foray, planned and executed with military precision, the country surveyed, and the depot of provisions known accurately before the march was made, and at the mound the prudent division of labor, and the care taken that none of their victims should escape. In conclusion, I would say, that improbable as these facts may seem, yet they were witnessed by myself and my friend, and we returned to our camp, wondering at the greatness of that Creator who could implant in these puny creatures of His hand, so marvelous an instinct.—*Land and Water.*

AND YOUNG FOLKS' CORNER.

(For *Fanciers' Journal*.) *

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending Aug. 6, 1876.

- 1 Great Blue Heron (*Ardea herodias*).
- 2 Spotted Cavy (*Celogenys paca*).
- 2 Agoutis (*Dasyprocta aguti*).
- 1 Ocelot (*Felis pardalis*).
- 2 Squirrel Monkeys (*Saimaris sciurea*).
- 2 Brown Capuchins (*Cebus fatuellus*).
- 5 Blue and Yellow Macaws (*Ara ararauna*).
- 2 Red and Blue Macaws (*A. macao*).
- 2 Red and Yellow Macaws (*A. chloroptera*).
- 1 Trumpeter (*Psophia crepitans*).
- 1 Cuvier's Toucan (*Ramphastos cuvieri*).
- 1 Crested Curassow (*Crax leucor*).
- 1 White Crested Guan (*Pipile jaotinga*).
- 1 Grey's Guan (*Penelope greyi*).
- 1 Cincerus Tinamou (*T. cimerus*).
- 1 Florida Gallinule (*G. galeata*).
- 2 Foxes.
- 13 Parakeets.
- 1 Waterhen.
- 1 Small Guan. Purchased.
- 1 Wild Rabbit (*Lepus sylvaticus*), and 2 chequered Tortoises (*Emys picta*). Presented by E. S. Meader, Hestonville, Pa.
- 3 Sparrow Hawks (*Falco sparverius*). Presented by James Mellor, Oakdale, Pa.
- 1 Young Alligator (*A. mississippiensis*). Presented by James H. Keyser, Philadelphia.
- 2 Bitterns (*Botaurus minor*). Presented by William and Frank Bowen, Chestnut Hill, Pa.
- 1 Young Alligator (*A. mississippiensis*). Presented by Joseph B. Moore, Philadelphia.

ZOO NOTES, No. 27.

BY HUON.

SCENE.—The Ostrich enclosure in the Garden. Two huge birds stalking about nipping the grass.

Hulchen.—Since our last talk about the ostrich I have been reading about it in the book of Job. A rather bad character is there given of it. Of the mother Job says; "She is hardened against her young ones as though they were not hers."

Grampy.—I suspect that the "patient man," or whoever wrote that knew very little about the ostrich, or the prophet Jeremiah either, who says much the same thing in his Lamentations. Modern naturalists and travelers contradict them both flatly. Job also says: "The ostrich leaveth her eggs in the earth and forgetteth them." Now it is well known that the eggs are not in the least forgotten, but are carefully tended by both father and mother, and when the young have burst the shell, the old birds tend them for some days, bring them food, and until they are able to help themselves stand by them ever ready to protect them from harm.

Hulchen.—Job also says the ostrich "forgetteth that the wild beast may break her eggs."

Grampy.—On the contrary, the ostrich seems to have a very good memory of wild beasts, for Burckhardt says—and he very carefully investigated the subject:

"When the eggs are laid they are never altogether left during the day. The parents seemingly aware that the sun's heat is sufficient, leave the nest and take up a position of watch upon a near hill, but as soon as the shades of evening fall, each return and alternately take their place upon the eggs." And says Lichtenstein: "Numerous small wild beasts of prey—wild cats, jackals and the like—who will run any risks to steal the eggs, are found in the morning crushed to death by the ostriches, who tramp upon them with their powerful feet until life is entirely trodden out."

Hulchen.—Lot also calls the bird stupid, saying that:

"God had deprived her of wisdom; nor had he imparted to her understanding."

How is that?

Grampy.—I am afraid that the idea of the bird's stupidity has been taken without investigation.

Hulchen.—But Pliny—and surely he knew—says, "The veriest fools they be of all others, for if they get their head hidden in the sand, they think no man seeth them, and they are safe enough."

Grampy.—Pliny knew more about the Book of Job than he did about the ostrich, and many a pretty nursery tale has been written from his statement, and many a wise "saw" founded upon it, and yet the thing never happens—the hiding of the head in the sand is a mere myth, after all. Sparman, the great Swedish naturalist, who was in Africa just a hundred years ago, visited the localities where the ostrich most abounds, and then and there inquired about this same habit. He met with no one who had ever seen it, or even heard of it. On the contrary, when the bird is pursued by an enemy it endeavors by flight to escape, and continues its efforts until it is knocked on the head by the hunters, or driven to a place where it may be taken alive.

Hulchen.—I have read somewhere that there is a bond of attachment between the quagga or zebra and the ostrich. Is there any truth in that?

Grampy.—Zenophon notices such an alliance, but modern naturalists say the zebras attach themselves to a troop of ostriches because of their being a prudent and wary bird, and thus they trust to their caution and prudence for the discovery of danger. So much for the zebra's idea of the ostrich's stupidity and want of understanding.

Hulchen.—The cry of the ostrich has been said to equal that of the lion. I have heard this disputed by those who seem to know. How is it?

Grampy.—"Doctors disagree" here again. Livingston, writing from among them, says: "the cry of the ostrich is often mistaken for that of the lion." Dr. Shaw says "he often heard them groan as if they were in the greatest agonies;" and the prophet Micah alludes to their "groaning"—though he may be no better authority than Job or Jeremiah. Certain it is, there has been no "lion roaring" or "groaning" done since the birds

have been in the garden. Perhaps they find themselves so well settled in life they have nothing to "groan" about.

Halchen.—You think then that the ostrich has some feelings of love and affection?

Grampy.—Yes. Here's an instance.—In the Jardin des Plantes, a few years ago, there were a pair of these birds—husband wife—living in connubial felicity. One day the skylight over their heads was accidentally broken and a triangular piece of glass was instantly appropriated by the "lady-bird," who at the time seemed to think it a sweet morsel. But her swallowing propensities brought her to grief, for a few days after she died in great agony. Upon dissection it was found that her death was caused by the glass, and now comes the "test of affection." From the moment the widower found himself such he had no rest. Bereft of his mate he began to waste away. Day and night he seemed to be expecting her return, and kept ever on the lookout for her. The keepers removed him to another quarter in hopes the change would make him forget the loss, but in vain. His fruitless, unavailing yearning for his mate continued as long as he had strength to keep it up. Constant unto death, he one day "laid him down and died." But the ostrich can hate, it appears, as well as love. Here is what is told of a pair in the Zoo, Regent's Park. The incident occurred several years ago. One of them had swallowed a gimlet, corkscrew, or something of the sort. It was never known what, but whatever it was, there was such a difficulty in "bolting" it that the poor bird never recovered the unnatural "crick" or curve of the neck it then acquired. His lady mate, regarding this, perhaps, as a sign of weakness on the part of her husband, took a dislike to him, and from that time forth never missed a chance of showing her contempt for him by teasing and "worritin'" him in every possible way. To such an extent was the poor fellow "ostrich-pecked," it was found necessary to separate them, that he could have some peace and quiet.

Halchen.—Is the family large, and has it any representative in America?

Grampy.—The ostrich is the leading type of a family remarkable for the wide dispersion of its members. The ostrich proper spreads over the whole of the burning district of the deserts of Africa. The "Cassowary" pair, now in the garden, is its representative among the luxuriant vegetation of the Indian Archipelago. The "Dinoris," a monster of a bird now extinct—formerly towered among the giant ferns of New Zealand—where the small Apteryx, a relative, now holds his place. Another relative, the "Emu," is confined to that wonderful "Fifth Continent," Australia, and the "Rhea," our American ostrich, flourishes abundantly on the La Platte river. England, too, has its representative in the Bustard, which was found until within a few years upon the least unfrequented downs of that land, and where, but for the shooting propensities of John Bull, it might be yet.

Halchen.—How came Pliny to say that no ostrich might, or should be, classed among the beasts or quadrupeds?

Grampy.—Aristotle says the same, and as ridiculous as such assertions seem, they are not without some excuse, according to the knowledge of the times. The ancient Greeks, Romans, and nations of the Orient, all called the ostrich "camel-bird," on account of its long, powerful legs, unprovided with feathers, and the division of the feet into two toes, which are very similar to the legs and divided hoof of the camel—nor does the resemblance end here. You see those black protuberances on the breast and rump? They are called "callosities," and upon these the birds lying down like the camel, first bend the knees, then rest on the a terior callosity, and finally the posterior one, and your camel-bird is down. To this you will please add the bird's patience for thirst, equaling the camel's, and its inhabiting the same districts, and you cannot wonder that the ancients confounded the two to a certain extent.

Halchen.—Do you think it true that Heliogabalus—that miserable young sinner, for he died at the age of 17, I think—had the brains of six hundred ostriches served up at one of his grand dinners?

Grampy.—He is reported to have had, and he seems to have been capable of any and every kind of extravagance and absurdity. Nor could all the arts of his cooks save him from ennui, or satisfy his passion for eating and drinking. Did he not for the want of a new sensation give a grand dinner to the patricians of Rome, and when the feast was at the highest did he not order "open doors," and let in upon his guests a troupe of lions, tigers, and bears more hungry and ferocious than are Mr. Nash's entire carnivorous family up yonder in the brick mansion.—But, hark!

"The bell tolls the hour for retiring,"

and unless we wish to be caged by Captain Thompson, we had better

"Take our homeward way."

Halchen.—Yes—and—
See the seals some other day.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"To Exchange for Cash" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want column*.

No Exchange or Want will be inserted unless accompanied with 25 cents.

S. S. REYNOLDS, Carlisleville, Ill., wants to exchange some Houdan Chicks for Plymouth Rocks, W. C. B. Polands, or W. Cochins.

G. R. HAY, West Laurens, Otsego Co., N. Y., will exchange a thorough bred Bull Dog Pup, eight weeks old, for anything that does not eat. Stylish Brown Leghorns (Bouney's strain), or B. B. K. Games, for a Buggy Harness.

JOSIAH BORTON, Yardville, N. J., has to exchange two pairs Ring Doves, one pair breeding, one pair young, and Pigeons, such as Faus, Tumblers, and Jacobins, for a No. 1 pair of Turbits, red or blue wings preferred. Wanted mailed birds. Speak quick.

C. D. LEWIS, Box 313, Ansonia, Conn., has Partridge Cochins, S. S. Hamburgs, and G. S. Bantams, choice birds selected from hatch of '75. Will exchange for Webster's Unabridged Dictionary, or offers.

ALBERT W. BESSEY, Box 548, St. Catharines, Ont., Canada, will exchange a Mocking Bird worth \$40.00 for Fancy Pigeons, such as Fantails, Jacobins, Pouters, and Barbs. All communications answered. Speak quick. Stock must be No. 1.

W. CUNNINGHAM, Milton, Pa., will exchange White and Black Pies, White Hackles, and B. B. Games, for a good English Bull Dog, or offers in Fancy Pigeons.

W. H. JEFFRIES, Irwin Station, Westmoreland Co., Pa., will exchange two pairs fine Black Jacobin Pigeons, for a No. 1 Creve Coeur Cockerel, April or May hatch. The same for a Bearded Silver Polish Cockerel.

D. M. HOWELL, 81 S. Eutaw St., Baltimore, Md., will exchange an Electro-Plating Battery (Sauce, maker), with a Book of Instruction to Nickel, Silver, and Gold Plate, for a trio of Buff or Partridge Cochins.

E. G. FLANDERS & CO., Manchester, N. H., have to exchange one six barreled Whitney Revolver, nickel plated and all in good repair, for Brown Leghorns or offers.

G. A. S., Box 700, Worcester, Mass., will exchange Frank Leslie's Illustrated Paper, bound, printed during the war of the rebellion, for Fancy Pigeons, Poultry, or offers.

BOX 474, Orange, N. J., has to exchange a good Gold Watch, Dark Brahmas and Houdans, for Milch Cow, Poland China Pigs, or Brown Leghorns.

W. H. BRACKETT, Boston, Mass., wants to exchange a choice Silver Gray Buck, 14 weeks old, from his imported English prize winners, for a Silver Gray Dove of equal age and quality, or will exchange Guinea Pigs, Loped, Dutch, or Himalayan Rabbits or Fancy Pigeons, for Magic Lanterns.

W. C. EATON, Newark, N. J., will exchange a Silver Gray, 125 slides, (cost \$29.00); also a Graves Incubator, for P. O., B. L., and Houdan chicks. Fancy points no object.

CHAS. F. FREEMAN, 1914 North Fifth St., Philadelphia, Pa., breeder of Swallows, Turbits, and Owls, will exchange some of the finest Blue-winged Turbits, Solid Black Turbits, Black-tail Turbits, and fine bred Owls, for Red Swallows or Blue Swallows. They must be perfect birds in every way. Here is a chance for any body to get good Turbits for good Swallows.

JOHN D. WHITE, Chicopee, Mass., will exchange one pair solid black Inside Tumblers, first premium birds and warranted first class, for a pair of Yellow Jackbats, or young Carriers of any color, but must be good.

IRVING H. ELLIER, Chicopee, Mass., has Brown Leghorn Cockerels, of various strains, to exchange for offers. Write.

G. J. BAKER, Postville, Truistgar P. O., Ont., will exchange any of the following thoroughbred stock—Cotswold Lambs, Berkshire Pigs, Black Cochins, Coach Slut, in pup, Black and Tan Dog Pup, and Hunting Rifle—for Jersey Heifer, in calf, or Bull Calf.

W. F. MUCHMORE, Basking Ridge, N. J., will exchange one trio Partridge Cochins (William's strain), one trio L. Brahmas, four hen Canary birds, one Setter bitch pup, 3 months old, noted strain and pedigree, for American Kennel and Sporting Field Books, or offers.

GEO. M. WOSNOL, East Gloucester, Mass., has two pairs of Peacocks, one pair three years old, full plumaged, twenty-seven first-class Aylesbury Ducks and four Drakes—the ducks are laying finely—to exchange for Poland China Pigs, Hamburgs in varieties, Bantams in varieties, Lop-Eared or Angora Rabbits, or offers.

CHAS. O. HENKELL, Milton, Pa., will exchange one trio B. L. Hens, five Dark B. Hens and ten Cocks, four Partridge Cochins Hens and one Cock, one pair Canaries and Cage, one Ground Hog, one pair Black Barbs, old birds, one Air Gun, one pair Rouen and one pair Pekin, 1 Drake and four Hens Aylesbury Ducks, for old mated Fancy Pigeons, or offers.

M. VAN CULIN, Delaware City, Delaware, has to exchange two pairs white Carriers, two pairs Pouters, one pair Barbs (cock red, hen dun), one pair White Crested Fans, one pair Black Balts, two pairs Tumblers, one red Carrier Hen, one white Carrier Hen, one Black Bald Hen, one White Fan Hen (crested), one Yellow Barb Hen, eleven Brown Leghorn Cockerels, one White Leghorn Cock and six Hens, five White Leghorn Cockerels and six Pullets, one trio G. S. Hamburgs, Cocker Spaniel Bitch, Setter Puppies, from imported parents, for Webster's Unabridged Dictionary, Works on the Horse, or Dog, or Natural History, Brown Leghorn hens or pullets, tools of any kind, poultry, or pigeons, or offers. Send along your postal cards.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

AUDUBON WANTED—Jos. M. Wylie, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

BOOKS TO SPARE.

GOD KNOWS ALL THE REST.

"Now I lay," repeat it darling—

"Lay me," lisped the tiny lips
Of my daughter, kneeling, bending,
O'er her folded finger tips.

"Down to sleep"—"to sleep," she murmured;

And the curly head bent low;

"I pray the Lord"—I gently added,
You can say it all, I know.

"Pray the Lord"—the sound came faint,

Fainter still—"My soul to keep,"

Then the tired head fairly nodded,
And the child was fast asleep.

But the dewy eyes half opened,

When I clasped her to my breast,

And the dear voice softly whispered,

"Mamma, God knows all the rest."

—*Ky. Live Stock Record.*

REMINISCENCES OF AUDUBON.

(BY A GRANDDAUGHTER.)

Among the most vivid of my childhood's memories, stand out the face and figure of my grandfather; a tall, old man, with snow-white hair and feeble step, wandering gently and quickly about the home he had made for himself on the banks of the Hudson. His travels were ended, his great work completed, and the soul which had quailed at no difficulty and paused at no obstacle had, if I may so express it, entered the Border Land; not quite yet could it leave its earthly tenement, and the old man was as a child. But in such love and veneration was he held by all who knew him, that these few years, as I recall them, seem to have been a resting-place between the busy, active life, and the Hereafter. Had I been older, I should have felt, as his sons did most keenly, the change between the enthusiastic naturalist and the quiet, waiting dreamer; but, child as I was, no grief attached itself to my memory of him, excepting the regret that I did not know him longer and better. What I here relate, however, is additional to what has been already stated in his Biography, and the general interest that has been taken in the subject has prompted me to write down these recollections. To us, his grandchildren, his life was and always will be a wonderful story; and though much has been written of him in his Biography and elsewhere, there are still some anecdotes which are not generally known.

Many a happy hour have I passed, listening to incidents of his daring, his patience and endurance,—his quick, nervous nature causing strange contradictions in his character. One can hardly believe that the man who for three weeks spent every day, and all day long, lying on his back watching two little birds build their nest, could be the same who would become so discouraged sometimes, and so impatient, when the effects he desired could not be produced, that he would throw canvas, easel, paints and brushes from him, and rush from the house, to find consolation in his beloved woods. On his return he would find his implements

collected together and arranged, and would resume work as if no outburst of temper had interrupted him.

His enthusiasm was sometimes intense; he would rise before daylight and walk about, eagerly waiting for the dawn that he might begin his work, and once at work would steadily and earnestly continue to paint all day. Sunset found him at his picture full of vigor and energy, but with no interest in anything else. He would retire almost immediately in order to rise early on the following morning, and would pursue this course for days till the fever left him, when he would lay his brushes aside, and roam through woods and fields, his keen, clear perceptions giving him far deeper insight into the heart of Nature than is granted to the world in general.

At no time did he lose sight of his work, and he carried it with him wherever he went; if not in the tangible form of paints and brushes, it appeared in his earnest questions addressed to those he might be with, or in the quick glances of those eagle eyes which were such a noticeable feature of his handsome face. Animals of various kinds, many of them far from attractive, were at one time or another inmates of his house. I remember my mother telling me that one of her first experiences with my grandfather, was being called up one night in common with the rest of the household to catch a number of white mice, which had escaped from their cage; and very amusing was her account of the pursuit and final capture of the runaways, the excited owner leading the chase, under tables and chairs, into corners and behind curtains, eventually securing them all, though not without a brave resistance on the part of the mice, whose sharp teeth left painful records on the fingers of their captors.

I sometimes think his enthusiasm must have absorbed his sense of smell, for, while he and my father were engaged on the picture of the American polecat, that animal to the view of which, above all others, "distance lends enchantment," and which they had made a resident of their "painting-room," in common with other fourfooted associates, my mother and aunt were compelled to leave the house for a more congenial atmosphere. At another time, the remains of a California buzzard, in the last stages of decomposition, lay for days on our piazza, and I never look at that picture without an involuntary shudder at the memory of its skinny head and neck, and general unpleasantness of appearance and smell. Whenever it was possible, the drawings were made from living specimens; bears, wolves, foxes, deer, moose, elk, and many smaller quadrupeds as well as birds, formed part of the establishment, though most of them were kept about a quarter of a mile from the house, and sketched as they moved about their enclosures, untrammelled by chain or rope. Though kindly treated, these animals rarely became tame, and we children always inspected them from a safe distance with the greatest interest, and we one and all looked down on the child visitors we had from time to time, and to whom these animals were new and wonderful, with a scorn which the overpowering conceit of childhood alone could have engendered.

Those animals which, from any cause, could not be secured or kept alive, were painted as soon after death as possible, before the

muscles had relaxed, or the coloring lost the gloss and brilliancy of life, and the most careful study was given to the motions and attitudes of both bird and beast while in their native home, in order that the delineation might in every case be as perfect as genius and industry could make it. Not only were the drawings accurate in action, but in size; the smallest bird was carefully measured, and I have memoranda in which are noted the length of bill and tongue, of tiny claw and bead-like eye. The figures of birds or animals were very frequently painted with no background whatever, my grandfather merely groning them, and passing them over to his eldest son, Victor, who supplied the deficiency.

Again, the landscape was sketched round a mere outline, and the animal painted in afterwards, being copied by father or sons, as the case might be, from the original drawings, which were often made on paper; in the case of the birds, all the original drawings were on this perishable material. The reason for using paper was that most of the drawings were made in the woods, or on the prairie, or by the sea-side, or wherever the bird was found, and the light weight of paper in comparison to that of canvas recommended it for drawing purposes, while the studio was an ever-changing one. On more than one occasion, personal risk and inconvenience were accepted, rather than the chance of the treasured drawings being injured. A curious thing about these sketches is the harmony with which different materials are used. It is common to find oils, water-colors, India ink, lead-pencil, and crayons, all employed on the same bird; the artist's aim was to represent nature truthfully, and any thing that helped him to fulfill this aim was instantly employed.

The entire collection of the original drawings of the birds have been mounted, and are now in the possession of the New York Historical Society. At the time of purchasing, the Society purposed building a room for the special exhibition of these drawings; but I am told they have not yet carried out this design, and the public is therefore unable to enjoy them, as the delicacy of the work would be ruined by careless or frequent handling.

In appearance Audubon was a man of wonderful beauty, added to which he had most attractive manners. In his conversation with those with whom he was intimate he always used the "thee" and "thou," acquired in his education among the French; and, though of American birth, and so proud of his democratic nationality that he never, even when in Europe, used his family crest, I find in his letters and memoranda many words wholly French, and others where the etymology of that language is preserved.

To be Continued.

THE BOTTOM OF THE SEA.

Professor Huxley, at a dinner in Edinburgh, to the Challenger expedition party, July 7, said:

I very much doubt if any nation whatever is able to show so admirable an example of the equipment of a ship for the purposes for which it was destined as the British admiralty produced in the equipment of her Majesty's ship Challenger, and I may be permitted to say that I speak to a certain extent as a connoisseur, having served on board her Majesty's ships of very different capacity a great many years ago. [Applause.] Well, now, what was it that the Challenger was sent to do? She was sent to obtain for us that more precise and accurate information of the physical characteristics of the sea and of the animal life in it which was absolutely requisite for the progress of science. For that purpose she was ordered to traverse the Atlantic twice, to proceed by the way of the Cape of Good Hope, to make a dive into the antarctic regions among the snow and ice of those localities; then to go north again by the way of Australia to thread her way among the coral reefs upon the eastern coast of Australia; to pass through Torres Straits, to reach the coast of China, then

strike across the Pacific and find her way home again by way of Cape Horn; and throughout the whole of that track, amounting by the course she followed to some 70,000 miles, it was her duty at regular intervals to ascertain the exact depth of the sea, the distribution of the temperature in the sea, the nature of the creatures which live on the surface, the nature of the debris found at the bottom, and thus to lay something like a solid foundation for our speculation upon the physical geography of the sea. It was a very considerable task; it was a task which would have been absolutely chimerical thirty years ago, but it was a task which had been rendered possible, and which has been actually performed in the most satisfactory manner. [Applause.] The Challenger has brought home, I am informed, the records of such operations performed at between 300 and 400 stations; that is to say, at 300 or 400 points along that 70,000 miles, we know exactly the depth of the sea, the gradations of temperature, the distribution of superficial life, and the nature of what constitutes the sea bottom; and such a foundation as that for all future thought upon the physical geography of the sea up to this moment not only had not existed, but had not even been dreamed of. Some of the discoveries which have been made by the Challenger are undoubtedly such as to make us all form new ideas of the operation of natural causes in the sea. Take, for example, the very remarkable fact that at great depths the temperature of the sea always sinks down pretty much to that of freezing fresh water. This is a very strange fact in itself—a fact which certainly could not have been anticipated *a priori*. Take, again, the marvellous discovery that over large areas of the sea the bottom is covered with a kind of chalk, a substance made up entirely of the shells of minute creatures—a sort of geological shoddy made of the cast-off clothes of these animals. [Laughter.] The fact had been known for a long time, and we were greatly puzzled to know how those things got to be there. But the res-arches of the Challenger have proved beyond question, as far as I can see, that the remains in question are the shells of organisms which live at the surface, and not at the bottom, and that this deposit, which is of the same nature as the ancient chalk, differing in some minor respects, but essentially the same, is absolutely formed by a rain of skeletons. These creatures all live within 100 fathoms of the surface; and being subject to the fate of all living things, they sooner or later die, and when they die their skeletons are rained down in one continual shower, falling through a mile or couple of miles of sea water. How long they take about it imagination fails one in supposing, but at last they get to the bottom, and there, piled up, they form a great stratum of a substance which, if upheaved, would be exactly like chalk. Here we have a possible mode of construction of the rocks which compose the earth of which we had previously no conception. But this is by no means the most wonderful thing. When they got to the depths of 3,000 and 4,000 fathoms, and to 4,400 fathoms, or about five miles, which was the greatest depth at which the Challenger fished anything from the bottom—and I think a very creditable depth, too—they found that, while the surface of the water might be full of those calcareous organisms, the bottom was not. There they found that red clay so pathetically alluded to by my friend on the right as the material to which, when glory called him, he might be reduced. [Laughter.] This red clay is a great puzzle—a great mystery—how it comes there, what it arises from, whether it is, as the director has suggested, the ash of foraminiferæ; whether it is decomposed pumice stone vomited out by volcanoes and scattered over the surface, or whether, lastly, it has something to do with that meteoric dust which is being continually rained upon us from the spaces of the universe. Which of these causes may be at the bottom of the phenomenon it is very hard to say; it is one of those points on which we shall have information by and by.

POULTRY DEPARTMENT.

(For *Fanciers' Journal*.)

HAMBURGS.

How my heart swells with joy and pride as I gaze upon my beautiful Hamburgs, skipping over the ground through the fields, after the wayward grasshopper, or singing right merrily as they direct their steps to the laying shed, whence they soon issue, and the "cut, cut, cut, cut-darent!" indicates that they have left their compliments in the nest, in the shape of a fresh egg so agreeable to the palate, especially when "dropped" on to-a, and so much of an invigorator for these canine days. Just now your great bean-pole, clumsy louts of Brahmas, are shedding their thick coat and lazing around inactive, or have been attempting to hatch a brick for the last month, while my Hamburgs are also moulting, but still continue to lay eggs daily. When confined during moult, eggs will be scarce; give them *range* and you will have no reason to regret the change.

The Gold and Silver Spangled are my favorites. I have had the others, but not being quite so hardy with me, I selected the Spangles, and have bred them several years. Now one man will say: "Hamburgs are very good in their way, but I want something to eat, and it will take several Hamburgs to make a meal for a family." I admit they are small, but their flesh is *god* (precious packages in small bundles), but I don't keep them for flesh or early market, but eggs, and have yet to see any other variety surpass them in this respect. Every little while some one "rushes into print" with an account of the egg-producing qualities of his fowls, and concludes they have "beaten everything," and cries, "who next?" while the novice just starting, not understanding the "tricks of the trade," thinks that must be a splendid variety, and forthwith launches into the fancy, ere long to learn that things are not as they seem, and as he rubs his eyes and looks around, he soon ascertains that he is a "green un." Another man will inform you that he kept Hamburgs for a while, but in the winter they were all the while "sneezing," and had swelled heads, &c., and upon calling in Mr. Smith, he told him it was the roup, and prescribed as follows:—"Give them cod-liver oil every night, wash their feet with snow water diluted with alcohol, and give a pill every morning, composed as follows: a little sulphur, a little chalk, a little blue vitriol, carefully mixed with kerosene oil." He did so, and lost his whole flock. I will forgive him, he'll know better by and by.

If Hamburgs are bred in and in to any great extent, you will have a poor looking flock; fresh blood is necessary to health and constitution in any strain or breed, and it shows itself perhaps sooner with Hamburgs than some other hardy breeds. I have kept mine with good success in a small house, with a hole for ventilation open throughout the entire winter (cold and severe at that), and had no unhealthiness among them, and received plenty of fresh eggs all winter.

Give them a *hot* or *warm* breakfast with a little cayenne pepper mixed therein, every day (in winter), and corn at night, and al-

ways fresh water where they can reach it. This, with a good ventilation at the top and sprinkling of ashes or sand under the roost occasionally, will insure you healthiness in this valuable breed, and the manner in which they will repay your little trouble will convince you that they "fill the bill," so far as eggs are concerned.

My neighbor will tell me that his Leghorns are larger, and it is his opinion will lay more eggs than mine, to which I respond:

In this latitude how much did you pay out for fuel last winter, to protect your Leghorn combs from "Jack Frost"? Any one knows, who has kept Leghorns, that with a frozen comb they are not disposed to "shell out" till said comb is healed or warmer weather arrives.

It is very well for some folks to have very positive opinions of their own, which they generally do, and will endeavor to convince you that *their* particular kind is better than any other, but wait till their particular kind is as thick about them as "hairs on a hog's back," and you will find them after a new breed which "beats everything," and thus their tune is changed and a new field of operations opened.

In conclusion, I will say, when you want the beautiful and the useful combined, *not* for market, but general household purposes, can you show me the superior of the Hamburgs? I am open to argument, if that can convince me, that the fowls are few and far between that can surpass these "everlasting layers."

QUILIBET.

MANAGEMENT OF CHICKENS.—No. 2.

All the while the present hot weather lasts the chickens cannot have too much shade, and their food cannot be too fresh and sweet. Shade is important for all breeds. Cochins, and Dorkings, and Hamburgs are all the better for shade. With white varieties to keep them white it is essential. Those who only have bare and enclosed runs will keep them cool and fresh by watering them every two or three nights. It is quite surprising to find how the chickens are benefited by that practice.

We again urge that the yards should now be thinned, and all the inferior specimens removed to make room for the others. Cochins with scanty leg-feathering, or Cochins with heavy hocks and inside leg-feathering, can never be of much use. Hamburgs with white legs, Houdans and Dorkings with bad claws, single-combed, and clean-legged Silkies, and all birds with such serious imperfections can never be up to the mark, and should be at once done away with. We are quite positive that many, too many inferior and perfectly useless birds are annually allowed to live, and then perhaps sold for 3s. or 4s. each, and in their turn used by inexperienced purchasers as breeding stock, and hence come the swarms of perfect rubbish which we find advertised in cheap advertisements. These birds will, we fear, in time, half ruin the fancy; and we often think the selling classes are in another way equally as unprofitable and damaging, for to every good bird sold in a sale class we should think we may safely reckon there are ten bad ones. Weed-out, we say that, now the wasters—roast them, boil them, pie them, only get rid of them, and we dare say—we feel certain—the remainder will be doubly as valuable as if all had been allowed to live.

It is important now, too, to see to the roosting places of the chickens, for many will soon be changing their feathers, and overcrowding or bad housing may spoil the new plumage. Those which are allowed still to sleep in their coops—and we fully approve of the plan—should be carefully watched, for often a dozen or two will try and crowd into a coop which can only hold half the number. We like our chickens to sleep in these coops, when there is no fear of dogs or foxes disturbing them, as long as possible, for by moving these small tenements every day to a fresh place the ground is well manured, and the chickens are always in

clean feather. Of course, only those who have a field or some such run can do this; but those who have the ordinary fixed houses merely for the chickens to roost in must keep such very clean, for just at this time many birds in one building, especially where any matter is allowed to remain and decompose, will fill the place with injurious and bad air. Boards under the perches which can be scraped every morning some use, but we like ourselves nothing so well as a bed of clean dust and sand, for it is so easily raked over with a finely-toothed rake, and the dust acts as a powerful deodorizer and removes every particle of smell. Some mix lime dust with this sand or road grit, but we do not approve of this where the birds can have access to the houses in the daytime, for they will often dust in it, and we are sure the lime injures the feathers and spoils some of the bloom and gloss.

Many who have a small plot of garden for flowers or vegetables, and also go in for chickens in quite an amateur way, are afraid of letting their brood loose in the garden, for a lettuce bed or young turnips or beet-roots would soon cease to exist under the mothers' claws and the chickens' mouths. We should recommend them to have a few yards of galvanized wire, and bend it loosely round the rhubarb bed, or when the strawberries are over round the plants there, or the artichokes and seakale, for they will now do no harm there; and we have seen a young brood of three or four weeks old thrive in a surprising manner when so wired in, for they obtain shade, and the loose straws and refuse which are generally found on such beds afford a capital opportunity for scratching, and plenty of wood-lice and flies and insects are being repeatedly turned up.

All will probably have by now, cockerels and pullets large enough to separate. If only two runs can be spared for this purpose let the birds be changed in them frequently. The cockerels can have one run for a fortnight, and then the pullets can go there and the cockerels come to the "ladies' enclosure." The greater distance these runs are apart the better. We do not care for them being side by side and only divided by wire fencing. When, however, this cannot be remedied, let there be close hurdles or wattle fencing for about three feet high, such as we described in the "Basse-Cour" of Mr. T. C. Burnell of Micheldever, for we do not desire the birds seeing each other through the wire.

The larger birds will not now want feeding so frequently. Birds four and five months old can well do now with three meals a day, and three-months-old birds well with four. We again recommend at this period of their growth an abundance of vegetable food and not too much water. Bone dust some use very much, and we were much surprised to hear this last week from one or two celebrated fanciers how extensively they use it. We have never tried it ourselves, and yet we have sent to the exhibition pen a goodly number of winning chickens; but those who do care to try it, or who are in the habit of doing so, must see they get a useful sample, for we have seen some sent out which was simply perfect rubbish, and which would do about as much good as sawdust. Bones from the house, or where the establishment is not large enough to supply any quantity, from the butcher, smashed up and crushed on a wooden block by a heavy hammer, would prove of value we can well imagine; and that is the sort of bone-food used of course, in moderation and with judgment, which we should recommend and feel inclined to use ourselves.—W. in *Journal of Horticulture*.

There is a vast difference in the flavor of eggs. Hens fed on clean, sound grain, and kept on a clean grass run, give much finer flavored eggs than hens that have access to stable and manure heaps, and eat all kinds of filthy food. Hens feeding on fish and onions flavor their eggs accordingly, the same as cows eating onions or cabbage, or drinking offensive water, impart a bad taste to milk and butter.

Yours drooly,

SCHONNY SCHPROAGLE.

A FEW JOTTINGS.

BY SPANGLE.

Editor Fancier's Journal:

The late hot weather has prevented me from attempting to write much for the poultry papers. I am glad to note the constant progress of the JOURNAL, which comes to my table every week, and I observe that you keep up its periodical interest, through its entertaining contents, and the efforts of your many talented correspondents.

The Herron vs. Warren quarrel (about a very small matter, from the start,) has now got so muddled that it is hard for a disinterested man to say who (if either) was very blameable. I don't think this sort of personal discussion helps either side—with the public. Al. Warren is pretty well known, and favorably esteemed. He has bred and sold many fine game birds, and is called an honorable business man. We all make mistakes, occasionally. Mr. Herron seems to have been aggrieved—but would it not have been better for both men to have settled their "little difference" without flying into print with it? I think so—though I may be mistaken in my judgment.

S. J. Bestor, of Hartford, Conn., advertises his splendid collection of high-bred crested white Calcutta Fan-tail Pigeons, I see, in your last number. Here is a good chance for some enterprising pigeon-fancier. If the purchaser of this magnificent stock can breed them as nicely as Mr. Bestor has for a dozen or fifteen years past, "there is money in it," as Mr. B. suggests. I have seen his stock, personally, and I am sure I express the opinion of all the numerous patrons and visitors of this enthusiastic fancier's establishment, that no such collection of White Fantails has ever been kept, or bred, on this side of the Atlantic. Five hundred dollars for 110 such breeding birds of this choice variety as Mr. Bestor can show, to-day, is a bargain, indeed, for any one who is in this line. And I hope as good a man, as careful a fancier and cultivator of pet stock as the present owner has been, will for-

tunately become the possessor of this magnificent clean-bred collection.

Your "Young Breeder" is a very good "reporter." But he ought not to assail my friend Dr. Dickie—who has "Plymouth Rock" on the brain, and can't help it. Besides writing so largely on this topic, the Doctor has "gone for" the Chicken Cholera business, rather earnestly, of late. I hope he may (not) catch it. When that 7,000 pp. work on the Rocks is published, please secure me an early copy—which I trust I may live long enough to read through. The realization of this hope will surely guarantee me "a green old age!"

Al. Warren says he "wants to be an angel." I suppose there is no objection to this laudable desire on his part, though I judge that Mr. Herron would hardly help to vote him into that category, if he has any choice in the matter. But when H. applies such offensive terms as "scallawag," "thief," etc., (even by intending) to such a man as we all know W. is—for one I must say it is in very bad taste, and altogether impolite, as well as untruthful. Why do you mar the otherwise fair pages of the JOURNAL with this sort of objectionable controversy?

"Huxon" is always a pleasant contributor. His articles are valuable, and very interesting. And if "SPANGLE" can make himself equally entertaining, as soon as the heated term lets up, he will occasionally send you a "screed."

BOOTED BANTAMS.

BY REGINALD S. S. WOODGATE.

We have seen at exhibitions and other places White, Black, and Mottled Booted Bantams, but we have never seen any of the two latter colors to equal good specimens of the White variety. They are a very old-fashioned breed, and specimens are often to be found in out-of-the-way villages, where the stock has been allowed to degenerate until it has lost many of its chief characteristics, but still unmistakable proofs of the real Booted Bantam remain. It is the Mottled or Speckled variety which is generally so found, and we often fancy that many of them may have been the result of a cross with a White or some other Bantam, for the leg-feathering is generally the last thing to breed out, and so has remained to stamp the descendants with boots and leg-feathering. We are quite aware that the Speckled variety has been imported with very tolerably good show points, as have the Whites, but we think they are really very old English customers, and were the British Bantam long before Sebrights, or Game, or Black Rose-combed Bantams were known. When classes are given for them they generally muster very fairly well; and with a little more trouble to circulate the schedules which contain such classes among the fanciers and admirers of the breed, we think many more entries would be found, for as a rule they are more to be looked for as lawn pets in country homes than in the exhibitors' pens. It is but sorry work to enter them in a Bantam class at a general exhibition, for Pekins or Sebrights, often just because they are Pekins or Sebrights, irrespective of merits, sweep away everything. We often really wonder Bantam exhibitors do not protest against those ever-winning Sebrights always taking the prizes. It does not matter whose they are, or where they come from, or if there is only one pen in the class, but a commonly decent pair will walk off with first prize or cup; and let a pair of Bootees be absolutely perfect they generally find one of those "highly commended" cards at most as their reward. We could name one judge in Lancashire who is kindest with them, and acts the most fairly of all judges we know towards them, while we can name a southern one who confesses he has no partiality for the breed.

They certainly make most amusing pets and look extremely pretty on lawns, and from the immense amount of leg-feathering

they rarely do much injury in the garden. They have interesting little ways, and can be taught easily to jump up to the windows to be fed, consequently they make great pets for children; and we know of two or three little nursery establishments whose live stock are Booted Bantams, for they soon get so tame and feed from the children's hands.

For exhibition the Whites should be as pure in color as possible, and the Blacks as deep in color and glossy in plumage as can be obtained, both of which latter points are difficult to get, for the Blacks are in the habit frequently of coming quite rusty colored. The markings of the Speckled or Mottled are a matter of taste,

BOOTED BANTAMS.

as much as they are in the Houdan. We have seen them with a deep chocolate ground and white spangles, which made a pretty contrast. They should have upright single combs in our opinion; and though sometimes we come across the double combs, still we think by them the breed loses much of its character, and often are inclined to think they result from a cross at some time or other with a Rose-combed White, for we can find no record of the old English Booted Bantam being rose-combed, though we hear from many places, especially in the east of England, of a single-combed variety having existed there for very many years. They should be as small as possible; but we are afraid there is a tendency to breeding them too large. We have tried in-and-in breeding, and find we get them no smaller—in fact, if anything, rather larger. They should be compact in shape, and not squirrel-tailed, which generally shows a cross with the Japanese for the sake of the comb in the first instance. We conclude they should be heavily leg-feathered and booted, and have long hocks touching the ground. We like them short on the leg, but not too short as to look like Dummies. The White variety requires to be shown very clean and pure in color for any hope of success. In mating them for breeding, choose the best-colored specimens and heaviest feathered. If not wanted for the chicken shows we should recommend the chickens being hatched in June, as more likely to keep them small. The older a bird gets the heavier does the leg and foot-feathering come, and so we generally prefer not to exhibit them until after their first moult. The White cocks are much inclined to turn yellow from the sun, as all white poultry do; but if kept in the shade they will, if of a good strain, remain white through the whole summer.

The chickens are hardy, but being so very small when hatched require a gentle mother. They make good sitters and nurses themselves, but their long hocks and feet-feathering make them liable to roll the eggs from their nests when leaving them to feed. The chickens are hatched as white as the driven snow, and afford

a peculiar contrast to Silkie, which so often hatch a deep buff and feather so very white. The eggs range in color from pale buff to a delicate cream color, and often are quite white. They are certainly large for the size of the birds.

Booted Bantams seem to bear confinement well, and a few feet of smooth lawn would be much better for them than a larger and rougher run, for on long grass or rough soil they very frequently break off the long feet-feathers, and wear their hocks down by the friction. For town Bantams, where something quaint is appreciated, we strongly recommend Black Booted if they can be procured good, and there is no reason then why the amateur with the smallest back garden in the smokiest town should not come to the front in the exhibition ranks. The Whites would answer the purpose equally as well, but they would require washing for exhibition; and although it is the simplest thing possible to wash a bird, many will not believe it, and if they did would not care for the trouble, which is certainly considerable. We may state for the benefit of those who read this Journal, and yet do not see the Crystal Palace schedule, that that Society gives a class for the White Booted variety.—*Journal of Horticulture*.

(For *Fanciers' Journal*.)

RAMBLES IN LITCHFIELD COUNTY, CONN.

Those who love to see nature in all her primeval grandeur, with here and there a touch of man's modern improvement, and to inhale the bracing air of the mountains, will find the undulating regions of this county adapted to their wants, peculiarly so at this season of the year, and along our route we found that these advantages were largely appreciated by summer sojourners from the cities and metropolis.

The trip from Watertown to Seymour, and the confines of New Haven county, extending over twenty miles, is a rough and rugged path, but not particularly beset with danger, when traveling with the native horses (although accidents have occurred).

The squirrel may be seen now and then using his light fantastic toes along the hedges and fences of the road. From Watertown we take the new Naugatuck branch railroad cars, which brings us to the former place in about thirty minutes. Watertown stands on an eminence, and on the summit is a spacious and beautiful hotel, the resort of many, during the hot term, from the metropolis. From Watertown we pass by stage, over fifty hills, more or less, balmy breezes fanning us on the top of each one, in about an hour and a half, to the ancient town of Woodbury, where some of the people live to be centenarians. Here we stayed till the following Monday. The next day being Sunday, after our arrival we repaired to the Episcopal church, where the devout rector, the Rev. Mr. Jaycox, officiated, and from the good attendance observable—the thermometer being above the nineties—we were deeply sensible that this was the land of steady habits. The town proper consists of one main street about one mile in length, the houses of which generally are very neat, and tastefully decorated with flower gardens. High mountains loom up on either side of it.

The peace of Woodbury is seldom disturbed, except by the stirring strains of the Curtiss cornet band, which consists of young men of the town. They have a stage erected on the upper part, where they perform on Saturday evenings—a truly blessed mode of closing the labors of the week, and a happy prelude to the exercises of the Sabbath. Passing southward about five miles by private conveyance to Southbury, is probably one of the pleasantest drives to be found in New England; or we ought rather to call it a natural boulevard, for all along the route are elms, maples, poplars, and chestnut trees, etc., some of which must have been there when the Father of our country traveled by stage through Connecticut.

But on leaving Woodbury, and turning to the right, we enter a beautiful glen, named Pomperaug, where is situated the woolen manufactory of D. Curtiss & Sons, and about a dozen houses. In one of these lives our friend Mr. Henry Stewart, a subscriber to this Journal, whom we visited, who showed us a family of about sixty chicks all bred from one pair of games, and he informed us that every egg he set hatched, and every chick hatched was living, a parallel rarely to be met with. Mrs. Stewart, who herself takes great pleasure in poultry, spread them a banquet of Indian corn, and at a signal call from her, they assembled from their hiding places from under the trees and bushes, as happy as crickets, and quickly gobbled up the sweet repast; as care had not been taken to exclude them from others (been bred more for the pot than for the show pen) they were not all exactly uniform, but a few could be picked out that would do credit to the latter. Indeed we noticed this promiscuous breeding to be the case all along our route; a cluster of fowls here and there would show fine Brahmas or Cochins amongst them, whilst others resembled the Houdan or Hamburg very closely—showing plainly that the parties sometimes purchased thorough-bred birds, but did not take particular pains to breed from them alone. However, we noticed and admired them as they were, for in many instances beautiful specimens of cross breeding could be found amongst them both with regard to development and design. The houses, here and there, are very elegant, some of them occupied only by summer tourists, whom we noticed fanning themselves on the verandas, while others were conversing in the shady gardens, amongst the flowers—the angels that give delight and hurt not.

Driving forward beyond Southbury, we halted at a farm-house on the declivity of a hill, where resides Mr. Hazen, a very hospitable gentleman, who invited us to the luxuries of his farm. In the half hour's conversation we had, he told us that he would have had about three hundred head of poultry, of one kind or another, such as hens, turkeys, geese, and ducks, but that the foxes had made great havoc amongst them. They descended upon them from the mountains, both night and day, and took them when half grown, reducing his stock to less than a quarter of the original number; he had had some trouble with the rats, but these he had overcome by the Costar rat poison. Mrs. Hazen had made this department of the stock raising her specialty, and naturally felt aggrieved at her discouragements. The last year, she had sold \$75 worth, besides domestic use, but this year, the miscreant foxes were stealing the profits. We advised the erection of light lath work frame buildings to protect the chicks, after a certain age. We noticed quite a number of sheep grazing on the hills.

They bid us good bye, with an earnest entreaty to visit them again. And here we will postpone further reports of our peregrinations in Litchfield County.

BRICS.

The Fire-Fly.—There are but few adults who have not pleasant recollections associated with that inseparable companion of summer evenings, the fire-fly, and with whom it was an unwearied amusement to pursue and capture in the happy and aimless time of early childhood. It is most numerous in this locality from the tenth of June to the tenth of July. During this time, when the first shades of evening appear, the rapid flashes of phosphoric light from countless numbers of this harmless little insect illuminate the lawn, as it ascends the blades of grass preparatory to taking its nocturnal flight.

After showers of rain it is particularly active and luminous, when tree, shrub and grass shine with its pale, transient light, which proceeds from a mass of yellowish matter under the rear portion of the body, and is emitted at will. When this is separated from the body it shines for several hours, but gradually fades and disappears. This singular provision of nature is said to be for the purpose of directing the sexes to each other. In Europe the fire-fly is substituted by the glow-worm, a wingless female insect of the same family. The male is not luminous and is guided to his mate by the light which she emits in a manner similar to the species in this country.—*Germantown Telegraph*.

PIGEON DEPARTMENT.

THE INTERNATIONAL PIGEON RACE.

I have received the *Epervier*.

The first English bird tossed at Brussels came back late the same day, the second in the morning the day after, and the third one in the afternoon. All three belonged to Mr. Colville of Burton-on-Trent.

The silver cup, offered by the Society Abeona of Brussels, was won by Mr. Cheffins of Dunmore (Essex).

There was a prize race in Brussels, from Langon, in the south of France, in which 2,164 birds took part. Will send particulars for next number. J. VAN OPSTAL.

(For Fanriers' Journal.)

PIGEONS.

The art of, and fancy for, pigeon breeding is very ancient. Even more than three thousand years before Christ, it was carried on by the Egyptians. The Romans, under the emperors, laid out enormous sums upon the breeding of pigeons, and kept accurate pedigrees of their descent, just as the Arabs keep genealogical pedigrees of their horses, and the Mecklenburg aristocracy of their own ancestors. In Asia, too, among the wealthy princes, pigeon breeding was a very ancient fancy; in 1600, the court of Akber Khan possessed more than twenty thousand pigeons. Then in the course of several centuries, and in consequence of the various methods of breeding practiced in different parts of the world, there has arisen out of one single originally tamed form, an immense number of different races and varieties, which in their most divergent forms are extremely different from one another, and are often curiously characterized.

One of the most striking races of pigeons is the well-known fan-tailed pigeon, which spreads its tail like the peacock, and carries a number of (from thirty to forty) feathers, placed in the form of radii, while other pigeons possess much fewer tail-feathers—generally twelve. We may here mention that the number of feathers on the tails of birds is considered by naturalists of great value as a systematic distinction, so that whole orders can thereby be distinguished. For example, singing birds, almost without exception, possess twelve tail-feathers; chirping birds (*Strisores*) ten, etc.

Several races of pigeons, moreover, are characterized by a tuft of neck-feathers, which form a kind of periwig; others by grotesque transformation of their beaks and feet, by peculiar and often very remarkable decorations, as, for example, skinny lap-pets, which develop on the head; by a large crop, which is formed by the gullet being strongly inclined forward, etc. Remarkable, also, are the strange habits which many pigeons have acquired; for example, the turtle pigeons and the trumpeters, with their musical accomplishments, the carriers, with their topographical instinct. The tumblers have the strange habit of ascending into the air in great numbers, then turning over and

falling down through the air as if dead. The ways and habits of these endless races of pigeons—the form, size and color of the individual parts of their bodies, and their proportions, differ in a most astonishing degree from one another; in a much higher degree than is the case with the so-called good species, or even with the perfectly distinct genera, of wild pigeons. And what is of the greatest importance, is the fact that these differences are not confined to the external form, but extend even to the most important internal parts; there even occur great modifications of the skeleton and of the muscular tissues. For example, we find great differences in the number of vertebrae and ribs, in the size and shape of the gaps in the breast-bones, in the size and shape of the merry thought, in the lower jaw, in the facial bones, etc. In short, the bony skeleton which morphologists consider a very permanent part of the body, and which never varies to such an extent as the external parts, shows such great changes that many races of pigeons might be described as special genera, and this would doubtless be done if all these different forms had been found in a wild and natural state.

How far the differences in the races of pigeons have been carried is best shown by the fact that all pigeon breeders are unanimously of opinion that each peculiar or specially marked race of pigeons must be derived from a corresponding wild original species. It is true every one assumes a different number of original species. Yet Darwin has most convincingly and acutely proved that all these pigeons, without exception, must be derived from a single wild primary species—from the blue rock-pigeon (*Columbia livia*).

From "The History of Creation."

HAECKEL.

ITEMS.

A clergyman lately addressed his female auditory as follows: "Be not proud that the blessed Lord paid your sex the distinguished compliment of appearing first to a female after the resurrection, for it was only done that the glad tidings might be spread all the sooner."

Josh Billings says: "The live man is like a little pig; he is weaned young and begins to root early. He is the peppercorn of creation, the alspice of the world. One live man in a village is like a case of the itch in a distrikt school, he sets everybody scratching at onst."

PASS IT THIS WAY, MR. BROWN.—Mr. Brown kept boarders. Around Mr. Brown's table sat Mr. Brown, Mrs. Brown, Mrs. Andrews, the village milliner; Mr. Black, the baker; Mr. Jordan, a carpenter; and Mr. Hadley, a flour, feed, and lumber merchant. Mr. Brown took out of his pocket-book a ten dollar note, and handed it to Mrs. Brown, saying: "Here, my dear, are ten dollars toward the twenty I promised you." Mrs. Brown handed it to Mrs. Andrews, the milliner, saying, "That pays for my new bonnet." Mrs. Andrews said to Mr. Jordan as she handed him the note, "That will pay you for your work on my counter." Mr. Jordan handed it to Mr. Hadley, the flour, feed, and lumber merchant, requesting him to give him credit for that amount on his lumber bill. Mr. Hadley gave the note back to Mr. Brown, saying, "That pays ten dollars on my board." Mr. Brown passed it to Mrs. Brown with the remark that that paid her the twenty dollars he had promised. She in turn paid it to Mr. Black, to settle her bread and pastry account, who handed it to Mr. Hadley, wishing credit for that amount on his flour bill, he again returning it to Mr. Brown with the remark that it settled for that month's board. Whereupon Brown put it back into his pocket-book, exclaiming that he "never thought a ten dollar note would go so far." Thus a ten dollar greenback was made to pay ninety dollars indebtedness inside of five minutes. Who says greenbacks are worthless?—*Winsted Press*.

EDITORIAL DEPARTMENT.

NOT YET SATISFIED.

We notice by an editorial in *Poultry Argus* that S. H. Seamans of Wauwatosa, Wisconsin, has recently imported a fresh lot of Golden Sebright Bantams. It is thought this last importation are among the best birds ever sent from England, and only sold to remove them from competition on the other side. Good birds are often bought with this understanding that would not be sold otherwise.

Mr. Seamans places his standard very high, and will not be satisfied with anything short of the best. During the past ten years he has invested large sums of money to gratify his taste in the Fancy. But, as he once wrote us, he has "always made it pay," and this is the true secret of his continuing and enthusiastic fancies. We have always contended that a Fancy should at least be self-sustaining, otherwise the Fancier is liable to continual change, and eventually will leave the Fancy in disgust.

"DISEASES OF DOMESTIC POULTRY."

Under the above title, Mr. Geo. P. Burnham, of Melrose, Mass., a few weeks ago announced as forthcoming a new Treatise, which many were desirous of getting a copy of—since Mr. B.'s well known experience with poultry and their treatment, in good or poor condition, warranted the belief that a work from his pen, as a specialty upon the subject of fowl ailments, would be a good and practical one.

We are informed that the delay in the publication has been unavoidable—but that the work is now in press, and will be published early in October. We have received several orders for it, and Mr. B. requests us to state in *Fanciers' Journal* that the numerous remittances and orders he has had by mail (which have been returned to the senders, on account of the delay in publishing the book), may be renewed, if desirable. The new volume (in paper covers), 50 pp. large 12mo, will be sent to all who order it, the last of September or the first of October, as is explained in Mr. B.'s advertisement this week.

"Diagonal boys' suits" are advertised in New York. Some of those boys must have been with the military encamped in Fairmount Park the other day, as there were many of them seen on the bias.

CORRESPONDENCE.

NOTICE.

JOS. M. WADE:

DEAR SIR,—At the request of several poultry fanciers, the time for entering fowls, and birds for the Centennial Exhibition, has been extended until October 1st. All specimens not entered previous to that date will be excluded from the Exhibition.

Very respectfully,

BURNET LANDRETH,

Chief of Bureau.

JOHN E. DIEHL,
Supt. Poultry Dep.

INFORMATION WANTED.

ED. "F. J.":

Would the editor please give an amateur fancier a few hints or points on mating birds for exhibition, as I have the finest flock of fowls that there is around here, and I thing there must be some premium birds in the lot, if I only could tell them from the others. They are Lt. Brahmas. Please give me a hint or two on the subject, and oblige
AN AMATEUR FOWL KEEPER.
SMITHTOWN, SUFFOLK CO., NEW YORK.

A PECULIAR FOWL.

MT. VERNON, ALA., Aug. 6, 1876.

EDITOR "FANCIERS' JOURNAL":

DEAR SIR:—I have a rare, and I think very curious bird, it is a cross between a common barn-yard fowl and either a turkey or a Guinea; or, as some suppose, a cross between a Guinea and a turkey. It is indeed a great curiosity, and is large and healthy, and feeds among my other fowls, but inclined to be a little pugnacious.

Perhaps some of your readers may value it more than I do, and by possibly crossing it with other fowls, produce a new variety of bird. I would exchange it for something of value.

Please inform me what you can do with it, and what is its value.

Truly yours,
JOHN M. KOLLOCK, U. S. A.,
Post Surgeon, Mt. Vernon Bks., Ala.

FINE PIGEONS SUFFOCATED.

FRIEND WADE:

Since I put the exchange in your *JOURNAL* I have had fearful bad luck. My place of business caught on fire last Sunday morning, at 1 A. M., on the third floor, where we roast coffee by steam. I had about one hundred fancy pigeons on the fourth floor, value \$300, many of them premium birds—some of them sold to Dr. Enos of Milwaukee, Wis., who wanted to take them away the early part of last week; but on account of their setting on eggs I would not ship them until this week, thinking they were too soft. I did not save a bird; every one suffocated, and I assure you it was a sad sight to see them scattered all over the floor. Our loss on stock was pretty heavy,—estimated at \$6,000,—but I believe the pigeons had as many sympathizers as we. However, I am going to get some more birds by January, 1877, to exhibit at the show. I would not have cared if they could have gotten out, but they could not, and such was their fate.

With regards, I remain, very respectfully,

W. B. COCHRAN.

BALTIMORE, Aug. 17, 1876.

It was Buzfuz who propounded the following. If the letters of the alphabet were to run a race and O should be beaten, why would it be like your servant, when sent for "Ere's delight short cut," bringing you "nigger head plug" instead? Buzzy says it would be wrong to back O! Oh!

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—A Boston lady has a canary sixteen years old, a Baltimore oriole and a dog twenty each, and a family horse thirty.

—A little weasel fought a black snake at Amherst, N. H., the other day, and bit him through and through until he died.

—Nashville, Kentucky, is overrun with thieves. Well, Nashville is not obliged to have councilmen, policemen, and other municipals unless she wants them.

—A man was arrested in Trenton last week for pulling down a lady's hair, in a street car. He was released at once. The hair had not been paid for.

—One hundred and twenty Chinese students from Hartford will visit the Centennial next week.

A notice to rats, mice, and young "purps," to keep close house.

—Green turtles retail in New York for 12 cents per pound.

So! Soup must be going down then? There must be a superfluous supply of the verdant tortle, if one can tortle off with a pound for 12 cents!

—Men visitors to the seaside now see the "harvest moon" rising out of the waters.

Most of them return home as prodigal sons, having spent all in riot and fine living.

—Henry Ward Beecher says: The poorest parts of newspapers generally are the editorials; they are the least reliable, and the least inspiring, and, if you skip anything, skip the editorials."

That's just what one would suppose W. B. would say.

—Two school girls out for a walk. First school girl (sweet eighteen)—I am so tired of walking along by twos and twos in this way! It is as bad as the animals going into the ark!

Worse my dear. Half of the arkers were masculine! That's what's the matter with Hannah.

—Lunacy is still increasing in Ireland. At the close of last year the number of patients under the supervision of the Inspectors-General was 11,777—an increase of 194 on the preceding year.—N. Y. Sun.

Whisky is cheaper as well as more plentiful in the green isle.

—It is said that no Chinese bank has failed during the past five hundred years.

Why? Because, when the last one went up, the heads of all the officers went off and were thrown in a corner along with the other assets!—There are some sensible things done in China.

—A woman in Barnstead, N. H., found the egg of a hawk the other day. She took it home and put it under an inverted bowl in a cupboard near the cooking stove. A few days after she heard a noise under the bowl, and found that the egg had hatched, and that she had a lively young hawk. But the little bird would not eat and soon died.

—CAN ANIMALS COUNT?—M. Houzeau says: "The mule is supposed to be able to count as far as five, at least; and this is considered to be established by the following observation. There is a short line of omnibuses in New Orleans where each mule makes the journey five times successively before being changed. The veterinary surgeon of these animals called attention to the fact that at the end of the first four journeys they are silent, but as they approach the end of the fifth, they neigh." But a writer in *Scribner* nearly spoils this by saying that the mule at the end of every fifth trip smells the preparations for his mess in the stable, where the hostler is expecting him.

—EAGLES.—A number of eagles have recently been shot in various parts of Pennsylvania. One shot by John Hadman, in North Coventry, Chester county, had carried off bodily a large lamb and returned the next day after another. When his wing was broken by a shot he fell and was seized by a dog, but he forced his talons entirely around one of the dog's ribs, causing him to howl terribly. The eagle was then killed with clubs. Another, a bald eagle, was killed near Landis Valley, Lancaster county, which measured seven feet three inches from tip to tip of wings. When eagles take to carrying off lambs and young babies, they must of course be killed; but in a few years the typical American bird will be as extinct as the great auk or the dodo.

—HOW AN APE SAVED AN EARL.—A braver or handsomer race than the Irish Geraldines never lived. A more romantic his-

tory than their's has never been written. The adventures of *Silken Thomas* are strange and wild as those of any Persian prince in Eastern story. His ancestor, Earl John Thomas Fitzgerald, adopted a monkey for his crest, and the old chroniclers say in explanation, that when a child in the Castle of Woodstock an alarm of fire was given. In the confusion that ensued, the young Earl of Kildare was forgotten, and on the servants returning to search for him, the room in which he lay was found in ruins. The child was supposed to have perished in the flames, but soon a strange voice was heard in one of the castle towers, and upon looking up they saw an ape, which was usually kept chained, carefully holding the child in its arms. The monkey crest of Earl John of Kildare flashed in the front of many a battle under the banner of Edward I, and the deeds of the hero have been sung by all the Irish bards. J. M. McCANN.

—SHAKESPEAREAN—HAMLET.—This gentleman has always been an enigma, but there were three things about him we know for certain.

1st. He was well acquainted with our southern plantation melodies, for he says in one of his remarks to Horatio—"It is indeed a nipping and an eager air."

2d. He was very economical in the way of clothing, and used to black the seams and well-worn places of his garments. Speaking to his mother, he says—"Tis not alone my inky cloak."

What else could he have meant?

3d. Prince as he was, he had a Sunday suit and a business suit. Thus—when his mother desires to interview him at a certain time and place, he answers—"I will in all my bestattend you." That is, in his Sunday suit.

Othello—he must have been a lawyer as well as a soldier, though "Sweet William" does not speak of him but in the one profession. We know, however, from the poet's description, that he was "A tawny general of Venice." H.

—HAS THE WILD TURKEY (*Melagris gallo-pavo*) BEEN IMPROVED BY DOMESTICATION?—From my own observation I would be led to answer in the negative. I have seen great numbers of the wild originals and think them superior in grace and beauty, and nearly equal in size to the finest Bronzes of our poultry shows. The young of the wild turkey are very hardy, seemingly indifferent to either rain or cold. In the tame varieties they require continual care, and are perhaps the tenderest of domestic birds.

Under the dense pine foliage on the Alleghenies where the rays of the sun seldom penetrate, and the deep moss is always damp, the wild turkeys make their home, and the young flourish under the evergreen trees. They seem singularly free from disease, and it is not uncommon to see a wild hen with a flock of twenty young ones in the autumn. I have seen wild gobblers weighing thirty-five pounds. Remembering the wonderful improvements made on the different varieties of geese, ducks and chickens by careful selection and successful breeding, I think we can but admit that our experiments with the wild turkey have so far resulted in comparative failures. J. M. McCANN.

—ANSWER TO J. H. McCANN in "Weekly Gossip," in JOURNAL of June 19th. "The power of serpents to charm birds and small animals is now admitted by eminent naturalists. I don't believe that all snakes possess this power," says J. H. McCANN. I want to go a step farther and say that I don't believe any snake possesses this power, but is I'm not an eminent naturalist—only a light weight, you know. Is J. H. McCANN sure that the nest and young of the ground-squirrel were not in the immediate vicinity of the snake, or that the snake was not in such close proximity to the hole of the squirrel that it was unable to get home without being gobbled up? The action of birds and small animals during the breeding season, or while they are yet guarding their young, seems to me to be the same in the presence of any threatened danger, whether from snakes or human beings. The gentleman who told Mr. McCANN what he saw should have climbed the tree, if possible, and have snaked Mr. Coluber Constrictor out of the hole, and if he had found the squirrel's nest in it, with or without young (for the snake might first have eaten them), he would have discovered a motive for the singular actions of the squirrel without any necessity for discussing the involuntary hypothesis. The devotion of birds and animals to their homes and their young, and their vigorous defence of them in the face of overwhelming odds, is well known. Snakes, being so much smaller than human beings, are subject to fiercer and closer attacks, and, being wiser in this respect, they remain perfectly quiet, simply eyeing their victims until they find themselves neither followed nor attacked, gain renewed confidence, and approach so close in their attacks that they become an easy prey, or, if they do not attack, they make a distressed fluttering pretense of being crippled, with intent to draw the intruder away from the nest or young, which

would be apt, under many circumstances, to delude even an experienced observer into the belief that the bird was charmed. There is one bird which, I would take my "affidavit" will not yield to the fascinations of the black snake or any other snake. This is the Blue-jay. A pair, or even one of them will discomfit or put to flight, from the vicinity of their nest, any snake having the temerity to approach it with hostile intent. I have never witnessed a case of even partial paralysis of bird or animal in the presence of snakes, although I often come across persons who have heard of such things, even to the charming of children. Snake stories you know are the *ætiest* stories, and it isn't so long since many good people believed in witchcraft and sorcery, and all that kind of evil eye business. There might be some sort of *paralysis* resulting from fear, but as we never hear of it except in connection with snakes, it would naturally follow that birds and squirrels and such feared nothing but snakes. I know a lady who feels an almost irresistible impulse to throw herself beneath the wheels of passing railroad trains, and on several occasions, after her first experience, when unavoidably in close proximity to passing trains, she has only saved herself, as she believes, by sitting down. This, I should imagine, is the same sort of feeling one experiences (especially if light headed) on looking down from a great height. It is certainly the result of fear. In regard to snake-charming, what we want is *bottom* facts. It is unfortunate that the evidence which we get from eminent naturalists on the subject is *what they have heard*, and that observers are easily satisfied with *effect*, and do not hunt hard enough for *cause*.

PHOCA.

—A QUEER THING IN CALIFORNIA.—A strange friendship has sprung up between two very dissimilar animals at Mrs Stratton's. A black rabbit came to the place some three months ago and took up its abode. Mrs S. keeps on the place a couple of cows, and a short time since the rabbit took up the strange habit of sleeping with one of these cows. It goes to the cow's wonted place of rest, waits her coming, and when arrived the motherly cow licks the little protégé with much the same affectionate tenderness that would be bestowed on a calf, the rough tongue and tremendous licks nearly raising the little animal off its feet, and it the meanwhile bracing itself with its four feet to withstand the pressure. Then little bunny puts its little nose up to the cow's nose, and appears to kiss it, after which the rabbit nestles up and goes to sleep. It is a singular bedfellowship, the tiny bundle of fur and ears of perhaps three or four pounds with the unwieldy carcass of six hundred.—*From the St. Helena Star.*

—THE BLACK SNAKE (*Bascanian Constrictor*) probably attains a greater length than any other serpent in the United States. They are seldom seen exceeding six feet in length, for the simple reason that they are many years in arriving at their full maturity, and are usually destroyed before having reached their greatest length. They grow but slowly. I kept one last year for several months, and it increased very little in size. A gentleman in whom I have perfect confidence told me that he once killed one of these snakes, and measuring carefully found it to be eleven feet and one inch. A friend of mine killed one this summer just nine feet and three inches in length. An engineer told me that he killed a snake of this variety and measured it with his chain, finding it to exceed eleven feet. I have often heard an old gentleman speak of having seen a monstrous black snake in a cornfield when a boy. He says that it extended across four of the rows, and must have been fifteen feet in length. Many years after this, near the same place, a farmer saw a snake of this variety so large that he was afraid to attack it; he says it was certainly more than twelve feet in length. A peculiarity about them, unnoticed by naturalists, is their power of following each other by the scent. I have watched a black snake glide across a field, and after a considerable time had elapsed, have seen another following its trail as surely as a hound would follow a hare. It was during the love season. When irritated the extremity of the tail vibrates with great rapidity, producing a peculiar rattling noise, and the body becomes covered with a h-colored spots. The tongue is concealed in a tube, and is invisible unless protruded by the animal. They can climb a tree by going *directly* up it, and it is not necessary that they should circle round it. They always swallow the eggs of birds without breaking the shell. They can glide over the ground with greater rapidity than any other native serpent. That they have the power of charming birds and small quadrupeds is certain, but the nature of this magic influence has never been satisfactorily explained. It is not due to the fiery brightness of the "evil eye" alone, nor to the paralyzing power of fear. Has animal magnetism anything to do with this mysterious gift?

J. M. McCANN.

SMALL PET DEPARTMENT

AND YOUNG FOLKS' CORNER.

(For Fanciers' Journal.)

PETS AND THE FATE OF SOME OF THEM.

THE MOCKING-BIRD. No. 7.

"The song was o'er, the last sweet note
Upon the air had ceased to float,
The life that thrilled in melody,
With his wild music passed away.
He longed for fragrance, flowers and light;
His heart had broken in the fight."

During the time of our late "oppleasantsness," and while the "cruel war" was at its height I was on a certain morning passing along one of the streets of that part of the city of "brotherly love," which Mrs. Partington denominated the "Rhubarb," when I heard the musical cry of "Ca-fish!" "Ca-fish!" or something so very near like what I had often taken for that, from the high pitched voices of the females who at certain seasons of the year, wake us from our morning snooze, with their piscatorial cries. The voice I now heard seemed to me to be a wonderfully clear, high soprano, well worthy of the concert room, and though I could see nothing of the crier, yet, again and again the sound fell upon my ear till I thought it must have been some star fallen out of the Opera sky, which had taken up a basket and was crying "Ca-fish!" through the streets. Returning home I made a note of the wonderful voice in my journal, and then thought no more about it. How quick one can forget, in the hurry and bustle of city life!

About a month after this I received a letter from a soldier friend in the Union Army, in which he said that an officer whose wife was in Philadelphia, had been wounded, and he requested me to call upon her and personally assure her that her husband was in no immediate danger from his wounds.

Finding her address from the letter, I was soon on my errand of consolation, and in due time found myself pulling the bell of a certain house in that very same block or "square," as the term is in the "Quaker City," where about a month before I had heard the musical voice crying "Ca-fish;" and where, strange to say, just as the door was opened to admit me, I heard the same voice and cry again. Concluding that the same "fish-wife" was going her rounds I thought no more of it, and was soon in the presence of the lady I was requested to see.

My friend's letter had informed me that the lady was a daughter of the "Sunny South," who had placed her fate in the hands of a northern man, and with him she had left her happy home in Charleston, S. C., for his in Philadelphia, about a year previous to the first gun fired at Fort Sumter. Two dear children had been born to them, when the first draft for soldiers called her husband to the field in defence of home, life, children and country.

I found the lady quite an invalid, and had but barely introduced myself and my errand before I heard once more that well-known cry of "Ca-fish," which I was rather startled with as I seemed to be haunted by it.

I encouraged her to hope for the best; told her that all would be well,—that more letters would come. "I must go to him" she said; "better tend on him wounded, or bury him when dead than live the dying life I am living here." I began to falter some other words of encouragement, when again "Ca-fish" broke on my ear. "It is my poor mocking-bird," she said, seeing my look of wonder. "He breaks my heart with his songs of home, while he startles the whole household by his wonderful imitations."

I looked up through a western window and there in the yard, in an enormous cage—just such a cage as a mocking bird should live in—hopping backward and forward, was the subject of my surprise, who had just then broke out in a strain of "Red, White,

and Blue,"—which he gave to a charm, and all at once the poor girl was weeping to the melody, as though it had only been composed for people to weep at.

"I wish I had never tamed him," she said, "I wish I had left him in Charleston! In this northern home he does not seem like a bird to me. I hear him whistle Arthur's tunes, and I think Arthur, who was always so cheerful, must be in the house. I cannot at times, bear the strange, sweet imitations, and so I keep him where you see him, away from my own room. I shall not have him long. He begins to mope; to day is only one of his bright days. I wish I had never taken him from his nest! He was such a little lump of a thing when I took him, and with no promise of such a long body, still longer tail, and wonderful powers of voice and imitation. His little mouth was always open and his scream was like two files rubbing against each other. Of mashed potatoe he could never get enough, but yolks of eggs rolled into the shape of worms was his especial delight.

Ah! poor fellow he will never live over November—that dreadful, unhappy month."

"What does he eat now?"

"Anything I eat, but mostly brown bread and milk—a saucer of which he will eat in a day, leaving for it his chicken, or beefsteak untouched. Every day he goes into his bath-tub and afterward makes his toilet like a gentleman. Every day his house must be thoroughly cleansed, or he would die long before November."

"His cage seems very large," said I.

"None too large for mocking birds. They will not thrive in small cages. Then, too, one should remember their freedom, which a bird prizes I sometimes think more than many other creatures. I wish he was in the orange groves of my old home, or at least in my dear old garden in Charleston, which used to be as full of music as the opera, and much sweeter to me, as dearly as I love music."

"Then Charleston seems your home still?"

"Yes," she answered; "you see, like my mocking-bird, I was taken from it young. But I came to Arthur's home, and O, it was a happy one until this cruel, wretched, cursed war broke out, and now"—Here her grief overpowered her, and she sobbed aloud as though her heart would break.

Again I tried to speak cheerfully, even hopefully, of her and her husband's future. She only sobbed out, "I must go to him; I must go to him."

"And the bird?" I asked.

"Oh, he will die in November; he will die!"

Just as though he was determined to contradict his mistress, the bird now began to move his long body from one side of the cage to the other, and all at once he commenced a song which seemed to be comprised of all the tunes he had learned in Charleston and Philadelphia combined, ending his *melange* with his native notes, which are exceedingly beautiful. The lady seemed to regard the bird with such a tender interest, as though it was, in some way, connected with her husband, that I rather led her to talk on about him, thinking it might, for the time being, somewhat relieve her of her anxiety and distress.

"There is almost a human interest about Dixie" (that I found was his name); "he mimics us all so well. He has a sharp, short cry, much like baby when his sister takes something away from him; and he dearly delights in mocking my poor dog Fan. The other day I heard Fan cry dreadfully, and I hurried out to see what was the matter, quite sure she had fallen into some unusual trouble—but no! there lay Fan on her mat, and there, too, was Dixie, doing the yelping to perfection! At first, Fan seemed to mind Dixie, but, now that she has got used to him, his noise does not worry her a bit."

Here, as though in illustration of what had been said, Dixie began a series of most wonderful performances, among which

was prominent the cry of "ca-fish," but the most perfect and curious part was the click of a pair of castanets! He seemed to have no real difficulty in doing anything. He would lean his head over to one side, consider what he wanted to do, and—do it. He did not practice the sound, but got it right in his mind at once, and then, like a vivaporous production, brought it forth perfect. When he had done the castanets, and matched them with a tune whistled, he once more broke out with "ca fish," followed by the shrill, quacked quaver which a child produces on a penny whistle. Presently he mewed like a cat, then he yelped like Fan, and finished up by crying, to perfection, like the baby!

"You should hear Dixie whistle my husband's favorite tunes," said the lady, her bright eyes full of tears at the thought. "Even dear Arthur could not surpass him in 'Red, White, and Blue,' but I am sure he will not whistle or sing after November—the month I so much dread."

I now rose to take my leave, and just then Dixie broke out with "Red, White, and Blue," interspersed with "ca-fish," ending with a yelp *a la Miss Fan*.

"He seems to be winding up the season with a final performance," said the lady; and, thanking me repeatedly for the good news I had brought her, she bade me good-bye with an appearance of reviving hope that she would see her husband again, and that all would be well in the end, and I passed from her presence.

On a dull, gloomy, suicidal day in the last week of the following November, I was called upon again to visit the home of the lady and the bird. I was then the bearer of sad, sad news. My sorrowful errand could not be avoided, or I would gladly have done so. Another battle had been fought, and I must tell her, whom I had endeavored to cheer with the words of comfort and hope, but a few weeks since, that her husband, whom she so idolized, had fallen among the slain—had passed to the far-beyond, where wars and the rumor of wars are never heard. As I neared her habitation I expected to hear the cry of "ca-fish," or some other of Dixie's various cries, but I did not; all was quiet, and I was rather glad of it, for the message I was the bearer of was of much too sad a nature for me to be amused by the performances of even poor, innocent Dixie.

I was met in the parlor by the mother of the widow, and I saw, at the first glance at her sad face and funeral dress, that I had sad news to hear as well as to impart; but I was saved the bitter task of telling her to whom I was sent that her husband was in the better land, as, several days before, she had gone to meet him there.

"Her babies?" I enquired; "they, poor orphans, are our babies now."

"And that wonderful bird?"

"Dead! He died on that same gloomy November day, a few hours after his mistress had breathed her last. His parting song was a single strain of "Hurrah for the Red, White, and Blue!"

Thus died out, in an ordinary street of a great city, one of the sad romances of real life; and such was the fate of Dixie, the mocking-bird.

HUON.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing ad and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"To EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

No *Exchange* or *Want* will be inserted unless accompanied with 25 cents.

P. P. HAAS, Tamaqua, Pa., wants to exchange ten pairs of A No. 1 Tumblers, for oilers.

W. A. R. ED, Box 1368, Natchez, N. H., wants to exchange a P. Rock Cockerel, (Gliman St-ck), for a P. Rock Pullet.

BOX 869, Rockville, Conn., will exchange a C Cornet, cost \$60, for a first-class Central-fire Shot Gun. Must be in good order, as the Cornet is.

JOHN E. SCHUM, 150 South Water St., Lancaster City, Pa., will exchange a fine Himalayan Doe Rabbit, two good Hunting Rifles, one good Revolver, one fine pair of Muscovy Ducks, two fine Lop-eared Does, for a good Lop-eared Buck, White Leghorns, or offers. All letters, &c., answered promptly.

FANCIER, Box 350, Milton, Pa., will exchange a Red and Tan Gordon Bitch Bel, M. Von Culin's stock, 1 Liver Color Pointer Bitch, and 1 trio Light Brahmas, for Fancy Pigeons or offers.

W. J. EVENDEN, Box 403, Williamsport, Pa., will exchange a thoroughbred Russian Setter Slut, for a breech-loading Shot Gun, or a good Watch; also 2 pairs of Red Carriers, 2 pairs Pouters, and 1 young Cock, 1 pair Black Priests, and a lot of Black Red Game Bantams, for anything that won't eat, or will sell.

P. O. BOX 325, Milton, Pa., will exchange one pair White Pouters, one pair Black Red Games, and 1 Smith & Wesson Seven-shot Revolver, for high-bred Tumblers, or offers in Fancy Pigeons.

J. HENRY, 4507 Rubicon Ave., Germantown, Phila., wishes to exchange a thoroughbred English Greyhound, seven months old, Newfoundland Pups, or Blue Skye Dog, for W. O. Black Polish, White or Brown Leghorn Chicks.

D. G. DONOHUE, New Chester, Pa., would exchange a No. 1 Cooz Dog, for a English Setter, well broken. Nothing inferior given or taken. Speak quick.

T. J. McDANIEL, Hollis Center, Me., has two pair Pit Games, warranted to stand up, which he wishes to exchange for Poultry Books, or offers. Postal cards acceptable.

A. L. HOUGHTON, South Adams, Mass., has to exchange 1 Red Tumbler Cock, 2 Red Quaker Cocks, 1 pair White Doves, trio B. B. Bantams, for Red Quaker females, and White Carrier Cock, Black Pied Pouter Cock, or offers of Pigeons. Will give good cock, and none but good wanted.

W. W. HARTO, Bay Shore, L. I., has for exchange, trio of D. Brahmas, one year old, or chicks three months, for trio of L. Brahmas, one year, or chicks; or for trio P. Cochins, Pea Combs. None but good stock given or accepted.

CHAS. SHAFFER, No. 206 Franklin St., N. Y., will exchange Buff and Partridge Cochins, Light and Dark Brahmas, Aylesbury, Cayuga, and Muscovy Ducks, for Black Spanish, W. B. or Dominique Leghorns, April or May hatch. What offers?

G. W. SEYBOLD, 32 Rowland St., Newark, N. J., will exchange fine Pointer Dog, 9 months old, (well bred), also Scotch Terrier Dog, splendid runner, for White or Brown Leghorns, or offers.

W. A. LYMAN, Keene, N. H., will exchange 1 pair Partridge Cochins, for 1 pair Rouen or Aylesbury Ducks, or offers. My towels are good show birds; want the same.

JOHN DEMAR, Lexington, Mass., wishes to exchange 5 B. Leghorn Cocks, for 4. Legehorns, or offers.

H. K. OSBORN, Cambridgeport, Mass., has for exchange one Patent Oil Cke Ginder, "hand power," new, never been used, for Fancy Pigeons or offers.

OLIVER D. SCHOCK, Hamburg, Hamburg, Berks Co., Pa., will exchange Fancy Pigeons, of twenty (20) varieties, in pairs, or odd birds, for Poland China, Bees, and Chester White Pigs, new Buggy, Harness, 6 Brown Leghorns, Pulletts and Cockerels, 1 pair each Yellow and Black Pied Pouters, 19 inches long, and pair 4 month old Maltese Kittens.

GEO. W. SCHEFFER, No. 21, South 2d St., Harrisburg, Pa., has to exchange the following birds: Tumblers, 1 Antwerp Cock, White Pouter Cocks, and Colored Fantail, for Turbitts, Suezls, or Blue Winged Swallows; also a Bread-Kneading Machine, worth \$25, for Blue or Yellow Pouters, Carriers or Fantails. They must be good, as the machine is good. Write soon for a bargain. Also White Muscovy Ducks for Pigeons.

W. S. REED, Homer, La., will exchange one Parlor Organ, one of Barnes' foot power Scroll Saws, and one \$800 piano, (all new, never used,) for good Breech-loading Shot Gun, double barrel, and improved stock, such as Hogs, Cows, Goats, Fowls, Pigeons, etc. Must be good stock and articles.

GEORGE A. COLONY, Fitchburg, Mass., has for exchange a very fine trio of D. Brahmas, and Webster's Patent breech-loading double-barrel Shot Gun, or offers. Speak quick.

G. J. BAKER, Postville, Trafalgar P. O., Ont., will exchange any of the following thoroughbred stock—Oxtowold Lambs, Berkshire Pigs, Black Cochins, Cock Slut, in pup, Black and Tan Dog Pup, Sheep Dog Pup, and Hunting Rifle—for Jersey Heifer Calf, or Bull Calf.

T. G. FLANDERS & CO., Manchester, N. H., have to exchange one six barreled Whitney Revolver, nickel plated, in all kind repair, for Brown Leghorns or offers.

BOX 471, Orange, N. J., has to exchange a good Gold Watch, Dark Brahmas and Houduas, for Milch Cow, Poland China Pigs, or Brown Leghorns.

CHAS. F. FREEMAN, 1914 North Fifth St., Philadelphia, Pa., breeder of Swallows, Turbitts, and Owls, will exchange some of the finest Blue-winged Turbitts, Solid Black Turbitts, Black-tail Turbitts, and fine bred Owls, for Red Swallows or Blue Swallows. They must be perfect birds in every way. Here is a chance for anybody to get good Turbitts for good Swallows.

M. V. AN CULIN, Delaware City, Delaware, has to exchange two pairs white Carriers, two pairs Pouters, one pair Bucks (cock red, hen dun), one pair White Crested Fans, one pair Black Bards, two pairs Tumblers, one red Carrier Hen, one white Carrier Hen, one Black Bald Hen, one White Fan Hen (erected), one Yellow Barb Hen, eleven Brown Leghorn Cockerels, one White Leghorn Cock and six Hens, five White Leghorn Cockerels, and six Pulletts, one trio G. S. Hamburgs, Cocker Spaniel Bitch, Setter Puppies, from imported parents, for Webster's Unabridged Dictionary, Works on the Horse, or Dog, or Natural History, Brown Leghorn hens or pullets, tools of any kind, poultry, or pigeons, or offers. Send along your postal cards.

Book Exchange.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

DAY-DREAMS.

Just within the cottage door
Baby plays upon the floor,
While her mother, with her knitting,
On the low door-step is sitting;
And the golden summer day
With the twilight slips away.

Building castles in the air,
Seeing visions bright and fair,
In that golden hour hazy,
Till the busy hands grow lazy,
And her work unheeded lies
'Neath her far-off dreamy eyes.

No more toiling day and night,
But a life so fair and bright
That without a stint of measure,
She is drinking deep of pleasure,
In that visionary sphere,
Which her dreaming brings so near.

She is plucking at her ease
Golden fruits her taste to please;
She is lifted in her vision
To the far-off bright Elysian,
While the twilight slowly dies,
And gray shadows fill the skies.

But hark! that merry shout
On the night breeze ringing out
Sets the bright air-castle falling,
For the fisher's voice is calling;
And the mother's dreams are o'er—
She's the fisher's wife once more.

Back again from marble halls,
Snug within her cottage walls,
Where baby must be tended
And homespun garments mended;
And her day-dreams thus are done
With the setting of the sun.—*Lebanon Courier.*

REMINISCENCES OF AUDUBON.

(BY A GRANDDAUGHTER.)

[Continued from No. 33.]

My mother relates her first meeting with my grandfather as follows: Some years before her marriage she crossed from England with my uncle Victor, with whom she became quite intimate, and, at his request, she went, soon after her arrival, and in company with a sister-in-law, to call on my grandmother, Mrs. Audubon. While walking up Broadway, they met a superb looking old man, with white hair curling on his shoulders. Involuntarily, both ladies stopped to look at him as he passed, while he, too, paused to look back at them. My mother exclaimed: "What a beautiful old man!" Her sister, a young and lovely girl, added: "How I should like to kiss him!" They went on their way, and, during their call, the door opened, and in walked Mr. Audubon, in whom they recognized the object of their admiration. He walked up to my mother directly and said: "Ah! I thought I knew the English girl of whom Victor has told us!" and, on my

aunt's remark being repeated to him, he insisted on taking her at her word, and kissed her then and there. Though, of course, familiar, in after years, with the face and form which had so attracted her at first sight, my mother has never forgotten the impression made that afternoon.

We have several portraits of my grandfather painted at different periods of his life. The earliest is a miniature by Cruikshank, taken when he was, perhaps, forty; one by Inman, which has been used as the original of the portrait in his Biography; and one by his son John, a full-length, with a favorite dog at his feet. These three have been photographed and engraved; but there is another, little known to the world, but the most real to me. It is unfinished, only three sittings having been given, and it was taken on my grandfather's return from the Rocky Mountains. He never retained the peculiarities of his woodman's dress longer than he could help doing so, after his return to civilized life, and one of his first steps was to remove the greater part of his luxuriant hair and beard. My father was very anxious to secure his portrait just as he was, fresh from the woods, and began it immediately on my grandfather's return, and worked vigorously for three days. On the fourth day urgent business called him to New York, whither he reluctantly went, charging my mother to keep strict watch, lest "the old coon-skin," as he called him, should take advantage of his freedom, and have the snowy locks trimmed off to more moderate proportions. All the morning my mother kept faithful, though unspoken, guard, having the old man constantly in sight. He made no allusions to the matter, and in the afternoon she went to her room for a few moments, to be met, on her descent to the parlor, by my grandfather, with smooth-shaven face. My father was in such despair that he did not touch the portrait for years. It was framed and hung in its unfinished state, and a few years before his own death he took it down and touched up the background. The face and figure were sacred to him as he had drawn them. It is a half-length, life-size, the head a little thrown back, the keen eyes undimmed, though the face shows deep lines of age and thought. He holds his gun in his hands, and his backwoodsman coat of green baize, with fur collar and cuffs, is but roughly painted; but it is the grandfather of my remembrance.

I have a description of him in this dress, or a similar one, which was given me by a gentleman who met him for the first time in his singular attire. He says: "I was at a fashionable hotel at Niagara, when an elderly man arrived, whose appearance excited much comment. He seemed to have sprung from the woods; his dress, which was of leather and heavy cloth, was dreadfully dilapidated, a worn-out blanket was strapped to his shoulders, a large knife hung at one side, a rusty tin box on the other, and his hair and beard were so long and thick, that they alone would have rendered him remarkable. He walked in and asked for breakfast, and as he did so, gave, as requested, his name. An instant change took place in the feelings of the spectators, and those who a moment before had been only curious and amused, were now anxious to speak to him, only to be able to say

they had met the ornithologist Audubon." Very different is this account of his personal appearance from the idea formed from a remark of an old lady, one of his contemporaries: "When I first knew Mr. Audubon, people used to ask, who was the gay young Frenchman, who danced with all the girls?"

He always loved children, and many a time did I stop on meeting him, and hold out my hand for the "comfit," which I knew would presently be forthcoming from a little wooden box kept in one of the pockets of the gray coat he generally wore. Often, too, did I evade the care of my nurse, and slip into the dining-room to partake of sly mouthfuls of omelette and bread, his customary lunch; the forbidden treat being eaten with all the keener enjoyment if, as sometimes happened, my grandmother attempted to depose me from my chair at his side; he always overruled her arguments and kept me with him.

It does not seem to me out of place to allude, at the close of this little article, to the services and assistance rendered to my grandfather by his two sons, Victor and John. The aid rendered by my grandmother has often been noticed, and is well known to the world; but that given by the sons has been almost ignored, and the entire labor of the "Birds" and "Quadrupeds of America," is generally accredited solely to my grandfather, assisted in some of the technicalities and descriptions of the latter, by his friend, the late Dr. John Bachman, of Charleston, S. C. I cannot feel that it is detracting from the honor due to my grandfather, to state that he was materially assisted in both great undertakings, especially the latter, by his two sons. Of the three volumes which comprise the "Quadrupeds," two were published after my grandfather's death, though both had been in preparation for many years. A large number of the animals were secured and painted by the younger son, John, and nearly all the landscapes are the work of the elder, Victor. I am the more emboldened to state this, knowing that my grandfather, in both journals and writings, is especially careful to mention by name the very many kind strangers, as well as friends, who in any way tendered him their assistance. Devoted as he and his sons were to each other, working as they did, in the utmost union, with perfect freedom from all jealousy, he would have been the last to ignore the filial love which led them to merge their genius so wholly in his, that their identity as artists was lost. While his younger son, John, spent months in Texas when Texas was a wilderness, procuring specimens and drawings, and afterward risked his life many times in crossing overland to California for the same purpose,—the elder, Victor, was busy at home, working for the same end, though in other ways. In my grandfather's journal he mentions receiving assistance from his sons when they were boys of fourteen and sixteen; in the same journal my grandfather invariably says: "our work." Yet Mr. Robert Buchanan, in the volume he prepared from my grandfather's carefully written "Life of Audubon," makes little mention of his sons, if I except one or two slight allusions, and this one direct remark: "The second volume was prepared mostly by his sons Victor and John, and was published the year their father died." Let me then bear loving witness, that the work those sons took up as boys with so much enthusiasm, was not laid down till death stiffened the hands which had so skillfully portrayed "the denizens of field and forest." Both sons were laid with the father whose talents they had to a great extent inherited.—*Scribner's Monthly*.

LEAVES, FERNS, AND GRASSES.

A year or two ago a lady writer of some celebrity, coming into my pretty parlor for the first time, looked around her in speechless admiration, and then turning to me, exclaimed: "More beautiful than fresco! I congratulate you, dear —, upon your lovely room. Surely you are an artist—a poet."

"Both, in my soul life, I hope," I replied, laughing, "but actually neither. It comes out in this way."

I was much pleased, on returning the call, to find my decorations imitated in the morning-room where this lady wrote her charming books. Let me tell you a few of my devices, for they are not costly, and are surely, for palace and cottage, the most

beautiful of all ornaments. In these times, too, when Christmas greens cost so much, many forego the beautiful old custom, which, if done in the right spirit, is done to the glory of God, and certainly adds much to the pleasure of the holidays. And with leaves and fern, one can do without cedar and bay and everything else, excepting holly.

The pleasantest time to go into the country is the autumn. Gather branches of brilliant leaves, and first brushing the right side of each leaf with raw linseed-oil, to preserve the tints and make the leaves less brittle, press them between newspapers and put them under boards, with large, heavy stones on top. If there are no boys around to get the boards and carry the stones, put the pile of papers under your trunk. A heavy weight is necessary in pressing branches, for sometimes the stems are thick. Or, if you find it difficult to press the branches, you can branch the single leaves after they are pressed by making stems of coarse wire, which are kept in place by winding them with fine wire, as in bouquets; then these leaves can be bunched together to suit the taste. The color of the leaves is preserved by pressing them on the right side with a moderately warm iron smeared with beeswax, after which they are placed between sheets of blotting paper, newspapers, or the leaves of books, and subjected to pressure.

Gather single leaves as well as branches, and lichen-covered sticks, immortelles, ferns, and brakes, green, yellow, brown, and white. The white ferns are the most beautiful, but they do not turn before the middle of October, and it is hard to find them perfect.

Save up your green ferns for the Christmas days, for you will want most green then, and with a few holly berries among them they will be best in the dining-room. Put them in bunches over the pictures, twine them up the picture cords and chandeliers; and if you have gathered any bitter-sweet berries in the country, they will do instead of the holly, only they are not so bright.

For the parlor take large branches of leaves, and fill in the spaces above the arch or folding-doors. These can be fastened with small pins without doing any damage to the walls. Hang small branches from the picture nails, where the cord points. Make up stiff bunches of green ferns, selecting dark green and large, coarse ferns for the back of the bouquet, and lighter, delicate ones for the front, and fasten these behind any Parian figures you may have. It will throw out the creamy white of a statuette or bust better than velvet.

Another way to dress a room is with single leaves and Florida moss. The moss can be bought at one or two Southern florists' in this city, but has not yet become common. About fifty cents' worth would be enough, I think, for an ordinary room. Get up on a step-ladder, and make an irregular fringe of moss all around the room. Take ferns of all tints, and make large round bunches. Put these at pretty regular spaces. Then take a spool of cotton, and single leaves and ferns of all tints, and fasten them into long garlands, with a slip knot around each stem. Do not join them closely nor regularly. Have some a few inches apart, some farther apart, and select leaves and ferns of all kinds, shapes, and tints. Then mount the ladder again and hang your garlands. If this is done artistically, it will look like a drift of falling leaves, for the white thread, of course, will not show, and the leaves look as if floating in mid air. If you have muslin or lace curtains, fasten a small branch of bright leaves or a fern, downward, on one curtain. This is the prettiest for a room in which there are no pictures.

Grasses are always useful, in vases or falling over the side of a picture, and a pretty way is to cut a cornucopia (I do not know what other word will describe the shape I mean) out of pasteboard, sew or glue on tiny pine cones, so that the pasteboard is quite covered; then tack this up on the wall about the height you would hang a picture, not quite flat, but a little full, to give it a round look and to leave a space to receive the stems; then put in a large bunch of grasses, and I am sure you will be pleased with this addition to your walls.

A lichen-covered stick with an empty bird's nest fastened above a picture looks pretty.

It is proper to dress churches or the house with immortelles, and to wear them, on All-Saints Day, for they are emblematical of the spirits and souls of the righteous. Very many more beautiful decorations can be devised; in fact, there is no end to the combinations that can be made by any one who loves beauty.—*Harpers' Bazaar*.

POULTRY DEPARTMENT.

(For Fanciers' Journal.)

* THE DUCK QUESTION—NO. 3.

BY J. Y. BICKNELL.

For convenience sake we prefer to have a separate apartment for ducks at night, but they will accommodate themselves to almost any condition, from an open shed, or even the open canopy, to a tasty habitation. If a low, cheap shed be constructed for them at night they will do as well as though they occupied a mansion, and we have known them to thrive and do well with only an empty hogshend turned down for them to roost in. It is generally considered improper for ducks and hens to occupy the same rooms at night, but with proper arrangement no harm will follow. Whatever place they occupy should be well littered with dry sawdust, cut straw, or something else suitable, for then the eggs are always clean. In case they are in company with hens, the latter should have a shelf under their perch wide enough to catch the droppings, which should be removed often; (in fact, such a shelf should be under every hen roost.) If the ducks have their liberty and roam at large by day, the other fowls need not be fed till after the ducks have gone off on their foraging tour, but if necessary a box or trough may be placed above the shelf, and the chicken food given in it, out of reach of the ducks. We have known of cases where ducks have hatched and reared their young successfully, but with us the experiment has always proved a total failure, and we have long since abandoned the attempt, and substituted hens.

In selecting eggs for hatching, providing the breeding stock is of good, reliable strains, no regard to color is necessary, for those laid by the same ducks vary so much in this respect from some unexplained cause, that no color is preferable. We should, however, reject all that are below the medium size, which will generally include the first laid egg of the season by each duck. The shell of a duck's egg is much stronger than a hen's egg, and is coated over with a mucous substance which immediately dries after being deposited, causing the eggs to have something of a greasy appearance. Occasionally one will be found with this mucous substance lacking, presenting a rough surface; such should be rejected, for they are imperfect; generally the shell is very tender, and they will, if used, only break and foul the others.

For incubators, we *always* select hens that will accommodate themselves to our wants. We generally select some of the Asiatics, for although they are heavy and may break an egg or kill a duckling occasionally, they are quiet and will sit wherever we desire to have them. In leaving the nest and returning to it they are very careful, and we have lost less eggs by them than by the lighter and more active kinds. If an egg has a perfect shell, whether it be hen's or duck's, no hen is heavy enough to break it by her weight. Let any one try the experiment, and he will find

that it will take more than the heft of ten hens to break an egg if placed on straw, hay, or anything suitable for a nest. Eggs in the nest are *always* broken by concussion, and a restless hen will break more than a heavy one. I find Dorkings, Plymouth Rocks, and some others also good, yet they will sometimes prove to be contrary. Some hens are apparently nervous, and are always inclined to be poking the eggs around with their beaks. This has led to the mistaken idea that "Hens turn their eggs every day," when the fact is they *never* intentionally turn their eggs, nor is it necessary that the eggs should be turned. We always assign separate apartments to our sitting hens, and never set them on the ground. We use coops, either single or with partitions, so that each hen is by herself. The nest is made in some low box of suitable size, (round ones preferred,) by putting a quantity of ashes in the bottom which have been previously sprinkled with a liquid disinfectant containing carbolic acid. A suitable powdered disinfectant would be equally as good.

A proper nest of fine hay or straw is made on the ashes, and the box is placed in the coop with one or more false eggs, and the hen put on at night. When she settles down to business, from nine to twelve eggs are given her, according to the season and her size. If early, and cold nights are common, care should be taken not to put under too many. During the period of incubation each hen is taken from her nest once a day. Don't deceive yourself with the idea that the closer the hen sits the better. If the weather is cold she must be off only a few minutes at a time, but if extremely hot she may be off one-half of the time with impunity. Even in moderate weather we have known hens to leave their nests for twenty-four hours at a time with no bad effect. Of course this last case should be avoided, but it and other facts prove that, under favorable circumstances, eggs are capable of resisting many obstacles that would seem to tend to their destruction.

The yard adjoining the sitting hens is supplied with food and fresh water, the former consisting principally of our favorite scalded mush, yet whole grain is also given sparingly. The earth is kept loosened and affords a good opportunity for the dust bath which each hen is sure to improve. In case we are occupied away from the yard during the day, the hens are taken off either before breakfast or before dinner, and will generally be found on their nests after our meal is over. Newly set hens will need to be shown the right nest for a few days, but they soon learn their own quarters and voluntarily return to them. Whenever the nest or eggs have become fouled by broken eggs or otherwise, a thorough cleaning is imperative; such eggs should be soaked a few minutes in tepid water, washed, and returned to the nest; this answers the same purpose as sprinkling them, and we prefer "dipping," or "immersion," to "sprinkling," in this case.

Some of the above hints are contrary to general expressed ideas, but they are in accordance with facts, and will apply to the management of eggs for hatching of other kinds as well as ducks.

P. S.—We would like to hear suggestions regarding the breeding and management of ducks, through the FANCIERS' JOURNAL, from any experienced party. Also, would be glad to have proper questions asked relating to the same, whenever points of interest are omitted by the writer.

J. Y. B.

NO POSTAL CARDS ANSWERED.

DAYTON, OHIO, Aug. 22.

To the Editor of the Journal:

During the last week I have written to two fanciers about some Light Brahma fowls, which I desired to purchase. I have received no answers from them. The only reason I can assign for it is, that possibly I have overreached the laws of business etiquette (as understood by poultrymen) in sending my communication on the only thing I had convenient at the time, viz: a postal card.

* No. 29, page 343, 26th line from the top, "passing upward" should be "pressing upward."

I have also read several advertisements containing this bit of information: "No postal cards answered." Are poultry fanciers, as a class, so much superior to the average business man that a postal card shocks their exalted sense of propriety, or are they so overrun with orders that they can afford to discriminate between the one on a postal card and the sealed one?

In my business we are only too glad these hard times to get an order for a buggy or a wagon, on a postal card; and we have not yet reached that height of independence (or impudence) which enables us to inform our customers upon what they shall write; and I have yet to see the man, from the President of these United States down, (poultry fanciers excepted,) that refuses to do business or receive orders on a postal card.

"No postal cards answered." Indeed! Why don't these "fine haired" gentlemen state in what shape they will receive their communications? I expect a yellow envelope would be offensive to some of their refined tastes. I suggest to some of them that they advertise "None but white envelopes (white denotes purity) received," or "No communications received unless done up in a band box."

I am yet an amateur and likely to stay one, as I find the atmosphere in which these kid gloved fanciers live and move, too pure and holy to contain a sin cursed, postal card tainted human like myself.

P. CARD.

REPLY TO "COGNOSCENTE."

I learn from the response of Cog., that I have been misinformed in regard to the Poultry Bulletin being an "organ," or the property of American Poultry Association. Having understood in conversation with some fanciers, that "Associated Fanciers" meant "Am. P. Assoc.," I made my remarks with that understanding, and asked the question "who would be responsible," &c., in order to learn the exact situation of affairs if the magazine in question was the property of said association, and if it should not be a remunerative investment; while my intentions were good, I find I have erred in that point and most gracefully acknowledge the same.

Since "Cognoscente" signs himself as "one who knows," it may not be improper to ask a few more questions for the benefit of the poultry fraternity as well as myself. I see by the June number of Bulletin, (kindly loaned me by a friend,) the following list of officers:

John J. Berry, President,
W. V. Clark, Secretary and Treasurer,
Wm. H. Kirby, Business Manager.

A. M. HALSTED, Editor.

The above list may be "news" to many, as well as the fact that "none of them are members of Am. P. Asso.," and Young Breeder's remark about "busting that standard," might be correctly applied and interpreted.

Was P. Williams, "Ex-Pres.," made rich by launching into that enterprise, (The Poultry Bulletin,) did the tears roll in torrents down the furrows of his face, when he saw that grand and noble institution passing from his hands, like the "Anthem of a gentle breeze?"

Did he wonder, when he found that big hole in his right hand pocket, what *made* it? Did he pat the Bulletin on the head and say "well done thou good and faithful servant," when he had also found the left hand pocket empty?

"Thou call'st me sweet and tender names,
And softly smooth my tresses,
While all the time my happy heart
Beats time to your carresses."

I have no ill will against the officers or owners of the Bulletin, yet it would seem more in keeping with the demand of the times, if they were harmonious with, and banded in support of the Am.

P. Asso., unless they are thoroughly convinced that said Association is a *fraud*, and if it is their honest convictions that such is the case, *show it up*.

I for one will most heartily thank them.

Has Mr. Halsted destroyed his diploma for judging? or hasn't he ever received any from said Association? Does the Association grant diplomas for judging, to non members? Allow me a brief digression. In one of the numbers of the Bulletin it says: (perhaps not in the same words,) "We have received the following from a *friend*, not from any member of the Transportation Committee." And then Mr. A. D. Warren says: "As chairman of the Transportation Committee, &c., &c." It would seem that there was some inconsistency in the above remarks, in other words, Mr. H. (or the Bulletin) politely informs Mr. W., that he lies; now the writer has read some of the proceedings of Am. P. Asso., and find therein that "Mr. Warren declined," but does not find that he was excused, or that his declination was "approved and placed on file."

There is a question of veracity existing between these gentlemen; and since Mr. Warren says: (see number 32 FANCIERS' JOURNAL) "My letter in your JOURNAL, No. 25, gives the exact truth of this matter, in every particular," (controversy of Herron vs. Warren) and further says: "*first, I want to be honest*," it is evident that there is a conflict of opinion or want of veracity in the statements. Mr. Warren must not think that his "great name" as a breeder of B. B. Reds, will protect him from imputations liable to be made against many of our so-called fanciers; and if he sends his B. B. Reds, "golden banded," (as a mark for the judges [?]) he is not honest, any more than it would be honest for any other breeder to place a private mark upon his fowls; but that is not the question.

Is Mr. Halsted right and Warren wrong, or *vice versa*, concerning that Transportation Committee? *Out with it*.

Ah! "Cognoscente," how the writer would enjoy an easy seat to see "Halsted vs. Warren" entered for the next act! Remembering the saying: "When Greek meets Greek then comes the tug of war," he would recline in an easy posture, cock his legs on the table, laugh, puff, and grow fat, even in this canine weather, to see the fun proceed, "honesty vs. honesty," "then comes the tug of war."

Can't you induce "Ed. P. Bulletin" to give us this act, we won't grumble, won't even whisper, if necessary, but be as quiet as possible, sitting with that calm composure indicative of the wisdom of an owl and the knowledge of a ——— Young Breeder.

Innumerable questions loom up before us, but for the present I will tax your patience no longer.

Now, "Cognoscente," meeting with no obstructions when the little family circle quietly proclaimed "another sinner come to light," I was not born with an interrogating nose, but have always believed in this free and enlightened country that there was no harm in simply asking questions; this has prompted me to put to you the questions which I have in this "reply;" if I have again erred in some statements, shall be only too happy to apologize in as gentlemanly a manner as possible; and tender you my sincere thanks for correcting my first article "Out with it."

Let us bear in mind that "to err is human but to love divine."

QUILIBET.

The following "Owed to Lake Ontario," is worth preserving:

"Green ar' thy waters, green as bottle-glass—
Behold em' stretcht thar?
Fine muskalongs and Oswego bass
Is oft'n katched thar.
Thar the red Injin once took his delights,
Fisht, fit, and bled,
Now, most of the inhabitants is white,
And narry red!"

SWANS.

The nest of the swan, says Mr. H. R. Robert-on, is a thick and rather untidy mass of sticks, reeds, flags, and rushes. From the fact of the birds naturally preferring the most secluded

cygnets are very young, one or two of them will sometimes climb up on to their mother's back, who never sails along more proudly than when her dusky brood is thus cradled between her snowy wings. Swans do not breed until they are several years old, and

spots by the water, we more often find a swan's nest on a small island than on either bank of the river; the osier beds are perhaps the localities most favored by them. The eggs are six or eight in number, and are hatched in five or six weeks. The young birds are termed cygnets, and are covered with a grayish brown plumage, which is not entirely lost till the beginning of the third year. Though the

swan is, in general, very gentle and inoffensive, the male bird will defend the nest with great courage, and advance to the onset with ruffled pinions and every demonstration of anger; nor is it, from its muscular powers, an antagonist to be despised. While the

tain other birds,' was an offence severely dealt with in England in old times. We find, in an act of Henry VII, that "no manner of person, of what condition or degree he be, take or cause to be taken, be it upon his owne ground, or any other mans, the egges of

they mate strictly in pairs: the technical terms for the male and female are cob and pen. The cob, or male, has a thicker neck and a larger berry at the base of the bill than the pen, or female; he also swims more buoyantly, from having more volume of lungs. Maturity in both cob and pen is shown by the size of the berry and the depth of the orange color of the bill.

Taking swan's eggs from the nest, and cer-

faun, goshawk, laners, or swans, out of the nest, upon pain of imprisonment of a year and a day, and fine at the king's will, the one half thereof to the king and the other half unto the owner of the ground where the eggs were so taken."

The swan feeds on aquatic weeds, the spawn of fish, and coarse grass growing by the sides of the water; it is furnished with a gizzard of extraordinary muscular power, which enables it to grind the weeds, however fibrous, to a pulp.

All writers on the subject agree that the swan is very long lived, some saying that it attains thirty years, while others assert that it sometimes survives a century.

"Man comes and tills the earth and lies beneath,
And after many a summer dies the swan."

The particular species that is the subject of the present article is often semi-domesticated on lakes and ornamental waters, and is known as the tame or mute swan—*Cygnus olor* of the ornithologists. It is said not to have been originally a native of the British islands, but is found in the eastern portions of Europe and the adjacent parts of Asia, where inland seas, vast lakes, and extensive morasses afford it a congenial home. In Siberia and some parts of Russia it is common, and it abounds on the shores of the Caspian Sea. It is doubtful when this most elegant bird was introduced into Great Britain, where it is such a universal favorite. Wild swans may be often observed flying in a wedge-like form high in air, but they very rarely settle. This species, *Cygnus ferus*, is neither so large nor so graceful as the tame swan.

For its value as an article of food, the swan is now almost entirely disregarded. Two or three are still fattened every Christmas time for Windsor Castle, where, in accordance with old usage, they make their regular appearance on the royal table. On only one occasion have we ourselves ever had the opportunity of proving the taste of our ancestors in the matter, and we are inclined to class the royal bird along with the royal fish, the sturgeon, as really inferior in flavor to many a plebeian dish. In color the flesh is extremely dark, and if we may speak from our solitary experience, we should describe it as somewhat dry and decidedly coarse in fiber; the bird in question was a young one, which had been carefully fattened, and kept till tender after being killed.—*Scientific American*.

(From Journal of Horticulture.)

THE EXHIBITION DORKING—NO. 13.

BY T. C. BURNELL.

WHITE DORKINGS.

These are the great favorites in all country places, their snowy plumage and coral combs never showing to greater advantage than when contrasting with the green of a country meadow. They do not do well, however, for a large town, as their bright plumage very soon becomes soiled.

A White Dorking's comb must be rose-shaped (double), firmly fixed on the head, and without any tendency to lop on one side. A single comb is a disqualification, but is now rarely or never seen. The ear-lobe, as in all Dorkings, should be red, and feet white. The legs and feet are frequently found of a pinkish tinge, but white is the proper color for the legs of a Dorking. The color of the feathers should be a bright spotless white, and it is here where the difficulty occurs, as so many birds show a yellow tinge in their plumage. Many birds will moult-out white, but if exposed to the influence of the sun will rapidly turn yellow. The cocks especially will become yellow on the hackle and saddle; their feathers, being brighter in color, are more prone to absorb the sun's rays. Some cocks will keep much purer in color than others, and, for breeding, we must be careful to select birds with this peculiarity in addition to their possessing a good comb and

all the Dorking characteristics. Yellow beaks and toe nails should be avoided, as clearly showing a cross.

White Dorkings are not very great favorites with the show community, owing to the great difficulty found in keeping them white and clean enough for the show pen. As soon as the sun attains any power the cocks to be shown are better kept out of the sun, or their plumage will soon become tanned; but with every care, white birds occasionally require washing before exhibition.

The simplest plan for washing fowls is to fill a large crockery-pan or tin vessel with about 8 inches of warm soft water, to submerge the bird well in it, and wash thoroughly with a soft sponge and white curd soap till the dirt is all out; then pour in fresh water and wash out the soap, and remember that as long as any soap remains the feathers will never web properly. After rinsing thoroughly, squeeze out as much water as possible. The bird should be lightly and quickly dried with a soft Turkish towel, and then be placed on some clean straw to dry. Each bird should be placed in a separate basket before a bright fire or in the sun, and in about twelve hours they should be quite dry and beautifully white. Sour milk is a capital thing to remove sunburn—that is, if the yellow tinge is caused by the sun and is not natural to the feathers.

White fowls should not be allowed to eat maize, or, as I have before stated, it will be very difficult to keep the plumage white. The best dust-bath for them is a heap of white drift sand or road grit.

The eggs are generally white in color, but Mr. Cresswell informs me that some birds of his well-known strain lay pink eggs, and these must certainly look very pretty on the breakfast-table. The chicks when hatched out should be of a yellowish-white color.

"IN THE GOOD GREEN WOOD."

To the lovers of nature the wild mountains have peculiar and unfading charms. In summer, deep carpeted with moss and radiant with the bloom of Rhododendron and Azalia, there is about them a mysterious beauty seen nowhere else. In winter cedar and pine are columns of silver, and the pillared rocks are turned to marble monuments, standing perhaps by the graves of red hunters, who have perished long ago. Hunting the wild deer all through the autumn evenings till—

"Many a night I saw the Pleiads, rising thro' the mellow shade,
Glitter like a swarm of fire-flies tangled in a silver braid."—

I could understand why the Swiss is in love with the Alps, and the Gael with the Highlands. Returning after a long day's hunt on the mountains through the gloom of the night to his lonely camp by the water, the hunter may hear the scream of the puma in the laurel, and the mocking laugh of the owl in the pine, yet wrapped in his blanket before his camp fire, his slumbers are none the less sound though he knows that the king of the mountains is abroad. Your hunter, too, is a naturalist in his way, were he not familiar with the habits of the animals around him his labors would bring him no returns. He knows that during the month of September the bucks are only to be found on the highest ground, hardening their horns in the sun, and rubbing off the "velvet" on the pines and the rocks. That during this time they are very quiet, seldom going far from the mountain summits. That at the beginning of winter the males fight fiercely among each other, and pursue the females night and day over the mountains and through the valleys; that the fern, the moss, and the laurel are the principal food of the deer in winter; that the young are concealed by the mother, and are scentless; being thus secure from the teeth of hound, or wolf, or cougar until they are old enough to save themselves by flight.

PIGEON DEPARTMENT.

PIGEON RACE FROM LOCK HAVEN TO NEW YORK.

NEW YORK, Aug. 25, 1876.

MR. EDITOR:

Our pigeon race from Lock Haven came off on Friday, the 18th of this month. Our seven birds were tossed by Professor Raub, at 7 o'clock, A. M. The weather was not favorable, the wind being partly against them all the day. Besides the weather was changeable, being partly clear and partly cloudy. Also, our birds did not make good time, and only for their superior qualities, and their numerous courses which they flew during the summer, no doubt some of them would have been lost. The bird who arrived first was my blue cock, Jupiter, Jr. He lighted on the top of my loft at 2 o'clock, and my son, who was watching the arrival of Mr. Waefelaer's birds, as Mr. Waefelaer was in the country, sent me word in a message by one of my pigeons, that at 2.07 two of his five birds arrived together. My son staid at Mr. Waefelaer's until 3 o'clock, and at that time his three others had not arrived. As Mr. Waefelaer only came home from the country on the Monday following, I did not know if all his birds were home, but on Tuesday I received a letter from him, in which he informed me that all his birds had arrived safely at home.

My bird Andrew Jackson, who generally was one of the first to come home, came only the following day at about 9 o'clock. So that our seven birds are all safe yet, and have done as well and better than we could have expected.

We are just commencing to train our young birds now, and will fly them during September as far as Easton or Scranton. I should wish some of our Philadelphia friends would put up some young birds against some of our stock, so as to have a few friendly contests together for any small prize they wish, as we want it to be understood that it is more for pleasure and amusement than for high strikes we want to fly our birds.

Yours truly,

JOHN VAN OPSTAL.

JOTTINGS.

KEEP A SCRAP-BOOK.

Pigeon keepers would derive pleasure and profit from the practice of keeping a "scrap-book," devoted exclusively to pigeons and kindred subjects. If you have loose numbers of poultry or pigeon papers (especially *THE FANCIERS' JOURNAL*), which are consecutive, by all means have them bound—do not mutilate them.

But if there are odd numbers of such periodicals lying about the house, which have been sent you gratuitously, or as specimen copies, or which are the only ones of neglected files that have escaped destruction or sale at *spring-cleaning*, provided you are interested in pigeons solely, the best way to utilize them is to cut out the articles on pigeons, and paste them into a book. Occasionally there are paragraphs in the newspapers which would

properly have a place in a pigeon scrap-book. It is likely you will be surprised to see how the contents grow. If passages of similar interest are encountered in your general reading, they may be copied upon letter-paper and posted neatly by the side of the cuttings; or a separate blank-book may be used for this purpose. Letters of counsel and condolence from brother fanciers, the contents of which have a bearing upon the treatment of your birds, might be placed in the book. An index may be started in the first place, and regularly posted, so as to keep pace with the additions. Portions of the book may be reserved for certain branches of the subject, or certain varieties of pigeons. If you keep no other memorandum book, you may enter original notes and comments. In a short time your book will be a compendium of knowledge and suggestions about pigeons. P. B.

HOMING PIGEON.

"A physician in the Isle of Wight has found the Homing pigeon to be of great service to him in his country practice. At every village through which he passes, and when his last patient therein is seen, he writes a list of prescriptions for that village, affixes it to the leg of a Homing pigeon, and despatches it to his house. Says the physician in a letter to a country paper: "By this means, either a country carrier is intercepted starting homeward from our market town, and the medicine is delivered by him on that very evening, or my chemist is enabled, hour by hour to see his work ahead of him, and forestall his dispensing necessities." "P. B."

ITEMS.

SCANDAL.—It was the saying of an old acquaintance of ours, when his attention was called to anything that had a smacking of scandal in it, "I have so much to do that I cannot hear it. One half of my time is taken up with my own business, the other half with letting alone that of my neighbors."

How many excellent opportunities of letting alone other people's busines are slighted, and the world is troubled with the interference of people with what does not concern them. Neighborhoods are driven crazy by reports of idle or mischievous people who watch for occasions of scandal, and lose no opportunity of making it public, regardless of its truth, or of the injury it inflicts upon the feelings of others. Gossip passes for fact, and surmise for history.

PREPARING FOR WINTER.—The ingenuity of Chinamen in what is called "making shift" is proverbial, and many a housewife who thought herself apt at expedients, has been taught a useful lesson by John. If Miss Ophelia could only step into the kitchen of any of our restaurants and see the quantities of provisions cooked by Chinamen in oyster cans and other unlikely culinary implements, her heart would be delighted. Just give one of them who "savies" a frying pan, a big boiler and a coffee pot, turn him loose in a kitchen and he will, if he chooses, produce a meal for a president. Any one who wants to see how ready they are for emergencies can do so by going to the burnt districts of Virginia and inspecting some of the buildings put up by them since the fire. It is well-known that they are the most industrious of scavengers and never pass by an old tin can as being unfit for some useful purpose. Some of them are now drawing on their supplies for building purposes. They use big oil cans, filling them with earth and building them into walls, which are covered with boards or cans as either may be easiest obtained. John may be a heathen and doomed to all kinds of torture in another world, but in this he can teach many who look upon him with contempt, a useful lesson in making much of little.—*Gold Hill News*.

EDITORIAL DEPARTMENT.

FOWLS THAT ARE MOULTING.

As most old birds are, just at this time, are of course unfit for marketing. This fact is not generally appreciated. But the moulting process is a species of skin disease, with domestic poultry; that is to say—during the weeks that the old plumage is dropping away, and the time that the new feathering is forming, the fowls' flesh is in a fevered condition, in consequence of the death and slow departure of the previous year's coating.

At such a period, the older fowls are quite unfit for the table, though thousands of such birds are kept by their owners up to this natural change in the fowls' life—which succeeds the laying of their final annual litter of eggs, usually—and are then killed off, because they are commonly at such time in good condition, apparently.

If these older birds are to be slaughtered at all, they should be killed *before* the moult commences, or they should be kept over to cold weather, or until their new feathering is fully out. This may be decided upon by taking your fowls from the roost at night, and examining the skin. If the body is covered with blue-shafted "pin-feathers," such birds ought to be kept till November or December, before killing. If these pin-feathers have not yet begun to show themselves, then the bird may be properly used for marketing.

With fall *chickens*, the case is somewhat different, though it is dependent upon their age. Usually, by October the spring chicks' first moult is completed, and the pin-feathering is *non est* upon their bodies. But, in either case, if there be a show of this, upon examination, birds should not be killed, for eating. These pin-feathers may be scalded off, or picked out, through careful plucking. But no one who knows anything about the above facts will ever choose a chicken in market for food whose skin is covered with these offensive blue, dead-blood-filled feather-shafts, and no poultryman should ever kill a bird to offer for eating, young or old, that is going through its moult.

CORRESPONDENCE.

TAUNTON, MASS., Aug. 14th, 1876.

FANCIERS' JOURNAL:

DEAR SIR:—I have two light Brahma cockerels that measure from the tips of their toes to the tips of their bills, three feet one inch and a half. Also, three pullets, same hatching, all four

months old the first of August, that measure two feet ten and three-fourths inches. These chicks came from the chicks that took the first, second, third, and special premiums at Providence, R. I., February, 1876. Can any one come up to this?

Yours truly,

J. E. WILMARTH.

NEW YORK, Aug. 24, 1876.

JAS. M. WADE, ESQ:

I have a pair of silver beard Tumblers, five weeks old and are still being fed by the old parent.

One of these young birds is continually feeding a young common pigeon of the same age. Is this a rare case or not?

By answering through the "Journal" you will oblige.

Yours truly,

X. O. P.

FINDLAY, OHIO, Aug. 23, 1876.

JOS. M. WADE:

Dear Sir:—Will you or some of your many readers inform me through the Journal, the proper manner to care for an eagle, and will he want any extra care during the moulting season? Has been captured about a year, been fed mostly on wild game since being captured, is in fine condition and commencing to moult his feathers a little.

Yours truly,

JAS. DENISON.

SCHONNY SCHPROAGLE AGAIN.

MEISDER VADE:

Soomdime ago soom veller hids me hardt apoud dot Schiraffe pisness, bud he dond pus his audograf behind his ardgle, so I dond vint out'd who id is. I hafd do rebly, howefor, or id puds me in a bat bredigament mit te reaters of te SCHOURL. I bed I yuse him ub so he dond coom ad me agane preddy soon.

We could tell more about that were we to see each of them “Scudding under bare poles.”

—The question, What nationality owns the North Pole? is gravely discussed by *Chambers' Journal*.—*Sun*.

Uncle Sam can soon settle that. Let him run up the stars-and-stripes banner on it, and you will soon see who owns the North pole!

—He wanted to buy a coat, and Perry wanted to sell him one. “That is not quite what I want,” said the customer, “but something like that.”—“If you want something like that,” said P., “this is as near like it as you can possibly buy.”

He bought!

—It is not, unfortunately, generally known that in the case of fire in buildings containing horses, if the harness be merely put on, however roughly, the horses will quit the stables. A knowledge of this fact may be the means of saving many a valuable animal from a horrible death.

—The unpaid orchestra of the Offenbach Garden, Philadelphia, refused to play, and the performance was suspended. The managers returned the money to the audience, and the majority of two hundred deadheads presented themselves with the others and took the cash.—*Phila. Times*.

All but the money and the cash—true.

—It may not be generally known that the eagle, raven, swan, and parrot are each centenarians. An eagle kept in Vienna, died after a confinement of 114 years, and in an ancient oak in Sheldborne, England, still known as the “raven tree,” the same pair of ravens are believed to have fixed their residence for a series of more than ninety years. Swans upon the river Thames, about whose age there can be no mistake—since they are annually picked by the Vintners' Company, under whose keeping they have been for five centuries—have been known to survive 150 years and more.

—Captain J. W. White, of the Revenue Marine Service, makes a favorable report of Alaska, saying that vegetation is luxuriant, the Yucon river navigable for 1,400 miles, the seal fisheries practically inexhaustible, and the minerals enormously valuable. Incidentally he tells the story of fishing off Sitka: “I had a barrel of Puget Sound clams salted for me for bait. I took my lead line, as large as my thumb, attached five hooks above the lead, with a clam on each, and fastened to the davit; soon the bites—one, two, three and often five—were often felt. I threw the line over the pulley, and put four men to pull, and up would come two, three and sometimes five cod, weighing thirty to forty pounds apiece. We had out about twenty lines, and caught 250 fish in two hours.”

—ELECTROPLATING OF LEAVES, INSECTS, etc.—A new and improved method of metallization of organic substances, so as to fit them for receiving galvanic deposits, has been devised by M. Cazeneuve. It is both more rapid and more safe for the operator than the ordinary way. The nitrate of silver which serves for the metallization is dissolved in wood spirit, by which means a thorough

impregnation of the object is obtainable. After maceration (more or less) the object is dried through rapid agitation, but while still moist it is submitted to a saturated solution of ammonia gas, and thus is formed a double nitrate of silver and ammonia, easily reducible. Drying is then completed at a mild temperature, and the object is then suspended in mercurial vapors and completely metallized in a few minutes. By this method, the author says, he has obtained a layer of copper on leaves, flowers, insects, etc.—*Scientific American*.

—PEEPING FROGS.—It is well for all people in the country to know the difference between “peeping” and “croaking” frogs.

Among the first and most noticeable of the spring sounds that come to us from the neighborhood of the ponds and streams is the voice of the peeping frog; and this little creature will well repay one's attention. It is commonly thought to be the young of the bullfrog; but this is not so; it seems to be a distinct variety of the frog family. He makes himself heard in the spring as soon as the ice has melted, and is most musical during the evening. You will find him sitting among the old brown grasses and leaves at the edge of the water; and, as soon as he hears your footfall, down he flattens himself, and you would easily mistake him for a brown leaf; but, trusting to your ears and not eyes, you soon will see this little brown leaf cautiously rise up, swell its little throat to half the size of its body, and give a “peep” shrill enough to leave no doubt as to what makes that sound. These frogs are, when sitting, about an inch long, and vary in color from a light to very dark brown. They are easily caught; and by putting them in a wide-mouthed bottle covered with thin muslin, and placing this under a hat, or in any place away from the light, they will continue their peeping for some time.

—BENEATH THE WAVES.—All parts of the bottom of the ocean are not barren wastes of sand or mud, lying in a darkness that no light penetrates. There are portions as beautiful as a garden, though no hand but their Creator's has cultivated them. They are the oases of the sea. One such spot is thus described by a diver:

One of my expeditions was among the silver banks of the Antilles, the loveliest place I ever saw, where the white coral grows into curious, tree-like shapes. As I stepped along the bottom, it seemed as if I were in a frosted forest. Here and there trailed long fronds of green and crimson seaweed. Silver-bellied fish flushed about among the deep-brown and purple sea-fans, which rose high as my head.

Far as I could see all round in the transparent water were different-colored leaves, and on the floor plates of shells so bright in color that it seemed as if I had stumbled on a place where they kept a stock of broken rainbows.

I could not work for a bit, and had a quarter determination to sit down for a while and wait for a mermaid. I guess if those sea girls live anywhere, they select that spot.

After walking the inside out of half an hour, I thought I had better go to work and blast for treasure. A little bit on from where I sat were the remains of a treasure-ship. It was a Britisher, I think, and corals had formed all about what was left of her. The coral on the bottom and round her showed black spots. That meant a deposit of either iron or silver. I made fairly good hauls every time I went down, and sold one piece I found to Barnum, of New York.

—MIMICRY AS A MEANS OF DEFENCE. The walking-stick insects, as they are called, in their turn imitate in the skeleton-like structure of their bodies the appearance of dried twigs, and it is a singular fact that even in their awkward ungainly manner of walking, the resemblance to the chance movements of twigs is clearly perceptible, the mimicry being rendered more realistic through this latter phase. Then, also, we find certain harmless groups of moths imitating closely the outward appearance of species of stinging bees and hornets. And one remarkable case of mimicry is the well known instance of some perfectly inodorous South American butterflies, which perfectly reproduce the external appearance of other butterflies which emit a most offensive odor; the reason assigned for this latter phase of mimicry being the very feasible one that the inodorous forms are protected from the attacks of birds by their resemblance to their strong-smelling neighbors. As a last instance of this curious phase of animal organization, we may note the example furnished by those curious little fishes, the hippocamni, or sea-horses—so named from the obvious resemblance of the form of the head to that of a horse—the body of which becomes covered with long streamers of certain kinds of seaweed; so that, when these fishes rest amid the seaweed-covered nooks of their marine grottoes, the presence of their streamers serves to render detection by their enemies no easy matter.

—CAN BIRDS CONVERSE?—Dr. Charles C. Abbott cites the following occurrence to show that birds possess some mode of conveying ideas to one another. In the spring of 1872 a pair of catbirds were noticed carrying materials for a nest to a patch of blackberry-briers hard by. To test their ingenuity, Dr. Abbott took a long, narrow strip of muslin, too long for one bird conveniently to carry, and placed it on the ground in such a position as to be seen by the bird when searching for material. In a few moments, one of the catbirds spied the strip and endeavored to carry it off; but its length and weight, however he took hold of it—and he tried many times—impeded his flight, and, after long worrying over it, the bird flew off for assistance. In a few moments he returned with his mate, and then, standing near the strip they appeared to hold a consultation. The chirping, twittering, murmuring, and occasional ejaculations, were all unmistakable. In a few moments these all ceased and the work commenced. Each took hold of the muslin strip, at about the same distance in each case from the ends, and taking flight simultaneously, bore it away. Soon there was much jabbering at the nest: the birds could not agree how to use the strip, and it was finally abandoned; but so, too, was the nest, and the birds left the neighborhood.

—THE AFTERNOON OF THE YEAR—WHEN THE SWALLOWS HOMEWARD FLY.—In these later days of summer (says the *Hartford Times*) many of our singing birds whose voices have been silent during most of the season, have resumed their pleasant songs. The melody of the brown thrush is heard again in the copses, the robin's song is renewed, theoriole's mellow note again resounds in the orchard, the little finch called the yellow-bird times his song to the swinging motion of his flight, and even April's blue-bird is heard again.

But it is the afternoon of the year: a still, slumberous scene, in which the dry locust's song seems only a shriller note in the universal droning cadence of the myriad insect choir in the grass. An afternoon in the country is full of the story of the waning season. Lying motionless in the orchard, one hears at times the thump of some ripe apple, that falls from the effect of its own ripeness.

On the fences, and on the telegraph wire, the swallows gather in hundreds—young ones, doubtless, who seem to be receiving certain instructions from the old birds, a number of whom are seen flying up and down the long, crowded line, and busily imparting something to the watchful crowd, possibly information of the fact that they must not expect to remain here in the north, but must get ready to follow them—the old birds—when, on some one of these fine nights, they take their dark and silent flight to the southland, and leave the world to winter and to us who stay.

They are the first to go, of all our migratory birds. And they go so early—usually by the close of August—that they leave behind them much of the summer warmth and beauty, which is to remain with us for a long time yet.

—THE TAMED HUMMING BIRD.—Mr. Webber, in his "Wild Scenes and Song Birds," says:

"After several unsuccessful attempts, at last I succeeded in securing an uninjured captive, which, to my inexpressible delight, proved to be one of the ruby throated species, the most splendid and diminutive that comes north of Florida. It immediately suggested itself to me that a mixture of two parts of loaf-sugar with one of fine honey, in ten of water, would make about the nearest approach to the nectar of flowers.

"While my sister ran to prepare it, I gradually opened my hand to look at my prisoner, and saw, to my no little amusement, as well as suspicion, that it was actually 'playing possum'—feigning to be dead, most skillfully. It lay on my open palm motionless for some minutes, during which I watched it in breathless curiosity. I saw it gradually open its bright little eyes to peep whether the way was clear, and then close them slowly as it caught my eye upon it.

"But when the manufactured nectar came, and a drop was touched upon the point of its bill it came to life very suddenly, and, in a moment, was on its legs, drinking with eager gusto of the refreshing draught, from a silver teaspoon.

"When sated it refused to take any more, and sat perched with the coolest self-composure on my finger, and plumed itself quite as aristocratically as if on its favorite spray. I was enchanted with the bold, innocent confidence with which it turned up its keen eyes to survey us, as much as to say, 'Well, good folks, who are you?'

"By the next day it would come from any part of either room, alight upon the side of a white china cup containing the mixture, and drink eagerly, with its long bill thrust into the very base. It would alight on my fingers, and seem to talk with us endearingly in soft chirps."

ZOO NOTES, NO. 28.

BY HUN.

THE LEECH (*Hirudine sanguisuga*).

SCENE in the Zoological Garden, Fairmount Park. Grampy and Jenchen seated under one of Gov. John Penn's umbrageous old beech trees.]

Jenchen. "Grampy, I know what leeches are used for, but I do not know what they are, or where they come from."

Grampy. "Well done, young naturalist! you are asking questions already which people of greater years and experience, I think, would be unable to answer. Well, never be afraid to ask, for if you are you will miss much in this world which it would be well to know; and better aim at the moon, even if you don't hit it, than never to aim at it at all. A leech, then, Jenchen, is a red-blooded, footless, smooth-bodied annelid, or worm, having a sucker at its posterior, and by which it can perform locomotion or attach itself to any substance it desires to. The young leech is reproduced from the egg, of which from six to fifteen are contained in a cocoon, deposited near the edge of the water, and hatched by the heat of the sun. The leeches live principally in the water, though a portion of the year they remain entirely underground; but in July and August they are obliged by a law of nature to come out of their hiding places, that their eggs may be deposited in tufts of herbage, the proper place of deposit. All the leeches—for there are a great many kinds—live at the expense of other animals, whose blood they suck, taking in enough of the sanguineous fluid at one meal, if they are allowed to, to last for a whole year. Their digestion, you see, acts very slowly, and it is a remarkable fact that the blood which the leech takes into its stomach will remain unchanged there, red, fresh, and liquid, for several months!

Now, Jenchen, having told you what a leech is, and given you enough of science for your mind to digest, I will endeavor to answer your second question, and perhaps enlarge upon it—"Where does the leech come from?" Many of them are to be found in America; one, the *Hirudo decora*, is quite abundant in Pennsylvania and the Middle States, where several hundred thousand are annually employed in the medical art. Formerly leeches were to be found in great numbers in the marshes and streams of most countries of Europe, but so great was the demand which suddenly sprung up for the blood-suckers at the close of the last century, that many of the abundant localities were exhausted; the most and best now come from France. That people seem particularly partial to them, and their use among the French has been more general than elsewhere. About the year 1830 the scarcity and high cost of leeches attracted the attention of a Frenchman, and an idea came into his mind that they might be bred and kept in farms just like any other animal for which there is a regular market and steady demand. The idea was soon put into practice, and at this date leech-breeding has come to be regarded in France as an industry of great importance, while it is also carried on to considerable extent in other parts of Europe. In one department of France, that of La Gironde, about 10,000 acres of land have been devoted to leech-farming, which land was of but very little value originally, but now it has risen in price sixfold, while men's wages, which were but twenty-five cents per day before, are now one dollar per day! Women and children even find remunerative occupations among the leech-farms. Shops have sprung up where none before existed, and the condition of the peasantry has generally much improved."

Jenchen. "We have no such farms in this country, I suppose; I should much like to visit one."

Grampy. "No, we have none here. With us the leech is caught in the primitive manner. Men and boys roll up trousers-legs and wade in the ditches and swamps for them. When one is felt taking good hold of leg or ankle he is quickly stripped off into pot, bag, or cup of the leech-hunter, and the *trap set again*. Now let us in imagination pass over to the south of France; we will settle down near Bordeaux. Here, by the waters of the Garonne, we find a leech-farm of about four hundred acres, which we will examine for a moment. It is all marsh land, as you see, divided into compartments of five or six acres in extent, each of which can be separately inundated. The whole is surrounded by a ditch eight feet wide and five feet deep. In this enclosure can always be found from 40,000 to 50,000 leeches to the acre, and besides the breeding grounds there is a reservoir, constructed in much the same manner, which contains from 30,000 to 40,000 more of the 'suckers' of the largest growth; so there is always a stock ready for the market."

Jenchen. "What do they feed upon?"

Grampy. Horses' legs, my dear. You see, during the cold season the leech remains underground, quite torpid, but when the first warm rays of spring fall upon the earth, out come myriads of them, and then a troop of horses in proportion of ten to the acre are turned into the breeding grounds for a leech-feed; to the legs of these the leeches attach themselves and there suck their fill. The same troop of horses remain on duty for six hours, when they are sent back to their pastures and another troop sent in. After ten days' rest, and to regain strength, the horses are again despatched to the leech-farm to do duty, and from about the 1st of March to the middle of June the leeches are thus fed about eight or ten times each month."

Jenchen. "How do they catch them?"

Grampy. "At the end of August the fishing for them commences; but there is something else we must know before we proceed to catch them. In June, after having gorged themselves with horse-blood, the leeches all go under the mud, the parks are drained, the horses kept out, and the herbage allowed to grow. In July the leeches come out to deposit their eggs in the weeds and grass, and now there is just water enough let in to keep the ground moist. When the leeches have performed their egg laying, to their mud-burrows they again betake themselves, leaving the sun to do the hatching of their young, which is quickly done, and then the parks are once more inundated, the end of August approaches, and we proceed to catch our leech. The fishers, protected by high boots, form a line in the pond and beat the water with sticks, arousing the dormant leeches, who by this time are again very hungry, and, supposing there is another lot of horselegs for them to feed upon, they rush out to the feast, when they are carefully lifted into the bags which the fishers have provided for their reception. This goes on until the whole pond is thoroughly searched, though none but the largest are taken for the market, the young and small, as well as those which have not digested their food, being left as stock for the future."

Jenchen. "Do the horses suffer by being used in this manner?"

Grampy. "No, as in some cases horses, having been condemned for work, have been sold for a mere trifle to the leech-farmer, who turned them in to his leeches, when they improved so much that he re-sold them at quite a profit! These horses are closely watched while the leeches are drinking their blood, and carefully tended afterward; and old horses whose lines, in the latter part of their lives, have not been cast in pleasant places, here find a relief from their hard knocks, long fasts, and heavy loads, and have a "horse heaven" indeed in comparison with the experiences they have undergone."

Jenchen. "What are leeches worth in the 'market,' as you call it?"

Grampy. "In Europe they are worth \$20 per pound, to which weight there go an average of five hundred in number, and as an establishment, such as I have described, will produce several million leeches annually, you will see that it is something of a business."

Jenchen. "Does France furnish the great bulk of them?"

Grampy. "Yes, now she does; but before the introduction of the farming I have been describing she had to import fifty million from other parts. That many were wanted independent of her own productions, as Paris alone consumes some 12,000,000 leeches annually!"

Jenchen. "What other countries do they come from?"

Grampy. "When the leech-famine began to be felt, say about the year 1800, Hungary was the first to supply, then Turkey, then Greece, Germany, Sweden (the very best are said to come from there), and even Algeria and Syria were ransacked for the blood-thirsty creatures; but now, thanks to the leech farmers of France, there is no danger, under the usual circumstances, of a future famine."

Jenchen. "As some physicians, Homeopaths, for instance, refuse to order them, why must the disgusting things be used at all?"

Grampy. "Leeches are only used by the doctors who believe in 'letting of blood,' or bleeding, a practice which is fast going out of use. But if doctors will bleed (besides in the pocket) leeches afford the least painful, as well as the speediest method of local depletion. They will generally bite with an appetite, and a single one will draw from one quarter of an ounce to one ounce of blood, according to the size and vigor of the sucker, and to where it is applied"—

Bell rings. "Come Jenchen, the

'Bell tells the hour for retiring;'

besides, that's all I have to say now about leeches."

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"To exchange for cash" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

"No Exchange or Want" will be inserted unless accompanied with 25 cents.

JAMES DENISON, Findlay, Ohio, will give a fine pair of Ginger Red Game Bantams, hatch of '74, for a good Sky Terrier Bitch Pup. A fine well-bred, fairly broken Orange and White English Setter, for a good Shepherd Bitch or Dog Setter, 3 years, and large size. Will exchange on account of change in the game laws of our State.

B. HULSE, Box 23, Allentown, N. J., will exchange Yellow Fans and a fine variety of Fancy and Common Pigeons, for W. C. B. Polands and other fancy fowls, and Black and Red Jacobins, Partridge Cochins, and Black African Bantams.

LOUIS MILLER, 375 West Church St., Elmira, N. Y., has to exchange 1 very fine pair of Red Jacobins, or a Yellow Jacobin Hen, for a first-class Yellow Jacobin Cock, or the three for a pair of Black or White Jacobins and a Yellow Jacobin Cock.

JAS. H. PHILLIPS, Coweatty, N. Y., has Light Brahmas, Part. Cochins, Plymouth Rock, Bro. Leghorn, and W. faced Black Spanish Cockerels, to exchange for offers. Some choice exhibition birds among them.

G. DILLE BERGE & SON, 65 Clifford St., Providence, R. I., will exchange Ferraris, White Angora and Lop-eared Rabbits, for first-class Highflyer and Houting Antwerp Pigeons. None but first-class stock will be accepted, as ours is the same.

H. UNGERER, JR., Warren, Pa., will exchange Oil of Peppermint, Laudanum, Paragoric, Young Aylesbury Drakes, P. Cochins, and L. Brahmas c-e-c-e-rs, June hatch, for Boots or shoes, Dry Goods, Fanciers' Journal, or Cleeton's or other Pat. Folding Exhibit in Coops. Speak quick!

NOVELTY PRINTING CO., Albany, N. Y., will exchange fine young male Mocking Birds, for all kinds of old second-hand Novels, or other books.

P. P. HAAS, Tamaqua, Pa., wants to exchange ten pairs of A No. 1 Tumblers, for others.

BOX \$69, Rockville, Conn., will exchange a C Cornet, cost \$60, for a first-class Central-fire Shot Gun. Must be in good order, as the Cornet is.

T. J. McDANIEL, Hollis Center, Me., has two pairs Pit Games, warranted to stand steel, which he wishes to exchange for Poultry Books, or others. Postal cards acceptable.

J. HENRY, 4507 Rubicon Ave., Germantown, Phila., wishes to exchange a thoroughbred English Greyhound, seven months old, Newfoundland Pups, or Blue Skye Dog, for W. C. Black Polish, White or Brown Leghorn Chicks.

G. J. BAKER, Postville, Trafalgar P. O., Ont., will exchange any of the following thoroughbred stock—Cotswold Lambs, Berkshire Pigs, Black Cochins, Cocker Sluts, in pup, Black and Tan Dog Pup, Sheep Dog Pup, and Hunting Rifle—for Jersey Heifer Calf, or Bull Calf.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for *Sale, Exchange, or Wanted*, will be allowed at 10 cents for each and every insertion.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

VOL. III.

HARTFORD, SEPTEMBER 11, 1876.

No. 35.

MR. EDITOR:

A valued friend hands me the following beautiful lines, clipped from his memory, which I think breathes the true spirit of poetry as well as of consolation. Please pass them round and, perhaps, some one of your many readers can tell us to whom we are indebted for them, as at present the author is unknown to either of us.

II.

NIL' DESPERANDUM.

"There is many a rest in the road of life,
If we only would stop to take it;
And many a tone from the better land,
If the querulous heart would wake it.
To the sunny soul that is full of hope,
And whose beautiful trust ne'er faileth,
The grass is green, and the flowers are bright,
Though the wintry storm prevaileth.

Better to hope, though the clouds hang low,
And to keep the eyes still lifted;
For the sweet blue sky will soon peep through,
When the ominous clouds are rifted.
There was never a night without a day,
Nor an evening without a morning;
And the darkest hour, so the proverb goes,
Is the hour before the dawning.

There is many a gem in the path of life,
Which we pass in our idle pleasure,
That is richer far than the jeweled crown,
Or the miser's hoarded treasure.
It may be the love of a little child,
Or a mother's prayer to heaven;
Or, only a beggar's grateful thanks,
For a cup of water given.

Better to weave in the web of life,
A bright and a beautiful filling,
And do God's will with a steady mind,
And hands that are swift and willing,
Than to snap the delicate silver threads,
Of our curious lives asunder,
And then, heaven blame for the tangled ends,
And sit to grieve and wonder."

(For Fanciers' Journal.)

GENIUS AND BEAUTY.

Mr. J. M. McCann, in No. 31 of FANCIER, has rather insinuated that dear mother Nature has been somewhat partial in her gifts of personal beauty to her sons of genius, and while he names quite a number of them, he entirely ignores her highly gifted and beautiful daughters! Dear friend, you should have been more gallant. Could you not have thought of the charming Mary Montague? of Sydney, Lady Morgan? of the "gorgeous" Lady Blessington? or any other of the many daughters of Eve who were possessed of great genius as well as the "fatal gift of beauty?"

However, it is not my purpose now to call up all the beautiful spirits from their vasty deep, but to show in a few lines that mother Nature has bestowed her gifts pretty well averaged—share and share alike—the fool getting his full allowance of beauty

along with the son of wisdom; and you and I, friend McCann, have known more than one consummate fool with more than a full hand of personal beauty. Suppose we look at a few of the sons and daughters of genius to whom Nature was not bountiful in the distribution of beauty.

It was of late, I think, it was written:

"With eyes so gray, and hair so red,
And tucks so sharp and keen,
Thou'lt fright the shades when thou'rt dead,
And Hell won't let thee in."

Demosthenes was infernally ugly, as well as having an impediment in his speech which caused him to make terrible contortions of face when he attempted to talk, especially the first time he filled his mouth with those historical pebbles, and endeavored to rant by the sea-shore. Mirabeau, one of France's most gifted sons, was so ugly as a boy, that his parents deserted him until he was twelve years old, and when he grew to be a man it was his great talent alone which saved his face and person from being voted those of a beast. His countryman, LaFayette, was also a very homely man, though one of great political and military genius. Sir Walter Scott, Hugh Miller, James Hogg, and Rob. Burns, were all homely men, and the whole lot had pug noses,—more or less,—which, friend McC., you say, men of genius are "never decorated with," and the great Samuel Johnson! how very ugly you were in person, ditto in face, especially when you ate and drank to the swelling of the veins on your forehead to the size of whip-cords; but what a genius you were! And you, too, Hans Christian Andersen; you dear, kind man, and good story-teller, but you were very ugly!

Passing any quantity of the uglies of the Old World, we will look at one or two of the New; and about one of them let me tell you a little story:

Henry Clay was one day walking with two friends through a menagerie, where there were a number of the larger order of apes. One of the gentlemen thinking Clay to be out of hearing, remarked: "How very much that ape resembles our friend," when to his horror he found Clay right behind him, looking over his shoulder! Something, of course, had to be said, so as quick as thought—"Clay!" said the friend, "I was just thinking how much you looked like our poor relation over there, but now I come to look again, blow me if I don't think I ought to make the ape an apology!"

Suppose we call up squeaky-voiced John Randolph, with his pinched-up face and diminutive form, or dear old martyred Father Abraham, with his lanky cheeks and long, awkward form, or sour-visaged, freckled, red-haired Thomas Jefferson, or fish-faced, out of all proportioned form of traitor Charles Henry Lee. Yet these were all undoubted sons of genius.

And the ladies! Bless them, beautiful or ugly. Frederica Bremer was positively ugly. Charlotte Brontë and her two sisters were very homely. Mrs. Hemans, L. E. L., and Mrs. Gaskell were quite "plain," while Ida Pfeiffer, who "by her lones" made three voyages round the world, was ugly to "a charm."

Did you ever compare the acknowledged portraits of Caesar, Washington, Wellington, and Cromwell, friend McCann? If you did, where did you find the close resemblance you speak of? And by the way, as there were twelve Caesars,—all of them men of genius, and some of them quite handsome,—which of them do you mean?

You would not compare Wellington, with his thin, long, hatchet face and parrot nose—such a nose that he received the *sobriquet* of “Nosey” even in his school days—to our Washington’s plain, round face, and full, broad nose? or either with the low forehead, high cheek bones, rather stumpy, thick-ended nose—with a wart on one side of it as big as a cherry—of “Old Noll”?

How know you, friend McC., that Shakespeare “was exceedingly fine looking?” Here is what a writer in the *Bibliopolist* says. He is speaking in favor of opening the grave of Shakespeare and, if possible, having a cast of his head or remains taken, that we may really know something as to what kind of looking man he really was: “If it should prove—as there is some faint hope it may—that the remains of the great poet are still in a state of preservation, rendering it possible for a photograph of his features, or even of his skull, to be taken, the world would by such means be put in possession of what it now has not, an authentic and undisputed portrait, or help to a portrait, of the man Shakespeare.”

After all, what is beauty? Who shall define? “Beauty,” you say, “is the opposite of ugliness!” Yes; well, what is ugliness? You will answer, “the opposite of beauty.” Clear as mud! but let me tell you there is none so ugly but what there is some one to think him or her handsome; and none so handsome but what about them there can be found an ugly spot by some one. It was ugly Mirabeau who said: “Give me twenty-four hours start in the race for a handsome woman, and I will outstrip the prettiest man in the world.” And it would appear that he had done it; more than once, too!

Did not Desdemona marry a Moor who is represented as black, and said she saw “beauty in his mind”?

“Fiction!” you cry. Well, then, it is the fact in our own time, for there’s more than one gentle Desdemona married to her black husband, and living in our land, which black man doubtless had beauty in the eyes of his wife.

There’s no accounting for taste. “*De gustibus non disputandum*” has been true from the time the old woman kissed her cow down to the introduction, on these blessed shores, of sauer-kraut, lager, and Limberger; and “handsome is as handsome does,” is equally as good a proverb, and equally true; and were I obliged to write a composition on beauty, I am much afraid I should be like that other boy who, when ordered to write on the “Seasons,” did so in the words “following, to wit:”

“THE SEASONS.—There are four—spring, summer, autumn, and winter. Some like spring; others, summer; others, autumn, and others again, winter; but for my part, give me Liberty, or give me Death!”

HUON.

THE TAJ MAHAL.

Vincent’s book of “Through and Through the Tropics,” published by Harper & Brothers, contains the following description of the Taj Mahal in Agra Hindoostan, the palace tomb built in honor of a Hindoo princess:

“For grace, symmetry, material and execution, the Taj Mahal surpasses the acknowledged masterpieces of architecture in all lands. It is not only the most beautiful and costly mausoleum on the face of the globe, the most faultless relic of Eastern architecture, but, taken for all in all, probably the most noble and perfect art-ideal of the kind ever embodied by man. It better deserves to be numbered among the wonders of the world than the Pyramids of Egypt, the Temple of Diana at Ephesus, or the Mausoleum erected

by Artemisia. Were nothing else of interest to be seen in India, the labor and danger of a journey around the world would be amply compensated by an inspection of that stupendous miracle of art, the Palace-Tomb Taj Mahal.

“The name ‘Taj Mahal’ signifies ‘Crown of Edifices.’ The building stands in the midst of a fine garden on the northern bank of the Jumna, two miles from Agra. You enter a spacious enclosure flanked with trees. Upon one side is a gate leading to a small village where sweetmeats, food, semi-precious stones, models of the Taj, and knickknacks are sold. Directly opposite is the entrance to the Taj—a magnificent portal whose doors are of solid teak, plated with copper, and studded with huge nails and bosses. The masonry is of sandstone, elaborately carved, ornamented with black marble, inlaid with extracts from the Koran, and surmounted by a row of marble cupolas.

“From the central sandstone platform, which is twelve feet in height, rises another terrace of white marble. This is perhaps twenty feet in height, and three hundred and fifteen feet square. In the center stands the imposing and beautiful mausoleum of Mumtaz Mahal. The Taj itself is built entirely of white marble. It is octagonal in shape, the sides being one hundred and thirty feet long. The roof is about seventy feet from the terrace. The marble dome is seventy feet in diameter and one hundred and twenty feet in height, and is crowned with a gilded copper spire and crescent, whose topmost point is three hundred feet above the ground. At each of the corners are four small cupolas, while the angles of the tomb are surmounted by slender minarets topped with gilded spires. On each of the chief sides are grand entrances consisting of pointed arches which reach nearly to the cornice, and two arcades of the same form placed one above the other on each side, all save one now closed by magnificently carved marble screens. From each corner of the terrace rise, to the height of two hundred and twenty-five feet, elegant minars of marble and inlaid work, crowned with eight pillared domes. In accordance with a requirement of Saracenic architecture, extracts from the Koran are inlaid upon the walls and corridors. The mosaic being in black marble and the walls of white, the effect at a little distance is airy and veil-like. The whole Koran is said to be thus inlaid—a sermon in stone of five hundred pages.

“The echo in the dome of the Taj is probably the finest in the world. An old and well-known American traveler thought it more sweet, pure, and prolonged than that in the Baptist of Pisa, one of the most perfect in Europe. At the time of my visit some country people were spending the day in the grounds, and one of them had a flute upon which he played beneath the great dome. The effect was magical. The sound, which at first increased slowly, diminished as it rolled and reverberated through the arches until you could scarcely distinguish the separate notes. A sweet female voice gives the best idea of the clearness and softness of this echo, a cornet or flute of its power. An enthusiast compares the melody to the ‘atmosphere breathed by Ariel and playing around the fountain of Chindara.’”

CHEERFULNESS.

The world goes up and the world goes down,
And the sunshine follows the rain;
And yesterday’s sneer and yesterday’s frown
Can never come over again—
Sweet wife;
No, never come over again.

For woman is warm, though man be cold,
And the night will hallow the day;
Till the heart which at even was weary and old
Can rise in the morning gay—
Sweet wife;
To its work in the morning gay.

—C. Kingsley.

POULTRY DEPARTMENT.

HOW I BEGAN BY KEEPING FOWLS AND ENDED BY THE FOWLS KEEPING ME.

"No eggs again for breakfast?" said my father. He was a stern and angry man, my father, and his quasi interrogation as he surveyed the table made my mother jump.

My mother was a mild, placid woman; and, as I said before, she jumped. My father repeated the remark; and this time my mother replied with a deprecatory "No."

"I'll keep no more fowls," said my father. "Eating their heads off with barley and all sorts of things, and never a spring chicken, nor so much as an egg for breakfast, when you want it. I'll have their necks stretched to-day, and make an end of it."

My father was a man of few words, and my mother did not care to dispute the point. His son (meaning myself) was a bit of a pet, and knew it.

"Give 'em to me, father."

"Go on with your bread and butter," said my mother. However, I knew how to coax, and in the end had my way.

My father agreed to allow me the bits of leavings from the scullery and half a bushel of corn once a week during the next three months, and he was to buy my eggs and chickens of me at a fair market valuation; and after three months I was to keep them myself. On these terms I became the possessor of six hens—one Dorking, two with a cross of Game in them, and three common barndoor fowls, with a barndoor cock, and at once commenced operations.

Adjoining the back kitchen we had a good sized yard, about 24 feet by 20, unpaved, with a bit of a shed in one corner, half of which was closed and filled with roosts as a hen house, and an old plane tree in another corner, which in summer gave a pleasant shade. Here it was that I stood and surveyed my newly-acquired property with a pride such as Alexander never felt in his conquered worlds when he wept that there were no more to subdue.

I began by digging up half way along one side of the sunny wall of the yard a strip of earth about a yard wide, and out of my pocket money, at a cost of about 2s., assisted by Tom, the gardener's boy, fenced it in with wire to prevent the fowls from encroaching; and here I planted quite a hedge of sunflowers. My fence was quite a temporary affair, for as soon as the seeds should have sprung up and the plants grown to about a foot high it was my intention to remove it. By favor of the groom I got a barrowful of horse litter and dung, which I shot in the corner near the base of the plane tree; and for half-a-crown I purchased a large barrow-load of good gravel, which I disposed in the middle of the yard. A row of orange boxes, filled with clean straw, in the fowl house, each with a chalk egg in it to tempt the sitter, made capital nests; and now I was prepared to commence the campaign.

The servants could not make the hens lay, and had been content to throw down so much corn every day and let the fowls

shift for themselves. It was my turn to see what I could do, and, boy as I was, I had my own ideas on the subject.

In the morning before going to school I used to feed my flock with a handful of barley mixed with the scraps of bread and leavings from the breakfast table, not forgetting the broken eggshells, rind of bacon, and other unconsidered trifles, but which to me were invaluable, the whole well cut and crumbled up into a homogeneous mass, and so distributed. After one o'clock dinner I used to pay them another visit, this time with the remains of the potatoes and other vegetables (not such as the cook would have saved, but simply the leavings on the plates), which I used to re-warm in a saucepan over the fire with a little gravy or sour milk that might be standing in the milk-jug. At five o'clock another handful of barley, or, if any scraps were lying about (and there were generally some), a mess similar to that at mid-day. Occasionally this would be varied by the addition of a little bran; and in winter I used to sop bread or potatoes in warm beer, which I saved from my dinner, and which I found my fowls devoured with extraordinary avidity. After one of these feasts I was almost always rewarded with an extra lay of eggs.

I had almost forgotten to mention that a few lumps of rough chalk and a piece of bay salt thrown casually down in the yard, were immensely appreciated by my feathered friends.

Every week I turned over my gravel heap and my manure heap, so as to afford fresh materials for my fowls to scratch in, and at long intervals renewed them with half a barrow or so of fresh stuff. These precautions I regarded as indispensable to the welfare of the poultry.

In the winter they might be seen scratching and clucking over the warm manure heap, or in summer dusting themselves in the clean gravel, with all the luxuriousness of confirmed Cleansees.

Before long the results of my treatment began to show themselves in a regular supply of new-laid eggs, and when two of the hens wanted to sit I purchased new-laid eggs of the Polish, Spanish, and Dorking breeds, to serve as the objects of their maternal experiences. I thus improved my stock with fowls reared from eggs of the finest breeds that could possibly be procured.

Whenever a fowl was seen to be ailing or moping, I always caught it, and after administering a couple of peppercorns or some other simple remedy, kept it in a hamper by the kitchen fire, a treatment which almost invariably proved successful. Once a hen had some obstruction in her crop, which would not digest, and I actually opened the crop with a lancet, cleaned it out, and sewed it up again; the hen not only surviving the operation, but thriving well after. But the ailments of fowls opens out too wide a subject; for the present I want to confine myself to the prescribed limits of my narrative.

When a brood of chickens was expected to be hatched, I was always in attendance, and a most skillful accoucheur I came to be—removing the chickens one by one from under the mother, and placing them in a warm flannel near the fire, with a little chopped hard-boiled egg and Embden grits, after giving each a peppercorn by way of commencement.

When all were hatched and the addled eggs thrown away, the mother was put under a coop placed over a sack for warmth, and for the first few nights placed indoors, till the chicks began to feel their legs and run about.

After a few days Dame Partlet was allowed to take her family under her own charge, and seldom did I lose by the permission, as cats were far more wary when the hen was at large than when confined beneath a coop and her young ones far away from her protecting wings.

In each brood there was naturally a larger proportion of cock

than hen birds; these, after a certain age, I used to weed out, preserving the pullets and putting up the young cockerels to fatten for the table. My process of fattening was to confine the young birds in coops, and feed them upon oatmeal brashed in sour milk, and served up scalding. A little salt contributes to the fattening process materially. If they showed any tendency to pine I would change their food, or even give them a few days' run of their legs, a course which used to put the fat again upon their bones, and leave them free to recommence the orthodox fattening process.

Now for the details. My first six months, I am free to confess, were conducted at a loss, as nearly as I can remember, as follows:—

	£	s.	d.
Laying out the ground—Fencing.....	0	2	0
Gravel.....	0	3	6
Manure.....	0	2	6
Barley, 26 weeks, at 1s. per week.....	1	6	0
Extras.....	0	5	0
	£1	19	0

Any returns during that period I will write off as lost. During this time, however, my sunflowers had come to maturity and flowered. My readers may not be aware that the seeds of the sunflower are the finest stimulant for poultry in existence, and the avidity with which fowls will scratch around the roots of the sunflower's tall stalks and pick up the seeds which fall from their wide open flowers is something perfectly surprising to behold.

Now for my gains. In the next six months I had doubled the number of my laying hens, and substituted a fine Game cock for the old barndoor fowl which I already had.

During the same period I had averaged four eggs a day, which I sold to my father at 1d. apiece—and I had had four broods of fine chicks—say in all twenty-eight young birds—of which six were now laying, and the rest (twenty-two) had been fattened and sold as fine birds at Christmas for 3s. and 3s. 6d. apiece (I did not charge my father full market prices "*bien entendu*," but this by the way):—

	£	s.	d.
182 days at 4d. per day.....	3	0	8
22 fowls at 3s. each.....	3	6	0
	£6	6	8
Deduct barley for 26 weeks.....	1	6	0
Extras.....	1	0	0
Cost of coops, etc.....	1	0	0
Loss on previous six months.....	1	19	0
Total.....	£5	6	0
Net gain.....	£1	1	8

In the next year I had more than doubled my number of laying hens, all of good breeds, and without any outlay, and my returns were more than doubled. My expenses at the same time were less, and even with a decreasing tendency. I sent one or two birds of my rearing to a poultry show, and won not only a £10 prize, but sold my birds at fancy prices. My eggs and fowls I now began to send to the tradesmen round about, after providing for the home demands, and especially during autumn and winter, realized high prices for my produce. I soon had a bit of money in the savings bank, and when I was forced to go into the world and work for my living, I could no longer devote my time to poultry breeding. I sold thirty-six fowls of various fine breeds at an average of £2 apiece, taking the bad with the good, and retired with a very decent sum at my back, as the result of my innocent request at the breakfast table a few years before—"Give 'em to me, father."

A great many details of fowl management I have necessarily been compelled to skip over owing to the limits of my space,

but on these, if I may be permitted and my readers would like to hear them, I can enlarge more fully at another time.—*Housekeeper, in Journal of Horticulture.*

FALL PREPARATIONS

Among our poultry fanciers will shortly be in order, again. The past summer season has been a good one for fowl-raisers. Young stock has never come forward so well, within our remembrance—and though for the present year, perhaps, not so many birds have been raised as previously, there are a great many fine flocks coming on, in the yards of leading dealers and cultivators of the favorite varieties.

Now is the best period of the year for those who have surplus stock for sale, to advertise the fact. There are constantly new men embarking in the business of fowl-raising, and they are anxious to know, through the poultry paper they read, who has the kinds they favor, and where they can procure good young birds to commence with, or add to their present supply of fall chickens.

We need hardly remind the reader that the Fanciers' Journal, weekly, is a good medium through which to announce the information above hinted at. Our paper goes into all the northern and middle states, as well as largely in the west and Canada. And we shall be happy to know that our numerous friends appreciate so appropriate a channel of communication as are our columns, to make known their saleable stock of all kinds—poultry included.

SICKNESS AMONG FOWLS

Has been perhaps quite as prevalent in the past year or two, as has ever been the case in this country. At the west, the cholera scourge has done fearful work in many localities, and we have heard of more than ordinary numbers of cases of common ailments in New England and the Middle States, as well.

In consequence of this unusual trouble and large mortality, in certain districts among poultry, the announcement of a work especially devoted to the intricacies of this very important subject, by an author known to be *au fait* in the business of rearing and caring for fowls, was greeted on all sides with welcome; and Mr. G. P. Burnham's new treatise on "Diseases of Domestic Poultry—and how to cure them," has been looked for with interest.

It will shortly be out, now, and we can assure our readers that this last contribution of Mr. B. to our American poultry literature is the best thing of this kind he has ever written. It should be in the hands of every fowl breeder in the land—for, if he has no sick birds now, he may have them fall ill, hereafter; and this little handbook contains valuable hints, concisely and simply stated, as to remedies for poultry diseases of all sorts, prepared in a careful and amply clear style, that is readily understood at a glance. We commend this low-priced but excellent work to general notice.

HOW TO SHIP POULTRY.

Secure plump, well fattened birds. Bleed them in the throat. Scald enough to make the feathers come off easy; pick both feathers and pin feathers all off nicely, taking great care not to bruise or break the skin in any way. If one or two of the lot should accidentally get bruised, or have the skin broken, sell or use at home, as they would hurt the sale of the whole lot. Leave all the entrails in, and heads and feet on.

After they are dressed hang them in a cool place, where they will dry off and get stiff before packing. Pack in boxes or barrels in nice, clean rye straw; if this cannot be obtained, dry oat straw may be used. Be sure and pack solid, so that they will not bruise in transit. Pack with breast down. Poultry prepared in this

way always finds a ready market, while poor, half dressed, sweaty (caused by packing while warm) and bruised lots will not sell well at any time.

Many farmers make a practice of feeding their half starved fowls all they will cut just before killing, and then send them to market with full crops, in order to get the price of poultry for corn. In this they make a mistake; the crop being swollen to an unusual size turns black after being packed awhile, and not only shows clearly the dishonest intentions of the packer, but injures the sale of the fowls a great deal more than is gained in weight. Feed meal only for at least two days before killing.

Remember it is the appearance of goods that sells them. Nice, large, fat, plump, white turkeys, ducks, chickens, or geese, always bring outside prices.

When is the best time to ship? This question is often asked. We answer: any time after cool weather. But if sent for the holidays, send them at least three days before Christmas or New Year's. Keep the largest turkeys for New Year's.—*Cor. Poultry Record.*

POSTAL CARDS NOT ANSWERED.

EDITOR FANCIERS' JOURNAL:

Your correspondent "P. Card" has probably never been pestered, as some of us have, with postal card inquiries, requiring a three-cent stamped letter in return—replying to queries interesting only to the postal card sender.

When a postal card is received by the subscriber, asking for a circular, a circular is sent, without comment, as a matter of courtesy. This usually ends the correspondence with that party, who nineteen times in twenty merely sends for the circular from curiosity. This is all right, and both parties are content.

But when a "patron" sends a postal card calling for a written answer that must be forwarded with a three cent stamp, and his questions relate simply to matters in which he alone is directly interested, it is but courteous that the sender should enclose a stamp in a stamped letter, to the person that *he* is asking the favor of.

This smacks neither of independence nor impudence, that I can discover, but simply decent treatment. I *always* do this, myself, whether I want to buy a wagon, or learn something about chickens, or eggs. I am not very "fine haired," and have no preference for white or yellow envelopes. But I do not notice postal card inquiries, when made for others' sole benefit. And I am one of those who long ago "advertised" this fact.

Yours truly,

B. G.

Boston, Sept. 2d.

THE EXHIBITION DORKING. NO.—14.

BY T. C. BURNELL.

CUCKOO DORKINGS.

During the last two or three years these have advanced much in public favor. They have now a class allotted them at the Crystal Palace and at two or three of the other principal shows, and as several fanciers are taking them up we shall probably see more of them in future.

They are called Cuckoo Dorkings on account of their feathers being somewhat similar to those found on the breast of our summer visitor the cuckoo; but they are also called Blue Dorkings. The term "speckled Dorking" is sometimes applied to them erroneously. They appear of a blue or dark blue color, but on examination it will be found that every feather is evenly marked with broad bars of dark blue or dark gray, on a whitish-gray or light blue ground.

In breeding these birds many chickens will come so darkly

marked as to be almost black; these must be discarded, as we must not forget the original blue-mottled breast of the cuckoo, to which we have to breed. They are also very liable to sooty feet. The chief point to look to in exhibiting them is, that the cock and hen are of the same shade of color, and that both are evenly marked all over. Rose combs are correct in this variety. The

CUCKOO DORKING COCK.

principal faults in the cocks are yellow hackles and saddles. They are too, commonly found with white in the sickle feathers. A perfect cock with a Cuckoo tail is a rarity; and as size is one of the principal points in a Dorking, it will not do to sacrifice an otherwise good bird for this slight blemish.

The hens are really wonderful layers,—in fact, quite equal to Hamburgs; while, though for the table they do not quite reach the size of the Dark Dorking, their full breasts and juicy flesh, combined with very early maturity, render them most acceptable in the larder. They are decidedly a hardy breed.

In conclusion, I will mention what I consider are the proper classes to be given to Dorkings in a poultry-show schedule. If only two classes are given they should be for Dark Dorkings and for "any other variety." If three classes are given they should be for Darks, Silver-Greys, and for Whites or Cuckoos. Many committees do not receive as many entries as they should do by classing the Silver-Greys with the Dark birds; the result being that the Silver-Grey birds are never entered in the class, for their defeat is certain. If there is only one class for Dorkings it is very rare to see anything but Darks, as a consequence of which the Committee lose the Silver-Grey, White, and Cuckoo entries, which if three prizes were given would be sure to make good classes.

—The facility with which canary birds and linnets have been taught to execute tricks is well known. In India the barga, a species of weaver bird, noted for the skill with which it constructs its retort shaped nests, so as to escape the depredations of the monkeys, are also taught wonderful feats. On giving signals it is said that the birds will feed every lady spectator with a bit of sweetmeat or candy, thus showing a ready discrimination between the sexes. A miniature cannon is also loaded by the birds with coarse grains of gunpowder one by one; the ramrod is skillfully used, and they then take lighted matches procured for them, and apply them to the touch-hole. It is substantiated that a bird has been known to apply the match five or six times on failure of the cannon to explode, and to remain perched on the gun apparently quite elated by the performance, when the piece finally went off.

PIGEON DEPARTMENT.

(For FanCIers' Journal.)

THREE PIGEON RACES.

The first race being the Fairmount Pigeon Society, for young birds bred in 1876, came off on July 17th, from Pottstown, distance 50 miles, for three money prizes. First prize won by James Schofield, time 57 minutes and 34 seconds. Second prize won by Mr. Fred. Woods, time, 61 min. and 41 sec. Third prize won by Mr. John Dalton, time, 61 min., 42 sec.

Mr. Wood declared he could beat Mr. Schofield's time, and challenged Mr. Schofield for another race, which was accepted for \$20, Mr. Wood's pigeon winning the race in 57 min. and 14 sec., Mr. Schofield's bird being 67 min. and 18 sec.

Third race was got up by that well-known fancier, Mr. Jos. Buckley, who contributed a handsome money prize to head the list; this race was open to all Philadelphia fanciers, and upwards of twenty-two birds were entered, although the distance was short, from Paoli to Philadelphia, a distance of 18 to 20 miles, for three money prizes. First prize won by Robt. T. Moore, time 26 min. and 40 seconds, and which is considered the quickest time on record. Second prize won by Mr. Peter Kershaw, time, 22 min. 05 sec. Third prize won by Mr. Jos. Buckley, time, 22 min., 26 sec., several other birds coming in a few seconds after.

PHILA., Sept. 4, 1876.

T. GRIST.

(For FanCIers' Journal.)

TRUMPETER PIGEON.

PAST AND PRESENT.

I know of no variety of the pigeon tribe that has made so sudden and rapid progress as the beautiful bird at the head of this article. I can refer back as far as 1850, when I was breeding the Trumpeter and other varieties. My strain consisted of a few birds with hooded roses and good crests, cocks generally well feather-footed. The hens I never could get anything more than grous-legged, and always very light mottled. Having met with Thomas Allen, an old and true fancier of Philadelphia (long since deceased), I found in his coop what I thought to be the true breed of Trumpeters; at least, they were better than any I had yet seen,—good in all points save in mottling in the hens, which were as usual very light. Being then in my teens, and but little cash my pockets, I used to sally forth to Philadelphia with an old champagne basket to see what I could pick up in the fancy, visiting the lofts of Dr. W. W. Clark, Moore, Nice, Franch, of Germantown Road, Heft, Clinton, Jordan, Steaver the old saddler, Allen, and a few others whose names I cannot recall to mind at this time. It was on one of these runs among the old fanciers that I purchased the best pair of mottled Trumpeters of those days. They had lately arrived from Germany. A fac simile of the cock can be seen by referring to Eaton's full-size engraving of

a Trumpeter, published in London twenty-six years ago, which was a black bird with mottling of white feathers on the head, neck, breast, and back. The flights and tail and feather-feet were to be free of any white feathers. This is what we termed a mottle. The eyes were generally orange, occasionally a pearl. They were

very musical at all times in uttering their curious coo-coo-coo, and not, as some writers state, being more sonorous in the spring than at other times. Having removed my place of residence to a distant State, the Trumpeters fell into the hands of Mr. F. Boddman, of Cincinnati. At his death, some two years ago, his birds being sold, some of which found their way back to Baltimore, and in the lot were some of this same strain of Trumpeters. Now, after a lapse of 24 years, we compare them to the Trumpeters of the present day.

In 1872 there were purchased in England three pairs of the best English Trumpeters that could be had of a celebrated prize-winning strain. They consisted of blacks and mottles, and were considered the best lot of Trumpeters seen in the State—good in all points save that of mottling. (We find no improvement in that one point over the old strains.) They were slightly larger, better feet-feathering, and very much superior in rose and hood than the present breed of Trumpeters we see at our exhibitions.

Now, in 1876, we think the climax has been reached, as far as fine points in Trumpeters are concerned, which brings us to the present breed. We will take the rose first. We now have them to measure from an inch to an inch and a half in diameter, the crown or shell nearly twice the size of the old strain, body much larger, very broad across the back, feet very short; feathers, in measuring from out to out when standing on the floor—hens as well as cocks—ten to twelve inches in extra fine specimens; eyes both pearl and orange. As to color, we speak only of mottles; we find the mottling is about the same as formerly. Now the question would naturally arise, what is the proper marking for a mottle Trumpeter? The English fanciers contend that a bird, to be properly marked as a mottle, must have a few white feathers on the shoulders and back similar to what is required in the mottle Tumbler (see illustration). Having had a long experience in the breeding of both of the so-called mottled Tumblers and Trumpeters, yet I have never succeeded in rearing a perfect mottle of either, and have long since concluded that it is a waste of time in trying to breed a perfect mottle Trumpeter, and have become reconciled to the present imperfect mottle, if fanciers so wish to call it. I think a black, red, or yellow bird, with the head, neck,

back, breast, and shoulders evenly dotted with white feathers, is the true mottle, and they are quite as handsome as any other style of mottling, be it rose wing or otherwise. We might naturally suppose, as has often been recommended, to match a black cock with the best mottled hen in your possession, and will be told the progeny will be mottles. My experience has it otherwise. If you have a few pairs of blacks and mottles, the latter dark or light, it makes little difference, match them up promiscuously. At the end of the season you will find as many approaching the desired marking as if the best attention had been paid in their matching to produce what was wanted. From a dark mottle cock, matched to a light mottle hen, I have raised in this season one black cock, one black cock showing a little white about the head, one dark mottled cock, one dark mottled hen, one light mottled hen. You will no doubt question how I know the sexes, especially of the one recently hatched. Simply by the resemblance of the parent; and should you study your birds well, you will soon learn the similarity of expression of countenance, as well as their actions, which will enable you to point out the sex. Some fanciers contend that a Trumpeter should have a pearl eye. I am breeding now from the so-called Russian Trumpeter. My best pair of dark mottles have the orange eye; yet I find some of the progeny have pearl eyes. My blacks are all pearl-eyed; some of their young have orange eyes. I would prefer pearl eyes; yet, as I have not the making of the eye, I am content. Should two pairs come into competition for a prize, being equal in all points, I would say the pearl eyes should have the preference. The Russian Trumpeters, at the sale in New York, had both pearl and orange eyes. The best specimen in the lot had a pearl eye, not very clear, however; but he had such an enormous rose that it was with difficulty his eye could be seen at all, and it was with greater difficulty he could view the American fanciers who were scrutinizing him so closely. His rose was about the size of a silver half dollar. Had he been in good condition, with a little more youth on his side, he would have brought a much better price. He was a black bird, with a few white feathers about the throat. As it was, the American fanciers had the opportunity of comparing him with the Trumpeters illustrated in Fulton's Book, which so many think were overdrawn. Below we give Fulton's points in judging Trumpeters:

Rose: size, regularity, and shape	10
Crest	8
Foot-feathers: length and abundance	6
Size	2
Color of body	2
Eye: color of	1
Beak, " "	1
Tightness of feather	2
—	32

A mottle to be allowed 4 points for color and markings instead of two for color alone.

Baltimore, Aug. 23, 1876.

MARBLE.

ITEMS.

Across the walnuts and the wine: Engaging Child—"Oh, Mr. Jenkins, do let me see you drink!" Mr. Jenkins—"See me drink! What for, my dear?" Engaging Child—"Oh, mammy says you drink like a fish."

Two sparks from London, while enjoying themselves among the heathen in Argyleshire last autumn, came upon a decent-looking shepherd reading on the top of a hill. They accosted him by remarking, "You have a fine view here; you must see a great way."—"Ou ay, on ay, a ferry great way."—Ah! you will see

America here?"—"Farrer than that," said Donald—"Ah! how's that?"—"On, just wait till the mist gangs awa, an' you'll see the mune!"

A wag, passing a livery stable one day, in front of which several horses were tied, stopped suddenly, and gazed at them for some time with a countenance indicating the utmost astonishment, and then addressed the owner, who was standing near, and asked him "if he made horses." "Make horses?" said the night of the broom and curry-comb, "no! Why do you ask me such a question?" "Only," replied he, "because I observe you have several frames set up."

Nearly all the amber of commerce comes from Eastern Prussia, where it is obtained by dredging the bottom of the sea, just off the coast. It was recently discovered that amber occurs in a deposit called the "blue earth." It has been supposed that this deposit extends for some distance inland, and a shaft was recently sunk to determine this point. At the depth of 140 feet there was found a stratum of "blue earth" without amber and two feet in thickness; then came another stratum five feet thick, which was rich in amber.

"We lately met an old negro trudging along," says an eminent writer, "with a heavy side of bacon that he had bought swinging over his shoulder. We noticed that he was miserably clad, and we felt sorrow for him, for a cold wind was blowing. We remonstrated with him. 'Why do you spend your money for meat? You'd better buy a coat.' The old man stopped, looked us full in the face for a few moments, and said, in the most solemn tones, 'Massa, when I ax my back for credit, it gibs it. When I speak to dis'—laying his hand upon his stomach—it calls for de cash.'"

There is a stage-struck poultry dealer in Detroit, and the following dialogue occurred between him and a customer one Saturday evening: "How much you wants for dat goose?" "One dollar and a half, most gracious madam." "Twelief shillin'! Mein Gott! Vat you takes me for? Before I pays you twelief shillin' I do mitoud soume geoses. I give you ten shillin'." "Ten shillings! Perish the thought. That noble bird has played with my children for ten years, and is endeared to my family by a thousand associations. Sell him for less than a dollar and a half? Never-r-r."

"JOSH" ON HASH.—Hash has been abused and praised more than enny other ov the legitimate nourishments, and I guess it iz able to stand it az well az enny ov them.

The Duke of Wellington used to call hash "What's left over from the fite yesterday."

The Baron Rothschild sed ov it; "Hash has no pedigree."

Tully, in one ov his orashuns, speaks thus: "Hash haz done more hard work to advance human natur than enny other assorted nourishment."

Sokrates, the philosopher, told of hash:

"That it was an end without a means."

Mark Twain calls it a "Mystery."

Nasby, the konfederate preacher, informs us that "Hash iz like faith, the substance of things hoped for, and the evidence ov things not seen."

Thomas Nast, the irrepressible caricaturist, in a piktüre prepared for the late Vienna expositishun, represented hash az a hydra-headed monster, in which pork, rooster, sheep, kodfish, lam, and menny other things stuck out in battle array.

Thomas Benton, forty years ago, in one ov hiz grate hard-munny speeches, declared that it was a "circulating medium."

George Washington, the father ov his country, and the hero ov the little hatchet, in one of his festive moments, spoke of hash az "the landlady's best holt." Hash is a great fertilizer, and I hope will for centuries to come retain its holt upon the affeckshuns and gratitude ov the people. Hash stands proudly at the head ov all mixt phood.

EDITORIAL DEPARTMENT.

DURING THIS AND NEXT MONTH,

The inquiries for good samples of this year's bred chickens, of the several varieties will increase, as the time approaches for the fall and winter exhibitions all over the country, in 1876 and early in '77.

Fanciers who have good specimens to spare, will find it to their advantage to make the fact public. The columns of THE FANCIERS' JOURNAL are a good channel through which to disseminate this information, and we are constantly being applied to for advice as to who is the best man to apply to, for obtaining such stock.

In response to these applications by mail, we can only say in general terms that a reference to our Advertising Department, and the "Exchange column," and column of "Wants," will give all the information in our possession upon this interesting subject.

Gentlemen who are in search of any variety, among the many favorites, can find some one who offers these samples for sale among our list of advertising patrons; and those who have such desirable stock, which they care to part with—and who have not already done so—will do well to forward their cards, a more extended description of their poultry, etc., ready for delivery this fall.

No better medium for bringing the producer and purchaser together is offered in this country—for the class of stock we treat of, weekly, in this paper—and our terms for advertising are low, considering our present steady and wide-spread circulation.

"IT SEEMS."

The article on Aylesbury Ducks, in BULLETIN for July, page 64, which we credited to "J. K. Fowler, in *Fanciers' Journal*," was, it seems, copied by the latter paper from one of the English weeklies. The English *Journal of Horticulture* fell into the same error as ourself, and being called to account for it, replied in the following item:

"AYLESBURY DUCKS.—We are informed that the article on Aylesbury Ducks, which appeared on page 459 of our present volume, and which was acknowledged as having been taken from the *American Fanciers' Journal*, originally appeared in *The Bazaar*. It is a pity that our American brethren of the press cannot afford to acknowledge when they are indebted to their contemporaries."—*Poultry Bulletin*.

It may "seem" to the editor of the Bulletin that the article in question was copied "from one of the English weeklies." If it

was, it was done by Mr. Fowler, and not by the FANCIERS' JOURNAL. The article was mailed to us by some friend; it was printed in double column, on a single sheet of paper. We pinned it against the wall of our Philadelphia office for some months, when finally it was handed to the compositor and set up just as it reached us. If it ever appeared in the "*Bazaar*," or any other paper, we did not know it. We hope it will "seem" but just to both the editors of the *Bulletin* and *Journal of Horticulture* to publish this assertion.

CORRESPONDENCE.

INQUIRIES.

DEAR SIR:—

Will you please answer in THE FANCIERS' JOURNAL, the following enquiries? I have a pair of Bobolinks, and they have been troubled with lice. What shall I do to get rid of them? Also, what do they require to eat besides canary seed, and will they eat too many seeds if allowed to have all they want? By answering the above you will oblige. Yours truly,

E. H. SMITH.

HOLLIS, ME.

INFORMATION WANTED.

JOS. M. WADE:

DEAR SIR,—J. R. Hasson, Lochiel Drug Store, Harrisburg, Pa., offered to exchange in the JOURNAL of May 29th, '76, No. 20, Vol. 3d, English Fox Hound, Gips, for fancy pigeons, or offers. I answered the above, and offered Mr. H—— one pair of Black Carriers and a Female Ferret with young, for the Fox Hound. He accepted my offer, I to pay express on pigeons and ferret, and Mr. H. on hound. I shipped to him on June 23d, and paid express. But the hound he won't ship to me. I have written several letters to him since I shipped, but I cannot get answer from him. I have got the letters I received from him before I shipped to him, which I will post to you, if wanted. Is there a protective society? and if so, where would I have to apply? An answer would greatly oblige.

Respectfully,

WM. AUSTIN.

NIAGARA FALLS, N. Y., Sept. 4th, 1876.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—There is one man who is sure to get bread when he needs it.
—The baker.

—These are fine evenings for leaning over gates.—*Sentimental Exchange*.

Would the leaner be an alligator or an over-gaiter?

—John Brougham says Pocahontas invented the game of poker. Perhaps John is correct, for it is well-known that John Smith called her on a bluff.

—Col. Sinn is running the Olympic Theatre, New York, and doing well.—*Times*.

Sin is said to flourish like a bay tree—for awhile.

—Herbs left exposed to the air, lose some of their properties.
—*Press*.

If exposed long, their owner generally loses all his property.

—Mrs. John T. Raymond was lately thrown off a horse, near San Francisco.—*Herald*.

Would it have been any better to have thrown the lady on a horse?

—Among the other strange things this Centennial year has turned up, are a few names. On one of our principal streets John Chinaman has just put up a shingle which tells us "Help Long" has opened a laundry; and on Elm Avenue opposite the main building, Centennial ground, the wayfarer reads "Gottlieb, (God-love) Lauermitch," "LAGER BEER."

—It is suggested that the best way to get the fashionable tangle in a lady's hair, is for her to fill it full of Indian meal and set a lot of spring chickens to scratching the meal out.

—Three sons of the Siamese twins are tilling Missouri soil.—*N. Y. Sun.*

Are we to suppose there is a son and a half of each on the Missouri farms?

—A new park has just been opened on the east of New York. It covers five acres of ground between Eighty-fourth and Eighty-sixth streets, Avenue B, and the East river.—*Pub. Ledger.*

"Park 1." Why New York you "had ought" to be ashamed of yourself! Five acres is only two-thirds the extent of one of the Philadelphia Squares. Put a few more acres to it Empire, before you call it a park.

—The Black Hills Pioneer says: On Thursday, of this week Jack McClear cleaned up between six and seven hundred dollars, the result of ten hours' work with five men.

It is not clear in what part of the Black Hills Jack McClear "cleaned out" his pot, but it is clear that should Sitting Bull meet with McClear, he would both clean and clear Jack McClear out in less than ten minutes.

—FIGHTING FOR AN EEL.—A fight between two eagles occurred at Masonboro Sound a short time ago. A large number of persons were at the different landings along the sound at the time, when their attention was attracted to the combatants by a piercing cry, often repeated at short intervals. The birds were each of the bald eagle species, and when first observed were about two hundred yards above the Banks channel. One of the birds held pendant from his talons an enormous eel, which the other bird was endeavoring to gain possession of. The bird possessing the eel was taken at a great disadvantage, as it required the use of his talons to hold his prey, which left him but his beak with which to ward off the assaults of his foe. The attacking bird, realizing his advantage, swooped upon his enemy, tearing the feathers and flesh from the back and breast of his opponent. Long and fierce the struggle waged. Each of the birds was of enormous size, yet one of them, taken at so great a disadvantage, at last perceived that resistance was in vain, and after one despairing wall released its prey. As the eel descended and had nearly reached the water, the triumphant bird, with victorious cry, swooped upon it, and firmly closing it in his talons, bore it away to the distant sand shoals. The struggle lasted about fifteen minutes.—*Wilmington Star.*

—THE WORM-SNAKE.—Mr. Editor,—I read with much interest a paragraph in your paper of the 25th inst., wherein an account is given of a supposed "snake," seen by a friend of your Bucks county correspondent. You say in a note, that a similar "snake" had been seen sometime previously in Connecticut. I was walking with my wife a few days since, when my attention was called to what appeared to be a "snake" about two feet long, crossing a lawn gravel walk. My wife, who has a horror of the genus "sarpint," ran off with considerable trepidation. I remained, however, to examine the reptile, and was greatly surprised to find, as described by your correspondent, that it was composed of myriads of small gray worms, each about a sixteenth of an inch in length. The form of combination was precisely that of a snake, small toward the head, larger in the middle, and tapering to a point at the tail. The worms seemed to be crossed, intertwined, and heaped upon each other, but the entire mass moved steadily forward. I have since learned that several of these "snakes" have been seen since by a neighbor, who said that they were the "army-worm," and so called because of their movements bearing a fancied resemblance to a column on the march. Can it be possible that this dreaded pest of the cotton fields has appeared among us?

—*Carroll S. Tyson in Germantown Telegraph.*
Phoenixville, Pa., August 26, 1875.

[NOTE.—We expect to hear from Professor Riley, State Entomologist of Missouri, as to the name and nature of the worms forming this singular combination. The "army-worm" does not confine itself to cotton-growing States, but has made its appearance in several western States and is known to feed on other growing crops than that of cotton. It may turn out that this is really that much-dreaded worm.—Ed.]

—CONTEST BETWEEN BIRDS.—Not long since, while at work on the wood pile, we heard a tremendous squealing in the orchard, and looking in that direction saw a cooper hawk and jaybird come to the ground together. Went for the gun which had to be loaded; yet when I reached the orchard the squeaking still continued. The birds were in the grass, fired one barrel, which made the thing bounce about three feet high; but before any forward movement

was made the second shot was fired, when the bunch came to the ground again. On walking up to where they lay, we took hold of the hawk and lifted it up, found the jay clinging to it and still, as from the start, making a noise. But as soon as lifted up the jay let go, and flew up on an apple-tree, scolding at a great rate. There was blood drawn, but the jay got over it, while the hawk was dead when first picked up.

The jaybird had acted on the defensive, it seems. Yet after this escape from the hawk and two loads of fine shot, he was very near caught by my setter dog, who was in the chase, and who jumped near six feet high and snapped at it as it flew for the tree. The dog's mouth was not three inches from reaching it. This is the second time in my life that I have killed a hawk with a live bird in its claws without killing the latter.

In a little town a few miles from us, there were two canaries left loose in a room, when a butcherbird (great American shrike) flew in and had one in his beak and one in his claws, but mistook the window for the door when intending to retreat, and was shut in and captured. The canaries did not die, and the butcherbird is also a pet now.

I have seen these fellows chase birds as large as themselves, and but for relief a robin would once have fallen a victim to it. The robin struck a wire of a grape-trellis and fell. I drove off the butcher, but the robin was so hurt that it died soon afterwards.—*S. M., in Germantown Telegraph.*

—THE SKUNK (*Mephitis mephitis*).—Huron, in "Zoo Notes," No. 25, says: 1st. "To his hole in the ground the skunk retires when winter sets in. He does not lay up any food, but being in excellent condition at the time he stows himself away, he lives on his own fat, dozes out his life till the warm sun of spring calls him forth."

The common skunk, like all the weasel tribe, is active throughout the year,—equally so in winter as in summer. I have seen his tracks in field and wood in the coldest weather, and the deepest snow. I know of no purely carnivorous animal that hibernates.

2d. "The habits of the skunk are strictly nocturnal." They are active by day as well at night. I have often seen them abroad at "high noon." In lone and unfrequented places they roam the forest all the day. I met one this summer in the fields in the full glare of the sun.

3d. "His home, which is built with an eye to murder, consists of a horizontal hole, always dug near a pond or still pool of water." No animal ever digs a horizontal burrow. The skunk in these mountains usually lives in a hole excavated under the rocks, or in the hill-side, often far from any water; indeed there is nothing aquatic in his habits.

4th. "I have often wondered why this terribly offensive secretion was given to any animal. Nearly every book on Natural History tells us that it is a protection against its enemies. I think not." The authorities are right. Because other equally feeble animals are not so armed, is no argument against this theory; they have other means of defense or escape. The badger is a far more powerful animal than the skunk, and able to offer successful resistance to most enemies it would be likely to encounter. The weasel, the ermine, and the pine martin, are all remarkable for the celerity of their movements, and can climb the tallest trees with the greatest rapidity and ease. The skunk is no climber, moves along the ground but slowly—could not escape by flight from any animal inhabiting the regions where it abounds, and knowing this, it never attempts to do so. Its "terribly offensive secretion" is its only means of defense. Without this it would be extirpated from the earth.

J. M. McCANN.

—In illustrating the "Laws of transmission by inheritance" Haeckel in "The History of Creation" says: "A very striking instance is furnished by the hornless cattle of Paraguay, in South America. A special race of oxen is there bred which is entirely without horns. It is descended from a single bull, which was born in 1770 of an ordinary pair of parents, and the absence of horns was the result of some unknown cause. All the descendants of this bull produced with a horned cow were entirely without horns. This quality was found advantageous, and by propagating the hornless cattle among one another, a hornless race was obtained, which at present has almost entirely supplanted the horned cattle in Paraguay. The case of the otter-sheep of North America forms a similar example. In the year 1791 a farmer, by name Seth Wright, lived in Massachusetts, in North America; in his normally formed flock of sheep a lamb was suddenly born with a surprisingly long body and very short and crooked legs. It was therefore unable to take any great leaps, and especially unable to leap across a hedge into a neighbor's garden—a quality which seemed advantageous to the owner, as

the territories were divided by hedges. It therefore occurred to him to transmit this quality to other sheep, and by crossing this ram with normally shaped ewes, he produced a whole race of sheep, all of which had the qualities of the father, short and crooked legs and a long body. None of them could leap across the hedges, and they therefore were much liked and propagated in Massachusetts."

Now I saw during the war, at or near Harrisonburg, Va., a cow whose *descriptive list* as to shape, corresponded exactly with that of this breed of sheep—very long body and very short legs—in fact I do not believe that the belly of the cow was over fifteen inches from the ground.

I was disposed to regard her as a *lusus nature*, but was informed that she was but one of a breed quite common in that part of the country. I think a history of this breed of cattle would interest others than myself. Will not some one in that locality oblige? or perhaps J. H. McCann can.

(For Fanciers' Journal.)

ZOO NOTES, NO. 29.

BY HUON.

POMPEY THE LION SPEAKS A PIECE.

Scene: The interior of the GREAT CARNIVORA HOUSE,—Lions, Tigers, Leopards, Panthers, Jaguars, and Hyenas, awaiting dinner.

Pompey "rises to explain."

Grw-w-w, grw w-w. When I was first placed in a cage, and began the study of mankind, it was from a very narrow point of view, of course. In my African home I had very few opportunities for the study of ethnology. Man was first brought to my notice only as an addition to the ordinary diet of the country; and when very young I was taught that the very best use to which one of the bifurcated species could be put, was to take it for food. Since I have been caged, however, with a full allowance of good beef and as much fresh water as I want, with nothing to perform for either, save to keep awake and promenade up and down my narrow domicile when visitors call, I have been making mankind my study, and am endeavoring to improve myself in that branch of science. In a few growls I will give what has occurred to me in this great metropolis where I now reside.

The most striking characteristics of these humans who daily visit us, seems to me to be their inordinate vanity, and their inconsistency!

Here were two or three just now whom I overheard in their growls call myself and Minnie "brutes"—"beasts"—"the lower animals"—and in the next breath, bragging about some of their own kind being as "*bold and brave as a lion*!" and speaking of a body of them as "*lion-like men*"—thereby acknowledging that we

possess those higher qualities which they are endeavoring to imitate! "Lower animals" indeed! Why I find when those bifurcated artists, poets, painters, and sculptors, want to illustrate beauty, strength, valor, sagacity, gentleness, and patience, they go to the "lower animals" for their examples. Thus, one is as brave as a lion—another has the strength of a rhinoceros—another the patience of a camel—another the sagacity of the elephant—another the wisdom of the owl, and another the gentleness and innocence of the lamb. To enumerate all the examples, I should have to growl through the entire animal kingdom. "Lower animals" indeed! Why, a remark of this kind was made here the other day among a crowd of these humans—most of whom had something in his mouth which was on fire at the end, which they call "tobacco" I think, and those who had none on fire, had their mouths filled with it, and were grinding it between their teeth!

Now this is a nasty weed, which but a single one of the "lower animals" will eat, and so filthy is that animal considered in consequence, that none of us would touch his flesh as food were we starving to death! "Lower animals" indeed! G-r-r-w-w-w.

Where was I? Oh—as to the effect the remarks of the humans just mentioned had on some of my neighbors, especially the tiger and the hyenas. Why, the former was so roused that he started off up and down the cage in a terrible state of excitement, showing his fangs, and giving angry growls with an irritability he did not care to conceal; and the laugh of the hyenas was something so horrible that I myself could hardly excuse them.

There's Minnie, my wife, she too must come in for a share of abuse; suppose she did neglect those children of her's? suppose my friend Nash (he's one of the humans I have learned to love and respect), did have to take them home and have his good wife to nurse them, what of it? Have'n't your humanesses been sending your cubs or whelps away from you to be nursed for generations past? And because one of Minnie's cubs dies, you send word out and write up a record that it died on account of the "neglect of the mother!" Now, if all the records of this kind which might be written against your human mothers were so recorded, how many of you would escape, do you think? Why, I remember hearing a party speaking about some Frenchman who was put away by his mother, and he saw neither parent until he was twelve years old! What do you suppose he thought of his parents? Did he think them the "higher" or the "lower animals?"

But again, don't I hear, every now and then, of some humaness leaving her cub on a cold winter night in some dark alley, or on some cold stone or doorstep, and of others who beat, whip, and starve their whelps? Has Minnie been as bad as any of these? Ger-w-w-w! gr-w w-w! Now, am I not right in calling you inconsistent, as well as vain? Yes, these things are done by you, who have made for yourselves a life beyond this, which you call "immortality" (you deny that life to us!)—that is, you think yourselves so good that you deserve another world to live in—as a reward for your "higher" order of conduct, a world beyond and a life where you are to live in bliss forever and ever! Do you deserve such a life? Don't you suppose I hear about Plymouth Church and those humans which you once called Lion-Beecher and Lion-Tilton? If we of the "lower animals" would call a "committee" to sit in trial on them, you would soon see in what "order" we should place them.

And what hard talk there has been, too, about my neighbor and relative, Ben the tiger, because the other day he bit his wife's leg off. Does not one of your hymn-makers say that "Dogs delight to bark and bite, and bears and lions growl and fight"? Why then must a tiger, who is but a cat, be abused for doing the same? Ben was only following up his nature; but how about the human Bens I hear of killing their wives, with clubs, guns, knives,

or any other weapon they can lay their cowardly hands on? That is when they are beastly drunk, you say. By the way, why do you say *beastly* drunk, or drunk as a beast? A beast does not get drunk; he's above that kind of business, and I never knew of but one, Sir Bruin the bear, who could *bear* the taste of rum, and he was made to like it by his human owners.

To be Continued.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

For "TO EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

BLACK LIST.

Wm. McIntyre, Milton, Pa.

D. PORTER, 261 North Pearl St., Albany, N. Y., will exchange a pair of his Homing Antwepers, for a Canary in full song, or Mocking bird.

W. G. WENCK, McEwensville, Northumberland Co., Pa., will exchange White Leghorns or Partridge Cochins, for offers in Fancy Pigeons.

WILLIAM HUNT, Tivoli, N. Y., offers a Smith & Wesson seven-shooting revolver, one very fine W. L. Cock, and some splendid Plymouth Rocks, in exchange for Black B. R. Game chicks of pure blood, and full pedigree. A splendid chance for fine Plymouth Rocks. Speak quick.

P. M. MASTERS, Everett, Pa., has Plymouth Rock and Brown Leghorn Cockerels, Books on stock raising, Bee-keeping, Agriculture, Horticulture, Architecture, &c., to exchange for P. Rock Pullets or Hens of 1875 hatch. Write for what you want.

F. A. PENNINGTON, Delaware City, Del., will exchange 1 pair White Pouters, 1 pair White Carriers, 1 pair Red Carriers, 2 pairs Blue Carriers, 2 pairs Black Carriers, 1 pair Yellow Barbs, 2 pairs Black Barbs 1 Red Barb Cock, 1 pair White Funs, 1 White Ruffe Hen, for Blue or Red Funs, or Black, White, or Red Ruffles.

CHAS. FOSTER, 26 Cedar Ave., Cleveland, O., will exchange five pair each, first-class Silver Dun Homing Antwepers and English Highblers. Wants Shot Gun, offers in Books, and Blue Owl Cock. Birds warranted first-class; same wanted.

D. GILPIN, Concordville, Del. Co., Pa., wants to exchange Plymouth Rock Cockerels (May hatch), for Plymouth Rock Pullets, Dickie's stock, same age. What offer?

ABM. V. N. DFOREEST, Metuchen, N. J., will exchange a Creste Cœur Cock, 1875 hatch, for White Dorking Cock, same age; Light Brahmas, in exchange for Fancy Pigeons, or a St. Charles Spaniel, a good Single barrel Gun and an Elliott Revolver, for offers.

JNO. V. BISHOP, Springfield, Ohio, has to exchange Silver Duckwing Game Bantams, fowls and chicks; also one pair of Silver Spangled Hamburg chicks, for Fancy Pigeons. They must be good, as I warrant my birds to be perfect in every particular. "Postal cards taken at par."

BOX 86, Tamaqua, Pa., will exchange 1 Cock, 4 Hens, 1 Cockerel, and 3 Pullets, Dark Brahmas; 4 hens, 2 Cockerels, 4 Pullets, P. Cochins; 1 B. B. R. Game Bantam Cock, 2 Game Bantam Hens, 1 Maltese Cat, 1 pair Blue Pouters, one pair Mottled Fans, 1 Black Jacobin Cock, for B. B. Red Game Hens and Pullets, Rouen or Aylesbury Ducks, or Bremen Geese, or offers.

N. S. CORNWELL, Northampton, Mass., has 2 Vols. Greeley's American Conflict (new), 2 Bound Vols. of Atlantic and Harper, at \$2.00 each, Foreign Reviews, Blackwood, and other Bound Magazines, to exchange for Pigeons of any laying breed. Fancy points no object, as it is the Eggs I am after. Please send your offers, and state what books you would like.

NO. 79, WEST CLIFFORD ST., Providence, R. I., will exchange a nice Silver Hunting Case Watch, Detached Lever, for Dark Brahms Pullets. Want only good birds.

ISAAC VAN WINKLE, Box 13, Greenville, Hudson Co., N. J., will exchange a few Fancy Pigeons, for Brown and White Leghorn, and Plymouth Rock Pullets and Hens. My stock has won 50 first premiums in two seasons.

HARRY K. WELSH, York, Pa., will exchange 4 Yellow Tumblers, 2 Black Tumblers, 1 pair White Fantails, 1 pair Red Barbs, 1 Red Barb Hen, 1 Almond Tumbler, 1 pair Magpies, and 1 pair of Red Fantails (with white tails); the two latter pairs are old birds and good breeders; for 1 Mottled Trumpeter Hen, 1 Silver Turbit Hen, 1 Blue Dun Fantail Hen, 1 Silver Dun Fantail Cock, one good Black Tumbler Cock, (small), old birds, and offers in Fancy Pigeons. Will give a good exchange for any or all of the above named birds. Speak quick. All letters, &c., answered.

V. S. TRUCK NITILLER, McEwensville, Pa., wants a good pair of Ferrets in exchange for Dark Brahmas.

E. L. LEWIS, Ansonia, Conn., will exchange 100 choice Black Red, Red, Yellow Stag, bred for the pit, and 1 fine Setter Pup, for a breech-loading Shot Gun, light jointed Pole and Rod, or offers; also Wright Poultry Keeper, new, for Dead Shot or Sportsman's Guide.

JOHN P. HOUSER, Tamaqua, Pa., wants to exchange 2 good Viollins, 1 Double Violin Box, 1 Bird Organ, 1 Bound Volume of Wright's Illustrated Book of Poultry, 1 Electric Battery, 1 Show Case, 1 Rifle, 2 Old Style Family Clocks, Fowl and Pigeon Exhibition Coops, 1 Rabbit Hutch, 1 Squirrel Cage, 2 Parrot Ages, 1 Red Bird and Cage, a good singer, 1 Accordion, in good condition, 1 Pool-Wheel, also Fancy Pigeons, for offers. Speak quick.

G. A. S., Box 700, Worcester, Mass., will exchange complete and perfect set of German Silver Draughting Instruments, in rose water case; and 10 Bound Vols. Little's Living Age, for P. Cochins, D. and L. Brahmas, P. Rocks, P. Ducks, B. Leghorns, Poultry, and Pigeon Exhibition Coops. Make offers.

S. D. R. SMITH, Williamsport, Pa., will exchange four Dogs and one Bitch, English and Irish Gull Bait Terriers, seven weeks old, best blooded stock known, pedigree given on application, Pups from Irish pig "Rose," noted pedigree and best English Dog, warranted to be so, for offers.

C. H. PALMER, Plymouth, Mich., will exchange one Double and one Single-barreled Shot Gun, one Spencer Carbine, Sharps' Four-shot Revolver, Violin, Two P-r Canary Birds, Tame Fox Squirrel, for B. B. Reds, P. Rocks, Battery, Ferrets, or offers. Satisfaction guaranteed. Write.

C. A. DERR, McEwensville, Northumberland Co., Pa., has to exchange, three pair of White Funs, and Light Brahma Chicks, (Williams strain), for a Black-Mottled Trumpeter Hen, Black Jacobin Cock, Brown Leghorns, or offers in Fancy Pigeons. None but good birds wanted.

G. DILLEMBERGER & SON, 69 Clifford St., Providence, R. I., will exchange Ferrets, White Angora and Lop-eared Rabbits, for first-class Highflyer and Homing Antwerp Pigeons. None but first-class stock will be accepted, as ours is the same.

NOVELTY PRINTING CO., Albany, N. Y., will exchange five young male Mocking Birds, for all kinds of old second-hand Novels, or other books.

BOX 869, Rockville, Conn., will exchange a C. Cornet, cost \$60, for a first-class Central-fire Shot Gun. Must be in good order, as the Cornet is.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering ONE BOOK for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

BEETON'S GREAT BOOK OF POETRY, containing 2,000 poems from 400 poets, from Caedmon and King Alfred's Boethius to Browning and Tennyson, with Biographies; G. A. S., Box 700, Worcester, Mass., will exchange the above for P. Cochins, P. Rocks, P. Ducks, and mated Pigeons.

UNCLE TOM'S CABIN WANTED—J. B. Tuckerman, Eaton, Madison, Co., N. Y., wants a copy of the above work. State condition and lowest cash price.

DINK'S ENCYCLOPEDIA WANTED—J. S. Edmonds, Box 841, Schenectady, N. Y., wants the above work.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

THE DELL.

There is a lonely rural dell
Where I in summer love to dwell,
In solitude—alone;
Beside a little purling spring
I sit, (as happy as a King)
Upon a moss-clad stone.

The flowering vine perfumes the air,
And floral gems bloom here and there,
Which art cannot excel,
And close beside my shady nook
(O'erhanging with trees) a murmuring brook
Runs winding through the dell.

Where Sol can through the branches gleam
Upon the surface of the stream
The sunbeams seem to dance.
Who could a scene so fair survey
With reasoning mind, and calmly say
"I merely came by chance?"

The more of Nature's works I see,
More wonderful they are to me
And show a grand design.
The tuft of moss that decks the glade,
The dewdrops on the grassy blade
Proclaim a power divine.

The Atheist may a God deny,
But Nature answers in reply:
"Fruit creature of an hour,
There is not skill in human heart,
Or power in science to impart
The fragrance to a flower."

PEPPERCORN.

(For Fanciers' Journal.)

SERPENTS—FASCINATION.

J. M. MCCANN.

Dr. Barton of Philadelphia, in a memoir published in 1796, advances *all* the arguments offered by Phoca against the theory of the serpent's power to fascinate its prey. And being a gentleman of culture he did not think it necessary to exchange the purity of his native tongue for the lower slang of which Phoca appears to be so great a master. Belonging now, it seems, to the family of the seals, perhaps in the far off future—if the Darwinian theory be true—Phoca may develop into a higher order of being—even into a student of nature, and a reader of her secrets. I have yet to learn that there is any variety of bird or squirrel that would willingly sacrifice its life in defence of its young. Birds and quadrupeds have been seen under the influence of the serpent's fascination by distinguished naturalists, who testify that they were *not* endeavoring to protect their homes, or to save their young. Most animals have an instinctive dread of the serpent, and even the royal tiger will cover and tremble when in the presence of his hooded foe. The author of *Chapters on Snakes* writes: "A friend of mine, in the civil service of Chittoor, had a pet tiger which he kept in a strong iron cage. Some one by accident threw a freshly-

slain cobra at his den, which, getting entangled amongst the bars, hung gloomily suspended. The tiger was so dreadfully alarmed at the appearance of this unwelcome neighbor, that he trembled from head to foot, and slunk into the furthest corner of his cage." If, then, the savage lord of the jungle is unnerved and powerless at the sight of a dead cobra, what effect would be produced upon the timid hare, or the feeble bird, by the flaming eyes and the fiery tongue of the living serpent?

Chamber's Encyclopædia, page 252, article *Fascination* by Serpents, says: "This popular notion has been ridiculed, *but is supported by a large amount of evidence, and has been fully adopted by some of the most scientific observers.*"

In the earlier part of last century, Kalm described the rattlesnake as frequently lying at the bottom of a tree, on which a squirrel is seated, and fixing his eyes on the little animal, which from that moment cannot escape, but begins a doleful outcry, comes toward the snake, runs away again, comes nearer and finally is swallowed. LeVaillant describes a similar scene, as witnessed by him in Africa, a shrike incapable of moving away from a serpent which was gazing fixedly at it, and *dying* of fear although the serpent was killed." Dr. Andrew Smith testifies to similar facts as coming under his own observation, and further adds, "whatever may be said in ridicule of fascination, it is nevertheless true that birds and even quadrupeds are under certain circumstances unable to retire from certain of their enemies, and what is even more extraordinary, unable to resist the propensity to advance from a situation of actual safety, into one of most imminent danger. *This I have often seen exemplified in the case of birds and snakes.*"

Here we have the evidence of a distinguished man of science, who relates only what he saw, and who was certainly perfectly competent to determine whether the birds were giving their lives for the young they loved, or were drawn by some irresistible power into the serpent's jaws.

Ellis in his *Three visits to Madagascar*, records anecdotes of the same kind, and one in particular, of a frog apparently unable to move, until an object was placed between it and the eyes of the serpent, when the frog immediately darted away, as if relieved from some mesmeric influence exerted over it. The celebrated French naturalist, Author Magin, speaking of the rattlesnake, page 361, *Desert World*, says: "It feeds principally upon the smaller mammals and upon birds, which it seems certain it possesses a peculiar power of fascinating—the effect it may be of intense fear."

"When the piercing eye of the rattlesnake is fixed on them," says Mr. Murray, terror and amazement render them incapable of escaping; and while involuntarily keeping their eyes fixed on those of the reptile, birds have been seen to drop into its mouth, as if paralyzed, squirrels descend from their trees, and leversets run into the jaws of the expecting devourer."

Lawson tells us that "the rattlesnake has the power to charm squirrels, hares, partridges, and other small animals, in such a manner that they run directly into their mouths. *This I have seen,*

and other snakes have in some measure the same power." A mouse was shut up in an iron box with one of these fascinating rattlesnakes: it sat in one corner, the rattlesnake was opposite to it. The reptile fixed his eye, terrible as Vathek's, upon the little trembler, which was at last forced to throw itself into the mouth of the serpent.* Mr. Gosse, the celebrated author of *The Romance of Natural History*, and other valuable scientific works, is a firm believer in fascination, and quotes several instances from authorities he does not question.

"The smaller snakes," writes a modern traveler in South Africa, "feed on birds, squirrels, and rats, which I am convinced from frequent observation, they are able to charm with their looks. This power of charming I had always doubted, but was convinced by one day watching a venomous black snake, over four feet long, subduing and catching a squirrel which sat on the lower branch of a tree. It was near, and in the rear of Obingie's town. I had gone out to shoot birds, and my attention was attracted by a very peculiar and continued chattering of a squirrel. When I saw it I did not know what to make of its movements. It seemed as though tied to the branch, and very anxious to get away. Its head was thrust forward, its eyes fixed, and glaring; but its body trembled, and was jerked about from side to side. All the time it was screaming and chattering in a really pitiable manner. Following the direction of its glance, I saw the cause of its alarm. The black snake was slowly creeping out on the limb, and as steadily kept its eyes fixed on its victim. The whole curious process went on under my inspection for at least ten or twelve minutes, during all of which time the snake seemed to fix the gaze of the squirrel upon itself. The squirrel came nearer and nearer until it reached the mouth of the snake, which made a spring, grasped its prey in its mouth, and quickly coiled its folds about it."†

In Dr. Russell's *Indian Serpents*, it is written, "When frogs were placed in a corner near to which the snake was coiled up, they remained motionless, as if enchanted, without attempting to escape; but the moment the snake was removed they jumped off, and escaped to the door." The following is recorded in the *Annual Register for 1771*: "Mr. Cook, a merchant of New York, once observed a cat-bird flying from one branch of a tree to another, and making a doleful tune. At the bottom of the tree, but at a fathom's distance from the stem, lay one of the great black snakes with its head continually upright, pointing toward the bird which was always fluttering about, and now and then settling on the branches. At first it only kept in the topmost branches, but by degrees it came lower down, and even flew on the ground, and hopped to the place where the snake lay, which immediately opened its mouth, caught the bird, and swallowed it." Is it possible to believe that this bird was battling with its enemy for the purpose of saving its young?

"The fascination," Mr. Broderip writes, "of serpents has been stoutly maintained by some, and as strongly denied by others. Acrell notices this phenomenon as being confirmed by the evidence of several of his countrymen, who had been a long while resident of Philadelphia. They relate that the American rattlesnake, which they describe as the most indolent of serpents, unquestionably possessed this power. They declare that, as the snake lies under the shade of a tree, opening his jaws a little, he fixes his glittering eyes upon any bird or squirrel which is in it. The squirrel utters a mournful and feeble cry, and, as if foreseeing its fate, leaps from bough to bough on every side, seemingly to attempt a sudden escape; but struck with the fascination, he comes down the tree, and flings himself with a spring into the very jaws of the enemy. The observations of some Englishmen," continues Acrell, "seem to confirm the truth of this." Mr. Gosse, speaking of his servant upon whom he could rely, says: "Sam has

seen a boa ascend a mango tree, on one of whose branches a fowl was perching, and when at some distance from the prey, began to dart out and vibrate its tongue, its eyes fixed on the fowl while it slowly and uniformly drew near, the poor hen all the time intently watching the foe, but without stirring or crying. Help came fortunately, just as the snake was about to strike, and the fowl was rescued. How strange it is that in widely remote parts of the world we should hear the same statements! Sam has never read what other observers have described about fascination; but he and others affirm, from their own observation, that some such power is exercised." The celebrated traveler Le Vaillant says that he once saw a mouse in agonizing convulsions, about two yards from a snake whose eyes were intently fixed upon it; and on frightening away the reptile, and taking up the mouse, it expired in his hand. How mysterious is this power of the snake! "Arrested in its flight by the basilisk eye of the creature, the birds and small quadrupeds shriek in helpless agony at the spell cast over them, and if no friendly circumstances should break the enchantment, they perish from the mere violence of their emotions." Here we have the testimony of eminent men of science, and of unimpeachable veracity. They have seen in various parts of the world, the fascinating power of the serpent exerted over its victim. What right have we to question the truth of their statements? They are men deeply skilled in the mysteries of nature, and could not have been all deceived. Then they are only affirming that which is firmly believed in every part of the earth—by the African Negro and the American Indian, the Australian savage and the Arab of the desert. If any bird, or quadruped was ever fascinated by the serpent, others may be. I have never seen any variety of squirrel offer the slightest resistance in defense of its young. The bird having perfect confidence in its power of wing, will attack the strongest and fiercest animals if they come near its "babes in the nest." But they would not come down from the tree-tops and throw themselves into the jaws of a serpent—sacrificing their own lives uselessly, and leaving their young to starve.

♦♦♦♦♦
LITERATURE OF AMERICAN BOYS. Do parents, guardians, and, in fact, those interested in the formation of the characters of the rising generation, pay sufficient attention to the class of literature that is freely placed in the hands of their children, which is made especially attractive to them, and may serve in a measure to mould their dispositions and form their characters? We have placed before us by the mail this morning, the copy of a paper issued in New York by a publishing company, the names of the proprietors not given. Its name implies that it is especially designed for circulation among boys, and the following are the titles of some of the leading stories: "Jack the Joker, or the Irish Robber's Apprentice"; "Pat Phelan's Bigamy"; "Fighting his Way"; "Tornado Tim, or the Boy Avenger"; "Nimble Nip, or the Imp of the School." The illustrations are of two policemen engaged in a club fight with each other, six men in desperate combat with pistols and dirks, three men and a boy with club, knife, and fists, and a base-ball match.

This paper and others of its stamp can be seen at any of our news stands, and is freely displayed in the windows of cheap periodical stores, where it is eagerly gazed at by young spectators from without. We leave it to the judgment of all right-minded persons as to what must be the effect of publications of this character upon youthful minds. If elevating, they deserve the most liberal encouragement from the press and people; if debasing, there is no punishment too severe for those who publish and circulate them.—*Ex.*

—Somebody might invent a machine to brush the furze off peaches.

Keely is going to invent it—when he has invented his motor.

POULTRY DEPARTMENT.

(For Fanciers' Journal.)

THE CENTENNIAL EXHIBITION OF POULTRY

Will commence in the city of Philadelphia October 27, 1876, and from present appearances it will be the most interesting exhibition of poultry and pigeons ever held in this country; nothing will be left undone by Mr. Landreth, Chief of Bureau of Agriculture, and Mr. Diehl, superintendent of this department, to make this show a grand and noble success. The time for entering stock has been extended to October 1st, 1876, and it will be well for the fanciers of the United States to remember that the fanciers of England and Canada will exhibit largely, and if we are not up and doing very soon, we will come out of the small end of the horn. We have the stock here at home, as good as any England, France, or Canada will send to the exhibition; never again in our time will such a grand opportunity offer itself to us. Come forward then at once, do not delay longer, fanciers of America—and we will show to the world that we will fear nothing that may come in competition with it. TENNET.

DOYLESTOWN, PA.

QUAIL RAISING.

I am greatly occupied with rural affairs, farming, fruit raising, chicken, goose, turkey, duck, pigeon, and quail culture. I have eleven of the last, nearly four weeks old, hatched by a game bantam, and carefully nursed by her. I keep them in one of my hen houses, 10 x 14, with ground floor, and southeast windows. I give them besides other food, proper for gallinaceous birds, a *dog's fill* of house flies once a day. They gobble them more greedily than any other food. It takes *twenty-two and a half days* to hatch the eggs. I have had bantam eggs in midsummer hatch in eighteen and a half days, and brown leghorns from eighteen days eighteen and a half hours to nineteen days ten hours, after being transported from Frehold, New Jersey. I am satisfied that quail can be reared with great certainty, if they can be kept from running away. To avoid this, it is necessary to plug or putty all nail and worm holes.

The first batch of eggs was trusted to a silky hen, who must have emigrated from Japan, in the days of her exclusiveness, for she killed every bird the moment it emerged from the shell. I discovered this in time to save one still in ovo, by giving it to a tolerant republican bantam. Another bantam hatched the second batch, and will probably raise all of them. None are drooping. They are very tame. DAVID TAGGART.

POSTAL CARDS NOT ANSWERED.

EDITOR JOURNAL:—I would like to add a few words to this controversy.

B. G. says that when a person asks for information that is solely for his benefit, he should enclose return postage. We must all agree with him in that particular. But he says, further, that when he writes for information about a wagon, chickens, or eggs,

he encloses a stamp. Doubtless he intends these as examples where the interest is all on the side of the buyer. If so, I think he is in error. If I have anything to sell, it is for my advantage to advertise the article as much as possible. If I ask an enquirer to pay me for giving him information in regard to anything which I wish to sell him, it is in my judgment as P. Card says, impudent, but not a bit independent. I am simply asking the applicant or buyer to share my expense incurred in advertising. The non-answering of postal cards does not suggest to me "high tone" or "fine hairedness," but the opposite qualities.

Suppose I write by card to Mr. A. making enquiries in reference to his fowls, and receiving no reply, call at his place, and he devotes an hour's time to me. I buy nothing. He could have given me the information sought for one or three cents, in five or ten minutes. Which would have been the cheaper?

Suppose, again, that on visiting Mr. A. he refuses to show his fowls or say anything about them until I pay him a certain amount. How would such a man be regarded in any community? And yet I see no difference between this act, and that of refusing to answer my enquiries made by letter.

B. G. also says that not one in twenty applicants for circulars are heard from again. Of course not. Is not the case exactly similar in any business? Let B. G. visit one of the large stores in Boston or elsewhere in the busy season. How many of those who engage the clerk's attention, buy or even entered with the intention of buying? Would it not be the height of absurdity to require each to pay on entering for the privilege of examining goods?

Not a few poultry buyers, or buyers of anything, have long since determined to let entirely alone these "No Postal Cards Answered," dealers, unless they much desire something they have that cannot be obtained elsewhere. If others would do likewise these non-answering, stamp-required gentlemen would soon learn that the public was not sufficiently interested in the disposal of their wares to pay a portion of their advertising expenses.

P. CARD, 2d.

WORCESTER, Sept. 10, 1876.

For The "Fanciers' Journal."

PEKIN DUCKS.

J. Boardman Smith, North Haven, Conn., writes: "I have to-day weighed a pair of my Pekin Ducks, eight weeks old to day, and they weighed just 10 lbs. and 11 oz. I call this a remarkable growth, considering they have had only a tub of water, and feed nothing but a mixture of cracked corn, ground oats, wheat bran, coconut, meat, ground beef scraps, and loppered milk. For dessert, fresh water, clams, parsley, plantain, clover, and twich grass. What will they weigh when *eight months* old?"

KENTUCKY POULTRY ASSOCIATION.

Pursuant to notice a number of poultry fanciers met in convention in Louisville on the 19th ult., for the purpose of organizing a State Association. Mr. Robert Dunlop, Jr., was called to the chair, and Dr. W. H. Merry elected secretary.

It was then resolved that a Poultry Association be organized under the name of the "Kentucky Poultry Association."

The following gentlemen became members: B. Beckmann, Walter Williams, John H. Thierman, W. Walker, C. W. Gruber, Jr., A. Bindawal, Randolph Martin, P. T. Barnett, Robert Dunlop, Jr., E. B. Hartwell, Bennett H. Young, C. H. Maydwell, Dr. C. W. Kelly, J. L. Franck, and Dr. W. H. Merry, all of Louisville.

Election of officers was then proceeded with, resulting in the election of the following gentlemen: President, Robert Dunlop, Jr.; treasurer, E. B. Hartwell; secretary, Dr. W. H. Merry.

A constitution and by-laws for the Association were drawn up

and adopted, and the meeting adjourned to meet on the 28th ult.

The adjourned meeting was held on the 28th ult., when the following gentlemen became members: Vin Bradas, Jacob Schulz, and A. Faulkner.

The following officers were then elected: Vice-Presidents, Vin Bradas, A. Faulkner, C. H. Maydwell, Jacob Schulz, P. T. Barnett, Bennett H. Young; Executive Committee, Robert Dunlop, Jr., E. B. Hartwell, Dr. W. H. Merry.

The Association will hold their first show at Louisville, on Dec. 26, 27, and 28, 1876, and there is every reason to believe that it will be a great success.

Before the meeting adjourned the following motion was proposed and unanimously adopted:

WHEREAS, This Association, to a great extent, owes its organization to the *Southern Poultry Journal*, and appreciating the energy it is displaying to develop the poultry interest in the South,

Resolved, That the members of the "Kentucky Poultry Association" pledge themselves to do their utmost to promote and encourage the *Journal* in its work.

Resolved, That it be the organ of the Association, and that all the members use their best endeavors to increase its circulation and sphere of usefulness.

The Association then adjourned to meet at 83 Eighth street, Louisville, Sept. 23d, at 8 o'clock, p. m.—*Southern Poultry Journal*.

INQUIRY ANSWERED.

EDITOR JOURNAL:

In the last number of the *JOURNAL*, a correspondent asks how to remove lice from Bobolinks. Have had no experience with Bobolinks, but have been successful in attracting lice from canary birds, by spreading a white cloth over the cage at night. In the morning the lice are found on the cloth. Yours truly,

GEORGE A. STOCKWELL.

WORCESTER, Sept. 10, 1876.

(For *Fanciers' Journal*.)

TASTE.

Taste, in relation to the various effects produced upon the tongue or palate, of whatever property or color, belonging to the animal or vegetable kingdom, has already been commented upon in these columns, with their various nutriments and necessities to the body in different circumstances and climates; but the higher taste pertaining to the exercise of all the senses, and the judgment of the intellect of external objects, its proper appreciation of true proportions and color of things in nature and art, we consider of equal, if not of higher excellence to the civilized and meditative mind, in the full attainment of human happiness. But while we would advocate an equality in the education of both (although the latter may be in the minority) for the maintenance and development of our species, we must concede that as the soul becomes inspired in admiration of the lovely, the bodily concerns sink into greater indifference. But while the animal senses may seldom ever err, in deciding what is bitter, sweet, or sour, the intellectant may not always so accurately define, with harmony, curves, colors, shapes, and combinations, in accordance to æsthetic taste. This perception comes partly by culture and partly by intuition, and training of the moral faculties as well.

Good taste is exemplified peculiarly, by the operations and constructions of the carpenter, mason, or mechanic, in their diversified arts, because necessity, experience, and ambition impels them to neatness and perfection; but in the poet, the painter, and the architect is concentrated a higher and grander embodiment of orthodox taste,—if we may be allowed the term,—the chief study of the architect being to combine beauty, strength, and adaptability, in his structures, whether he builds according to any of the five ancient orders,—Tuscan, Doric, Ionic, Corinthian, Composite,—or a due mixture of either of them, according to the necessities of the case.

In the various professions of the painter,—whether he portrays the human form divine, or whether he paints a landscape, bird, fish, or flower, or if he is a decorative, or textile designer,—he cannot undertake these tasks without due devotion and study of nature. And what a feast of admiration the artist often presents to mankind, and sometimes emolument to himself or employer, in the reproduction of natural objects in gold, silver, wood, marble, wax, &c., &c., as well as in the combination, in outline and color, of attractive designs in household ornamentation, or the embellishment of textile fabrics; a desire for novelty being one of the keenest faculties of the mind.

When Sir Titus Salt of Bradford, England, devised machinery to work up and spin the alpaca goat's hair so that he could weave and produce the sheeny fabric called after the animal's name, so much resembling silk—at about quarter the cost—he touched a sympathetic chord, which thrilled throughout Europe and America, and made himself a Knight and a millionaire. Mons. Jacquard, a Frenchman, who lived in the time of the first Napoleon, who made himself quite as immortal, and was certainly the greatest benefactor to mankind of the two, by his invention of a machine called after his name, which, when constructed upon the loom, can be arranged to portray any pattern of any animal, plant, or flower, or even delineate in silk, landscapes or likenesses as finely as a well executed steel plate, or any combination of forms the designer finds appropriate for the cloth woven. As the result of this, we can walk on representations of gorgeous groups of flowers, and have them emblazoned on curtains and furniture, so much so as to convert home into a paradise as comfortable as the original, while Eve never had the pleasure of clothing her sacred person with such elaborate patterns as the modern ladies attire in. Previous to this invention, figured cloths could only be made by embroidering by hand, and of course was beyond the means of the million. Cotton chintz, or painted fabrics had been imported from India, but these subsided on the advent of Brocades and Damasks, &c. The highest concern of a true artist is not so much to get gain—although reward and wealth may be a sequence—as to attain pleasure in the perfection of his labors.

An ancient master, after several years' labor, having finished his painting, was asked its price. He replied, "It is beyond all price." He retained it for a few years, and then presented it to a friend. But we fear this class of nature's true noblemen is fast giving place to patent medicine makers and charlatans.

The poet, in his admiration of the beautiful in nature and art, diffuses to others his inspirations in poetic form, which produces in the sympathetic soul responsive meditation and holier contemplation of the wisdom displayed by the Creator, and a more appreciative sensibility to the works and struggles of humanity. There are undoubtedly obstacles in establishing a standard of taste for all (and especially in the standard of excellence for poultry), because in some things it is so evanescent, particularly when ruled by a popular passion for certain styles, with for instance in fashion of dress, as well as in prevailing styles in architecture or furniture; but the fundamental principles, in combination of color or form remain immutably the same, only they are diversified in catering to public curiosity. Worth, the prince of Paris milliners, is fully conscious that however his styles in dress may please his patrons, they will only be worthily esteemed for a limited time, and be succeeded by others *ad infinitum*. But the successive designs are only flowers of different hues and shapes,—and who ever saw a flower, with its colors not exquisitely matched, in which the critic may invariably find the same controlling inexorable law pervading all nature, that governs the artists in their multiform productions for public approbation. Nature is continually teaching us, by her changing scenes and seasons, to abhor monotony, and the reader will probably concur with us in our opinion that men in civilized life, and women more especially,

are not loth to obey her admonitions. Spring comes to cheer us, dressed in her dainty green, studded with fragrant pink blossoms. The merry lark from out of her hiding-place ascends and warbles till out of sight, and after. Summer succeeds, laden with a delightful profusion of flowers, the mountains clad with verdure, and the little hills rejoice on every side, while some sections are blessed with the melodious serenade of the nightingale.

A new kaleidoscopic scene follows in autumn when the golden fruit bends the bough, and the earth yields her increase; while the forest sombre greens are changed to red, russet and brown, with an intermingling of tertiary tints. And last of all comes winter, like a warrior, and sets his fierce elements in battle array to destroy every vestige of the summer's grandeur, and having subdued the earth, bids the vanquished inhabitants be merry, while he spreads his fleecy mantle over all, as if to make the greatest contrast. Then comes the sweet enjoyments of the luxuries, and good taste of home, but here we cannot omit the glowing lines of Thomson:

Look Nature through—'tis revolution all;
All change—no death. Day follows night, and night
The dying day. Stars rise and set, and rise;
Earth takes the example. See; the summer gay,
With her green chaplet and ambrosial flowers,
Droops into pallid autumn. Winter gay,
Horrid with frost, and turbulent with storm,
Droops autumn and his golden fruits away,
Then melts into the spring. Soft spring with breath
Favonian, from warm chambers of the south,
Recalls the first. All to re-flourish, fades;
As in a wheel all sinks, to re-ascend;
Emblem of man, who passes, not expires.

To the mind who can read sermons in stones can certainly read homilies, in these revolving views; unerring beauty in every form, imitable perfection in color, and a manifestation of love from the Creator to all his creatures. Here then to the inquirer, is the grand standard of taste. Whatever in art pleases the eye, here we have the original, and the closer we adhere to the copy, the more shall we approach perfection. In the structure of flowers, plants, and trees, the architect may learn a lesson. The artist, with his matchless skill, finds a pleasing task; whilst the poet always finds food for reflection and reverence. But all persons are not poets, painters, and builders, and consequently have not the same appreciation. They may have equal culture and learning, but their thoughts and labors are beguiled into more selfish and sensual channels. However profound a judge may be in the law, if he does not love justice from moral principles, but allows corruption or prejudice to warp his reasoning, his decisions will be unjust and erroneous. So if a man allows himself to be overcome with avarice, or any other vain glories, his passions may be exercised in. As a connoisseur in art or manufactures, his criticisms would be by no means reliable, except in case of a specialty he might be interested in. A fancier of poultry would see with a keen eye every point of beauty and excellence in the Brahma, Polish, or Hamburgs, but might look upon a field of daisies, unlike Burns, with no fascination. (We trust these are exceptions.) Put a flower into the hand of a miser, and although he would admit it was pretty, would look upon it with the cold eye of indifference, but place before him a gold piece, or an empty promise greenback, and presto, change! delight beams in his countenance. Is there anything so universally magnetic as money? It is a necessity as a medium by which to transact business; but to fall down and worship it, and make its acquirement the chief end of life, is an evil. Love for horses is creditable, so far as concerns treating them with kindness; but to have an inordinate passion for the noble steed, and unable to see any beauty in other objects—using him as a medium for dishonorable gain, is truly unreasonable taste.

However we may vary in our ideas of the details, the funda-

mental principles of beauty are acknowledged by all. Whoever denied that the horse is superior to an ass, a swan more graceful than a goose, a peacock handsomer than a frizzly hen, a tall poplar with its trembling foliage, grander than a scrub oak, a chaste, snowy white, unfolding calla, or the portly, delicately painted and chiseled lily to a dandelion. To treat the subject further with regard to taste, as it pervades all the ramifications in the whole economy of human life, we will leave to the philosopher, and satisfy ourselves with quoting the sayings on this topic of one who lived over eighteen centuries ago: "Finally, brethren, whatsoever things are true, whatsoever things are honest, whatsoever things are just, whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good report; if there be any virtue, and if there be any praise, think on these things." BRCS.

SPORTSMAN'S DEPARTMENT.

THE DOGS AT THE EASTERN PENITENTIARY, PHILADELPHIA.

It has been stated that application had been made at the Eastern Penitentiary for bloodhounds to chase criminals. A reporter of the *Bulletin* has visited that institution, and interviewed the Warden, who began with:

"There have at times some pretty exaggerated stories crept into the newspapers about us here, but you may say that we have not, as yet, grown quite that bad. In fact, our dogs never see the convicts nor do the convicts see them. We keep them solely for watch dogs, for the purpose of intimidation, and their presence has a very salutary effect. In addition to those I have named, we have two full-bred English bull dogs and a few of mixed breed, or what I call curs. 'Czar' is not so large a hound as many of those owned by the brewers in Brewertown. Nevertheless, he is a fine specimen of the breed. He is of medium size and a bright, intelligent animal. None of our dogs are vicious. If they find any stranger roaming about the yard, especially about the gates, they will seize him, but you could walk all over the place provided a watchman accompanied you and, beyond keeping your company, they would do nothing."

"What about the story published some time ago of a bloodhound attacking a keeper?"

"That was very much exaggerated. A couple of the dogs had been fighting, and one of the men separated them, and in doing so was slightly bitten by one of them. About half an hour afterwards the dog approached him, and supposing the animal was going to make an attack, he drew his pistol and shot him. Some time ago one of the men ill-treated one of the hounds, and the animal resented it but the man kept him off with his stick until he backed into a doorway, and that was all there was of it. It is the curs that are treacherous, as was shown in this instance, for while the hound attacked from the front, some of the curs attacked from the rear and tore his pantaloons."

"Then you don't keep bloodhounds to devour prisoners?"

"Bless your soul, no! We prefer the hounds simply for their

endurance. They run all night and never seem to tire, and, as I have said, they show no treachery. We change our watchmen every half hour, and generally three or four dogs accompany each man. Why, as an evidence that our dogs are not so bad as painted, when we get on a new watchman we never bother about the animals. The old watchman shows him the rounds once, and then transfers to him his club, which all carry. The dogs stand by and look on, and the transferring of the club satisfies them that the new man is all right, and they accompany him as quietly as well-bred dogs know how. Yes, they generally keep barking all night, but we all get used to it. I'm never annoyed, except when 'Czar' barks, unless it is necessary, and he has a peculiar voice that cannot be mistaken. When he gives warning I'm always on the alert. Would you like to see him?"

We said we would. Whereupon the Warden conducted us through his little paradise of a garden, sweet with the perfume of flowers, and wherein hung a number of canaries, in pretty cages—the feathered songsters sleeping as soundly, with their heads beneath their wings, as though they were just tired out with doing the Centennial—to an iron-barred gate that admitted one into the yard of the Penitentiary proper. Taking from his pocket a whistle such as car-drivers use, the Warden blew a blast, and almost instantly "Czar," three of the hounds and one of the curs came tearing along like a pair of horses attached to a steam fire engine and making as much noise as their throats would admit of—the cur leading. Following them came the watchman, with his short hickory staff, to whom Mr. Townsend explained the object of the visit, while a couple of beautiful black and tan terriers, either of which you could carry in your coat pocket, and which are the private property of the Warden's family, kept dashing at the gate, eager for a combat. Their frantic efforts to reach him seemed to amuse "Czar," who ceased his barking to philosophize over their foolishness. Both of them wouldn't have made as much as a lunch for him.

"Did you notice 'Czar's' peculiar ringing bark?" said the Warden. We answered that we did.

"Well, whenever I hear that bark I know there's something wrong, and the prisoners know it as well as I do, and fear it."

And then as we once more entered the cheerful sitting-room of the Warden's dwelling, he told us of the female black and tan, which panted so eagerly to fight the 'Czar,' and her many little traits. How the female bloodhound, losing one of her pups, carried it out, dug a grave, and deposited it therein, filled with earth, and, carefully padding it, returned to the rest of her little ones. And then hearing the State House bell tolling the hour, for we did hear it, new bell as it is, we bade the Warden good night, and left the faithful official in charge of those whose crimes have hid them from the general view.—*Evening Bulletin.*

AN INTERESTING INCIDENT.—One night, recently, at Boston, a patrolman had brought in a ragged, dirty four-year old gamin and his dog, the waifs having been found comfortably riding in a Red Line coach, and neither knew where nor seemed to care. The driver of the coach said the biped and quadruped got in with other passengers on Causeway street near the Eastern depot, and he did not take notice of them again until they had gone a couple of miles toward the South End.

When the officer lifted the little fellow, the canine, a very handsome, bright female, became very much interested as to what was to be done with her charge, for she seemed to feel the responsibility of a mother. On the way to the station-house she would jump up against the officer's legs, look inquiringly in his face and then at the youngster in the same manner. When they arrived in the office the actions of the child and dog were quite amusing.

The little fellow at first was very uneasy, and the dog seemed

equally disturbed. When the officers found that all they could learn of the lad was his name, Georgie Wood, they sat him down on the floor. This pleased the dog, which had stuck closely to Georgie, and the two soon commenced playing. Presently, the boy became drowsy and the dog appeared glad to lay down by his side for a nap, and they would soon have been sleeping had not Lieut. Pierce brought along part of his midnight lunch.

The child's eyes began to open as he crammed his mouth with cake, and the dog drew up closer, watching eagerly for his share, which was sure to come, for it was evident from their actions that they lived together and had everything in common. When a bowl of water was brought them, the child drank and then the dog, and the division of the supper—all they had had for the day, the boy said, was continued to the end.

The dog had throughout shown the greatest affection for the child, but when the food came his behavior was noble. For a while he took only the crumbs that fell from the little hand, not offering to touch the tempting food held close to his nose or laid down by his feet when the child drank. After they feasted they had a frolic, which lasted till they were both tired out. Then the lad wanted something to "cover them both up," and they cuddled together and went to sleep.

HOW TO KEEP A DOG.—Don't keep him tied at all hours, if any. Monotony for an animal is as tedious to bear as for a person. See that he has fresh water to which he can have access every hour. Don't leave it to Peggy or Jimmie or Peter; if you do, your faithful animal will not know what a good, pure drink is, or, at least, but seldom. Take him to walk. He loves the woods and a walk quite as well as you do. Don't overfeed him one day and neglect him a week afterwards. Show him that you love him. Be firm when he disobeys; but firmness does not mean beating. Do not let his food flavor of sameness, for he needs variety and frequent change to be healthy. Never kick a dog or allow a servant to do it. Whip him when he needs it, but first be sure that you do not need the whipping yourself. Don't think you are going to keep a dog and never have any trouble. If you expect to get along without that, buy a toy dog.

Your dog will come bounding to you sometimes with wet and muddy paws; he will bark at your friend, just when you want him to be quiet, and by way of variety he will chase a hen. But be patient; he is worth all the trouble you will have with him, for when the light of his loving eye is gone, and he is no longer at your door to welcome you, it will be a pleasure and a comfort to you to remember that you bore with his faults.

Keeping a dog tied all the time makes him savage or dull. It gives him but half a life. Before resorting to such a treatment for your dog, think whether it would be agreeable to yourself to be at the end of a chain or rope all your days.

Reward your dog with pleasant words when he obeys you. Do not allow children to tease him when he needs sleep and rest. Above all things, after your faithful animal has learned to wait your coming, and to know your step among a crowd, don't go and coldly sell him or give him to a stranger. Count the cost of his keeping before you have gained his affection.

Follow these rules and you will be rewarded by a faithful and loving companion, one who will never leave you when your fame or fortune wanes—one who will love you and serve you till death with a fond and true affection.—*Selected.*

—A recent advertisement contains the following: "If the gentleman who keeps the shoe store with the red head will return the umbrella of a young lady with whalebone ribs and an ivory handle to the slate-roofed grocer's store, he will hear of something to his advantage as the same is the gift of a deceased mother now no more with the name engraved upon it."

PIGEON DEPARTMENT.

JOTTINGS.

A couple of anecdotes are told of a late breeder of pigeons in this city, which are too good to be lost, though I would not advise any beginners to take copy from them. The said pigeon-breeder sold a number of young Tumblers to a gentleman of his acquaintance, and informed him, when it was inquired how long birds should be confined in their new home, that about three weeks would be long enough. The purchaser was about to leave, being highly satisfied with his bargain and pleased at the prospect of allowing the pigeons their liberty so soon, when he was stopped by the words "look here! here's a couple of old cocks I have no mates for; take them along too." The man was only too glad to do so, for, being a novice, he reasoned "the more the merrier," and put them in his basket with the squealers. The birds were locked up the time advised and, when let out, gladdened the owner's heart by remaining for some hours upon the roofs in the neighborhood. Soon, however, a loud clapping of wings was heard, and the old birds, which had been "thrown in" to fill up the basket, started in a bee line for home, and, naturally enough, off flew all the young ones in their wake. The old birds were of the sort known as "tollers." He visited his loft at night and it was silent and empty. Whether the birds were reclaimed and again obtained possession of we do not venture to say. We hope so; but, if the following is true, the chances perhaps are a little slim.

A disconsolate young man, who had previously purchased birds of this same breeder, once came to inquire if his fine yellow cock had returned to its former owner. The acute pigeon keeper, strewing hemp-seed in the yard, called "tib, tib, tib," and down showered the Tumblers from the eaves. As they were scrambling over one another eagerly devouring the seed, the question was put, "Do you see your birds among them?" The unpracticed eyes of the beginner were utterly unable to do so, though he thought he made a thorough examination; and he sadly and hopelessly went away. "D—ish fool! couldn't tell his own bird—I saw him all the time!" P. B.

ITEMS.

A CUNNING BEAR.—A small menagerie exhibited at a fair in a village in Ayrshire was much crowded with visitors. Among the animals was a brown bear, not shut up in a cage, but fastened by a chain in a corner of the area, which was fenced off by a slight rail, that people might not go too near him. A woman who was there with a basket selling gingerbread, however, went so near that bruin, putting forth his huge paw, clutched the basket which he quickly drew from her hand, emptying most of its contents upon the ground within the space allotted to himself. She began to make some attempt to recover her gingerbread, but the animal, offering no violent resistance, quietly lay down upon it,

and then proceeded to draw it forth piece by piece, and to eat it at his leisure. Something of reason was surely displayed by the bear in adopting this method to secure possession of the gingerbread.

DANGEROUS ATTACK FROM A DOMESTIC CAT.—One of the strangest and most persistent attacks we have ever heard of was made on Monday, by a cat upon a little girl whose name we could not learn, who with two companions had been out berrying, and had approached Mr. S. B. Branton's house, on the convent property, to obtain a drink of water. The children no sooner appeared at the door than a house cat, which had been quietly dozing in the sun, made a spring at one of the children, and with teeth and claws bit and tore the child's face and shoulders in a dreadful way. Attracted by its shrieks, Mr. Branton, who had been at work near by, ran up, and snatching the child in his arms, beat the maddened and infuriated animal off with a club. Thrice was the attack attempted to be renewed upon the same girl, and had assistance not been at hand there is no doubt the beast would have overcome the child. Mr. Branton's clothes were covered with blood.—*Chatham (C. E.) Planet.*

HARNESSING A STURGEON.—Mr. Robert L. Pell, residing near West Park, on the Hudson, has made an experiment in utilizing a sturgeon, from which he has extracted much entertainment for himself and visitors. Having caught a fine fish of the kind, nine feet long, it occurred to him that it was sufficiently powerful to draw a boat with at least one man. The fish was therefore secured until a leather and rope harness could be attached to his body, in a way which prevented its slipping back of the fins. The fish was placed in an artificial lake, about a quarter of a mile long, on the grounds of Mr. Pell.

In order to obtain the services of the sturgeon when needed, a pair of rope reins, eighteen feet long, were attached to the harness, and these were fastened to a large cork float, which swam upon the water. A boat five and a half feet long and two and a half wide, was then constructed. It could contain but one man, and in that Mr. Pell took his seat, and attached the chain at the bow to the floating cork. The sturgeon soon began to move, and the moment he realized that a further impediment existed to his movements he shot frantically ahead. The boat swayed to and fro, and the spray, dashing furiously from the prow, flew in every direction. Frequently the gunwale was an inch or two below the water's edge, but such was the rapidity of motion that the water had not time to overflow it. The lake being but seventeen feet deep, and the reins eighteen feet long, there was no possibility of being pulled under the water by the diving of the fish, and the career of the boat was uninterrupted. The sturgeon kept near the sides of the lake, and swam four times around without slackening his pace. He then rose to the surface, rolled on his back, and exposed his white stomach to the sunshine, as if to say, "I have swum long enough, and am not going any further."

Mr. Pell, satisfied with his experience, then detached the boat from the float and landed. The fish soon again disappeared. At each subsequent sail, whether by Mr. Pell or any one else, the fish would rush regularly four times around the lake and no more. He would then, as at first, regularly roll over on his back and rest.

A neighbor of Mr. Pell caught a large sturgeon, and imitated his experiment in the river. Matters worked well for a few moments, but it suddenly occurred to the sturgeon to dive. This, the river being deep, he could easily do. To the dismay of his owner, under went the cork float, and a violent jerk at the prow of the boat was a warning to jump into the stream. The boat went down, and was lost to sight for several minutes. That was the beginning and end of harnessing sturgeon as a river pastime.

ANNUAL MEETING OF THE MIDDLESEX POULTRY ASSOCIATION
AT LOWELL.

The annual meeting of the Middlesex Poultry Association was held Wednesday afternoon, Sept. 6th, in the Citizens' Committee Room, Huntington Hall, Lowell, Mass. The old board of officers was re-elected, as follows: President, Mr. Laurin Martin of Lowell; Vice-Presidents, Mr. George F. Penniman of Lowell, and Mr. George V. Fletcher of Belmont; Secretary and Treasurer, Mr. E. T. Rowell of Lowell. The Executive Committee consists of the above-named officers, and John H. Nichols, W. H. Hope, W. M. Noyes, Neil Thompson, John McQuestion of Lowell; Philander Williams of Taunton; J. Henry Symonds, Woburn; Charles H. Edmonds, Melrose; D. F. Ellis, North Cambridge; W. Frank Bacon, Lexington. Some new members were admitted, and the Treasurer's report was accepted and adopted. The annual exhibition is to be December 5th, 6th, and 7th, when a large number of premiums and special prizes will be awarded. Several of the latter have already been contributed. Very many fowl fanciers have signified their intention of being present with specimens; a band will furnish music on both evenings, and the prospect is for one of the best exhibitions yet given.

CORRESPONDENCE.

INFORMATION WANTED ABOUT PARROTS.

EDITOR FANCIER'S JOURNAL:

Can you inform me of a good remedy which will cure Parrots when they have a cold, with difficulty of breathing. If you can, please let me know through the JOURNAL. My birds are young, and I should not like to lose them. Also a remedy for lice.

E. R. KRAUSE & BRO.,
P. O. Box 508, Zanesville, Ohio.

POSTAL CARD.

DEAR EDITOR:

Good for "Postal Card,"—in your JOURNAL, No. 34, he is right. I can save ten dollars per annum by using the handy little "Postals." They are more convenient too, and I am willing to let all concerned see my offers to my correspondents for the stock

I have as a specialty. I have enclosed Cards to others for their use in answer to my enquiries, and they almost invariably would answer in a white envelope and send ten words on a whole sheet of heavy paper. Save it, save it, and give the benefit to your customers; run on a cheap scale as far as communication goes. Give us your right hand, brother "P. C."

HOLLIS CENTER, Sept. 4, 1876.

P. CARD, JR.

SATISFACTION EXPRESSED.

I am glad to say that through your exchange columns we made several exchanges, all of which were satisfactory.

WORCESTER, Sept. 10, 1876.

G. A. S.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—6,500 persons visited the Philadelphia Zoological Garden Sunday, August 27, and the receipts were \$1,972.

—A notice of a steamboat explosion in a western paper ends thusly: "The captain swam ashore. So did the chambermaid; she was insured for \$15,000, and loaded with iron."

—A writer speaking of the late Matthew Vassar, founder of the college which bears his name, says among other things that "in early life he was an oyster seller."

Doubtless then, he had often good steaks and fries in him.

—*Suspicious Mother.*—"Johnny, last Monday morning I found several long golden hairs on the lapel of your Sunday coat!"
Dutiful Son.—"Yes mother—fact is my girl put a head on me Sunday night!"

—Norway makes a very imposing exhibit of cod-liver oils.—*Ledger.*

So do some of the dealers about here—imposing lard scented with codfish, for the genuine.

—A Berks county artist has painted a bunch of onions, which exhibits strength.

A Jersey man last week looked at the painting and swore the bunch of onions was nothing but "Ingins."

—WHAT'S IN A NAME?—John Shortguts writes to the London Times, complaining that the Herald's College won't change his name to Brown. He says his sons are teased by their schoolmates and nobody will marry his daughters.

—A woman in Albany is on trial for cruelty to a cat.

The poor cat's offense was taking a cat-nap in a fine bed of catnip when she met with the broomstick cat-astrophe, which fell upon her with the force of a cat-a-ract, and the weight of a cat-a-pultic stone, falling from the Cats-kills, which, coming upon the poor cat-sauq, killed her as dead as though she had been seized with a cat-a-leptic fit in one of the cat-a-combs of Egypt, or a coal mine of the cat-a-wissaw. *Requiescat.*

—We may as well quote a bit of obituary poetry which recently appeared in a Philadelphia newspaper, because nothing more wonderful in the way of rhyme was ever constructed. Here it is: "Our little Sallie did to heaven go, Baby life so fleet is. She was afflicted with the cerebro-Spinal meningitis. 'Tis hard to loose our Sallie so, But the reflection sweet is, That she's gone where there is no cerebro-Spinal meningitis." A lovelier little bit of elegiac poetry we do not remember to have read, albeit the demise of the infant population is continually calling out that sort of thing.

—WASTE TOBACCO.—Tobacco is boiled at the Richmond Cavendish Company's bonded works in Liverpool, to make a wash for sheep. As much as 28 cwt. has been boiled down on the premises in a single day, and on one occasion the Mersey river authorities were put to much perplexity and trouble by the difficulty of sinking a mass of refuse which had been sent out to sea, and persisted in floating back with the incoming tide. There were about 50 tons of it, and days passed before it could be induced to disappear. The decoction of tobacco is adulterated with sulphate of copper, turpentine, and salt, as soon as it is cool, and the exhausted leaf partially destroyed (denicotised) with quicklime before leaving the boiling house, under the direction of the customs. This prevents either the waste or the refuse from being used in

tobacco manufacture afterwards. Each gallon of the sheep wash contains the essence of 24 ozs. of strong American leaf. The preparation, which is allowed to be sold free of duty, has found favor not only among breeders of sheep, but among agriculturalists and gardeners, as an effective vermin destroyer.—*John Dunning, in Journal of Applied Chemistry*

—The preparing of the skin of the fur-seal is at present monopolized by certain firms in London. It consists of three processes. The first, the plucking by hand from the inner side of the skin the long hairs that project beyond and hide the fur; second, the shaving and tanning of the skin; and lastly, the dyeing. How to change the light brown of nature to the deep rich brown of the furrier shops, was said to be a secret known to but one house in the world—and that in London—but a German in San Francisco has of late shown specimens of his own dyeing that compare favorably with the best imported work. The American traders receive \$10 each for the raw skins, while the American purchaser of dressed skins must pay \$40. It is proposed now to establish an Industrie in San Francisco to do the work there, thereby saving the expenses of transportation and duty, with the enormous profits the English demand. It is estimated that 150,000 skins of the fur-seal pass through San Francisco annually, from the islands of Alaska and Kamtschatka.

—THE VORACITY OF FISHES.—In your issue of June 24, you give us an engraving of fish-hooks, &c., found in the stomach of a cod, by Mr. Frank Buckland. Some of our southern streams contain voracious fish. An acquaintance of mine caught a catfish in a lake on the Arkansas River, near Little Rock, some few years since, from the stomach of which was taken the larger part of an ox liver, twenty-three hen's eggs, three puppies, and a child's shoe. Whether the fish had swallowed the child whole, and it had been digested by the juices of the catfish's stomach, and the shoe alone remained to tell the child's fate, or whether the child escaped the jaws of the voracious fish, losing only its shoe in the *rencontre*, the evidence was not sufficiently clear to determine. But that the above enumerated articles were found in its stomach is undeniable; and I think this is enough to establish the fact that the catfish is also a voracious fish.

ROBERT L. STEEL,
In Scientific American.

—THE DUBLIN LIONESS.—In the report of the council of the Dublin Zoological Gardens, there is an account of the death of one of the lionesses, in which is noted a touching incident, worthy of being recorded. The large cats, when in health, have no objection to the presence of rats in their cages; on the contrary, they rather welcome them, as a relief to the monotony of existence, which constitutes the chief trial of a wild animal in confinement. Thus it is a common sight to see half a dozen rats gnawing the bones on which the lions have dined, while the satisfied carnivores look on contentedly, giving the poor rats an occasional wink with their sleepy eyes. In illness the case is different, for the ungrateful rats begin to nibble the toes of the lord of the forest before his death, and add considerably to his discomfort. "To save our lioness from this annoyance, we placed in her cage a fine little tan terrier, who was at first received with a sulky growl; but when the first rat appeared, and the lioness saw the little terrier toss him into the air, catching him with professional skill across the loins with a snap as he came down, she began to understand what the terrier was for. She coaxed him to her side, and each night the little terrier slept at the breast of the lioness, enfolded with her paws, and watching that his natural enemies did not disturb the rest of his mistress. "The rats had a bad time during those six weeks."—*Scientific American.*

—ANIMAL LIFE.—Few men engaged in the practical walks of life are so intimately associated with nature as the farmer. He has to deal every day with a great variety of domestic animals, while at the same time he is constantly favored with opportunities to study the habits and peculiarities of animals in a wild state, in the fields and the forests. An intelligent, observing farmer is a practical zoologist. He has a wider range of knowledge, and greater mass of facts about animals, birds, reptiles, fishes, and insects, than most other men, and this knowledge is technically called zoology. Almost every kind of knowledge, when it is classified, seems to end in some *ology*. Zoology treats of animal life, and is a science of the utmost interest, but of vast extent and difficulty. The general system of classification in this great kingdom of nature, and the natural history of the more common animals, with some knowledge of their comparative structure, should be familiar to every well-educated person. The zoologist in applying his knowledge to agriculture, would, as an entomologist, discourse of useful insects, like the silk-worm and the honey-bee, their habits, diseases, and proper treatment under the varying

circumstances of their existence; or he would point out the injurious insects, the borers, caterpillars, and beetles, and inform us what to do for protection against their depredations. As an ichthyologist, he would reveal the mysteries of the new branch of farming, the breeding of fish; and as an ornithologist, he would give us an insight into the structure and habits of domestic and other birds. He should also teach the history and peculiarities of the different breeds of mammals, which have resulted from domestication, and the principles by which varieties are to be produced or preserved.—*Ploughman.*

—CAN ANTS TALK?—No one has studied the habits of "our six-legged rivals" out with being impressed by their ability to communicate with each other, and the wide range of intelligence which they seem able to convey. Information of common danger is quickly spread throughout colonies numbering many thousands, the news being brought by perhaps one or two spies. Hitherto their mode of communication has been a mystery, the most plausible hypothesis being that it was by a sort of fencing with their antennae. Thus an ant returning from a foraging expedition meets another outward bound. They stop, strike antennae together a few times, then proceed, No. 1 to the nest, No. 2 setting off on a new course and going straight to the place where No. 1 found her load. It would now appear that the striking of antennae is merely a sort of salutation, as two neighbors might shake hands, while conversation goes on by other means. At any rate, according to the report of Professor Landois to the Natural History Society of Prussian Rhineland, they are provided with a sounding apparatus resembling that of the wasp. To have implies to use; and though its pitch is generally inaudible to human ears, its range of tone may be ample for a fully developed language. We say "generally inaudible," notwithstanding Professor Landois' belief that it is always so, having more than once noticed a faint strident, hissing sound proceeding from columns of large ants when annoyed. The next thing in order is an apparatus for making inaudible sounds audible, as invisible rays are made luminous; then some enterprising student may give us a comparative grammar of formic idioms.—*Scientific American.*

—DUTCH BULBS.—The fall of the year is the proper time to plant hyacinths, tulips and crocuses, which are the chief roots known as Dutch bulbs. In Holland, where they seem to grow to greater perfection than in any other part of the world, they are raised in a sort of black soil, reclaimed by draining from the sea. This is something similar to our salt marsh mud. It may be that a little salt mixed with a sandy soil would benefit these roots in our culture, but this is a mere suggestion, which, as the lawyers say, must be taken for what it is worth.

In regular garden experience these bulbs are found to do well in any rich garden soil. In planting they are set about two inches beneath the surface, with a little litter of some sort thrown over them to keep them from being drawn out by the frost in the winter season. The named kinds are, as a general thing, much the handsomest, and then they offer one a better chance to make a nice selection of various colors and shades. It requires more labor to keep these kinds separate and to name them afterwards, and so they are more costly than the mixed unnamed kinds. As a mere matter of quality, the unnamed ones are generally as good as those which are named, that is those which are sold as first quality roots.

The growth of hyacinths in pots and glasses of water is always of interest. Few things give more pleasure in the floral line than they do. The best results in this way are obtained when the roots are planted early in the fall, and set in as cool a place as possible, so as to give time to the roots to grow before the plants are introduced to warm rooms. If brought into these warm places before they have time to root well, their bloom is rather small. Those who grow them for forcing, and in these days of winter cut flowers, they have become popular with florists for this purpose, the best results are had from roots set singly in four inch pots at this season, and the pots plunged in sand in the open ground. If not put into too great a heat when taken into the house in October they will flower by Christmas, when flowers are in most demand. Others are kept in the pots buried in sand in cellars or sheds, where they can be got at easily in the frosty weather, and in this way they can be had to flower in succession all through the winter.

When in glasses they are not plunged, of course, but it is usual to keep them some time in cellars or closets, as the roots always grow best in the dark.—*Maryland Farmer.*

—A FOSSIL DEER-TRACK IN A HUNTER'S SKULL.—While hunting in the Alleghenies in the autumn of 1875, Lofen amused myself by searching for the fossil foot-prints of animals in the rocks of the river-beds. In company with an old mountaineer, I visited,

one morning, a valley said to be very rich in these leaves of stone in the book of nature, written over by the feet of animals in the long ago. We found a large spring bubbling up from under a cliff, and flowing over a smooth surface of limestone, perhaps fifty feet in length falling at its lower extremity into a beautiful cavern half hidden by laurel and pine. On this rock are the fossil foot-prints of almost all the animals to be found in these mountains. Here are the tracks of a frightened deer sunken deep into the solid rock, and close beside them those of a bounding puma. Here a bear has left his foot-prints, and just beside them an Indian hunter followed in pursuit. My companion, seeing the interest with which I examined this pictured rock, told me that he had a deer-track in his skull. Hunting one day on the mountain, he had fired at a large buck, and as it fell, apparently dead, he threw aside his gun and approached it, armed only with his hunting knife. The deer sprang up and attacked the hunter furiously, having been only stunned for a moment, the ball striking the "beam" near the head. The day was intensely cold, the snow lying deep on the mountains, and in the struggle that ensued the hunter lost his knife, and both combatants fell over a cliff concealed by the rhododendrons, weighted down by the snow. The hunter was stunned by the fall, and the deer sprang upon him, striking him with his hoofs and goring him with his tines. As long as he would lie perfectly quiet the deer would stand over him with glowing eyes, but offering him no injury. The moment he would make the slightest movement it would again trample him under its feet. Suffering from many wounds, and slowly freezing in the snow, the hunter sought to change his position to one of greater ease, when the deer, springing high into the air, struck him on the head with all its force, sinking the hoof into the skull, and he remembers no more until he awoke to consciousness next morning in his own cabin. Another hunter, coming upon their trail in the snow, followed it down to the cliff and seeing the deer and its victim bled, ended the conflict with a ball from his rifle. The hunter recovered from all his wounds, and has roamed the mountains for years since then, in search of bear and lynx and puma, but he carries a perfect deer-track in his skull, as fairly printed as any in the rocks. J. M. McCANN.

—GLASS SPONGE UNDER THE MICROSCOPE.—Among the Japanese the sponge is known as "sea cotton." And until recently this idea of the vegetable nature of the sponge was universal. The microscope alone cast light into this darkness. The sponge is indeed an animal. It is also true that these sponge animals belong to many genera and species. The work of classification, is, however, so far as the sponges are concerned, one of great difficulty, and without the microscope it is impossible. In general terms, the sponge of the toilet is the skeleton of an immense number of sponge animals. The horny skeleton holds the sarcode or sponge flesh. This sarcode surrounds the entire structure, and, indeed, excepting the openings or tubes necessary for inhaling and exhaling, it is also the filling in of the structure. Now this sarcode is of a consistence like jelly, and would be diffident but for the fact that it contains mixed all through it little spiculate particles of a siliceous or calcareous nature, that give to the sarcode a consistency or ability to hold together, much as the hair does to the plaster through which it is mixed. And as these minute spicules have very definite forms, and these forms vary with the species, they become of great help in their determination. It is noticeable, then, that a sponge skeleton, when alive, consists of two parts—the one with which we are familiar as the sponge of commerce, and which is of an animal nature, namely, keratose or horn, and the other the spicules, or filling-in of the reticulated horny part; and these spicules are mineral, either siliceous or lime. Now the strange exception to all this is with the glass sponges: instance the familiar Japanese glass-rope sponge, the *hyalonema*. Its skeleton is all siliceous, the long fibres or threads which compose the rope or coil, also the finer structure called the head. The greater part of the head is made of very fine fibres or glass threads, and the filling-in is with beautiful spicules of the same material. The whole skeleton then is composed of siliceous.

When dry some glass slips or slides were prepared for the microscope. This was simply done by touching a slide against the paper, when the merest trace of dust would adhere to the glass. The slide was next put under the microscope. The scene presented was a vision of beauty. Forms innumerable appeared as the slide was moved slowly on the stage of the instrument. The variety of these forms was endless, although nearly all could be reduced to a few patterns, of which they were modifications. And every one of these pretty figures was transparent, for they were of natural glass. Many of them gleamed like pearls. Some of these forms were so odd, others were so exquisite! Crosses were there of indescribable beauty. Some forms there were that resembled the knightly lance of the hero of

La Mancha. Others were like feathers, and some were like churn-dashers. Some suggested snow crystals, and besides their similitude of form, they had the same sparkle too. Many, however, were of forms not easily described. As the best that could be done, we have drawn from the microscope some seventy of these *hyalonema* spicules. There are two figures among them—the one of a discoidal form, and that one of a truncated oval—which, though found among the spicules, are plainly shells of some foraminifera which have served as food to the glass sponge. The figures are all greatly enlarged, from 400 to even 1400 diameters, and some even 2000.—*Harper's Magazine*.

ZOO NOTES, NO. 29.

BY HUON.

POMPEY THE LION SPEAKS A PIECE.

(Continued from Page 423.)

I was sorry for Mrs. Ben, that she received such rough treatment at the hands—or rather feet and teeth of her lord, nor must she be called a "monster" because she made a hasty meal off the log which had been so effectually mangled. She was not hungry, as some of you supposed, but was merely following out her instinct, and performed amputation on herself that she might save her life; and she would have saved it had she been in her native jungles, where fights continually take place, and fearful wounds are both given and taken. There, self-amputation and careful licking, together with plentiful applications of saliva will set things to rights much sooner than any of your doctors can. As it was, however, the poor girl had to be put out of the way, and as she soon would have died in her confined place, I was glad you gave her poison, friend Nash, thus ending her misery, but it will be a long while before you see her like again, for she was a splendid sample of that tiger race only properly produced in Bengal, and which I am proud to own as relatives.

Reports come to me (being King of the Beasts) from all parts of the Garden that these same pretentious conversations take place in front of nearly all the cages. With some, however, it is not so hard as it is with others. There are my friends the bears, down yonder; the great grizzly whom I respect, though I am not much acquainted with him. Give him enough apples or cakes, and he don't mind what is said; or if he hears what he does not like, he can retire to his private chamber (something I am not provided with), or he can perform his gymnastic exercises, and by climbing to the top of his tree, get out of the way of the talk when it gets too "small." Now the elephant is, I confess, rather weak as regards humans, and will persist in viewing the species of both sexes, as well-meaning, harmless creatures, who flatter it for its traditional intelligence, vast size, and great physical strength. The rhinoceros is too stupid to have any opinion worth hearing; and the wolf has no opinion at all when separated from his pack,—but I hear that he is always hiding his fangs in order to remind visitors of Romulus and Remus—that story of man's invention which he does not believe himself now, no more than the other stories he creates, and then denies in half a generation after they have been created! Did they not rub out Tell, and make me the "lion" of the Swiss? If you don't believe me, go to the Lake of Lucerne and witness the carving of my effigy on the face of the huge rock. The monkey's opinion—well, I don't know what they think, or whether they think at all. There is really such a resemblance between them and many of the visitors who every day surround their cage that one cannot speculate as to what might be their opinions. One thing is certain, the monkey family holds its human imitators in considerable contempt, for there are some of them over in the house who, I am sure, are continually turning somersaults to show how upside-down most of

those same humans are in their notions, and how all the while they are talking about "advancing," they are fast developing backwards.

Only a few days ago I was exasperated beyond endurance, and had it not been for my friend Nash whose word with me is law, I should have torn up one of my floor boards in my excitement. It was just after dinner and I was dozing with my head on my paws alongside of Minnie, you see, when I heard a whispering near my bars. It came from two humanesses, one of which had endeavored to imitate my friend the camel in a tremendous *hump* placed on her back, and if the humaness had got down on all fours it would really have been a good imitation. The other had quite as successfully impersonated the peacock in the gorgeously-ness of the many hued garments in which she was decked, as well as the peacock tail—*tail* I think she called it—which she swept after her along the ground. Well these two halted before my cage, and woke me from my doze, Miss Peacock whispering to Miss Camel, "Dear me, how like!" and Miss Camel whispering back, "Yes, dear! what a wonderful resemblance." So I just turned my head on my fore paw and I saw—it almost makes me go at that plank in my floor in earnest when I think of what I beheld!—A big buttoned-up, strutting, pudding-chested, yellow-kidded, shiny-booted humanite, who had, with the help of razor, seissors, pomatum, hair parted in the middle, and various other contrivances, *tried* to make himself look like me. "What a lion face," said Miss Camel. "What a kingly leonine form!" piped Miss Peacock, and then both together, looking direct at me, "how m-a-j-e-s-t-i-c! what a wonderful resemblance indeed!" What! I resemble him? . Shade of my ancestor, slain and riddled by Samson, but this was too bad, gr-r-w-w-gr-r-w-w, and there was a swish of my tail against the bars of the cage with a crash and roar that made these "higher" animals scamper away in a convulsion of terror as though the Puma had broken loose, or the Tasmanian gentleman in black (he of the wicked name, with whom, until I came here, I never had acquaintance), was exercising his *devilish* propensity upon them. Dear me, how that roar and swish of my tail did frighten those "higher" animals, "whose eyes" they say, "have power to quell the very fiercest of the animal kingdom." And the manner of their going! ha ha, it was anything but "majestic." Anyhow, I was clear of the Peacock, the Camel, and that "fellow that looked like me," for that day.

One more growl and I have done. Why do these humans call us the "animal kingdom" and themselves only the human race, if it is not that they acknowledge our superiority? Surely a kingdom must be greater than a mere race! They call me "King of Beasts."—I know what their flattery means. How can they help it now after having so long made a "lion" of me? Wasn't I a king in the Garden of Eden? Don't I figure on the old Assyrian and Egyptian temple walls with the addition of angel's wings? Wasn't my mouth, through all the long and glorious years of the Venetian republic, the receptacle for the tremendous secrets of the awful and thrice dreaded Council of Ten? And to this day does not my form from the column of St. Mark watch over the side which ebbs and flows by the "City of the Sea?" Has not England, that nation upon whose possessions the "sun never sets," used me long as an emblem of her mighty sovereignty? How else then should they call me? But I know what their flattery means. I am praised and given all these titles because of the vanity of the humans as well as to excuse themselves for endeavoring to attain the development they practically strive after. O, I know them now! As to their somersaults and their theories I have nothing to do with them; but one of their theorists—Darwin I think he is called—claims to have been developed from an ape. Now, that fellow over there in the monkey house, who is continually turning heels over head as a mere expression of contempt for the "higher order," might give quite a different opinion. Indeed,

he might object to the proposed relationship were he to quit his topsy-turvy business for a moment and "rise to explain."

I have said that since I had been caged up here, I have learned something of these humans—many of them have improved upon acquaintance besides my friend Nash.

Many a time when I have been taking my after-dinner nap would I have been "stirred up" with the stick of some bifurcate, or have my paws tickled by the umbrella of some bifurcated, had it not been for him. Humaness Nash, I don't see much of. She it was who took my cub Rosy home to nurse. She must keep her eye on that girl! I wouldn't like her to put too much confidence in Rosy, or take her to bed with her much longer—Rosy's "sickle razors" grow very fast—or some of these nights there might be a "Nashing of teeth."

Ah, here comes our beef—no more growls to-day—I'm hungry and dinner is "metal more attractive" than "jawin' back" to humans—Thanks friend Nash for this fourteen pound piece, and my wife is equally as thankful for her twelve pounder. Come Minnie, the banquet waits, gr-w-w.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"TO EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the **Exchange** or **Want** column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

W. H. CUNNINGHAM, Chenango Bridge, Broome Co., N. Y., will exchange a few first class White Leghorn Hens or Pullets, for a good Revolver, Double-barrel Shot Gun, or good Buggy Harness. Must be new, or nearly so.

W. H. J. CHINICK, Trenton, N. J., will exchange a Skye Terrier Dog, 8 months old, from imported stock; 1 pair brown winged Turbitts; 1 pair white Fans, 3 odd Pouter Cocks, for Pouter hens, Antwerps, Carriers, (mated), and old hen Carriers, Leg Eared Rabbits, or others.

E. S. WHITING, Plainville, Mass., will exchange a few pairs of nice Black African Bantams, for a nice Double-barrel Shot Gun, or a good Silver Hunting Game Watch. Correspondence solicited.

JOHN WYKOFF, Basking Ridge, N. J., will exchange an Orange and White Setter Dog, 2 years old, well broken, warranted staunch and true on point, for a good Muzzle-loading Patent-breech Shot Gun, 11 or 12 bore. Dog fully warranted worth \$75.00. Gun to be sent on inspection. References given.

L. GORDON, Sloatville, N. Y., will exchange first-class Houdan Cockerels, and young Rouen Drakes, for Brahmas, Cochins, Bantams, White Leghorns, White-crested Muffed Polish, White Guineas Fowls, Silkies, Cayuga, or Call Ducks, a Pekin Duck, Sultans, or a Muscovy Drake.

FANCIER, Box 314, Worcester, Mass., will exchange choice White Fantail Pigeons, both crested and smooth neck, worth \$5.00 and \$10.00 per pair, for good Pullets of any breed for laying, fancy points not required, Nursery Stock, Jewellery, or others.

L. J. NEWHARD, Allentown, Lehigh Co., Pa., will exchange fine Partridge Cochins, Fowls and Chicks, and Black Bald-head Tumblers, for good Potatoes. Will guarantee satisfaction.

SMITH & BRO., Stony Brook, N. Y., will exchange fine Dark Brahmas, Brown and White Leghorn Chicks, also Game Bantams, and Aylesbury Ducks, for Spangled Hamburgs, Polish or French Fowls.

E. P. CARPENTER, Mendota, Ill., will exchange 2 Setter Pups, one 10 months old, the other 2 months old, for any Sporting Implements of value, or Stuffed Birds. (The pups are well bred.)

DR. J. THOS. RUSSLEY, Emmitsburg, Md., will exchange P. Cochins, 1 Hen and 1 Chick, and several Brown Leghorn Cockerels, for P. Rock or Houdan Pullets, or Fancy Pigeons, or others; also D. Brahma Cockerel, (Sharpless, crossed with Williams Cuck), for D. Brahma Cockerel. Same strain.

S. V. BECKWITH, Winsted, Conn., will exchange three Flying Squirrels, raised by hand, very tame, pretty pets, for trio Creve Coeur Chicks, or others. Stock must be first-class.

G. A. S., Box 702, Worcester, Mass., will exchange Scroll Saw, foot power, (\$20), and 18 Tumbler Pigeons of various colors, 3 mated pairs, rest odd or young, for P. Cochins, Leghorns, P. Rocks, D. and L. Brahmas, Bantams, Poultry, Pigeon Exhibition Coops, or others. Postal cards.

JOHN P. HOESER, Tamaqua, Pa., wants to exchange 3 good Violins, 1 Double Violin Box, 1 Bird Organ, 1 Bound Volume of Wright's Illustrated Book of Poultry, 1 Electric Battery, 1 Show Case, 1 Rifle, 2 Old Style Family Cocks, Fowl and Pigeon Exhibition Coops, 1 Rabbit Hutch, 1 Squirrel Cage, 2 Parrot Cages, 1 Red and Blue Cage, a good singer, 1 Accordion, in good condition, 1 Pool-Wheel, also Fancy Pigeons, for offers. Speak quick.

F. A. PENNINGTON, Delaware City, Del., will exchange 1 pair White Pouters, 1 pair White Carriers, 1 pair Red Carriers, 2 pairs Blue Carriers, 2 pairs Black Carriers, 1 pair Yellow Barbs, 2 pairs Black Barbs 1 Red Barb Cock, 1 pair White Fans, 1 White Ruffle Hen, for Blue or Red Fans, or Black, White, or Red Ruffles.

ISAAC VAN WINKLE, Box 13, Greenville, Hudson Co., N. J., will exchange a few Fancy Pigeons, for Brown and White Leghorn, and Plymouth Rock Pullets and Hens. My stock has won 50 first premiums in two seasons.

E. L. LEWIS, Ansonia, Conn., will exchange 100 choice Black, Red, and Derby Stags, bred for the pit, and 1 fine Setter Pup, for a Breech loading Shot Gun, light jointed Pole and Reel, or offers; also Wright Foultry Keeper, new, for Dead Shot or Sportsman's Guide.

NOVELTY PRINTING CO., Albany, N. Y., will exchange fine young male Mocking Birds, for all kinds of old second-hand Novels, or other books.

BOX 869, Rockville, Conn., will exchange a C Cornet, cost \$60, for a first-class Central-fire Shot Gun. Must be in good order, as the Cornet is.

JOHN F. HOUSER, Tamaqua, Pa., will exchange for offers Pigeon and Hen Manure, by the barrel or bushel.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

BALLOU'S TREASURY OF THOUGHT, 579 pages in cloth, good and new, will be exchanged for offers in Poultry and Pigeons, by G. A. S., Box 700, Worcester, Mass. Postal cards.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

BOOKS TO SPARE.

1. Handel's Israel in Egypt.....Novello's.
2. Haydn's Creation....."
3. Mendelssohn's Elijah....."
4. Mendelssohn's St. Paul.....Ditson's.
5. Handel's Messiah....."
6. Life and Writings of Charles Dickens, by Phebe A. Hanford.

VOL. III.

HARTFORD, SEPTEMBER 25, 1876.

No. 37.

AFTER.

After the shower, the tranquil sun ;
After the snow, the emerald leaves ;
Silver stars when the day is done ;
After the harvest, golden sheaves.

After the clouds, the violet sky ;
After the tempest, the lull of waves ;
Quiet woods when the winds go by ;
After the battle peaceful graves.

After the knell, the wedding bells ;
After the bud, the radiant rose ;
Joyful greetings from sad farewells ;
After our weeping, sweet repose.

After the burden, the blissful meed ;
After the flight, the downy nest ;
After the furrow, the waking seed ;
After the shadowy river—rest!

Southern Magazine.

(For Fanciers' Journal.)

McCANN vs. HUON.

1. Mr. J. M. McCann, in No. 35, says that "The skunk is active throughout all the year—equally so in winter as in summer."

The American Cyclopædia says :

"They (the skunks) remain in their burrows from December to the middle of February, remaining dull and inactive."

Prof. Goodrich says : "During the winter, in the cold parts of the country, these animals (the skunks) keep close house in their burrows, in a dozing, but not torpid state."—*Animal Kingdom*, Vol. 1.

2. J. M. McC. says : "The skunk is active by day as well as at night."

J. K. Lord, F. Z. S., says : "The habits of the animal are strictly nocturnal."—*British Zoology*.

Other authorities might be quoted, but space will not allow, and the above should be enough. It is a curious fact, that those who have caught their skunk, Audubon, Dr. Lyman Beecher, and the French gentleman in Connecticut—all caught them in the night. And it is another fact, that in the Philadelphia Zoo, you can have no good sight of the animal during the day.

3. Mr. McC. says : "I met one this summer in the full glare of the sun!"

Yes—an alligator was caught one day last week, in the Hackensack river, N. J., and a whale was captured a few years ago, in the Delaware, almost within sight of Philadelphia! Does that argue that the Hackensack is the home or native place of the alligator, or the Delaware river that of the whale?

4. J. M. McC. says : "No animal ever digs a horizontal hole."

Indeed! The mole, badger, mink, vision, prairie-dog, rabbit, chipmunk, and others, all dig what must be termed horizontal holes. How would you have them construct their homes? None of the animals named are such fools as to think they could live long in perpendicular holes.

5. Mr. McC. says : "The skunk in these mountains usually

lives in a hole excavated under rocks or in the hill-side, often far from the water."

The italics are mine. "Usually," means that sometimes he lives somewhere else, and "often," that he does go near the water, now and then. That is, that the skunk accommodates himself to the mountain or level plain, as the case may be. And pray, if he excavates a hole *under* the rock, or in the *hill-side*, is it not a horizontal one?

J. G. Wood says : "His (the skunk's) residence is by the side of some still pool." This is, we may presume, where the animal is not in a mountainous country.

6. Mr. McC. says : "I know of no purely carnivorous animal that hibernates."

How about the bat, the boa, the alligator, the crocodile, the anaconda, and other serpents, and the tenrec, a resident of the torrid zone, who passes three of the hottest months of the year in a state of hibernation? These are all purely carnivorous, which the skunk is not, as he makes many a good meal on fruits and nuts.

7. Mr. McC. says : "There is nothing aquatic in his (the skunk's) habits."

J. G. Wood, Dr. Lord, and others, say that "he will catch wild fowl while they are asleep on the lake or pond"! Now to do which he must have some aquatic skill and knowledge. How does my friend McC. know? assertion is not proof. It is *said* that a cat detests the water, yet upon investigation we find that most of the cat kind will, upon occasion, take to the water without fear or trembling.

8. "The authorities are right about the offensive secretion," says Mr. McC. That may be, but the doctors disagree. Dr. Lord, and J. G. Wood, do not believe the "offensive secretion" is for the purpose of defense. As for Huon, he believes still—despite Mr. McC.'s opinion to the contrary—just what he stated in "Zoo Notes, No. 35," which he will here repeat as his belief, and the reason for it.

"The badger has no such weapon, the pine martin, the weasel, the ermine, or the fisher; and yet they all live in the same localities, and feed in the same robber-fashion, and have exactly the same enemies to contend with."

I have preferred bringing authorities to bear upon the subject, rather than trust to my own eyes and observations, though I exercised both in my years of country life, when I often examined the burrows of the skunk, found the remains of many of his victims, and scented his sweet perfume, but where I was never able to see more than one alive in day-time, and that one by mere chance.

HUON.

A correspondent writing from Newark, N. J., asks, "Is immaculate spelt with one or two m's? I have looked through several dictionaries, and no two agree." That may be the case when those dictionaries are in "Spain," but when they are in the United States or Europe, that word is spelled with two m's.

MAKE HOME HAPPY.

At this season of the year, when our city homes are gathering in their truant inmates, many of whom have been drinking in energy and inspiration for their coming duties, from sea breezes and mountain air, many plans are being formed for the approaching winter. Schools are rapidly getting into working order; business plans are being laid; societies, clubs and associations of all kinds are re-uniting; new organizations are forming; the lecture season opening; entertainments and excitements are vying with each other for precedence, and the community generally is in a state of hopeful preparation which only comes in its fullness once a year.

It is, therefore, especially suitable at this time to consider the claims of the *home*—that center from which may emanate so large a proportion of life's elevating, invigorating and gladdening influences. It is doubtless, just now, a prominent subject in the thoughts of many householders. Dwellings are being renovated, cleansed, refurnished and decorated, alterations made in the style and manner of living, new arrangements formed to suit the new conditions that have sprung up. But the special point to which we desire to call attention is the *happiness* of the home. It is true, that this is but one out of its many blessings, but it is the foundation upon which they may all be built with most security. This is often lost sight of by conscientious persons, whose main desire is to inculcate virtuous principles. They often wonder that, with so much effort, they yet fail, but never dream that had they tried as earnestly to create happiness as they have to promote well-doing, these failures might have been successes. "Be good and you will be happy," is a frequent admonition of parents to children. With at least equal justice might it be said to the parents, "Make your children happy and they will probably be good." The memory of a happy home is the best preparation that can be given for the duties and cares of mature life, and its continual influence is the most successful teacher of every good quality.

Too many of us are inclined to think that happiness is a chimera which can never be reached, an illusion of the fancy which can never be realized. We put it far from us in the unattainable future; we make it consist in wealth which we cannot gain, in station which we cannot reach, in events which we cannot control. Meantime, we are daily throwing away the means that lie close around us, by which tranquil, temperate, and permanent felicity may be secured. It is no phantom of the imagination, no improbable something in the far distant future; it does not depend upon rich and costly surroundings, or a fortuitous combination of events. The happiness of which we speak may be the boon of every family, the priceless treasure of every household. It may dwell with the poor as well as the rich, the simple as well as the learned. To believe this to be possible is one great step towards securing it. We cannot work successfully without faith in the end pursued. The household that is united by family affection holds the keys of its happiness in its own hands. By loving kindness, gentle courtesy, sympathy and good will; by self-denial, forbearance and patience; by bringing the various talents and qualities of each member to bear upon the good of the whole, the foundation stones of a happy home may be securely laid.

It is sometimes affirmed that the wife and mother is wholly responsible for this duty; that it is her sole province to create a paradise, which her husband has only to enter and enjoy. This is manifestly a most unjust demand, and one impossible to fulfill. Whatever enters into the home forms the elements of its joy or its sorrow. If the husband bring home with him a clouded brow, pre-occupied thoughts, a cold and indifferent manner, or a peevish and dissatisfied spirit, it matters little that the wife has striven with all her energies to make a happy home; his entrance has poisoned it and nullified all her efforts. Both must work together to this end, if it is to be reached; both must bring sympathy,

the kindness, and good will to task; both must leave self behind as a secondary object, and devote themselves to the needs and pleasures of the rest; both must together lay plans and make arrangements according to their means for the comfort and enjoyment of the family.

In the disposal of the dwelling nothing more directly tends to promote family happiness than a cheerful, bright, inviting sitting room, or family parlor. It needs no expensive decoration or costly furniture, but only such comforts and ornaments as the taste and purse can easily supply. It should freely admit every member of the household, and give a warm welcome to their various amusements and occupations. From that room all loneliness, silence, and gloom should be banished; private vexations and petty trials should be left outside; only love, sympathy, good humor, pleasant feelings and inspiring thought should be allowed to enter. Especially should such a room be provided for the long winter evenings about to come upon us. Many a weary spirit may thus be cheered, many a restless youth be drawn from enticing temptations to pure and simple pleasures, many a seed of happiness be sown that shall develop into rich and noble fruit.

In all our plans, then, for the coming winter, let a happy home be included. As each one shares its privileges, so each one can do something to secure and to brighten it. Let all combine to this end, from the oldest to the youngest, and whatever the winter may have in store for us, of outward joy or sorrow, it will surely yield a deep and quiet foundation of happiness that nothing can destroy.—*Public Ledger.*

CROW STORY.—A correspondent of the *Portland Advertiser* gives the following interesting story:—There must be odds in crows as well as in deacons. Your correspondent, whose letter was published yesterday, describes the performance of some crows of his acquaintance who could only count one. I have known others which counted three with accuracy and ease. A farmer in Maine, who had a large cornfield in which the grain was just sprouting above the soil, was greatly annoyed by the depredations of crows, which used to congregate in great numbers in a clump of trees near the boundary wall, and after vociferously talking the matter over for awhile, swoop down among the spreading rows. This was some years ago, before farmers and others had learned that the crow more than pays its board by destroying the insects, which are much more expensive pensioners upon the agriculturist than crows; and the farmer vowed vengeance upon the corn-pullers, and laid in wait for them often and long without success. In the center of the cornfield was a small board-shanty, and the farmer noticed that when he was in this building, although he was quite concealed from the crows, they would never come down to be shot. As soon as he left the field, however, they would come down by hundreds. They could evidently count one. The idea occurred to him to test their further skill in mathematics. The next day he took his son to the shanty, and after a time sent him home, thinking that after the crows had seen one person leave the field they would suppose the danger past and come down. But they wisely kept aloof, and not until after he had himself started for home, did they venture to alight in the corn. The next day he took two persons with him with the same result; first, one person left the field, then another, the crows cawing their approval but remaining in their safe position, and not until the third person had been seen to depart from the field would the cunning creatures trust themselves within gunshot of the little building. The next day half a dozen persons entered it. Presently one of them went back across the field. The crows mentioned the fact among themselves, but kept their distance among the trees. Another person went away with the same result. Directly a third emerged from the building and disappeared. The unhappy crows, having reached the end of their mathematical rope, came down in platoons, to their deserved breakfast, unaware of the three armed enemies still remaining in the building, who at once opened fire upon the poor birds, whose great misfortune was that they were unable to count more than three. This experiment was tried repeatedly with six, seven, and eight persons, but the crows never failed to take the position that there could be no more than three, and when three departed they invariably descended to their doom.

POULTRY DEPARTMENT.

(For Fanciers' Journal.)

THE POULTRY CENTENNIAL.

It does not seem generally understood among fanciers that all the first rules and regulations relative to the exhibit of poultry, &c., at the Centennial, have been rescinded, and new ones promulgated. But such is the case. No entry is demanded. The authorities furnish coops at exhibition and feed and attendance free. Although the entries are free, no more than ten pairs or trios of one variety, from the same exhibitor will be received. They can be entered in pairs, trios, or flocks, the latter to consist of not over 12 to 15 birds. Awards will be in pairs.

All the expense the exhibitor will have is express charges on his birds. The entries from "abroad" are "numerous," over three hundred we understand are already "booked" from Canada, and more than that number will be sent from England. The "Lord Clive" is at Liverpool having the steerage fitted up with "pens" &c., and will sail early next month with a poultry man of experience in attendance. The United States—must look to her laurels—must wake up, or be caught napping. It seems to us fanciers hardly realize the importance of this great exhibition. There is yet time, provided action is taken at once, as the entries will not close until Oct. 1st.

American fanciers, you have birds that can hold up their heads in any company—send them to Philadelphia next month. Mr. John E. Diehl, the gentlemanly superintendent of the Poultry Department of the Centennial, is exerting every endeavor possible, to make the approaching display the greatest ever held in any country, and he will succeed.

All exhibitors will be given a ticket that will admit them to every place on the grounds during the entire display.

G. O. BROWN.

THE CONNECTICUT STATE FAIR.

The eighth annual exhibition has just closed at "Charter Oak Park," Hartford, and we chronicle the first prominent exhibit of fine poultry this season.

Taking into consideration the fact that it is early in the season, and for the most part the old fowls look their worst; moulting, &c., the show was a very creditable one. The judging was performed in a very satisfactory manner, by that veteran judge, and courteous gentleman, Charles H. Crosby, Esq., of Danbury.

Below we give a partial list of the premium awards on poultry, pigeons and pets:

Largest and best collection, Whitney & Woodward of Hartford. Gold medal.

Asiatics—Light Brahmas—Whitney & Woodward, 1st and 3d. J. W. Mahon, Hartford, 2d. Dark Brahmas—D. C. Waterhouse, New Haven, 1st; P. W. Hudson, North Manchester, 2d. Partridge Cochins—D. C. Waterhouse, 1st and 2d. Buff Cochins—P. W. Hudson, 1st and 2d.

Games—Black B. Reds—P. W. Hudson, 1st and 2d. Game

Bantams, B. B. Red—S. Hartwell, Washington, 1st; J. K. Camp, Winsted, 2d.

Leghorns—White—H. S. & C. A. Pitkin, Hartford, 1st on fowls, 1st and 2d on chicks. Black—S. L. Barker, Avon, 2d. Dorkings—J. K. Camp, 1st. Silver Grays—C. B. Davis, Higganum, 1st, J. K. Camp, 2d. Plymouth Rocks—S. C. Pierson, West Meriden, 1st; John Hills, Hartford, 2d.

Houdans—D. C. Waterhouse, 1st.

Polish—E. S. Brewer, Hartford, 1st for Silver muffed and bearded.

Hamburghs—J. K. Camp, 1st for Silver; J. W. Tuller, Hartford, 1st for Golden.

Turkeys—S. Hartwell, 1st on old, 2d on young; S. C. Colt, Farmington, 2d on old, 1st on young.

Ducks—Pekins—S. Hartwell, 1st; Whitney & Woodward, 2d.

Rouen—E. S. Brewer, 1st. White Crested—G. C. Washburn, Hartford, 1st.

Pigeons—Whitney & Woodward, Carriers 1st and 2d, Antwerps, 1st, Runts, 1st and 2d, Turtle Doves, 1st and 2d; E. Palmer Tiffany, Hartford, 1st and 2d on White-crested and smooth headed Fantails, 1st on Blue, Red, Black and Mottled Fantails, 1st on Ring-neck Doves.

Pets—E. Palmer Tiffany, 1st, Lop-eared Rabbits. S. C. Colt, 1st, Angoras. J. Daniels, Hartford, 1st for Fox Squirrels. A. P. Seymour, West Hartford, 1st for Flying Squirrels, 1st for Chipmunks, 2d for Red Squirrels. J. W. Mahon, 1st for Esquimaux Puppies. Geo. D. Curtis, Hartford, 1st for Java Sparrows. C. B. Davis, 1st for White Guineas.

POSTAL CARDS.

MR. EDITOR:—I was much pleased with the letter of P. Card in the Journal of Sept. 4th, in relation to no Postal Cards answered. I have been treated in like manner by some of the Fancy when making enquiries of them on postal cards as to prices of birds: a record of all such I have kept in my mind for future use.

I desire to say to all such, that I have been called on by two young friends, who have farms and ample means to indulge in the fancy, for a list of persons from whom they could purchase poultry and pigeons: and the names of those who do not answer postal cards, were omitted from the list.

POSTAL CARDS ALWAYS ANSWERED.

ALEXANDRIA, VA., Sept. 8, 1876.

THE CHICKENS OF 1876.

IN ENGLAND.

Are we to have an unusual display of chickens this season or not? Will they be more numerous or better in quality than usual? We think they will be tolerably numerous; but we very much doubt whether great strides have been made in quality. So far we have heard of nothing equal to some which were shown long ere this, in the bad season of 1875. Since the April snow we fancy that the youngsters have thriven very well, but that disastrous storm killed large numbers. Cochins have not shown up at all well so far; one or two late 1875 birds have been shown as usual, but Mr. Burnell, of Southwell, has brought out something which will place him very high again among Bufts. Mr. Sedgwick, too, has achieved his usual position with early chickens. What a pity he does not maintain it, when all the cracks appear, instead of retiring for the winter. Dorkings have not done wonders so far, but there are some promising birds in several yards we know; a few of which we have seen, but they are no advance upon previous years. Brahmas have so far dropped back, for we have not seen a single dark bird of merit; even Mr. Lingwood has failed to score yet, and among lights the chickens of a young exhibitor are the only birds, or nearly so, of any pretensions to

merit. So far we have not seen anyone else show a good cockerel, and the pullets of all are very moderate indeed. Spanish have so far confined themselves to the notorious Oundle birds, about which we need say nothing here. We have seen a number of game fowls, but a really high class cockerel of any color has not put in an appearance, and in this breed we have usually heard of something very good long ere this. Where are the Creves? Not a chicken of any kind to be seen. Has Mr. Wood retired; and will no one fill his place? Has poor Mr. Dring no successor? Will no one come to the rescue? Houdans are somehow reduced to promiscuous exhibitors. We could hardly name one real go-ahead Houdan man, where a year or two ago there were so many. These birds are too good to drop. There have been several good chickens shown, but nothing of any merit at all, we believe. Polish and Malays have put in no appearance at all. Hamburgs have been confined to a very few pens, and those chiefly golden pencilled; yet there is more excuse in this breed, as they are not hatched so early as hardier varieties. Game Bantams have, of course, made an appearance, and strangely, Mr. Entwisle is never behind with them. Schbrigts too have been winning, and we hear Mr. Leno has a large number; he is not yet worsted. Leghorns have appeared, but it is rather late; we ought to have seen a number of this precocious breed long ago. Duckwings have been winning some time; but we wonder more of them are not shown. Altogether, then, though we are satisfied that there are plenty of birds, they seem to be behindhand, and so far as can be judged, the quality is not up to the usual standard. Another month will, however, make a great difference. We shall have had the production of Rochdale, Bury, Bingley, Manchester and Liverpool in the north, and of Weymouth in the south, at all of which chickens are shown in force, and for which, we believe, the northern fanciers scour the whole district. It is a treat to visit these first great chicken shows, and compare the most minute points of future champions. There birds appear which, in many cases, stick to the top of the list the whole season, or make an impression upon the judge, which, like first love, is not easily erased; and in spite of fresh appearances, he is insensibly drawn, as it were, to the same birds show after show. Let us hope, whoever judges, the best may win. We shall jealously watch the awards, and uphold fair play, as the only means of holding together a fancy which is as ennobling in its simplicity as it is beneficial to the mind and body of the whole community.—*The Pigeon*.

(For Fanciers' Journal.)

THE POSTAL CARD AND STAMP NUISANCE.

The individual who signs himself P. CARD, evidently is not a victim to the business of breeding chickens, or we think he would not feel exactly as he does. Really he does not appreciate the situation, and we have not an unkind word for him.

Will some one of the Fancy please explain to us, and give us *solid* reasons on *What benefit is it to poultry breeders to answer postal cards?* There seems to be a large number of persons to do an extensive correspondence on P. Cards, on such subjects as "What is your lowest price for a Brahma Cock?" "What strains are your birds?" &c. We have spent a fearful amount of time, ink, patience, and postage, in reply to such innocent inquiries, but after this we *never, NEVER* hear from them again. We would like to hear from one breeder who in *aggregate* of sales from such inquiries ever received as much money as his *postage* amounted to, to say nothing of time, stock, and labor. Our idea is, if all poultry men would unite and hang on their advertisement, "*No postal cards answered,*" "*All letters of inquiry must enclose stamp for reply,*" it would more than half our time and postage be saved. It was related of the celebrated? Jim Fisk, that at one time he cut off the free passing of his railroad employ-

ees over the ferry between New York and Jersey City. On being reasoned with and informed that many of his men did not *always* have three cents *cash* for ferry fare, he closed the argument by triumphantly remarking, "*If a man hadn't got three cents, it made no difference which side of the river he was on.*" We would say to correspondents, if you haven't got three cents to spare, better not think much about buying fine poultry. But when you write us, if you would have us think you *mean business*, and are not a mere inquirer from motives of curiosity, and really wish to convey a favorable impression, when you write us put a three-cent stamp on the *outside*, and another on the *inside*, then will your pap-fed P. M. not feel it his duty to inform you that he hopes you will pay your debts before buying fancy fowls, and you will not feel the necessity of telling him to "get into his hole behind the counter and mind his own business." Then will your bright-faced boy, meeting you on your way home, not say, "Dad, the man you wrote to, asks ten dollars for a rooster," but will simply say, "Marm's got a letter for you." Then will your gentle spouse not meet you at the gate, and with a postal card between one thumb and forefinger and your nearest ear in the other, inquire in dulcet notes, whether "you are agoing to buy a ten dollar rooster or get that pump fixed?" If you have done the thing "manfashion," and enclosed stamp, you may take the letter unconcernedly *out in the barn* and read it, and if she asks "who it was from," (as she probably will,) you can inform her it's from a man who wants to build you a *wagon*. And when the rooster comes, perhaps you will tell her that Tilden or Hayes sent it, and that you feel *awful* about the \$1.60 express charge, and say to her you won't pay it, and will not take that d—d rooster anyway. But in the A. M. you can have an imaginary row with the express agent, (they are generally mean cusses anyway,) so you are obliged to pay charges after all. When she asks you for money, you will perhaps say, "Hard times, can't collect anything." But after your hens begin to lay, and your neighbors come every Sunday and hang on the fence, and squirt tobacco juice pretty much all over your backyard while admiring your new Brahma rooster, each in his turn taking home a setting of eggs, you without doubt will give the wife the egg-money, because it *belongs* to her, and when she has netted something in this way, (which is almost certain,) you will probably tell her the whole transaction, and how much smarter men are than women.

But to be serious. However convenient postal cards are when *judiciously* used, we assert that to the breeders of poultry they have been and are a downright continual curse and nuisance, and better it would have been for the fraternity had they never been issued. Correspondents are not *always* in the right, and let us say here (although Mr. A. D. Warren is not an acquaintance of ours, and the Lord knows we don't breed games) "Go in Mr. Warren; stand firm in your position. You have done the whole poultry fraternity a hearty favor by an exhibition of *backbone*. As to the 'tail' question, we don't presume to be posted; but if the man undertook to abuse you (and we fully believe he did) please hang on to that \$12. Do! Get it into specie, and every time that birds crow, *jingle it*. And when we meet you at Buffalo and Boston shows—

'Oh! yes, we all
Should be dar'—

we hope to have the pleasure of taking you by the hand and inquiring after your best health, and the specie, and the wry tails."

Some of these poultry correspondents are getting obstreperous. They threaten all sorts of things on the slightest provocation. Next thing they will kick a man out of his *poultry* society because he fails to answer a postal card. We have seen at least one instance where a prominent breeder was bullied and insulted by a poultry journal because he failed to write a "piece" for said paper.

YOUNG BREEDER.

For the *Fancier's Journal*.

PEREGRINATIONS OF UNICORN.

The buzzing engine bore me swiftly o'er hill and dale, through the waving fields of grain, past the pretty village, into the busy town. This was in the southern part of "York State."

I naturally looked around for my friend who anticipated my visit, and we were soon engaged in conversation on various topics, from "dead beats" and "frauds" exposed and being exposed, and others in perspective, to the chances of the two leading political Presidential aspirants whom we presume have been nominated by "reform within the party" and whose private lives we are daily having placed before our eyes by ambitious newspapers, and the inquisitive reporter. When our conversation had turned into the chicken channel, I tell you we made things rattle.

Now A. K. thought he had some pretty fair specimens of poultry, pigeons and rabbits. Those Hamburgs with jet black plumage and round, solid, smooth, white ear-lobes, with graceful carriage and artistic contour were beauties on which the eye could rest with pleasure, and wherever I see fine specimens of this variety I (know it's wicked) envy the owner.

His rabbits and pigeons are first-class, and his fondness for those feathered pets is passionate. But here are the Games, yes *games* (you know what that means) fit for the show or the pit; there is a lithe graceful fellow, high stationed, clear hackle, willow legs, bay eyes, perfect shoulder, straight breast-bone, no "duck-foot," neat and "handsome as a picture," proud and courageous. Black Breasted Red, long may your name wave o'er this land, and should you ever succumb to the steels of an opponent, may it be inch by inch till your life-blood has ebbed, and you die with the words "I will never say beat," thus perpetuating the proud name of your race, and leaving behind in the heart of your owner "foot prints on the sands of time."

But what is that, a Brass Back? "No, that is one of my crosses which I have named Mosby." And do you sell them for show birds? "No, they are a cross for a far different purpose, you know that Bl'k B. Red we just passed is a fine exhibition bird, and at the same time the *game*ness is there, but I don't think it would prove so strong an antagonist as this, for several reasons. The *Am. Standard* tells what birds must be to have a chance with others at the show, and if you get them beautiful and *gamey* so much the better. I have seen game-cocks which scored into the nineties, prove what is called "dead game," but many not having the natural vim of the well bred pit cock would "stand and be counted" out; now this breed is one of my crosses, as I have said, especially for the pit, and in my estimation has the necessary qualifications to make it in a majority of cases the winner, but another man breeding for the pit would have an entirely different opinion as to station and general characteristics."

Don't you think it rather absurd for a man to boast over his Game beating a "Buff"? "Well you know such fellows haven't been in the business very long, and experience is the best teacher, that even a "Buff" might whip a Game (when unwell) and even then, in due time, prove himself true to name."

Don't you think "Young Breeder" had better not boast so much over the pugilistic qualities of his Brahmas? "Yes, but don't you remember he said they could whip a "so called" Game? and you well know there are several who have "that kind," and of course, in this case, it is an easy matter to make a Game whistle under the bar in a jiffy, but since the "proof of the pudding is in the eating," when this necessary adjunct is brought to bear upon those "so called" Games, their breeders realize that they have been laboring under a delusion, and the sooner the vile things are in the pot the better for the name they are "so called" to represent.

Yes, I see, but now don't you think that the flesh of the Game is better eating than any you know, more sweet and juicy? "Yes, I do without a doubt, but tastes differ; You may like clams, I

may not; You may like tripe, I may not; You may think the Game the best eating in the world, while I might consider the Brahma much its superior." That is very true, but I don't like to see a man who keeps Brahmas, constantly lauding them to the skies, to the detriment of every other breed. If "Young Breeder" keeps any other "kind" what does he do it for, unless he considers there are *others* besides Brahmas equally entitled to merit? "Y. B." like most fanciers has a "hobby" and if he wants to sell eggs or fowls he must "sling a little ink" just to see how it will look in print, and to hear "himself crow," then he will be the better able to talk to strangers, and have a better opportunity to dispose of surplus stock; but come with me and I will show you a gentleman who keeps Games I consider of the "so-called" type, for the reasons you will soon perceive." Away we sauntered till we had reached the "so called" breeder; here in a yard were running several old cocks and hens promiscuously, and seemed as far from the name they represent as could be easily imagined.

I asked if they didn't quarrel. "Oh no! have a little spat, now and then, it's soon over, and then are very peaceable. I think I can put the spurs on those cocks and *whip any thing* in America; they have a noble lineage, and their pedigree extends to a very remote period. The man of whom I bought those fowls from which I bred, said he would put a \$1,000 on this strain, best three in five any time; now I have heard a great deal about your Tartars, Prince Charles, Strichines, Heathwoods, Claibornes, Billy Beards, Dusty Millers, Derbys, Rattlers, Hennies, and I have heard considerable about the "Repellers" of a man in this town, but all of them will have to "git up and git" when one of my fowls goes for 'em, sir; (waxing warm) my game cocks can whip any thing on the face of the earth. I know of many who think they have the true bred Game, but you just put one down in my yard, and he will have to *dust*; no use talking, gentlemen, I have got a good thing there and I know it."

We also believing there was "no use talking," for this broad world is full of just such fellows, continued our march to various other fanciers where we were most cordially welcomed, and whose fine stock we were pleased to view.

Regretting that I did not have more time to look around, but hoping to be there again, in due time, was soon comfortably ensconced in the cars, and once more whirling on my way.

IRON DURING MOULTING.

A good article to use in the water given your moulting fowls to drink is the tincture of iron. It is very handy and cheap, and should be accessible constantly during the critical time when old fowls are changing their plumage. It is strengthening, palatable, and works like a charm in its way as a stomach tonic. A tablespoonful of the tincture to a quart of water is sufficient. To be had at any drug store.—*Poultry Nation*.

—SLAUGHTER OF BIRDS FOR PLUMAGE.—Mr. Alfred Newton writes a striking protest to the London *Times* against the wholesale slaughter of birds for the sake of ornamental feathers. He quotes the proceedings of a single sale of feathers to show that to supply that sale alone 9700 herons (or egrets) must have been destroyed. All these feathers are said to have come from India last autumn. Mr. Newton observes that no country could supply 10,000 herons in a single breeding season without nearly rooting out the stock. Moreover, 15,000 humming birds and upward were included in the sale, of which 140 were of a single kind. As far as we know, none of these birds really diminished the stock of food available for man, so that in destroying them for mere show we empty the world absolutely of a certain portion of its beauty and happiness—while the beauty is certainly by no means made up in the ornamentation of feminine toilets which is thus procured. In this age of fine moralities does no one really bestow a thought on the morality of such reckless spoliation of life as this?

SPORTSMAN'S DEPARTMENT.

(For *Fanciers' Journal*.)

THE CENTENNIAL BENCH SHOW.

FRIEND WADE: Thinking your readers who were not fortunate enough to see this great display of highly bred dogs, may desire to learn something of it, and the manner in which it was conducted, I send you this hastily prepared paper for publication.

The exhibition opened, as you are aware, on the 4th of September, lasting five days. The benches were about eight feet long, and four feet wide, raised thirty inches from the ground, with projecting roofs to exclude sun and rain. Each bench contained two dogs, tied to rings in one end of the stall. The whole management, under the care of the able, courteous, and indefatigable superintendent, Mr. Charles Lincoln, of Detroit, was a complete success. Everybody was delighted with the thoroughness of the affair, and Mr. Lincoln falls in for his full share of praise. The show was crowded from the opening to the close. The sportsmen and fanciers from all parts of the country were in attendance in full force, and it was a subject of remark, the number of ladies among the sight-seers.

In addition to the medals offered by the Centennial Commission, many of the sporting papers, and individuals offered silver cups, and other valuable trophies for competition in the classes of sporting dogs. These attracted canine celebrities from all quarters, and occasioned a good deal of goodnatured chaffing on the part of their owners as to their respective merits.

Commencing in the order that the dogs were arranged on the ground, we first take up the hound class, beginning with the foxhounds: of these over fifty were on the benches, comprising representatives from three rival packs in the vicinity of Philadelphia. First in order was the "Leopard" pack owned by Jonathan Yerkes of the Leopard, Delaware Co., Pa. He showed eight couples of fine dogs. Next in order came the West Chester pack, represented by fifteen magnificent hounds, showing the finest blood and breeding. Their owner, Jefferson Shaner, is an enthusiastic fox-hunter, and captured the "Turf, Field and Farm" silver cup, for the best couple of foxhounds in the show, with his "Dandy" and "Chip."

Next comes the Marshalltown pack, owned by Frank Clayton, a veteran fox-hunter of three score and ten; he was on the ground during the entire show, his hunting horn swung to his side, with which he "woke the echoes" now and then, answered by every hound in the show in concert. Mr. Clayton owns fifty hounds and showed eight couple of good dogs, showing quality.

Of harriers, there was a small show, but good. Mr. Ahrens of Baltimore sent a very handsome pair of imported bitches that were much admired.

In the beagle class there was a good show in numbers. John E. Diehl of Beverly, N. J., sent three very nice ones, and there were several good dogs from a distance, but I am unable to give the owners' names.

Of Dachshunds there were ten on exhibition, eight from West Philadelphia, seven of which were owned by L. H. Twaddell, one ("Billy Bowlegs") by Rathyen & Trauter of Fort Richmond, and one from W. Schueller of London, England. There was a silver collar for the best dachshund of any age; it was taken by L. H. Twaddell's "Unser Fritz," eight months old.

But it was in the setter class that the competition was closest and most exciting; over three hundred setters were on show, including the best of the "blue bloods," and many celebrities among the plebeians.

L. H. Smith of Strathroy, Ontario, was on hand with the field trail dogs "Leicester," "Paris," "Llewellyn," and bitches "Petrel," "Countess," and "Victress." "Paris" won the Philadelphia Sportsman's Club cup for the best setter in the show.

The cup for the best imported English setter, between one and two years, went to L. H. Smith's (Strathroy, Ontario, Llewellyn.) There were several other imported English dogs on the ground, but the Canadian dogs were a little too much for them.

The Gordon setters were a strong class in numbers, and fine in quality; only one imported one, a bitch, appeared for competition; she is very nice, named "Loo," owned by Wm. M. Tileston of the "Forest and Stream," N. Y. City.

In the native Gordon class, however, it was hot and heavy; there were no special prizes offered for this breed, and it is not yet known who are the lucky winners of the Centennial medals. It would be invidious to particularize and mention owners, unless I could include the whole lot, which their large number and want of space forbids. I will only say that those who missed seeing this lot of Gordons, will probably never have an opportunity again to see a like number level in quality, rich in color and markings, and altogether first-class.

Dr. A. Russell Steachan, New York city, showed some stock, white, and tan Gordons that pleased me much; they looked like brisk, merry workers, and the color is just now very fashionable in England. I fancy they have a little more steam in them than the black and tan have, and look as though they can go the pace.

Another large class was the Red Irish. I noticed quite a number of the true blood red color, but the bulk were a little off in shade, showing that yellow tinge that effectually kill their chances to win on the bench. Among the imported ones was "Floss," owned by J. C. Cooper, Limerick, Ireland, and "Aileen," owned by J. K. Milner, (of the Irish Rifle Team,) Dublin, Ireland. Aileen won the silver tea service offered by the "Forest and Stream" of New York, for the best Red Irish setter bitch, and takes it home to Green Erin. The "Chicago Field Cup" goes to Rufus 2d, native Red Irish, owned by M. Von Culin, Delaware. He is a nice dog and of good color.

And now I come to the Native English class. Here the field was very large and the competition heavy. Many of the most distinguished dogs in America, put their claims for consideration; the Bismarcks and Gildersleeves were out in full force. About forty of old "Bismarck's" sons were shown; and old "Busser," eleven years old, looking hale and hearty, was here to do battle for the Gildersleeves; a large family of sons and daughters were on hand to attest the merit of their venerable sire.

The famous "One-eyed Sancho," nine years, owned by F. T. Taylor, attracted much notice from his well-known field qualities. Space prevents our noticing many fine dogs in this class. The silver mounted whip went to J. Ayres' "Glen," Capt. Clay's prize, a silver whistle, to "Bess," and the Scott gun, value \$350, for the best setter in the show, went to "Guy Mannering," bred by C. S. Raymond, and owned by Dudley Oilcott of Albany.

The Detroit Gun Club cup for the best setter from Michigan, went to John E. Long's Juno, who also took the cup offered by C. S. Westcott for the 2d best American bred, setter bitch.

The Pointers were a large class and of even quality. G. A. Strong's black dog "Pete," one of the finest dogs it has ever been our good fortune to see, came to the front for the Philadelphia Sportsman's Club silver cup, for the best pointer in the show. There was a fawn colored dog from Baltimore, whose name and owner we did not ascertain, that was very near the thing. This class numbered up to fifty, and was a very even lot throughout.

In my next I will take up the Spaniel and non-sporting breeds, and give a general glance at them. T. H. L.

ITEMS.

The St. John's papers report an extraordinary catch of seals this season, 340,050 in all. The people on the shore even had unusual luck, for the heavy winds driving the ice toward the land, seals were driven with it, the result being that in two townships, Tillamook and Fogo, the fisher folk who were unable to get to sea, made more by staying at home. All hands, women and girls with men and boys, sallied out to make prizes of all the luckless animals. The least estimate for those two places was over 50,000, valued at \$150,000.

HOW A DUTCHMAN GOT EVEN.—Once on a time there lived a jovial Dutchman, whose first name was Hanness Von Shrimpe-tiffel. He had a wife. He also had a little grocery where beer and such personal property was sold. He gave credit to a parcel of dry customers and kept book with a piece of white chalk on the head-board of the bedstead.

One day Mrs. Shrimpe-tiffel, in a neat fit, took it upon herself to clean house and things. So she did, and she cleaned the head-board, and with soap and water settled the old man's accounts by wiping away every chalk mark.

Pretty soon, before long, the old vender of things came into his house and saw what ruin his frau had wrought. Then he said: "Mein Gott, Frau Shrimpe-tiffel, what for you make a ruined man of me, I guess not? You make wipe away all dem names and figures what I owe dem fellers what's going to pay me before they get ready, and I loose more as swei hundred tollar!"

His frau left the room in fear and disgust. When she returned, he had re-covered the head-board with marks. Then said she:

"Hanness, you have make them all right again, don't it?"

"Well, meine tearer frau, I make the figures all right, but I put down some petter names as dem old fellows vot you wiped out!"

INVENTION.—Yankee ingenuity is something that cannot be solved by quadratic equations or computed by the principles of calculus. It is as puzzling as a juggler's trick, and its manifestations are as varied as a kaleidoscope. It has produced superior wooden nutmegs, and double back-acting wagon-jacks, not to mention the less important invention of the steamboat and the electric telegraph. While it has partially failed in perfecting the wonderful Keeley motor, and completely burst in discovering perpetual motion, it has more than redeemed itself in the invention, after one hundred years of persistent study and labor, and unexampled self-sacrifice, of a machine for counting eggs as they are laid. An idea of it may be gained from the following, clipped from an exchange: "It is adjusted to the hen, forming an ornament rather attractive than otherwise, thus blending the agreeable with the useful, and when an egg is laid the number is recorded on a strip of paper." It will be seen at once that, as a labor-saving machine, this apparatus has few equals. Indeed, next to the steam engine, the electric telegraph, the champagne cocktail, and the Bogarduskicker, it is the greatest invention of modern times. And then its cheapness. Even when nickel-plated and furnished

with an extra duplex, back-acting balance-wheel, it costs but seventeen hundred dollars, thus being within the reach of all. The utility and value of such an apparatus will be evident to every one who has had anything to do with investigating the conduct of hens. It is now on exhibition at the Centennial, and is attracting considerable attention. The inventor is unknown, but certain wise individuals claim that his name is Archimedes Woodcock, and that his residence is in the little village of Hoppergrass, Connecticut.

AUTUMN LEAVES.

A lady in the *Floral Cabinet* says: "That much nonsense has of late been written about autumn leaves, I know, and many failures have been caused thereby. But they can be preserved so that they will be really beautiful. I have never yet seen full instructions on the subject. My knowledge has been gained by experience, which I will give for the benefit of those who yearly, 'when the melancholy days come,' gather the bright-hued leaves, press and give them one thin coat of varnish, only to have them wither and curl up. Much depends upon the selection of leaves. Many lose their beauty. The best I know are hard and soft maple, hickory, quivering aspen, cottonwood, pear, scrub, and black and white oaks. White-oak leaves are beautiful, but fade soon. Sumac leaves and the crimson leaves of the sassafras are the very best. Leaves can be preserved by pressing, and then dipping them in melted wax or ironing them with a waxed iron. But the colors are much more brilliant when ironed and then well varnished, and will keep their colors full as long. Gather the leaves and iron them the same day, and iron them dry. A little practice will teach you how hot to have your irons. You must have a good supply of leaves, as you will spoil many. For bouquets, bunches of leaves can be kept on the twigs by careful ironing. Frames should be large, or you must select very small leaves. Large frames will give most satisfaction. They need not be put together very neatly, as the leaves will hide all imperfections. Tack strips of pasteboard on the frame, as some leaves will not adhere to wood. If medium size, very heavy pasteboard alone will do. Put in your glass and picture first, and fasten firmly with strips of muslin pasted around the edge. Put common brown glue in a large baking-powder can and fill two-thirds full of water; soak over night, then boil slowly. Have it thick and hot. Pour out a little in a saucer and dip in the lower half of the leaf, press it on the frame, leaving the upper half loose. They will curl slightly after a time and have a more natural appearance. If the frame is oval begin at the top, and finish the bottom with a rosette of leaves, having several long slender ones, like scrub oak or sumac. On square frames groups of leaves can be put on the top, bottom, sides, and corners. For the center of these use everlasting flowers, berries, or acorns.

"To preserve choice leaves, arrange on cards, or form into bouquets on heavy paper and frame. A pretty design is a basket made of cones or moss, arranged to look as if filled with leaves and ferns. It must be framed flat against the glass. This arrangement will be sure to please. Ferns can also be made into many lovely designs. They must be gummed on paper or put into books, as ironed, or they will curl. The secret of success in pressing autumn leaves lies in ironing them dry and using plenty of varnish. White is usually recommended. I prefer common furniture varnish. Leaves for cards varnish on one side, for bouquets on both sides. Frame immediately after the work is done. Give two or three coats of varnish. Follow faithfully these directions, and you will be astonished at the brilliant beauty imparted to the leaves. They can scarcely be distinguished from wax autumn leaves. Engravings look better framed in leaves than chromes, and small oval frames, or wreaths of leaves, look well hung on the long cord above large pictures. Wreaths of grasses and everlasting flowers can be hung in the same way."

EDITORIAL DEPARTMENT.

"The body of the laborer becomes bent and distorted by his daily toil, so that even in repose it remains fixed in the attitude acquired during years of exertion. So the habits forced upon us by necessity become at last so confirmed that we cannot throw them off when the necessity has ceased, the pressure which was painful at first, being continued, gives a bent to our thoughts and feelings which become a second nature, thus we see minds as well as bodies fixed in immovable and inflexible distortion."

"SELF-MADE; OR OUT OF THE DEPTHS,"

By Mrs. Emma D. E. N. Southworth, is proving to be one of the most popular works ever written. It is published complete and unabridged, in two volumes, under the names of "Ishmael" and "Self-Raised," both of which have passed into the eighth edition. We advise all in search of good books, to get these at once and read them.

DO ANIMALS REASON?

The opinion which has obtained in most minds with regard to our domestic animals as well as those which still exist in a ferine or wild state, is that they are simply "the beasts that perish," and are governed and controlled in their daily round of life by the power of instinct only. The thought that they are or could be endowed by the Creator with a thinking or reasoning faculty similar to that with which we are possessed, seems not to have been very generally entertained. So extensively has this opinion prevailed, and so little thought has been given to the subject, that we were to put the question whether animals do in reality think, or are capable of reasoning from proposition or fact to conclusion, we should in all probability be answered in the negative by a very large majority of people, and for the simple reason that they have never given to the subject sufficient consideration to enable them to arrive at any other conclusion. Let us however examine the subject from a common sense standpoint, and take the evidence of our own observation and experience. What we term instinct is "that faculty by which all animal life is directed to do whatever may be necessary for its preservation and reproduction," or "the operation of the principle of organized life by the exercise of certain natural powers directed to the present and future good of the individual." But in our intercourse with our domestic animals we are daily

cognizant of some power or faculty greater and higher than mere brute instinct, some intelligent faculty which in man we call mind, working in and through the actions which come under our observation. If then we admit that animals are possessed of such an intelligent faculty, capable of receiving ideas, why may we not also conclude that this faculty is not only receptive in its nature and operation, but also active and capable of entertaining and revolving ideas, and therefore of exercising a reasoning power. A story is told of a little bantam cock, who, standing upon the wheel of a cart, observed a young swallow fall from its nest under the eaves of a barn. The cries of the parent birds brought together a large concourse of their mates who seemed to be holding a consultation on the accident, when the little bantam flew down from his perch upon the wheel, picked up the young bird and carried it in his beak to the roof of the barn, and reaching over placed it again in the nest. Now we submit that here was an instance of deliberate thought and reason emanating from the mind of the bantam which enabled him to take in and comprehend the situation of things, to plan deliberately how the necessary relief could be applied, and to put those plans into execution. This was evidently no action on the mind without the intervention of a reasoning faculty, it was not an act of mere instinct but an act of a mind capable of receiving impressions, and determining by a process of reasoning, the necessary means to be employed in the needed assistance. No human mind could have better conceived; no human will have better executed its plans, why then should we not concede to the little bantam the same power or faculty as that upon which we should rely under the same conditions and circumstances.

Let us take another example. A gentleman of the city in which we reside owned a dog about one year old, which was the constant companion of a little boy about four years of age. On a certain day the boy got possession of a hatchet which he had been forbidden to touch, and went about hacking things generally, and endangering his own legs. After watching him for a short time the dog approached, took away the hatchet from the boy, carried it to the garden and buried it, and when the child attempted to dig it up, the dog drove him away and laid himself down over the buried hatchet, effectually preventing the boy from recovering it. Instances are again and again recorded of exhibitions of this thinking and reasoning power in the horse, dog and cat, and we are not prepared to doubt its existence in any animal, but rather to ask in the language of Dr. Clark "wherein is man superior to his humble relations whom we call animals?" "It is not," says he, "that he thinks and reasons, for animals assuredly think and reason too. It is not that he has a soul, for many of the most essential arguments which prove the existence of an immaterial principle in man, the unit in which are centered his life, thought, love and will, the unit from which they proceed will also prove the existence of a like unitary center in the animal." The horse who called his companions to assist in breaking the ice that he and they might drink of the water confined beneath; the dog who being placed by his master to guard the treasures of the poor widow, and in the darkness of the night kept his faithful watch against the attack of his own master; or the cat who pursued and returned the lost canary unharmed to its mistress or protected the sweetmeats from infantile fingers, and held the culprit a prisoner until the arrival of its mother, were assuredly governed and controlled by the same faculty which guides or restrains our frail, human natures, and sustained themselves by a conscientiousness and a sense of moral obligation which would put many of us to shame. We have said that the mind is that intelligent faculty by which we receive ideas and sensations. Now we know that animals are also possessed of a power or faculty by which they receive sensations or impressions, and the higher they range in the order of being the more intelligent they become, and the more susceptible are they to these mental impressions. This

is partially true during the period of maternity, and their offspring are affected in various ways by these impressions, not only in form and color, but also in individual markings and characteristics. The old story of Jacob and the flocks of Laban has been verified again and again in modern days. We are placed upon a plane of life above that of the animals by which we are surrounded and from our

"Austere
And calm indifference we little care
Whither they come or go, or whence or where."

But because we are thus exalted, and endowed by the Creator with larger and nobler faculties and gifts, does it follow that we should take cognizance of them only as brutes, created solely for our use, abuse or gratification, too often forgetful that they are created by the same being who gave us life, and that he has endowed them with faculties and powers suited to their enjoyment and modes of life, and for aught we know, with thought and reason akin to those by which we hold communion with the world around us, with the stars in their courses, and with him who is the great fountain of life. 'Tis true they have not the power of human speech by which they can communicate to us the workings of their minds, but does this necessarily indicate the absence of the mind? Do not they communicate to each other their thoughts, their sympathies, their heart-aches, as they relate the toils and trials they endure, or the kindness they receive from man, who, being above them in the great order of creation should be their friend and protector rather than the cause of most of their sorrow and suffering.

Dr. Stables, in a series of papers on the "Newfoundland Dog," after stating his conviction that animals have a reasoning power or faculty and are capable of being taught, says: "From a good many years' study of animal life, I have drawn the following inferences, which the reader may adopt or discard as he pleases. First, that the theory that animals are mere automatons is ridiculous and sinful.

That all animals have vital and probably immortal souls.

That the difference between the soul of man and that of a lower animal, is in degree, not in kind.

That the souls of the different lower animals also differ in degree from each other.

That different animals possess different gifts of instinctive intelligence, enabling one animal, although placed lower in the scale of existence, to perform certain actions of which another higher animal, placed under the same circumstances, would not have been capable.

That the relative size of an animal's brain to that of its body, as also its shape, determines the amount of that animal's intelligence as well as its capability of being educated.

That animals are responsible beings.

That instinct is a form of reflected intelligence transmitted from the parents to their offspring."

Dr. James Freeman Clark, in a paper on the soul of animals, says: "Life reacts upon the body. A sight, a sound, a few spoken words, a message seen in a letter, cause an immense revolution in the physical condition. Here mind acts upon matter, showing that in man mind is not merely a result but a cause. Hence men have generally believed in the existence of a soul in man. They have not been taught it by metaphysicians, it is one of the spontaneous inductions of common sense from universal experience. But this argument applies equally to prove a soul in animals. The same reaction of soul on body is constantly apparent. Therefore regarding the soul as a principle of life, or as an immaterial principle of activity, there is the same reason for believing in the soul of animals that there is for believing in the soul of man." If, then, it is true that all animal life is guided and directed by a faculty higher than mere instinct, that they are

endowed with powers of thought and are capable of reason, in short, that they are possessed of a soul differing from the soul of man only in degree. What a change should the thought work within us in all the relations which exist between us and them, and with what different feeling should we regard them and their welfare.

CORRESPONDENCE.

CORRECTION.

FRIEND WADE:—

I find in the article on Trumpeter Pigeons, page 418, No. 35, hooded-roses, instead of *hooked-roses*. Eaton's engraving should be 1860, instead of 26 years ago.

Yours truly,

MARBLE.

OFFER OF PREMIUM.

EDITOR OF FANCIERS' JOURNAL:

Please state in your paper for the benefit of the American fanciers that I offer a gold medal, value one hundred dollars, or the same amount in coin, at the option of the winner, for the best collection of high class pigeons, not less than five varieties, owned by the exhibitor at the Centennial show, such as Pouters, Carriers, Short-faced Tumblers, Owls, Barbs, Trumpeters, or any other high-class varieties.

Yours respectfully,

L. BURLINGAME, 36 DEX STREET.

NEW YORK, Sept. 16, 1876.

CORRECTION.

FRIEND WADE.

DEAR SIR:—I sent you an account of three pigeon races, which you published in your valuable journal last week. First was a race from Potstow, as I stated in my letter, distance 40 miles, and of which you have made an error and put it 50 miles. The next error you have made in the race from Paoli, which I stated to you in my former letter was won by Robert T. Moore, time, 20 min. 40 sec., and which you published in THE JOURNAL 26 min. 40 sec. By correcting these errors you will much oblige the Philadelphia Fanciers. Hoping great success to THE JOURNAL, I remain yours,

T. GRIST.

PHILADELPHIA, Sept. 12, 1876.

OUR ENGLISH LETTER.

MANCHESTER, Aug. 25th, 1876.

MY DEAR MR. WADE:

I enclose you the full set of my friend Mr. Nichols' articles on the Spanish fowl.

Some people here (who know nothing about the matter) have been very busy abusing Mr. Nichols for telling how to trim Spanish fowls for exhibition. Spanish fowls have been slightly trimmed for exhibition from their first introduction. All leading exhibitors, including one of the leading poultry judges, have so trimmed them, and no bird of this breed wins or stands a chance of winning without such trimming as is described by Mr. Nichols. And as far as it goes it is as necessary to success as the trimming of game fowls. The outcry against Mr. Nichols in this matter may be summed up as follows:—Disappointment of a few charlatans amongst exhibitors who wish all such matters kept as secret as possible, and editorial unbecome on the part of the editor of a contemporary.

A MANCHESTER FANCIER.

P. S.—Hereafter I will send a weekly letter. My spare time has lately been taken up by the Agricultural Society. We will have a big show here in two weeks.

[The articles on Black Spanish will appear as soon as we can prepare the illustrations.—Ed.]

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—**GOt HIS FOOT IN IT.**—One of Dr. Crawford's horses the other day opened his mouth and put his foot in it. Strange as it may appear, we are stating a literal fact. The horse actually caught his shoe calk in his mouth, and, but for an accidental discovery, would have been ruined. —*Warsaw Times.*

—**LIVERPOOL.**—The site of this great commercial city was formerly a marsh or pool, where the liver, a bird resembling the crane, nested and lived, and was found in no other place in England. The bird is now extinct, though specimens are preserved in the British Museum, and a counterfeit presentment in silver is worn in the cap, as a badge, by the Liverpool policemen.

—**DISCOVERY OF A LOBSTER-BED.**—Only two years ago an extensive colony of lobsters was discovered in deep water a few miles off Long Branch, New Jersey. There it has probably existed for centuries. Some of the largest lobsters now found in American waters are obtained there. The eastern fisheries whence this market formerly received, and from which New York still continues to obtain its supplies, have been so heavily and constantly drained of these crawfish, that the coast is nearly exhausted of the larger specimens, and those now taken do not often exceed three pounds each in weight.

These fish, taken off Long Branch, sometimes attain thirty pounds in weight; and one specimen, we are informed, weighed as much as forty pounds. Those of large size are apparently of great age, their heavy, black, misshapen claws not unfrequently are covered with moss, similar to that found on the backs of veteran sea-turtles. The overgrown fish are not marketable, their flesh being tough and leathery. In fact, those weighing beyond ten pounds each are very indigestible and unwholesome, and should not be eaten.

It was formerly supposed that this variety of the crustacea found upon our coast was identical with the European lobster, but naturalists have since proven that they are a distinct species. They are generally taken in traps made of willow branches and baited with offal. The contrivance attached to a cord and buoy is sunk by means of a weight. The supposition formerly entertained, that they annually divest themselves of their shell, like the crab, is untrue. The latter during the shedding period frequent the shore or very shallow water, where its enemies cannot follow, and even in this comparatively secure position it is guarded by a hard-shell crab. The New England coast, where lobsters thrive in a remarkable manner, is characterized by bold shores, deep water, and but few marshes overtopped by the tide, where the crab delights to relieve itself of its old armor and wait for its new covering to harden.

Lobsters are extremely sensitive to any jarring upon the water, and it is well-authenticated that they have lost their claws upon the concussion produced by thunder and by the discharge of a cannon. The restoration of claws thus lost, or from their frequent and desperate encounters with each other, in which the vanquished party generally leaves one of his limbs in his adversary's grasp, may be readily noticed, as the new limb but rarely attains the size of its undisturbed companion.

These crawfish are said to have abounded, previous to the war for Independence, in New York harbor, but during the war entirely forsook that water, owing, it is believed to the discharge of cannon. In the water they are extremely rapid in their movements, and when alarmed can spring to a great distance. They generally retreat to holes among the rocks and throw themselves into small openings with remarkable dexterity. They are very prolific, nearly fifteen thousand eggs being counted under the tail of a female, which did not include the large number that had not then passed from the body. The eggs are deposited in the sand and are rapidly hatched by the influence of the sun.

State lobsters are very unwholesome and often produce temporary and sometimes severe illness to those who have partaken of them; consequently it is important to select live specimens for boiling, which should be prepared for the table and eaten within twenty-four hours after. —*German town Telegraph.*

—**The infinitely complicated correlations** which exist between the organisms of every district, and which must be looked upon as the real conditions of the struggle for life, are mostly unknown to us, and are very difficult to discover. We have hitherto been able to trace them only to a certain point in individual cases, as in the example given by Darwin of the relations between cats and red clover in England. The red clover (*Trifolium pratense*) which in England is among the best fodder for cattle, requires the visit of humming-bees in order to attain the formation of seeds. These

insects, while sucking the honey from the bottom of the flower, bring the pollen in contact with the stigma, and thus cause the fructification of the flower, which never takes place without it. Darwin has shown by experiments, that red clover which is not visited by humming-bees does not yield a single seed. The number of bees is determined by the number of their enemies, the most destructive of which are the field-mice. The more the field-mice predominate, the less the clover is fructified. The number of field-mice, again, is dependent upon the number of their enemies, principally cats. Hence in the neighborhood of villages and towns, where many cats are kept, there are plenty of bees. A great number of cats, therefore, is evidently of great advantage for the fructification of clover. This example may be followed still further, as has been done by Carl Vogt, if we consider that cattle which feed on red clover are one of the most important foundations of the wealth of England. Englishmen preserve their bodily and mental powers chiefly by making excellent meat—roast beef and beefsteak—their principal food. The English owe the superiority of their brains and minds over those of other nations in a great measure to their excellent meat. But this is clearly indirectly dependent upon the cats, which pursue the mice. We may, with Huxley, even trace the chain of causes to those old maids who cherish and keep cats, and consequently, are of the greatest importance to the fructification of the clover and to the prosperity of England. From this example we can see that the further it is traced the wider is the circle of action and of correlation. We can with certainty maintain that there exists a great number of such correlations in every plant and in every animal, only we are not always able to point out and survey their concatenation in all the last instance.

Another remarkable example of important correlations is the following given by Darwin. In Paraguay, there are no wild oxen and horses, as in the neighboring parts of South America, both north and south of Paraguay. This surprising circumstance is explained simply by the fact that in that country a kind of small fly is very frequent, and is in the habit of laying its eggs in the navel of newly born calves and foals. The newly born animals die in consequence of this attack, and the small, deadly fly is therefore the cause of oxen and horses never becoming wild in that district. Supposing that this fly was destroyed by some insect-eating bird, then these large mammals would grow wild in Paraguay, as well as in the neighboring parts of South America; and as they would eat a quantity of certain species of plants, the whole flora, and, consequently again, the whole fauna of the country would be changed. It is hardly necessary to state, that at the same time the whole economy, and consequently the character of the human population would alter.

Thus the prosperity, nay, even the existence of whole populations can be indirectly determined by a single small animal or vegetable form in itself extremely insignificant. —*From "The History of Creation,"—Haeckel.*

(For Fanciers' Journal.)

FABULOUS ANIMALS.

"They wove bright fables in the days of old,
When eastern borrowed fancy's painted wings;
When truth's clear river flowed o'er sands of gold,
And told in song its high and mystic things."

Philosopher and poet in the olden time, and the bard and minstrel of the middle age, peopled forest and stream, lake and mountain, with strange wild forms—some monstrous and terrible, others light, airy, beautiful. But when the sun of civilization beamed brighter and clearer over the earth, these creatures of the land of Fairy faded and paled before its ever increasing splendor—retired to lonely caves in lonely lands, and are now seen only by shepherds on the mist-wrapped mountains far from the haunts of men and the song of the engine. The beautiful Fairy no longer dances in the ghostly moonbeams to the sound of elfin music. The treasure caves of the Dwarfs are closed among the hills, and their gems and gold are hid from the eyes of man forever. The fiery eyes of the Basilisk are harmless now, and the Hippogriff no longer soars away with knight or paladin to deeds of arms or fields of chivalry. We know that these strange creatures never

walked the earth or soared through the fields of heaven—that they are only the dream created beings of an infant race, yet we love to think of them as living animals, for they have been glorified by painter and sung by poet, and in losing them we know—“That a glory has departed from the earth.” The Phoenix with its gold and crimson plumage, feeding on frankincense and odoriferous gums—filling its nest in the palm tree with cinnamon, spikenard, and myrrh, breathing out its dying breath amidst perfume—the young arising from the ashes of the parent bird, is a beautiful conception, worthy of

“the bards sublime,
Whose distant footsteps echo
Down the corridors of time.”

The Griffin was a strange creature, having the body of a lion and the head and wings of an eagle. It built its nest of gold among the inaccessible mountains, and laid therein an egg ofagate. The old chroniclers say that its claws were used for drinking cups by the knightly Crusaders during the days of chivalry. The Seemurg was a Persian bird. It was possessed of prophetic wisdom, and could speak the language of every nation. Like the Hippogriff of the middle ages, it was the companion of heroes, and bore them through the clouds to foreign wars, or to the combat with genii or dragon. The snow-white Roc soared over the mountains of the Orient with the elephant in its talons, and the wisest men in Europe believed in its existence in the days of Galileo and Shakespeare. The Basilisk was the king of serpents, and wore on his head a royal crown. Pliny, the Roman naturalist, says, “he kills the shrubs by breathing on them, and splits the rocks, such power of evil is there in him.” The only animal that could resist his venom was the weasel—the only plant he could not wither was the rue. He was produced from the egg of a cock hatched under toads and serpents, and he immediately expired if he but heard his father croak. The Mermaids combed their golden hair on the island rocks, or sighed for human lovers in their ocean gardens. The Kraken threw its serpent arms around the storm-tossed ship and drew it under the waves of the northern seas. And so imagination filled the earth and air with animals unknown to us.

Peru, when discovered by the Spanish adventurers, was a strange, beautiful country. Inhabited by a race far advanced in civilization; the plains were filled with cities, and the mountains were glittering with golden temples of the Sun. The wild recesses of the Andes were believed by the Indians to be the haunts of an animal of wondrous beauty, which they called the *Glow Beast*. Its only eye was a blazing carbuncle, which, at night, illuminated the tropical forests far and wide, and obscured the splendor of moon and stars. It could not be captured by man, because it clouded its light with a curtain of exquisite plumage, or dazzled him with its intolerable brilliancy. Yet the Spaniards, mad with the lore of gold, searched for it everywhere, as De Leon did in the wilds of Florida for the Fountain of Youth.

In the wild legends of the Arabians it is related that their Prophet was borne into Heaven on the back of a wonderful flying animal called *Borak*. He had the body of a horse joined to a human head. His color was milk-white; the hair of his neck of fine pearls; his ears emeralds, and his eyes two sparkling hyacinths.

In the frozen northern seas, where the icebergs float like stately palaces with minarets and towers, and the snow is sometimes red as blood, or green as emeralds, and the Northern Lights shine over land and ocean with a glory greater than the sun's, lived the mighty serpent of the sea. The old Scandinavian writers say that it attained a length of 600 feet, its head closely resembling that of a horse, its eyes black and sparkling, and its mane as white as snow. The Norwegian poets compare its pro-

gress to the flight of a swift arrow, and say that it revolves sometimes in a circle around the doomed vessel, whose crew thus find themselves assailed on every side. Its hiss, they said, was like the roar of the wind when the storm was on the sea. Though such a monster never lived in the ocean, sailors of the northern seas sometimes “see, or dream they see,” it even yet. If these brief sketches of some of the strange creatures that have excited the lore, or awakened the fear of people long ago, contribute anything to the pleasure of the youthful readers of the *FANCIERS' JOURNAL*, my object is attained.

J. M. McCANN.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

For “To Exchange for Cash” or “GREENBACKS,” “WANTED A PURCHASER,” or “WANTED AN OFFER,” etc., etc., cannot under any circumstances be admitted to the *Exchange or Want* column.

For No Exchange or Want will be inserted unless accompanied with 25 cents.

JAMES H. GODDARD, Newport, R. I., will exchange 1 Hen, 1 Pullet, and 1 Cockerel, Spangled Leghorns, for Bantams, or offers.

E. H. SMITH, Hollis, Me., wishes to exchange 7 Light Brahma Pullets, 1 Cockerel, (Williams strain), 1 pair kip boots, new, for Double-barrelled Gun, good shooter. Please send offers.

F. G. PATTERSON, Portland, Me., will exchange Pearl case opera glass, in good order, that cost \$18.00, for offers; also Guinea Pig, Fancy and Common Pigeons, at their value, for Pullets of any good breed for laying. “Postals” solicited.

J. E. WILMARTH, Lock Box 95, Taunton, Mass., will exchange Light Brahma Hens for a trio of Silver Grey Dorkings. Fowls must be good; mine are the same.

HENRY LIVELY, No. 37 N. Prince St., Lancaster, Pa., will exchange 4 D. Brahma Hens, 1875 hatch, Herstines stock, for 6 early hatched Houdan pullets.

GUSTAVE HUNOLD, 46 Page St., Providence, R. I., has 1 red Irish Setter Bitch, 2 years old, well broken; 1 fine Liver and White Pointer Bitch, 7 months old, to exchange for good Double-barrel Shot Guns, Ferrets, or a good Rabbit Hound that will bark at a hole, or for offers.

G. A. S., Box 700, Worcester, Mass., has 10 vols. of *Atlantic Monthly*, in extra binding, to exchange at \$3 per vol. for offers in high-class Cochins, Leghorns, Brahmas, Turkeys, Bantams, P. Rocks, P. Ducks, Chester White or Berkshire Pigs. Make offers. Postal cards.

W. H. WILTSE, Sharon, Mercer Co., Pa., will exchange Buff Cochins, S. H. H., G. P. H., or Marble Medallion, called the Morning Glory, for Wt. C. B. P. Greves, Wt. Dorkings, LaFleche, or offers.

G. O. RUDD, Evergreen, Ala., will exchange “Wonders of the World,” “Footprint of the Ages,” “Work’s on Shortland,” numbers of *Fanciers’ Journal* from 28 to 62 inclusive, Vol. 2, 11 numbers, “Wright’s Illustrated Book of Poultry” for “Wright’s Illustrated Book of Poultry,” bound, “Doyle’s Illustrated Book of Poultry” or offers. Write.

FRED H. ANTHONY, Box 610, Hornellville, N. Y., will exchange 4 Duckwing Bantam Stags, 1 Co-k, 1 trio of Black Sumatra Chicks, 1 Duckwing Stag, 1 Black Red Stag, 2 Blue Red Stags, 1 Derby Stag, 1 Black Red Muff Stag, 1 Pile Muff Stag, all warranted pure bred, for any kind of Bantams, Fancy Pigeons, 1, or a pair of Berkshire Pigs. What offers?

B. HULSE, Box 23, Allentown, N. J., will exchange Fancy Poultry and Pigeons in variety, for Dominique Leghorn Hens or Pullets, Red Jacobins, Blue and Yellow Orbs, Barbs, Bearded Tumblers, Runts, and Trumpeters.

O. C. BARROWS, Bristol, R. I., will exchange a nice Eater Closet, nearly new, black walnut, for nice Houdan or Dominique pullets.

DR. STANTON, Milton, Pa., will exchange Black Red Games, or Sebrigt Bantams with double combs, both varieties guaranteed to be full blood, for Light Brahmas. Will give good stock, and none but good wanted.

A. C. VAN DOREN, Washington, N. J., will exchange 1 pair Red Squirrels, in new cage, for 2 good singing Canaries.

J. C. LONG, JR., 39 North 9th St., Philadelphia, Pa., will exchange 1 pair Blue Orbs, and 1 pair Blue Chequered Antwerps, good birds, for a good trio of Plymouth Rock Chickens, well grown.

P. O. BOX NO. 9, Milton, Pa., will exchange 1 pair Black Tumbler Cocks, 1 pair Brown Tumblers, 1 pair White Pouters, 1 good Revolver, seven-shooter, 1 pair Bald Heads, 1 pair Duchess, 1 Mottled Fan, for Fancy Pigeons, or offers.

E. P. CARPENTIER, Mendota, Ill., will exchange 2 Setter Pups, one 10 months old, the other 2 months old, for any Sporting Implements of value, or Stuffed Birds. (The pups are well bred.)

NOVELTY PRINTING CO., Albany, N. Y., will exchange fine young male Mocking Birds, for all kinds of old second-hand Novels, or other books.

JOHN F. HOUSER, Tamaqua, Pa., wants to exchange 3 good Violins, 1 Double Violin Box, 1 Bird Organ, 1 Bound Volume of Wright's Illustrated Book of Poultry, 1 Electric Battery, 1 Show Case, 1 Rifle, 2 Old Style Family Clocks, Fowl and Pigeon Exhibition Coops, 1 Rabbit Hutch, 1 Squirrel Cage, 2 Parrot Cages, 1 Red Bird and Cage, a good singer, 1 Accordion, in good condition, 1 Pool-Wheel, also Fancy Pigeons, for offers. Speak quick.

BOX 869, Rockville, Conn., will exchange a C Cornet, cost \$60, for a first-class Central-fire Shot Gun. Must be in good order, as the Cornet is.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering ONE BOOK for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

THE NEW STANDARD OF EXCELLENCE, OR FANCIERS' AND BREEDERS' DIRECTORY, (Rev. Neitz), and *The Cholera Preventive and Extirminator*, by A. J. Hill—T. D. Adams, Franklin, Pa., will exchange the above books for Cocker's Manual, by F. H. Gray.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

BLIND NED.

Who is dat ar a playin' ? Shucks ! I wish I wuzn't blin' ;
But when de Lord he tuk my eyes, he lef' my yeals behin' ;
Is dat you, Mahs'r Bob ? I t'ought I reco'nised your bowin' ;
I said I knowed 'twas you, soon's I heered de fiddle goin'.

Sho ! dat ain't right—jes' le' me show you how to play dat tune—
I feel like I could make de fiddle talk dis afternoon.

Now, don't you see dat counter's jes a leerle bit too high ?
Well, nebber min'—I guess you'll learn to tune her by an' by.

You's jes' like all musicians dat learns to play by note ;
You ain't got music in you, so you has to hab it wrote :
Now dat ain't science—why de debil don't you play by yeah ?
For dat's de onlies' kin' ob music fitin' for to heah.

Do you suppose, when David wuz a-pickin' on d harp,
He ebber knowed de difference atwixt a flat an' sharp ?
But any tune you called for, he could pick it all de same,
For David knowed de music, dough he didn't know de name.

Dis yeah's a splendid inst'ument—I 'speer' it cost a heap :
You ra'n't out to let me hab dis fiddle for to keep—
You ain't no use to you, sah ; for, widout it's in de man,
He kain't git music out de fines' fiddle in de lan'.

It quires a pow'r ob science for to fiddle, sah, you see.
An' science comes by natur' ; dat's de way it is wid me—
But Lord ! dat Bill ! It 'muses me to heah him talkin' big ;
You nebber heered a braggin' fiddler play a decent jig !

Dat Bill, he is a caution, sah ! I wonder now whar he
An' oder folks I knows of—yes, I wonder whar'll dey be
In hebbin, when de music's playin', an' de angels shou—
If Bill should jine de chorus dey would hab to put him out.

—*Sunday Chronicle.*

SCANDAL-MONGERING.

There are those in every denomination under the sun, engaged in the contaminating and polluting occupation of scandalizing ; not only the living, but the dead are not free from their venomous fangs. If it was in the power of God and man to convince them of their utter degradation, civilization would no longer be compelled to tolerate their presence. Our rivers and lakes would be filled to overflow with drowning, venomous scandal-mongers. Our oceans would be a moving mass of decaying pestiferous miscreants. Our atmosphere would become impregnated with a stench deadly to those not engaged in the contemptible occupation.

It is beyond the power of rational beings to comprehend the depth of debasement of the obnoxious character—vampires. What we term the dregs and rubbish of mankind are the nobility compared with those who are forever and eternally protruding their snouts into the jaws incident to life. They will proceed in a cool-scientific manner to cut and slash neighbors, holding their mutilated forms up to the gaze and ridicule of the world. This, the ignoramus will tell you, is a part of civilization. Call it if you please by its true name, heathenism of the lowest, basest kind. Of all the words in the English language there is only one that will express nine-tenths of the absurd, damnable scandal afloat in community.—*lie.*

Deep as hell itself, will the scandal-monger delve for one morsel of truth, whereon to build the superstructure of obnoxious false-

hood. Sensible people shun the loathsome, detestable, wholesale vender of scandalous and diabolical falsehoods as they would a venomous reptile. There is nothing in the wide world that will tend to dehumanize man, rendering him unfit for earth, heaven or hell, more than scandal-mongering. The slanderous class of humanity are morally, cowards ; intellectually, fools ; and socially, detestable.—*Vermont Farmer.*

A NARRATIVE OF TRAVEL IN EASTERN HIGH ASIA.

Lieutenant Colonel Prejevalsky of the Russian staff corps has written a narrative of a journey through Mongolia, the Tangut country, and northern Tibet, which has recently been translated and published in England. Colonel Prejevalsky, at the suggestion of the Russian Geographical Society, and with the support of his own government, undertook to head an expedition to northern China, and spent three years between Pekin, Lake Kobonor, the Ala-Shan Mountains, the Mongolian Plateau, and the tracts adjacent to the sources of the Hoang-ho and the Yangtze-Kiang. The term "commander of an expedition," which he applies to himself, raises a smile when we find that his subordinates mainly consisted of a young companion, Michael Pytkseff, two or more Cossacks from Lake Baikal, and a faithful dog named Faust. Leaving Kiakhita, on the Russian frontier, in a Chinese post cart, Col. Prejevalsky came to Urga, and thence via Kalgan to Pekin. Here he remained for some time laying in stores, purchasing camels, horses, guns, ammunition, and boxes to pack skins and specimens, and gaining such information about the nature of the country as Chinese indifference or open hostility would permit. From the Chinese capital he went north to Dolon-Nor, "an important place of trade," and then back to Kalgan, at which place he "re-formed" his caravan. The re-formation, however, seems to have consisted principally in the appointment of two new Cossacks and the purchase of one more camel. Here he mounted the plateau of Mongolia, and the faces of the travelers were turned to the west, and eventually to the southwest. Traveling leisurely, they came to the town of Bautu, or Poto, caught a sight of the Yellow River, made an excursion into the mountainous regions of the Ala-Shan, and had an interview with its prince of "amban," whom he describes as addicted to opium, and extremely despotic and corrupt. At this point they had hoped to reach the Lake of Koko-Nor, which was only four hundred miles distant. But want of means and an insufficient passport compelled them to retrace their footsteps all the way to Kalgan, and eventually to Pekin, for money, supplies, and ammunition, and thus refreshed and inspirited the adventurers again turned west, retraversed the Ala-Shan range, explored the province of Kansu, and reached their terminus in Lake Koko-Nor and the Shuga Mountains. Here they were doomed to experience a fresh disappointment. They were compelled by utter exhaustion of resources and loss of camels to give up all idea of reaching Lhassa, when only five hundred miles or twenty-seven days' journey from that famous but inaccessible

capital. So they turned back with heavy hearts and empty pockets; and spending a spring in Kansu, made the march over the desert of Gobi back to Urga during the heats of summer, and reached home in the month of October, 1873, after three years of arduous exploration and fatigue. Colonel Yule summarizes their results by showing that they traveled in that time over 7,000 miles of country; that they collected more than 100 specimens of animals, large and small; 1,000 specimens of birds, 80 of reptiles and fish, 3,500 of insects, and 5,000 of plants; and that without hardy frames and a resolute spirit, they must at more than one point have given up the attempt in sheer despair.

The climate appears to have presented every horrible variety, aridity and cold predominating. In Mongolia the spring must have been detestable. Ice was seen in May. Gales blew constantly, raising clouds of sand and dust mixed with fine particles of salt. At intervals came rain and hail and fine sleet. Once, when in Ala-Shan Mountains, the party had carelessly pitched their tent in the dry bed of a torrent, they were nearly washed away by a deluge. A dismal tract, called the sands of Kuzupchi, near the Hoang ho, was the acme of desolation—yellow hillocks of sand, no plants, and the only living things gray lizards. This solitude is peopled by local tradition with the departed spirits of Chinese slain by Chenghiz Khan. A similar region, but of vast extent, was the desert of Ala-Shan; so extensively as to be called *Imgeri*, or "sky" by the Mongols. In the whole of this country the stunted vegetation seemed to grow under compulsion, and to be born with the elements of decay in every blade or plant. But even this was surpassed by the plateau between the Shuga Mountains and the Baian-Kara-ula range, at the extreme point of the travelers' exploration to the west of Lake Koko-Nor. Breathing is impeded; marching is difficult; fuel will not burn, fire will not light, nor water boil; a cold winter is succeeded by a howling spring, and this by a summer of rain and hail, and it is only during the short interval of clear autumnal weather that caravans of pilgrims can accomplish a hasty journey to the capital of Thibet. No wonder that we read that the two months and a half spent in this region were the worst part of the expedition. The party lived in a *yurta*, or tent, given by the prince of Koko-Nor, which took to pieces easily, was eleven feet in diameter and nine in height, and had an opening in the side three feet square, through which the travelers crept in and out. The sides were lined with felt, and fire was lighted in an iron grate in the center. They rose two hours before midnight, boiled brick tea pure, and cooked wheaten cakes, or devoured a horrible compound of the said tea thickened with baked flour, butter and salt, tasting like soap. Then came the packing of the *yurta* and the baggage, and a march of six, seven, or twelve miles at most was the day's work. Hurricanes of sand and dust overtook them, and they were forced to halt, go through the process of unpacking, and chop up frozen meat. After all this, they stalked game under difficulties in order to supply their larder. At this time, too, their boots were worn out, and their furs were in tatters, and the whole system was so unnerved and prostrated that a good night's rest was impossible, even after the fatigue of marching and the weariness of the chase. These arctic experiences were exchanged, on the return home, for the July heat and the suffocating tornadoes of the Gobi Desert, through which they made forty-four marches with parched throats and aching heads. It was here the faithful dog Faust died, and even the camels almost gave out.

The suspicions of the inhabitants who were met with at intervals of civilization or who accompanied the author, compelled the travelers to have recourse to all sorts of expedients in order to record their observations. Mongols of an inquisitive turn of mind were told that a field-glass was of use to descry game at a distance, and this enabled Colonel Prejevalsky to substitute a compass for the "artful machine," and record the bearings of

places. In Chinese towns and villages he lost heavily by exchange, and by what he calls rascality and roguery, though we fear this process of attrition is not peculiar to Chinese money changers. At Bantu he was lodged in a filthy apartment, and mobbed by the populace and some ruffianly soldiers. At the town of Ding-hu the incidents were even more unpleasant. A mandarin, bearing a strong likeness to Mr. Borrow's Spanish alcalde who could not understand why the author of the "Bible in Spain" went up hills to see "prospects," wanted to know the object of the visit, and objected to the passport as a forgery. Then a curious official inspected all the packages, and evidently wanted to abstract a rifle and a revolver. Matters were compromised by the surrender of percussion caps and some gunpowder for two-thirds of their value. And there are other instances of Chinese pilfering, audacity and bombast. But much as the author disliked this race and their habits, he has no better opinion of the Mongols. They live in *yurtas*, or tents of felt, which would be snug and comfortable were it not for the filthiness of the inmates. Their subsistence not depending on agriculture, but on flocks and herds, they are slothful and apathetic unless roused into action by horse-racing, pilgrimage, gossiping excursions from one encampment to another, and the chase. They rarely walk; but, on the other hand, they can endure the extreme of cold for fifteen hours at a stretch, seated on their camels. They are also described as cowardly, cunning, and inquisitive.—*Selected.*

THE POWER OF KINDNESS.—A Cadiz letter says: "Notice had been posted in all the public places, that on a certain day the bull called 'El Moro' would be introduced into the arena, and that, when he should have been goaded to the uttermost fury, a young girl would appear and reduce the animal to quiet subjection. The people of Cadiz had heard of 'El Moro' as the most magnificent bull ever brought into the city, and it soon became known that the girl thus advertised was a peasant girl of Espara, who had petted the bull, and fed it and cared for it during the years of its growth. On the appointed day the vast amphitheater was filled with an anxious, eager crowd. Three bulls had been killed and dragged away, and then the flourish of trumpets announced the coming of the hero of the day. With a deep, terrific roar, 'El Moro' entered upon the scene. He was truly magnificent—a bovine monarch—black and glossy, with eyes of fire, dilating nostrils and wicked looking horns.

"The picadores attacked him warily, hurled their banderillos (small, dart-like javelins, ornamented with ribbons, and intended to jade and infuriate). The bull had killed three horses off-hand, and had received eight banderillos in his neck and shoulders, when, upon a given signal, the picadores and matadores suddenly withdrew, leaving the infuriated beast alone in his wild paroxysms of wrath. Presently a soft, musical note, like the piping of a lark, was heard, and directly afterwards a girl not more than 15 years of age, with the tasteful garb of an Andalusian peasant, and with a pretty face, spring into the arena, approaching the bull fearlessly, at the same time calling his name, 'Moro! Moro! Ya voy!' At the first sound of the sweet voice the animal ceased his fury, and turned toward the place whence it came, and when he saw the girl he plainly manifested pleasure. She came to his head and put forth her hand, which he licked with his tongue. Then she sang a low, sweet song, at the same time caressing the animal by patting him on the forehead, and, while she sang, the suffering monarch knelt at her feet. Then she stopped and gently removed the cruel banderillos, after which, with her arms around 'El Moro's' neck, she led him toward the gate of the torril."

A New York paper announcing the arrival of a vessel says: "The only passengers were T. B. Nathan, who owned three-fourths of the vessel and the captain's wife."

POULTRY DEPARTMENT.

CHICKENS FOR PROFIT.

A gentleman of our acquaintance at New London, Conn. has recently been keeping a debit and credit account with a yard of about twenty fowls, consisting of Leghorns and Asiatics. The feed for the time (about six months) cost \$2.75, during which time the hens laid five hundred and forty eggs, which, at 25 c. per dozen amounted to \$11.25. Who says that keeping chickens is not a source of profit?

SWELLED CROP, OR CROP-BOUND.

A correspondent enquires "what can be done for a fowl when its crop is swollen and distended to thrice its ordinary dimensions?"

This is a common occurrence with over-fed, or carelessly fed birds in confinement. The remedy is very simple, and where the fowl is a valuable one, it should be applied, seasonably. An attendant should hold the afflicted subject firmly, while another person should make an incision at the under edge of the crop-skin, transversely, and of sufficient length to clear the crop out clean. The trouble is caused by undigested food that has caked in the crop. After emptying the sack, the skin of this opening should be closely sewed up again, with fine white (not colored) silk; and if the bird be placed by itself afterwards for a week or two, and fed upon soft food, it will usually recover without further trouble.

If neglected beyond a certain time, this stoppage in the crop will destroy the fowl, of course. But the suggested remedy is so easily managed, that if the hen is worth saving, the experiment may be made successfully by any one who can use a needle and silk handily.

CHICKENS THAT HAD A NURSE.

This summer two of my hens took a freak such as I have never before known, and which may indicate that fashionable ideas and follies are extending into quarters where least suspected. One of my Brahma hens was lamed early in the summer. She had fourteen chickens, all hatched by herself. As soon as her lameness appeared, a small black hen, part Bantam, took the young chickens and divided the responsibility with the mother. The nurse did the scratching and providing for the family, including the mother, while the latter, as the largest, did the brooding. The way the Brahma made the little black nurse "stand around" at feeding-time was comical enough. The Banta's humility was like that so often required and so seldom seen in human servants. The strange copartnership continued until the chicks were turned off by both mothers to shift for themselves.

Another hen, also part Brahma, with whom I had put eighteen chickens, also took as nurse a small hen of the common barn-yard breed. This hen did not hire a nurse until the chickens were nearly three weeks old, and she had already begun to lay a new litter of eggs. The nurse, as in the other case, did most of the work, the other mother hen eating the seeds and insects that the

smaller one had scratched from the ground. Neither of the nurse hens took any notice of the chickens until the brood was two or three weeks old. Neither was mother to any of the chickens except by adoption, and I could not see that any compulsion was used.—*Rural New Yorker.*

OLD EGGS.

The yolk of eggs will keep for many years after the whites have disappeared. This has been tested by experiment.

The *Manchester Mirror and American* says that twenty four years ago a gentleman in a suburban town packed several eggs in a box of oats, and put them in an out-of-the-way place in the attic of his store, with the intention of testing their condition at the end of a year's time. Forgetting all about them, nearly a quarter of a century had passed, when, in overhauling the contents of the attic, he came upon the box in its hiding place. Upon breaking the eggs, the shells of which appeared sound, the whites were found to have totally disappeared, while the yolks remained dried and quite hard. The oats in which the eggs were packed were sound as the day when they were put in the box, and the gentleman has planted several, with a view of discovering whether they retain their vitality. In the box was found a memorandum giving the date on which the eggs were deposited.

For the *Fancier's Journal.*

"SOY" FOR POULTRY.

When making up my stores for winter's use, I fill all the spare bottles with what I call "soy," for the use of my poultry. I use it as seasoning to the "mixed feed" of meal that forms their morning meal in winter, and I have found it so good for keeping fowls healthy and in a profitable condition, I feel as if I could scarcely keep poultry without it. Now, when tomatoes are cheap, is my time for making it. As I have profited by the experience of others as recorded upon *THE JOURNAL's* pages, so I give my experience in return.

I cut into thick slices twenty-four ripe tomatoes, and put them over the fire in a kettle that will hold as much again. While they are cooking I chop fine, eight large onions, adding them to the mass in the kettle. I also add six spoons best cayenne pepper, four spoons ginger and two spoons salt, and I allow all to simmer together for an hour at least, when I add two quarts of vinegar. Permitting the mass to "come again to a boil," I move the kettle to the back of the stove, when I let it cook slowly for an half hour longer. This I put away in bottles, using corks sealed, if I have the corks. If corks are not at hand, I use beef's bladder, cut into bits and tied over the bottle's mouth. If I have not that at hand, I fill the bottles to within an inch of the top with soy, filling the remaining inch with melted beef or mutton tallow.

If I have a plentiful supply, I add a tea cup full to the morning's meal for fifty fowls two mornings in the week.

FARMER'S WIFE.

(For *Fanciers' Journal.*)

POSTAL CARDS.

You know I am always contrary, and therefore will not be surprised if I do not quite agree with your "P. Card" correspondents. Still I do not disagree for the sake of being contrary, but for the purpose of ventilating the subject a little for the good of some, like myself, who do not agree with the aforesaid writers. Now I perfectly agree with them that in many cases it saves time and money—that no one should write anything about his stock or prices that he should not be willing the whole world should see. Particularly is this true at the present time in the poultry business, when some of our heaviest guns in the fraternity are treating us to

their "little unpleasantnesses." I also quite agree with them that for a man to offer goods for sale, and then ask his customers to pay him three cents to tell them about his wares is also rather a cheeky transaction to say the least, if you look at it with the eyes of a purchaser rather than those of a seller.

All these, and some others I perfectly appreciate, and yet am opposed to Postal cards, except in cases where acknowledgments come in, when brevity is a virtue.

But if I want to purchase stock, either to breed from or exhibit, I want to know all about it. For exhibition it is not so important, for then you want something to win honors, which when worn, stand in the light of "borrowed plumes." But when it comes to purchasing breeding stock it is a very important matter as on its selection, depends our future success, and, I claim that I, at least, cannot fully describe what I want on a postal, nor can any one fully satisfy my inquiry on one. No doubt "A" can ask the price of a trio of chickens on a Postal card, and "B" can give a price in the same manner. Because if "A" should think so little of the subject as to ask a general question, "B" could give him a general answer, for he would argue at once that "A" did not mean anything, or did not know what he really did want, and therefore did not require a very particular answer. Now in writing this I do not allude to inquiries for circulars that can be made as well by P. card as any other way. Nor do I mean such general questions as may be asked in that way. But I do mean that I cannot buy *what I want* nor sell what a customer may want by P. card correspondence only, and am also satisfied that most breeders and purchasers feel as I do. And while on this subject let me say for the benefit of those who do use them: I am not refusing to answer inquiries by P. card or to P. cards, for I always answer them just as readily as letters, but I would advise all who use them, to *write with ink*, give P. O., State, and County, and also the name of the writer. I have received cards written with a pencil, so completely rubbed off that I could not decipher a word. I have also had them without either name of writer, P. O. address, County, or State, and have now on my desk more than one hundred such cards that I presume the writers of which are *cussing* me for not answering. Again, I say, I do not believe in imposing return postage on an inquirer for my goods, but will be only too happy to answer all inquiries whether by letter, or P. C. at my own cost, when the inquiry is for my stock. But when it comes down to a matter of a purchase or sale, I do not believe in the use of a P. C., because I do not think there is territory enough on the back of one to ask or answer questions intelligibly on, and would advise all to use letters in such cases.

I did mean to sign my name to this at the outset, but will adopt the plan of the other, and subscribe myself

P. CARD, SR.

AN ASTONISHING EGG STORY.

It is very well known that John W. Corning is Sergeant at Arms of the New York State Senate. Last winter he attended the session of the Legislature for the first time, and though almost continually absent from home, he, with the assistance of his accomplished wife, discovered a new and wonderful process for producing chickens from eggs without artificial heat or the kindly ministrations of the parent hen. Mrs. Corning, knowing well John's partiality for toothsome cakes, and the many dishes of which eggs from a part, prepared to greet him with a good dinner every time he came home. In order to carry out her designs, it became necessary to have fresh eggs, and therefore during the fall a large quantity was packed away in salt, and carefully placed in the dry part of the cellar. From time to time during the winter the eggs were taken out and used. The long convalescence of the Senate, without a holiday, just before its adjournment, kept John sometime from home, and it was resolved to keep

the rest of the eggs until he came to stay, there being no fatted calf in the neighborhood. Finally he came, and with him news of a final adjournment of the session. The eggs were then brought forth, but on examination it was found that nature had been at work in the salt, and had made some advance toward incubation, quite enough to render the eggs unfit for culinary purposes. As the season then was becoming quite warm and house-cleaning was in order, the debris which had accumulated during the winter, including the eggs which were left, were sent away and deposited on the east side of a highway running out of the village, between the canal and creek bridges. Here, amid coal ashes, the contents of straw beds and other accumulations, the eggs were left and thought no more of for the time being. But there was life in that mass as will be seen. Close adjoining this place of deposit, Mr. Tappenden, who lives at the south end of the canal bridge, milks his cows, and one morning, while so engaged, heard a chicken crying, the cry coming from the rubbish. On going there he found a little fellow calling for his dough, which he took home and fed. A few mornings after he found several more, and for a week thereafter went regularly to the place and carried away newly hatched chickens, until he had procured a large brood, nearly all of them doing well. There was a mystery about the case, and only last week the real truth came to light. Mr. Tappenden has now a fine flock of spring chickens, and he told the writer that he expected to take the premium at the fair next week on artificial hatching, though he said the honor properly belonged to John W. Corning—*Rochester Express*.

COUNTY FAIR AT MERIDEN, CONN.

BY OUR STAFF CORRESPONDENT.

The Meriden Poultry Club at this place, imbued with the "spirit of the fancy," have made their maiden effort in the way of an exhibition of fine poultry at the Agricultural Fair. Having just purchased from Mr. James Shepard, about one hundred of his patent exhibition coops, a large room in the public hall was arranged for the reception of the fowls, and in a few hours every coop was filled. They made a splendid display, and it was the general remark that there was not a poor bird in the hall. During the three days of the fair the room was crowded nearly all the time, and in the evening it was almost impossible to get through the crowded aisles. We were told that many birds were sold at remunerative prices. The exhibits were not confined to a few breeders, but each member of the club seemed to desire to do his part. Thus the eleven entries of White Leghorns bore the names of seven different breeders. The judging was performed by that prominent breeder of White Leghorns, J. Boardman Smith, assisted by Jacob Lockrow, of Meriden.

We note the following awards:

Brahmas. Light—Elijah Loy, 1st and 2d. Dark—Levi E. Coe, 2d. *Partridge Cochins*—J. McCall, 2d.

Leghorns. White—W. B. Hall, 1st; Elijah Loy, 2d. Brown—E. J. Crawford, 1st; J. McCall, 2d. Dominique—W. W. Mosher, 1st; E. J. Crawford, 2d. Black—W. A. Reed, 1st and 2d.

Plymouth Rocks. S. C. Pierson, 1st and 2d.

Am. Dominiques. C. P. Ives, 2d.

Houdans. W. A. Reed, 2d.

Black Spanish. Levi E. Coe, 2d.

Black B. R. G. Bantams. C. Loeffler, 1st.

Ducks. Pekins—W. S. & H. E. Savage, 1st and 2d; Aylesbury—John Thorrett, 1st; Common—John Thorrett, 1st.

China Geese. Almon Andrews, 1st; Common—N. S. Baldwin, 1st; Elijah Loy was awarded first premium for collection of Pigeons; 1st on Ferrets; also, 2d on Lop-Eared Rabbits. L. Bridsey, 1st on Lop-Eared Rabbits, and 1st on Newfoundland

Puppies. E. J. Lewis took 1st on Angora, and 1st on English Rabbits.

Miss Allie. E. Castelow was awarded 1st premium for pair of White Rats.

All things considered, the exhibit was a grand success. The Club is in a flourishing condition, has over sixty active members. The officers are C. P. Ives, President; J. P. Parker, Treasurer; L. P. Chamberlain, Recording Secretary; E. E. West, Corresponding Secretary. They propose holding a "grand exhibition" the first week in January, at which time they hope to have a large number of entries, and will make every effort to make it an object for breeders to bring out their "prize-winners." We predict for the new society a long, and prosperous career. At some future time we will give a few "points" we learned there, and a description of some prominent yards. Many of the breeders have been to large expense to procure good birds, and have built fine and substantial houses. We hope to be able to visit them again ere long.

Before leaving the hall we wended our way to the second floor, and here we beheld a dazzling array of exhibits. Prominent among them at the right we came very nearly breaking the tenth commandment as we gazed upon the splendid display of the Wilcox Silver Plate Co. What with the handsome combinations in flower stands and vases, elegant designs in water pitchers and castors, and those charming jewelry cases, it certainly made one almost wish he were wealthy for about ten minutes. Following down the tables, the handsome show of bronzes, from the Bradley & Hubbard Co., attracted a great deal of attention and at the lower end of the hall, the sweet tones of the Cimbella and other choral organs, exhibited by the Schoniger Organ Co., of New Haven, held a large audience in breathless enchantment. Passing to the other side we find the exhibit of piano stools, manufactured by Mr. E. D. Castelow. They were very handsome, and of every style, pattern and value, some thirty-three styles being shown. Mr. C. interested us greatly in his vivid description of his factory, and at some future time we hope to be able to accept his kind invitation to visit him. A large wreath, some six feet in circumference, composed of sixty different varieties of seeds, and encased in an elegant frame, was a center of attraction. It was a result of the patient labor of Mrs. Castelow. The floral display was large and profuse, that furnished by Mr. Henry S. Forbes being very prominent. There were many other exhibits worthy of note, but time and space forbid, at least I fear you will say so. In closing, we must return thanks to the genial officers of the society for the many courtesies received.

AN INFERNAL MACHINE

Is said to have been recently invented somewhere in the south, called "the torpedo chicken," which was lodged in poultry-houses where night fowl-thieves were occasionally found prowling about, for the purpose of blowing the intruders to pieces—smashing arms, heads and legs indiscriminately.

I would not apologise for this class of offenders by any means, but I can not discover the justification in this sort of butchering maneuver, since it can hardly be thought just, by any reasonable being, that a fowl-thief should be murdered, or have an arm or leg blown off, for this offense.

The thievery is a wrong, and it should be punished. But I see no sense in committing a far greater wrong, by such foul means as is suggested through the use of this "infernal machine," which a late southern journal asserts "went off" in somebody's hen-house the other night, and in the morning they found a man's hand shattered from the wrist, lying near the chicken-house door.

Those who are compelled to resort to such severe measures as this to protect their poultry, will sleep, I should say, with a much

more quiet conscience if they go out of the business, altogether. All the chickens in the town where this injury occurred were not worth a human limb; and the injury done was both irreparable and heartless, as I look at it.

Proper guards against depredations in our fowl-houses by night or by day are well enough, and there can be no valid objection urged against reasonable cautionary measures. But the man who would smash the limbs or head of a fellow-being, in this way for such an offense, possesses the spirit to commit any other deed of harshness that his ill temper might suggest; and is by far too ill-natured ever to become a good poultry fancier. This is my judgment, and I charge nothing for the frank expression of it.

GEORGE.

IMPORTATION.

WARREN, MASS., Sept. 21, 1876.

DEAR EDITOR:

I received to-day a very fine trio Yellow Duckwing Games from J. C. Cooper, Limerick, Ireland. They arrived in good condition, and are the finest I ever saw.

Yours very truly,

C. S. LINCOLN.

Not having heard from the debating societies in relation to the conundrum, "Why do hens always lay eggs in the daytime?" Hans Schneider says: "Because at night they are roosters."

THE KING OF ALL CATS.—Talk about cats, says the London *Telegram*, none of them equal Cato, the recently deceased, the property, when alive, of Mrs. Stevens Rogers. The animal lived twenty years, lacking one month, and when he departed, was mourned for by a large circle of friends. Cato was a religiously inclined cat. Told, "Cato, it's time you went to bed," his catship walked solemnly to the chair or stand, and placing his paws over his face to shade his eyes from the glare and glitter of a sinful world, engaged, apparently, in earnest devotions.

Mrs. Rogers is an old lady and rather feeble. Cato used to go to call her up in the morning, would wait around until she was ready to go down stairs, and then would mimic his mistress in the manner of her descent. Mrs. Rogers was compelled to steady herself by leaning against the balusters; the cat regularly went through the same exercise; but upon getting within three or four steps of the landing he would spring clear down at a leap, and then look around in a way that said distinctly: "Why don't you come down in that way?"

Mrs. Rogers one day fainted, and attention was called to the fact by Cato, who ran to the old lady's daughter and succeeded by pulling, and pushing, and crying to call her from another part of the house to the mother's assistance, probably this being the means of saving the latter's life.

There used to be kept in the house a little box in which from time to time were deposited pennies for procuring food for Cato. Cato understood the arrangement, and would watch over his pile carefully as could any little boy, manifesting anxiety whenever the supply of cash ran so low as to be suggestive of short rations. If the box of coppers gave out altogether, Cato knew enough to go to the next pocketbook. Cato would allow the canary to hop around upon his back, and would play at "catch-paw" with it upon the floor.

When Capt. Rogers died the cat manifested the utmost grief, and would sit and watch the portrait of his deceased master exactly as if he saw a resemblance between it and him. James, a son of Mrs. Rogers, came home, and one day concluded he would have a smoke. He purchased a pipe and tobacco, and laid them on the table, at once interesting exceedingly Cato, who commenced calling "Papa, papa," as he used to do when Capt. Rogers was still alive. A comb was set apart for the cat's use, as a matter of fun, and daily Cato came to have his toilet made by some member of the family.

When finally he was taken sick the neighbors of Mrs. Rogers used to come in to see him; and when at the very last Cato saw he was going, he raised himself up in his bed, waved an adieu to his friends, and sunk back into the sleep from which he never fairly woke.

PIGEON DEPARTMENT.

(For Fanciers' Journal.)

OUR ENGLISH LETTER.

SOUTHPORT, ENGLAND, Sept. 9th, 1876.

MY DEAR MR. WADE:

A prominent fancier writes me as follows: "One of my pigeon pens seems to be infected with roup; birds in that pen are always subject to it. A yellow discharge comes from their nostrils and mouth which is very difficult to cure. What should I do with it? and how should the birds be treated?"

I will answer the above questions through THE FANCIERS' JOURNAL, hoping my letter may be of some use, as the above subject has troubled almost every fancier, especially in the fall of the year when pigeons and fowls are moulting, or about to moult.

First of all, the house must be made quite secure against damp and drafts—without these precautions no cure can be found. There must be also a supply of pure air, and to get pure air without drafts, the room should not be too low over head for the number of birds kept in it.

To disinfect the room after the above conditions are secured, thoroughly scrape out every particle of dirt and dust. Then with a whitewash brush wash over the whole of the floors, walls, and ceiling, and the inside and outside of all boxes with hot water with which there must be mixed when hot, a quarter of a pound of carbolic acid to every three gallons of water.

Next make a wash as follows: take unslaked white lime enough to make two gallons of whitewash; mix one-fourth of a pound of flour of sulphur with crude petroleum oil to the consistency of a thin batter; put it in the bucket with the lime, add two gallons of water, boiling from the kettle; add three ounces of carbolic acid after the wash is made, and again thoroughly wash the place with this wash; and give the place a third coat of whitewash, made of lime and water only, on the third day after the second washing. The first two washings should succeed each other as quickly as possible. The first washing with carbolic acid and water should by no means be omitted, as it penetrates deeper than a thicker wash, and destroys infection and the eggs of insects, which are too deep for the thicker wash to reach.

The carbolic acid used should be the common fluid acid, such as is sold to use on ships, at an English shilling or twenty-five cents a pound. The "carbolic powders," "disinfecting powders," &c., generally advertised, are weak preparations of a little acid mixed with burnt clay, air slaked lime, venetian red, &c. &c. I propose to give what my experience has proved to be the best modes of treating the diseased birds, by next steamer.

Yours truly,

A MANCHESTER FANCIER.

PIGEON EXPRESS

At Eureka, recently Mr. Fitch, the operator at the Atlantic and Pacific Telegraph office, sent by stage to Tybo, a common tame

dove or pigeon, with instructions to attach a message to it and turn it loose immediately on the arrival of the stage at Tybo. The next morning the bird was found in its cote in this town, having returned some time during the night. On one of its legs was a string, but the paper upon which the message was written was gone, having probably been pecked off by the bird. The distance between the two places on an air line is about eighty miles. There is no telegraphic communication with either Tybo or Belmont, and Mr. Fitch intends to procure a number of regular carrier pigeons to work between Eureka and those places. It is a novel operation in this country, but we can perceive no reason why it should not prove a successful one.—*Cal. Express.*

ITEMS.

There is an experiment on foot and print newspapers without ink.—*Ex.* Some people think they can be printed without money, we should judge, by the slow way they pay their subscriptions.

RARE FISH.—Mr. Lovell of Yarmouth took in his weir last week a rare fish, which was shipped to Wood's Hole. It was called by the professors a *Tarpon*, or Jew fish. It was five feet long, was estimated to weigh fifty to sixty pounds, and had scales two or three inches in diameter. It was of a silvery color, except the head and back, which were of a darker hue.

CORN-COBS AS FIRE-LIGHTERS.—Corn cobs are extensively used in Europe for fire-lighters. They are first steeped in hot water containing two per cent. of saltpeter, and after being dried at a high temperature, are saturated with fifty per cent. of resinous matter. These lighters, which are sold at from three to four dollars per thousand, are employed with advantage and economy in private houses and for lighting furnaces.

An ingenious device is practiced in Cochin China for the capture of eels, which consists in cutting pieces of bamboo as thick as the arm into sections of about three or four feet in length, the divisions of the interior being broken out, with the exception of the one at the end, which forms the bottom of the snare. At the entrance is placed a slight grating of bamboo, and some bait, either of fish or earth-worms, is introduced into the interior. The bamboo is then laid at a slight depth in the mud, and the eels enter the hollow tube, in which they can scarcely move, and cannot turn themselves, and are consequently taken captive. The bamboos are taken up every morning, and the eel, which holds on very firmly to the interior, is pulled out by means of a strong hook.

THE COMMON HOUSE-FLY.—We take the following from the *Catholic Times*: The familiar house-fly (*musca domestica*) is apt to be considered an unmitigated pest. It is, therefore, time to call attention to some recent investigations of a chemist which go to bear out the pious axiom that every thing has its use. This observer, noticing the movements of flies after alighting, rubbing their hind-feet together, their hind-feet and wings, and their fore-feet, was led to explore into the cause, and he found that the fly's wings and legs, during his gyrations in the air, became coated with extremely minute animalculæ, which he subsequently devours. These microscopic creatures are poisonous, and abound in impure air, so that flies perform a useful work in removing the seeds of disease. Leanness in a fly is *prima facie* evidence of pure air in the house, while corpulency indicates foulness and bad ventilation. If these observations are well-founded, the housekeeper, instead of

killing off the flies with poisonous preparations, should make her premises as sweet and clean as possible, and then, having protected food with wire or other covers, leave the busy flies to act as airy scavengers.

♦♦♦

The other evening, a young lady abruptly turned the corner and very rudely ran against a boy who was small and ragged and freckled. Stopping as soon as she could, she turned to him and said: "I beg your pardon. Indeed I am very sorry." The small, ragged and freckled boy looked up in amazement for an instant; then, taking off about three-fourths of a cap, he bowed very low, smiled until his face became lost in the smile, and answered, "You can hev my parding, and welcome, miss; and yer may run agin me and knock me clean down, an' I won't say a word." After the young lady passed on, he turned to a comrade and said, half apologetically, "I never had any one ask my parding, and it kind of took me off my feet."—*Indianapolis Herald*.

♦♦♦

RARE COLLECTION OF BIRDS.—Robert T. Barker of New Bedford has a remarkable collection of birds. The list includes California valley quail, plum-head paroquets, Madagascar paroquets, Australian love birds, white Java sparrows, common Java sparrows, chestnut finches, zebra finches, bobolink, African lone bird, African weaver-finch, African fire-finch, Nonpareils, English chaffinches, East Indian wax bills, a female cutthroat finch, English sparrows and linnets, Tomikeno finches, a number of mule birds, being a cross between goldfinches and canaries, chaffinches and canaries, and linnets and canaries; English siskins, African gres-beaks, German and Western Island canaries, Brazilian cardinals, Virginia nightingale, European bulfinches, East Indian silver bills, Jamaica parrot, and Cinnamon canaries. In the water of the room where they are kept is a good-sized eight-sided aquarium, containing gold and silver fish, horn-pout and shiners, and surmounted by a fountain covered with a large glass globe, in which cork-balls are continually tossed up by the action of the water. Another room contains a number of cages and perches, where are kept Cuban blackbirds, Australian mottled paroquets, a Florida grackle, robins, East India "mino" Brazilian and African parrots, Australian white cockatoo, and western and a Florida fox squirrel, the latter so tame that he will sit in his master's lap and permit himself to be fondled. A Mexican ant-eater completes the list of these strange pets.—*Boston Transcript*.

FLY-CATCHING RATS.—Mr. C. B. Odell, at his hotel on Front street, says the Newburgh (N. Y.) *Telegraph*, is the happy owner of a fly exterminator, which for thorough work is unsurpassed by anything we have ever seen. In one of the windows, fronting on Front street, where samples of his wares are occasionally shown, a rat began several weeks since to make sly visits, and secure a good meal as often as he came by catching the many flies which are on the panes of glass. He grew very expert at it, and though at first quite shy, soon became emboldened when he found he was not disturbed in his foraging expeditions, and would pursue his business not at all intimidated by spectators who were only separated from him by a pane of glass. He obtained entrance to the window by gnawing a hole through the wooden base, coming from below. For weeks he has pursued his fly-hunting business undisturbed. One Sunday one of the waiters discovered him in the act of introducing a friend or member of his family to his foraging ground. The new comer was very shy, and only put his head through, while the old *habitué* tried to coax him to the window. He would catch a fly, gravely hand it to his friend, who would as gravely eat it, and look for more. By degrees he lost a little of his fear, walked out, and soon became an expert in the new business. Either one or both may be

seen almost any day by any one who may be patient enough to wait for their appearance a short time. It is certainly a very novel sight and well worth a few minutes' time to see.

♦♦♦

STUDY OF BOTANY.—No study is more charming, and few are more useful, than that of botany. It ought to be taught in every school, and to every class that has passed beyond the mere rudiments of an education, especially in every farming district. Every teacher of a district school ought to be able to teach it practically.

The science of botany teaches the student the structure of plants, their mode of growth, their various forms and names, and their useful or injurious properties. In its applications to agriculture, it reveals the diseases of vegetation, and often their causes and remedies; unfolds the reasons for many of the processes of the horticulturist, such as hybridization and artificial fertilization, and the numerous modes of propagating by extension and by seed; explains how plants feed and grow, and are improved for special purposes; and tells the origin and habits of cultivated plants and weeds. Botanical knowledge requires no costly apparatus, is easily acquired, and is of great value to the farmer.

If the teacher is competent, it is the easiest thing in the world to interest the young in this pursuit. We hope the time is coming when all the children in our public schools will be taught to know the names and properties of all the natural objects that come under their observation daily, when they will be taught to observe, to investigate, and to think. This knowledge would constitute the most useful and the most precious part of all their education.

—*Ploughman*.

SAGACITY OF ELEPHANTS.—How THEY CONDUCTED THEMSELVES IN THE GREAT IOWA STORM.—Howe's circus was showing at Indianola when the storm of the Fourth came on, and, because of injury to the railroads, was compelled to remain there until the track was temporarily repaired, on Friday evening. Then the circus started for their next place of exhibition. When about eight miles out, one corner of the bridge gave away, and three cars, containing animals, ran off the track and turned over into the mud very gently. The first car contained horses, the second an elk and a camel, the other three the five elephants. The small animals were easily liberated, but the elephants were all in a heap. To remove them the car was cut away, exposing the tops of the unwieldy animals' backs. Then was exhibited the intelligence which marks these half human brutes. They obey every command of the keeper, crawling on their knees, turning on their sides, squirming like eels, and assuming more wonderful and novel positions than was described on the show-bills. When released from their perilous position, there was not a scratch upon them, and no school-boy ever gave more emphatic expressions of relief from confinement than did those elephants. They tumbled, swayed back and forth, and did everything but talk.

The remaining distance to the city was made overland, and a happier crew never started on than were those animals. The cool breezy atmosphere, and the bright moonlight were all-inspiring. As the bridges were gone at each stream, the elephants took fresh enjoyment of their liberty. At no time were they obstinate or disobedient, but seemed to realize the situation. On arriving at Des Moines, railroad cars had to be procured, which was not easily done, as ordinary cars are too low. Some were finally found, which was about one inch higher than the tallest elephant's back. They were brought alongside and the platform properly placed, when "Jack" noticed that it was a strange car, seized the door frame with his trunk, gave it a vigorous shake and then tried the floor. Satisfied that it was strong he marched slowly in the car, placed himself lengthwise, gave a rocking motion, and humped up his back. A bolt overhead hit his back, and he marched straight out of the car. "It's no use," said the keeper, "he won't go back there again." The ribs which supported the roof were removed, the elephants closely watching the operation. When this was done "Jack" went in, swayed the car, humped his back, found everything all right, trumpeted his satisfaction, and went to eating.

EDITORIAL DEPARTMENT.

CONNECTICUT STATE FAIR—CORRECTION.

Our report of this show in last week's Journal, gave Mr. D. C. Waterhouse the credit of taking 1st and 2d on Partridge Cochins, whereas 1st on both young and old was awarded to Mr. P. W. Hudson, of North Manchester, who also exhibited some extra choice Dark Brahmas.

DISEASES OF DOMESTIC POULTRY.

As we go to press, Barnham's new book "Diseases of Domestic Poultry" is laid upon our table. For lack of time we leave its review until our next number. It will be mailed post paid by us to any address upon receipt of fifty cents for edition in paper covers, or seventy-five cents, bound in cloth.

CORRESPONDENCE.

GAME COCK.

MR. EDITOR:—I would ask Game Fanciers, "through the Journal," what we are to understand by the term *Game cock*. Can any one tell.

GREENHORN.

SHOW AT NORWICH.

JOS. M. WADE, ESQ., FANCIERS' JOURNAL:

DEAR SIR:—At the New London County Agricultural Society's show held at Norwich, Conn., Sept. 19th, 20th, and 21st, I was awarded 1st prize on Dark Brahma fowls, 1st prize on Black Hamburgs, 1st prize on B. B. R. Game Bantams, as you will see by list of awards which I mail you to-day.

Yours very truly,

WM. H. RATHBONE.

UNCASVILLE, CONN., Sept. 25th, 1876.

A NEAT CHICKEN HOUSE.

BRAHMIN, Sept. 12th, 1876.

FRIEND WADE:

I am very busy building an addition to my large chicken house, and I calculate it's going to be about the neatest thing in the country. The addition is 30 x 20; 1st story nine feet in the clear; has two tiers of pens 3 x 6, sixteen to the tier. Shall have an elevator to get into 2d story, where I shall have eight large pens,

and if necessary, large exhibition coops on top for single birds. I have plenty of glass, but the whole can be warmed by the stove in the main building if necessary.

Two of the leading fanciers were here on Monday last.

Hoping you will do well; Yours truly,

YOUNG BREEDER.

RESULT OF ONE EXCHANGE.

EDITOR FANCIERS' JOURNAL:

I have been an interested reader of the Journal for over two years. In all that time every correspondent who has referred to the Exchange column has cuffed it without mercy, while not a word of good-will or thanks for its favors, has appeared in its behalf. With your permission I will give my experience which is on the side so seldom heard from.

Some time in the winter I noticed that Dr. J. L. Connelly (Vice-Prest. Ill. State Poultry Association) of Harristown, Ill., wished to exchange some fine poultry for a fine dog. Having a magnificent young St. Bernard that I had no further use for, I made him an offer. Owing to various causes, the chief of which was the exorbitant price of the dog (as he considered) the exchange was not consummated until July 1st. In Journal of June 5th, was an account of one of the dog's exploits in taking care of a drunken boy. Now I certainly wish to cast no reflection on the Doctor's temperance proclivities but he at once concluded that that was the dog he wanted. Accordingly in a few days I received a small car load of his prize-winners, which were all that his pen or my fancy had painted them, and more too. To say that he was pleased with the dog would be drawing it entirely too mild. Judging by his letter I would say he was frantic, his wife delighted, his children delirious, his neighbors happy, and the whole village wild with enthusiasm. The dog was unanimously chosen President of their Fourth of July celebration, the Doctor, Vice-President, and the honors were even reflected away back on your unworthy scribe as the following testimonials received will show, viz., one demijohn of old bourbon, expressage pre-paid, one invitation to lecture, one order for chickens, two requests for autographs, and it is whispered that the Doctor's youngest neighbor bears a part of my name.

Perhaps you think this a great hullabaloo about a dog-trade and so it is, but I want the readers of the Journal to know that one fair, square exchange, with which both parties are pleased, has been brought about by the

EXCHANGE COLUMN.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—FERNS FOR MATTRESSES.—Every country neighborhood has woods which are full of ferns and brakes, which usually die and go to seed without doing any good, save as a gratification to the sense of sight. The softer parts if stripped from the stems and dried in the sun, retain their toughness and elasticity for a long time, and are said to be superior to straw and husks, and even to "excelsior," for stuffing mattresses. The ticks, when filled, should be firmly stitched with a mattress needle, using strong linen twine, and making the intervals between the stitches an eighth of a yard.

—THE CAL. BOTANY COMING.—A correspondent of the Santa Barbara Press writes from San Bernardino county as follows: At Crafton, one of the most desirable inland retreats for invalids in this southern country, we find a delightful group of sojourners from all parts of the world, and among them those enthusiastic botanists, Prof. Lemmon and Dr. Parry, who are searching every canon and hillside and scouring the very desert to hunt out any unknown individuals of the California flora. They are generously remembering the Santa Barbara college in their collections. We were interested to see in their hands a recent letter from Dr. Asa Gray, assuring them that the long promised work on the botany of California was receiving its last touches, and would soon be in the hands of the printer.

A WINGED WORD.

It was but a little word
Yet it took wings,
Like unto living things,
And flew away;
But one dark day,
Mid gloomy clouds and rain,
"The word" came back again
Like any bird.

Came back to trouble me;
But not alone;
My winged word had grown
Into a sentence,
And brought repentance
For a spoken thought,
That had but wrought
Me misery.

Words are like thistle-seed;
Mind what you sow,
And where your blossoms grow.
When once they've flown
On wings of down,
Across the fertile field,
A harvest they will yield:
The warning heed!

—SEAWEED AND CELERY.—It is probably a matter of curiosity to some, what is done with those large wagon-loads of sea-grass which are to be seen moving into the country, about this time of the year. Their design is to cover celery. A coating only six inch deep will protect the plant from the most intense frost. Celery raisers all around Boston use large quantities of this weed, which costs to deliver about \$4 a ton. During July and August is the best time to procure the material, as it seems old Neptune mows his fields then and the waves wash the hay, if it may so be called, upon the beaches in unlimited quantities. It is used also to some extent for compost, containing, as it does, soda, iodine, and other valuable ingredients.

—BITE OF THE RATTLESNAKE.—A post-office agent traveling in Texas, tells of the successful use of the gall of a rattlesnake as an antidote for the bite of that reptile. In the case spoken of relief was almost instantaneous to the patient, who was writhing in paroxysms of great pain, rapidly swelling and becoming purple. A friend of the writer, who spent several years in California and New Mexico, saw the same remedy successfully used among the Indians in the latter country. In one instance an Indian's dog near the camp was bitten in the nose by a large rattlesnake. The Indians immediately opened the reptile and administered the gall. The cure was rapid and effectual.—*St. Augustine (Fla.) Press.*

—INHABITANTS OF MAMMOTH CAVE.—In addition to its eyeless fish, the Mammoth Cave furnishes a beetle which is totally blind; two varieties of eyeless spiders, one brown and the other white; a blind centipede with very long hairs, by which the creature guides itself, and a blind crawfish. Regarding the last of these Dr. Telkamp remarks that "the eyes are rudimentary in the adults, but are larger in the young." Prof. Hazen caught a specimen "with the eyes well developed."

In reviewing these facts Mr. A. S. Packard says: "It seems difficult for one to imagine that our blind crawfish was created suddenly without the intervention of secondary laws, for there are the eyes *more perfect in the young than in the adult*, thus pointing back to the ancestors unlike the species now existing. We can now understand why embryologists are anxiously studying the embryology of animals to see what organs or characteristics are inherited, and what originate *de novo*, thus building up genealogies, and forming almost a new department of science.—comparative embryology in its truest and widest sense."—*Scribner.*

—REPTILES IN NEWFOUNDLAND.—As a natural and somewhat curious feature, it is mentioned that the island of Newfoundland, though abounding in game, is not infested with reptiles. The absence of snakes and toads in Ireland, for many years has been the subject of comment; but we believe the peculiar condition of Newfoundland has attracted but little general attention. Captain Chearley writes:—"In Newfoundland there is not a snake, toad, frog, or reptile of any sort. There is not a squirrel on the island, no porcupine, moose, or minx; whereas, with the exception of the porcupine, wanting in Cape Breton, Nova Scotia, all these creatures are found in the neighboring provinces. The Arctic hare is found in Newfoundland, but neither in Cape Breton nor Nova Scotia." Captain Hardy, an English officer, calls atten-

tion to other deficiencies. He visited Newfoundland at midsummer, and could not help remarking the fact that fireflies were not to be seen here; while in Nova Scotia they swarm by thousands, their scintillations adding beauty to the pall of a quiet night. The island is full of bogs and swamps, which render it difficult to account for the total absence of reptiles.—*Ploughman.*

—THE GLACIERS OF CALIFORNIA.—John Muir delivered a lecture on the Glaciers of California last evening at Dashaway Hall, beginning with a description of a glacier as a river of ice which is fed every winter by snow, and slowly moves down the mountain side till it melts. There was a time when the western slope of the Sierra Nevada was covered by a vast sheet of ice, one immense glacier, and as the quantity of snow decreased, or the climate became warmer, the ridges of rock came through, dividing the original one large glacier into a multitude of small ones, each confined to a cañon. There are now fifty-five glaciers in California, most of them small. One in Shasta has its lower end at an elevation of 9500 feet above the sea, but most of them do not come lower than 11,000 feet, and the average speed of their movements probably does not exceed a mile in three hundred years, though in Switzerland some move at the rate of a mile in fifteen years. That country has 1100 glaciers with an average area of a square mile each. Here the average area, as well as the number, is considerably less. The glaciers carrying large boulders, which, under the pressure of immense weight grind deep into the rocks over which they pass, have done much to give shape to the mountains, and canons, the domes, cliffs and chasms of the Sierras. The lecture was received with much favor by the audience.

—A LEAF-PLANT.—A friend, whom we were visiting a few weeks since, gave us a leaf from a plant in her window, and told us to pin it up where it would get as much sunshine as possible, and watch the result. It was an oval-shaped leaf about two inches long. We fastened it to a sash on the eastern side of the house. After a few days there were signs of life at one of the points on the edge of the leaf. The end of the vein was expanding like a bud. Slowly the development went on until a tiny plant was formed there, with roots, and stem, and leaves. Without soil, without moisture, without any signs of a germ, from just such a point as you find a score or more of on the edge of an ordinary leaf, this specimen of vegetable life came forth to excite our wonder. When the new plant was an inch or so long, we planted it in a pot, and it is growing there.

Before we cut off this plant another point on the edge of the leaf began to bud. Soon roots appeared, then a stem, and then branches, as in the former case. We have now two plants in pots from the leaf. The production of those two seems to have exhausted its vitality, and it has begun to shrivel. We are assured that each leaf of the plant we have potted will, when full grown, have this same power of producing perfect plants from the ends of their veins.—*Rev. Dr. Babb, San Jose, California.*

—Okra, a species of mallow from two to six feet high, which grows profusely at the South, and has heretofore served chiefly to thicken soups with its pods, is on the verge of promotion to higher uses. It has been talked of for paper stock for these twenty-five years, and has in fact been successfully used for paper at various times since 1860, being one of the comparatively few discoveries at the South. The first suggestion, that the outer fibre of the plant could be so used, was made by a French officer in Algeria, but it was of no practical value, this fibre bearing too small proportion to the whole plant to make it pay. Dr. Read, of Richmond, Va., first discovered the adaptation of the whole plant to paper making, and patented his discovery eleven years ago; since then several Northern mills have tried it, and a Mobile mill made a good enough paper to use for newspapers. The only reason the manufacture has not been prosecuted is the lack of material, and it is yet to be introduced to any extent, even in the South. It would make a profitable field crop and will grow in any part of the Union. It requires a pressure in bleach-bolling stronger than is necessary for any stock now used, in order to have the paper white, and boilers would have to be constructed with reference to this. The paper is remarkably tough, and in this respect better than almost any other now used for newspapers.

—SAVE THE ROSE LEAVES.—Amidst the wonderful variety of roses introduced through the praiseworthy enterprise of scientific florists, the damask rose has fallen into undeserved neglect, and its cultivation into strange disuse. Numberless are the hybrids whose vivid colors and piquant odors at present delight all lovers of flowers, yet it must be admitted that for fragrance the damask still retains its pre-eminence. It were perhaps not extravagant to aver that all the improvements of culture and hybridization have been made at the expense of that quality which gives the

rose its commercial value as the source whence is drawn the world's supply of one of its most exquisite perfumes and delicate voring extracts.

It seems strange that, with all-pervasive spirit of enterprise that characterizes many portions of our vast country, the cultivation of the damask rose should have allured no capitalist to compete with the East in producing otto of roses and rose-water. In the country, where space is not a matter of consideration, the suggestion to raise damask roses by the quantity may not be ill-timed; for that its culture may be made conducive to the comfort of a family by furnishing several refined accessories to the table and toilette may be easily shown. This is not the season, however, most advantageous for setting out such a plantation, and we will give hereafter a few recipes useful to such as may be fortunate enough to be surrounded by a profusion of roses, enabling them to lay up a little winter time enjoyment from the summer's supply of floral wealth. Let it be premised that recipes demand damask roses to be prepared in perfection, but it is believed that other very sweet roses may serve as a substitute.

—THE CONDOR.—The Indian tries to catch the condor by stratagem. He employs him to fight in a ring at those bull-fights which are the favorite amusements in that part of the world. He does not attempt to attack the condor openly, for he knows how strong he is, and he wishes, besides, to take him alive. He procures the skin of a cow, and hides himself beneath it. Some pieces of flesh are left hanging to the skin, and are sure to attract the condor. He comes pouncing on the prey, and while he is feeding with his usual greediness, the Indian contrives to fasten his leg to the skin. When this is done, he comes out of his concealment, and the bird sees him for the first time. He flaps his wings and would fly, but that his feet are entangled; and more than this, a number of other Indians come running up and throw their mantles over him. We can tell you an anecdote about the condor's power of life. A miner in Chili, a very strong man, once saw a condor enjoying his feast on the mountains. He had eaten so much that he could not fly, and the man attacked and tried to kill him. The battle lasted a long time, and the man was nearly exhausted. But in the end he thought he was the victor, and left the condor dead, as he imagined, on the field. Some of the feathers he carried off in triumph to show his companions, and told them he had never fought so fierce a battle. The other miners went to see the condor, when, to their surprise, he was standing erect, flapping his wings, in order to fly away. A bird with such power of life continues to exist years and years. Indeed, the condor is said to live for a century. We named not long ago the eagle, the raven, the parrot and the swan, as the four century-living birds. It appears that we must add the condor to the number.

—The learned Schleiden eloquently paints the wonders of the deep: "If we dive into the liquid crystal of the Indian Ocean, the most wondrous enchantments are opened to us, reminding us of the fairy tales of childhood's dreams. The strangely-branched thickets bear living flowers. Dense masses of *Meandrinae* and *Strobilinae* contrast with the leafy cup-shaped expansion of the *Explanarias* and the variously-branched *Madrepores*, now spread out like fingers, now rising in trunk-like branches, and now displaying an elegant array of interlacing tracery. The coloring surpasses everything; vivid greens alternate with brown and yellow; rich tints, varying from purple and deepest blue to a pale reddish-brown. Brilliant rose, yellow, or peach colored *Nallipores* overgrow the decaying masses: they themselves being interwoven with the pearl-colored plates of the *Reticipora*, rivaling the most delicate ivory carvings. Close by, wave the yellow and lilac sea-fans (*Gorgonia*), perforated like delicate trellis work. The bright sand of the bottom is covered with a thousand strange forms of sea-urchins and star-fishes. The leaf-like *Fusulinae* and *Escharella* adhere like mosses and lichens to the branches of coral, the yellow, green, and purple striped limpets clinging to their trunks. The sea-anemones expand their crowns of tentacula upon the rugged rocks or on flat sands, looking like beds of variegated ranunculuses, or sparkling like gigantic cactus blossoms, shining with brightest colors.

"Around the branches of the coral shrubs play the humming-birds of the ocean; little fishes sparkling with red or blue metallic glitter, or gleaming in golden green or brightest silvery lustre; like spirits of the deep, the delicate milk-white jolly fishes float softly through the charmed world. Here gleam the violet and gold-green Isabelle and the flaming yellow, black, and vermillion striped coquette, as they chase their prey; there the band fish shoots snake-like through the thicket, resembling a silvery ribbon glittering with rose and azure hue. Then come the fabulous cuttle-

fishes, in all the diaphanous colors of the rainbow, but with no definite outline.

"When day declines, with the shades of night this fantastic garden is lighted up with renewed splendor. Millions of microscopic medusae and crustaceans, like so many glowing sparks, dance through the gloom. The sea-pen waves in a greenish phosphorescent light. Whatever is beautiful or wondrous among fishes, *Echinoderms*, jelly-fishes, and polyps, and molluscs is crowded into the warm and crystal waters of the Tropical Ocean."—From preface to "The Ocean World"—*L'Esquiver*.

—PLAIN LIVING.—There can be no question that much that is considered necessary nowadays is not so in truth, especially with respect to what we eat and drink. We put into our stomachs what costs us no little money, but does us fearfully more harm than good. We pay more for our food in order that we may have the luxury of dyspepsia, and complain of hard times and poverty, when if we lived more plainly we should have abundance, and be at the same time both healthier and happier.

A Swedish Councillor, who had emigrated to Minnesota, determined to make the experiment at how little cost he could sustain life for a year. He found that on Indian meal the cost of living was only about five dollars. The Scotch peasants, who are proverbially strong both in body and mind, live almost entirely on oatmeal and kail, a kind of cabbage.

If you wish to see how little is necessary for subsistence and even enjoyment, go and watch an Italian laborer on a railroad, while he takes his favorite dish of polenta. This is made by stirring Indian meal into boiling water until a thick mass is formed, much more solid than our ordinary mush. This is divided into large pieces by a string. A lump is taken into the hand and eaten with a slice of sheep-milk-cheese to give it a relish. Yet the Italian can accomplish more work than the German, who eats and drinks much more heartily.

The Hindoo is distinguished for the simplicity of his diet, and, though lacking in energy, has a wonderful power of endurance. Two meals a day of rice, or thin cakes made of meal and water, is all that the majority have for their subsistence. There is really no need that any one in a country like this should starve. Sir John Herschell states that bread may be made of some kinds of saw-dust, such as will sustain life. According to Dr. Lyon Playfair, a man may lay a pound of flesh on his body most cheaply by a diet of beans or peas, the cost in England being sixpence, or less. The usual cost at which people maintain their bodies in good condition is many times this amount,—the difference being spent in the gratification of the palate.

—AFRICAN HIPPOPOTAMUS HUNTERS.—The late Dr. Livingstone, in his "Last Journals," gives the following interesting account:—"At the Longwa of Zumbo we came to a party of hereditary hippopotamus hunters, called *makombus* or *akombus*. They follow no other occupation, but when their game is getting scanty at one spot they remove to some other part of the Longwa, Zambesi, or Shiré, and build temporary huts on an island, where their women cultivate patches; the flesh of the animals they kill is eagerly exchanged by the more settled people for grain. They are not stingy, and are everywhere welcome guests. I never heard of any fraud in dealing, or that they had been guilty of an outrage on the poorest; their chief characteristic is their courage. Their hunting is the bravest thing I ever saw. Each canoe is manned by two men; they are long light craft, scarcely half an inch in thickness, about eighteen inches beam, and from eighteen to twenty feet long. They are formed for speed, and shaped somewhat like our racing boats. Each man uses a broad, short paddle, and as they guide the canoe slowly down the stream to a sleeping hippopotamus, not a single ripple is raised on the smooth water; they look as if holding their breath, and communicate by signs only. As they come near their prey, the harpooner in the bow lays down his paddle and rises slowly up, and there he stands erect, motionless, and eager, with the long-handled weapon poised at arm's length above his head, till, coming close to the beast, he plunges it with all his might towards the heart. During this exciting feat he has to keep his balance exactly. His neighbor in the stern at once backs his paddle, the harpooner sits down, seizes his paddle, and backs too, to escape; the animal, surprised and wounded, seldom returns the attack at this stage of the hunt. The next stage, however, is full of danger. The barbed blade of the harpoon is secured by a long and very strong rope wound round the handle. It is intended to come out of its socket, and while the iron head is firmly fixed in the animal's body, the rope unwinds, and the handle floats on the surface. The hunter next goes to the handle and hauls on the rope till he knows that he is right over the beast; when he feels the line suddenly slacken he is prepared to deliver another harpoon at the instant when

hippo's enormous jaws appear with a terrible grunt above the water. The backing of the paddles is again repeated, but hippo often assaults the canoe, crushes it with his great jaws as easily as a pig would a bunch of asparagus, or shivers it with a kick of his hind foot. Deprived of their canoe, the gallant comrades instantly dive and swim to the shore under water; they say that the infuriated beast looks for them on the surface, and being below they escape his sight. When caught by many harpoons the crews of several canoes seize the handles and drag him hither and thither, till weakened by loss of blood, he succumbs."

"CATCH," AND MY WHITE MICE.

BROOKLYN, N. Y.

MR. J. M. WADE:

I see your paper every week, and I read all the stories in it about the chickens, and the pigeons, and birds, and dogs. I remember about the dog "Sport," that got stuck in the street water pipe, and the last one about "Spot," that plays so many parlor-tricks. I have got a little black and tan Terrier, too. His name is "Catch." He is very small, and we have to keep him at home close, or he would be lost or stolen—because he is so pretty, and smart and cunning. He weighs only five pounds and a half, and is two years old.

I am very fond of Catch, because he is so bright and intelligent, and he keeps our house free from rats and mice, better than any cat would, I think. And speaking of mice is what made me write this letter. I have got a cage of beautiful white mice that my father brought home last spring for me—three of them. They are cunning little fellows, and I have nice good times with them every day.

I keep them in a cage, wired all around at the bottom of the sides, or else they would gnaw out of it. And they are not much trouble, while I like them to play with better than with Guinea pigs. Now I must tell you about these mice and my little terrier dog, and what happened to them. You can print it in the FANCIERS' JOURNAL if you think it would interest your readers, as the other stories have pleased me.

There were four white mice, at first. One of them got *baked*, unfortunately. He gnawed his way out of his nice cage one night, and the oven-door of the stove was open. He went into the oven, and when Bridget came down in the morning she closed the door, made the fire, and "cooked him," without knowing it. He was smothered there.

The other three I have taught to do little tricks, and my pet dog "Catch," who will catch a grey or brown mouse quick as a flash, if he sees one—at first watched for these sharply. But I have got them so well acquainted now, that they play together the same as if they were all of one little family. I place a mouse on Catch's nose, another on his back, and the third hanging to his tail, and he will run round and amuse himself with them for a long time without offering them harm.

They will eat from the same plate with him, drink milk from the same dish, and lie down snuggled up to him, just as if he were their mother, instead of being, naturally, their mortal enemy. Isn't this a great result? But it is easy to accomplish, with a little management in the right way. It gives me great pleasure to watch the antics of these pets, and my little dog has been taught to perform several of the same tricks that "Spot" does. "Catch" will walk on his hind legs, toss up a cracker from his nose at the word, and catch it as it falls, leap the hoops and bars, pretend to smoke a pipe, and take a little parcel up or down stairs for me, very promptly, when I tell him.

I think we shall have to look after him though, about the white

mouse. I don't trust him alone with them, when they are out of the cage. He might snap them up. But, so far, they have agreed nicely together, and I think a great deal of my pets, whose pranks and simple habits give me and my playmates much pleasure, from time to time. You asked your young readers to tell their stories, and so I send you this.

Yours respectfully,

GEORGEY.

[We are pleased to have you write to us of your pet, Georgey, and wish more of the young people would follow your example. Hardly a boy but has some pet whose doings would interest others. For such we will always find room. Ed.]

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged. "To EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

GEO. A. WILSON, Box 907, Fitchburg, Mass., will exchange high-class B. R. G. Bantams, one trio foxes, five trio chicks, for S. G. Dorkings, W. F. B. Spanish, or American Dominique pullets. What offers? Gentlemen speak quick.

BOX 25, Emmitsburg, Frederick County, Md., will exchange one Pleasant Game Hen, one Ducking Game Hen, one B. Red Game Hen, for P. Rock, L. or D. Braham Hens or Pullets, Maltese Kittens or Game Bantams.

P. H. HORNE, Stoneham, Mass., will exchange No. 1 Brown Leghorn Chicks (suitable for exhibition,) or double-barrelled Shot Gun, un-injured, but little used, cost \$18, for small sized English or German Beagle Hounds, or Harrier, or others; also one Fox Hound, for any of the above.

J. F. FERRIS, Hartford, Conn., would like to exchange an exceedingly choice pair of Golden Sebright Bantams, (the cock is winner of several first premiums, and is one of the best in the country), value \$12, for something useful—(as well as ornamental.)

GEO. A. STOCKWELL, Worcester, Mass., will exchange Hale's Dictionary of Poetical Quotations, \$2; Life of Michael Angelo, 2 vols. \$3.50; Robert's Italian Dictionary, (new) \$5; Foresti's Italian Reader, (new) \$2; Fontana's Italian Grammar, (new) \$3; Burton's Anatomy of Melancholey, 3 vols. \$4; Bell's Shakespeare, 5 vols. \$5, for offers in poultry.

A. C. BELTZEL, 807 N. 2d St., St. Louis, Mo., will exchange an Italian Grayhound dog, small and fine, one and a half years old, half brother to "Agnes," winner 1st prize at Springfield Bench Show, for an equally good Italian Ritz Pup four or five months old, Dark Barcha Chicks, Angora or Dutch Rabbits.

HAYDN H. TSHUDY, Lititz, Pa., will exchange B. Leghorn Cockerels, P. Cuckoo Cockerels and Pullets, Dark Braham Cockerels and Pullets, and Tumbler Pigeons, for P. Rock, S. S. Hamburg, and B. Leghorn Pullets or Maltese Kittens.

A. M. CAREY, Selins Grove, Pa., will exchange four beautiful Maltese Kittens, and a lot of desirable Fancy Pigeons, for choice Pullets or Hens of following breeds: D. L's, W. L., L. B., P. C., B. C., S. S. H., or Houdans or others.

J. W. HARTMAN, Westchester, Pa., has Owls, Yellow-wing Turbit Hens, Dutchies, Blue Antwerps, Trumpeters, Carriers in colors, Red Barbs, 1 Young Blue Pouter Cock, Blue wing Seawall Hens & d. 1 mated pair, Outside Tumblers in colors, Jacobins in colors, Moorcoops, 1 Hen and 1 mated pair, Archangels, and many odd birds of the different kinds; also one Chester White Boar, eleven months old; wants in exchange, Yellow and White Barbs, mated, 1 good size pocket seven-shooter, Earth Closet, or Commode, or offers.

W. W. ELLIOTT, McEwensville, Pa., wishes to exchange one "Williams" Light Brahmas, (75 and 76 hatch) for a good Black Carrier Cock, Turbits, Osh, Moorcoops, Muggies, An werps, Swallows, or Trumpeters. Make offers. No objections to posts.

LEO. A. BOSCH, No. 3, Mayre St., Dayton, Ohio, will exchange for anything that won't eat, my stock of Partridge Cocks, D. Brahmas, Brown Leghorns, B. B. Red Games, and 1 pair A. Dominiques. Stock first class. Postal cards taken at par.

J. F. FERRIS, Hartford, Conn., will exchange fifty good White Leghorn Cocks, value \$2 to \$5 each, and one hundred Pullets, value \$5 to \$10 each, for offers of saleable merchandise. Lots of stock of every kind to trade. No trouble to write.

W. D. HUMPHREY, JR., Tarrytown, Westchester Co., N. Y., would like to exchange one pair of Tarter Game Fowls, the pair weighing about ten pounds, (breeding stock), Cock 3 and Hen 2 years old; 1 mitch Gout, 1 Kid, 1 months old, 2 Game Hens (pit stock), 1 pair of B. B. Game Bantam Chicks, 1 Derby Stag, bred for the pit, and white legs, for Plymouth Rock Hens, or Poultry Books.

P. W. CAREW, Toledo, O., will exchange two Black Red Game Hens, one weighs lbs. 12 oz., for "Cooper on the Game Fowl"; 1 Red Fife Bantam Cock, for a Pullet; No. 1 Dark Braham Cockerels, with "Dea Brunnel," and William's Pullets, for offers. Satisfaction guaranteed.

JOHN A. LORD, Kennebunk, Maine, will exchange choice White Cochins, light Brahmas, and Plymouth Rock Chicks, for foot-power Grindstone and Cabinet-Makers Tools. All to be of the very best quality.

F. G. PATTERSON, Portland, Me., will exchange pearl case opera glass, in good order, that cost \$18.00, for offers; also a fine Pigeon, Fancy and Common Pigeons, at their value, for Pullets of any good breed for laying. "Postals" solicited.

BOX 869, Rockville, Conn., will exchange a C Cornet, cost \$60, for a first-class Central-fire Shot Gun. Must be in good order, as the Cornet is.

MAPLE GROVE YARDS, Sullivan, Ohio, has 4 Pekin Drakes, Yearling Am. Merino buck, two Berkshire boars, Land and Water fowl, 30 varieties to exchange for good Sewing Machine, double Harness, Corn-sheller, popular books or offers. Fair exchange or none.

W. F. MUCHMORE, Basking Ridge, N. J., will exchange, direct from the factory, a new Parlor Organ, nine stops (warranted), value \$275, for a first class breech loading shot-gun, ten or twelve bore, with appendage. Write for full particulars

W. J. ROW, Greensburg, Pa., will exchange a Thoroughbred Berkshire Sow or a Jersey Bull calf for a pair of Prince Albert Suffolk pigs, 6 mo. old or over. All letters &c. answered.

Book Exchange.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

A HISTORY OF ENGLAND—By Temple Sydney, printed in 1773, embellished and illustrated with upwards of one hundred beautiful copper plates. E. H. Diehl, Delanco, N. J., offers above for sale.

AUDUBON WANTED—Jos. M. Waite, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

BOOKS TO SPARE.

1. Handel's Israel in Egypt.....Novello's.
2. Haydn's Creation....."

"NOT FOR ITSELF—BUT FOR ALL."

VOL. III.

HARTFORD, OCTOBER 9, 1876.

No. 39.

"TO BE LEFT TILL CALLED FOR."

"'To be left till called for.' Young un, what's your name? Don't know where you're going? don't know whence you came?"

Got your baggage with you—all your little frocks? Looks like dad's old kerchief tied around the box.

"Tell us, now, who brought you. Came down on the train? Big conductor left you, then went on again? Is the family comin'? Queer folks them, I guess—Thought they'd sent the baby forward by express.

"Hullo, Jack, my hearty! Who's the little girl? Eyes as big as saucers, hair all out of curl. Must belong to some un. Tell us, don't you know Who's the party owns her? where she wants to go?"

"Don't ye look so frightened. Needn't be afraid—No one's goin' to harm ye, pretty little maid. I'm a rough old codger—mean well, all the same; Tell us, now, my pretty, what's your little name?"

"Once I had a young un, looked a heap like you; Cheeks about as rosy, eyes of chummy blue. Lots of rides I gave her on this very line When I stoked the engine Number Forty-nine.

"Thought her dad was splendid; not a bit afraid; Loved the black old fireman, my sweet little maid; Used to take her with me often as I could; Popped her in the tender on a log of wood.

"Brakemen used to joke me—'twas a funny place, My own pretty baby, with her milk-white face. But I couldn't keep her—lived till she was seven; Then one day she left me; guess she went to heaven.

"Parson said God did it when we watched her start; S'pose He knows His business, but it broke my heart. Somehow you look like her. If your folks don't come, I'll kidnap you, baby—carry you off hum.

"Who's that spruce young feller coming down the street, Lookin' round for somethin'?—you, or I'll be beat! 'Uncle Ned,' you call him. Yes, you'll go with him; (God wouldn't send an angel to cheer up poor old Jim.')

Harper's Bazar.

THE INDIAN CROW.

A stranger arriving in India is at once introduced to two of the greatest curiosities of the country. As his vessel slowly steams up the Hooghly and almost before the custom-house officer has come on board, her rigging has been invaded by at least one kite and two or more crows, all busily scanning from aloft every nook and corner of the deck with a keen eye to No. 1. Should any uncovered dish be incautiously conveyed from the galley to the saloon, its contents run a strong chance of being swooped off by a kite; and any droppings of food are as certainly pounced upon by a crow.

Leaving the vessel, the new arrival loses sight, temporarily, of the kites; but on reaching his quarters he is certain to reëncounter the crow; yes, absolutely certain wherever he subsequently travels, there he will find this amusing and omnipresent bird; and from the first, he cannot fail to notice, and be amused by, its audacious antics. On the morning after his arrival, let us imag-

ine him seated in the veranda, discussing his first *chota hāzre* (literally, "small breakfast," a light and early meal universally taken in India). No sooner are the viands placed before him than he will see two or three crows alighting on the veranda rails. Ignorant as yet of their tactics, he will quietly discuss his buttered toast, and perhaps introduce himself to the birds by throwing them little fragments thereof. Greedily devouring the inch, they quietly prepare to take the ell. Something calls him away for a moment, and he returns to find the thieves retreating with his toast or egg; and he sits down highly amused at their impudence.

Perhaps this scene occurs in his room, all the Venetian shutters of which are wide open. As he sits down to his meal, he will see a crow sitting on the top of the Venetian, and peering sideways and curiously into the room; and should he for a moment leave the table, he only returns to find his toast and the crow gone together.

Having thus generally introduced the Indian crow to our readers, let us proceed to describe his habits, character, and accomplishments.

Our friend rejoices in the learned name of *Corvus splendens*, and this designation has been evidently applied to him in derision, or perhaps on the *lucus a non lucendo* principle. The natives only know him as *kaw-wā* (pronounced cow-wā), and apparently name him from his caw. He is certainly in no way (except in genius) a shining bird, as will be admitted when I describe him. Take a rook give him the curved beak of the raven, and the gray neck and eyes of the jackdaw, and you have a tolerable picture in size and color of *Corvus splendens*, or, as he should be more appropriately called, *Corvus latro*. Our friend, though found throughout the Bengal presidency—I may say throughout India, is not generally a gregarious bird, like the rook; you commonly meet him in families of from three to five individuals, and never, as a rule, at any distance from the haunts of men. I regret to be obliged to admit that he prefers to live by plunder rather than by honest labor. Everything is fish that comes to the nets of those pillagers; they will plunder alike the stall of the *bunya* (dealer in grains and flour), or the butcher; they will gorge on sweetmeats, or pilfer fruit; and eagerly will they tap the toddy pots hanging from the top of the palm; while with still greater gusto they will revel on the white ant when it swarms into the air as a perfect winged insect at the commencement of the rains. They will plunder the nosbags of horses, remain in close attendance on the kitchen, carry off young chickens from the fowl-yard, devour strawberries and tomatoes, await the daily shakings of the tablecloth, or carry off a greasy duster, and, in short, be in constant readiness to carry off anything and everything.

They generally get the first pickings of carrion, and are always to be seen in the company of vultures when engaged in their sanitary operations. I have seen a crow deliberately sit on the back of a gorging vulture, and try to pull out of his beak a choice bit of carrion, the vulture being quite at the mercy of his agile tormentor. Frogs, the young of birds—except of their

own kind, for "there is honor among thieves"—mice, weak rats, and small and helpless creatures generally, especially the young of the squirrel, are eagerly carried off and devoured.

They are very fond of the cattle tick, and in search of this pest you will see a crow deliberately climbing up a cow's tail, and carefully examining its root and neighborhood for any hiding tick. Cattle generally value this partiality; and I have actually seen a cow lift its tail, as if to help the crow in its ascent. The neck and ears of oxen and buffaloes are also carefully examined for ticks.

Though possessed of such a bad character, the crow is universally tolerated as a comic pest, amusing alike to native and European.

A thief so accomplished must necessarily be wary and vigilant, and this quality is the only recommendation we can adduce on behalf of our friend. You may as reasonably hope to catch a weasel asleep, as to find a crow with his weather eye closed; and this habitual wariness, even at night, often gives the alarm of danger. As the cackle of geese once saved the Roman Capitol from the thieving Gauls, so the cawing of crows has repeatedly given warning of the prowling thief or burglar. Crows will always announce the presence of, and try to mob, any animal that goes abroad at unseasonable hours; thus they will mob the tiger or jackal, the owl or bat; and they invariably make an immense commotion on the appearance of a snake.

As a further illustration of the wariness of the crow, I may mention his thorough knowledge and immense fear of a gun. A crow will worry you in one of the many ways familiar to the tribe, and you will try to get rid of him by shouting and gesticulation. He will hop away a few paces, or fly a few yards, and then stop and look at you from both sides of his head. But point a gun at him, or even raise a stick to your shoulder, and he will at once fly in dismay, looking behind him all the time. This fear of a pointed stick seems to prevail with crows everywhere. But whence originated this mortal fear of a gun or stick? Believers in the theory would adduce it as an illustration of development, due, perhaps, to the presence of gun-using Europeans in the country; but then the crow at Dan dreads the gun or raised stick just as much as the crow at Beersheba, and it is quite possible that neither ever before saw a gun; and it is certain that there are thousands upon thousands of crows which have never seen, heard, or even dreamt of a gun, though equally certain that each one would exhibit the same dismay on seeing one.

As an offshoot of this wariness, let me notice the extraordinary confidence of the crow. I have frequently seen my little son run out to a collection of strange crows with some food in his hand; they would receive him in their midst, take the food scattered, and even try to rob him of it; but they would never allow me to be so familiar with them, but would retire at once to a respectful distance. How was this? They confided in the young child, but dreaded the father, both absolute strangers to them. Reason was clearly here at work; they knew that the child was more artless than the man, and confided in him accordingly.

I have alluded to the teasing and worrying propensities of the crow. Let me adduce some instances, which every Indian reader will indorse. During the hot weather it is a common practice to sleep out of doors, and thus endeavor to secure the sleep denied in the stifling room. Toward the small-hours the air generally cools a little, and sleep then steals over the tossing and weary frame, and daybreak finds you fast asleep; then it is that a crow will alight as near as possible, and awake you by his cawing; or if your bed is under a tree, he will rouse you by cawing, or by dropping twigs or other materials upon you. What is the use of shouting or throwing your slippers at him, in hopes of scaring

him away? The mischief is done, and sleep has departed, and so has the crow, thoroughly satisfied with his cruel mischief.

A large astronomical telescope stood in the veranda of my study, in full view of my writing-table; now why should a particular crow delight in perching upon the tube of the instrument, cawing all the time, to distract me from my work? Why should he do this daily, and only cease when I rested an empty gun against the tripod? He had nothing to gain but the mere delight of teasing me. Perhaps a corvine apologist may say he was astronomically disposed, and wished me to tell him something about the starry wonders; but I scout this idea.

I have thus alluded at some length to the wariness and mischievous propensities of the crow; let me now adduce a good quality, notwithstanding his otherwise filthy habits and tastes. He is a very clean bird and never goes without his daily bath, for which, if possible, he prefers running water. Crows are very fond of bathing in irrigation rills, and often vex the gardener by destroying them in the exuberance of their antics. They flock in crowds to a shallow river side and then afford a most lively spectacle. I have stated that crows are generally not gregarious, like the rook, and I will now illustrate the exceptions to the rule. In addition to their bathing assemblages, they have remarkable parliaments, which I have frequently watched in the distance with great amusement. These are always held in quiet out-of-the-way places and always on the ground, and to them flock the brotherhood from all quarters. The proceedings are absolutely silent, and seem mainly to consist in small knots of individuals exhibiting their graces before one bird; they will hop round him in various attitudes, look at him first with one eye, then with the other; and all the while the central individual will be supremely indifferent to their attentions. Perhaps the proceedings will be varied by a disconnected crow hopping to another group, there to exhibit his or her charms. This silent session will be maintained for an hour, and then suddenly break up with loud cawing; just as if the crows were being released from a disagreeable duty, and were rejoicing in their escape.

I never could make out what these assemblages are for; they are not amatory, for they occur as often before as after the breeding season; and they are not judicial, for they are absolutely silent, and no results follow.

(To be Continued.)

—A letter to the *Hartford Times* says:—Young Tiffany's chameleon shed its skin this morning. When my attent was first called to it, I thought it was an imposture—for the little reptile looked just as if it had on a little night-gown of fine lavender colored muslin, tied or tucked in at the neck and top of the tail. This strange garment gradually parted in openings. While this process was going on, the chameleon, which was on the floor, and had a thread tied around it, held at one end by Willie Tiffany, would very unexpectedly and suddenly make vigorous little rushes and darts across the floor, to the length of its string, and to the great discomfiture of the ladies who were gathered around it, watching the shedding process. On such occasions the ladies would run screaming to a corner of a room, the suddenness and rapidity of the small "varmin's" movements whenever he started seeming to deprive them of all presence of mind. The chameleon got held of what he could of this cast-off garment and tried to swallow it. Upon examining segments of the cast skin under a magnifying glass, it was seen to be full of perfectly circular holes, arranged in the most regular and orderly manner, and the texture resembled that of the crown of a bonnet, though not quite so close.

Your voiceless lips, oh flowers, are living preachers;
Each cup a pulpit—every leaf a book—
Supplying to my fancy numerous wonders
From loneliest nook.

POULTRY DEPARTMENT.

MOULTING.

The season of moulting, that is, the time when birds discard the old plumage and take on the new, is the most critical in their existence, both because of the time of year in which it occurs, and the demands which are made upon the system.

The frequent losses of birds at this season have caused the experienced fancier to give the extra care, both in food and shelter, the case seemed to call for; and he always regards it as a season of rest from egg-producing.

The extreme heat of summer is in itself debilitating. The system of the bird is relaxed, and scarcely more food is taken than is necessary to sustain life, so it is noticeable that birds beginning early in the summer to moult, are long out of plumage, and it often happens if an epidemic prevails among poultry, they are the worst sufferers.

In the early autumn the worst foe of the moulting bird is dampness. The poultry keeper is apt to forget that the extra ventilation the heat of summer made imperative, is now not only unnecessary, but injurious. He forgets that the muggy days of autumn, with the heat so debilitating, the damp so penetrating, and the cold so chilling, are felt as keenly by his fowls as by himself.

Many poultry men advise the addition of a tea-spoonful of the "Douglass mixture" daily, during the moulting period, to the drinking water. Others think the simple sulphate of iron sufficient; others again provide water in iron vessels at this time. All unite, however, in advising more than the usual allowance of meat, plenty of lime, bone dust, or burnt shells and bones, and an occasional feed of hemp seed.

The "Douglass mixture" is simply the solution of one ounce of sulphuric acid and one-half pound of sulphate of iron in two gallons of water. It is used by those fanciers who consider "the ounce of prevention" necessary, as some people take a regular course of medicine spring and fall "for fear they might be ill."

For our poultry, no such dosing is needed. Give fowls pure air, quarters clean and free from vermin, runs sheltered from sun, rain, and snow, pure water often, and in a shaded place, with good nourishing food, permitting them always to have free access to lime, or burnt bones, or shells, and our word for it, fowls are better without than with "mixtures" of any kind.

FEATHER-EATING FOWLS.

Take a small quill feather about three inches long, pass it through the nostrils about half way. The operation will not harm them in the least. If its mate pulls it out, serve him the same way. I breed the Black Spanish, which are the worst feather-eating breed that I know of, and it is always a sure cure. If the bird is treated this way on the runs, it is better to tie the feather across the upper bill.

H. D. G.

RIGHT, FOR A THOUSAND CROWNS!

"YOUNG BREEDER" hits the nail on the head in No. 37 of THE JOURNAL, on the "Postal Card Nuisance." He is right. If a man "means business," he will go to the expense of a three-cent stamp to make his inquiries, and enclose another for an answer, when he writes to a breeder about fancy fowls, or pet stock. For one, I do not answer postal cards, except to forward a printed circular, when that is simply applied for. This is well enough.

But the other style, of asking a dozen questions on a postal card, to be answered by a three-cent stamped letter, is not the thing. And I agree with "Young Breeder," that poultry men who really have a large correspondence to respond to, have found this "a curse, and a nuisance," that ought to be abated.

If I want to purchase a wagon or a sewing-machine, I will write and send my letter. And I enclose a stamp *always* when I seek any information that is to benefit me, individually. So, 'rah for "Young Breeder!" Do it again.

B. G.

Boston, Sept. 25.

CENTENNIAL.

NEW YORK, Sept. 22d.

EDITOR FANCIERS' JOURNAL:

While in Philadelphia visiting the Centennial, I thought I would take a day off and visit the Baltimore fanciers.

I called, about eight o'clock in the morning, on Mr. Gladdess, the well-known Short-faced Tumbler fancier, but before showing me his birds, he went with me to Mr. Mordecai's loft, where the exceedingly fine collection of Barbs were of especial interest to me, being a Barb breeder and fancier myself.

I regretted the absence of Mr. Mordecai, though his son did the honors of the place most acceptably. I enjoyed my call, and the long pigeon talk we had together. At Mr. Gladdess', upon our return we saw, what I should say, was the best collection of Short-faced Tumblers in America. His black and black-mottled Russian Trumpeters were also very fine. He also showed a very fine collection of Toys. Mr. Gladdess is indeed an enthusiastic fancier. After showing me his loft, which in its arrangements is perfect, we went to the library. Among other works he has a large collection of books relating to pigeons. I think he is the owner of every known book on pigeons. Our next call was at the loft of Mr. Becker. His collection of Pouters is especially fine. I think some of our New York gentlemen will have to look out for him at the Centennial exhibition. Returning to Philadelphia, my first duty in the interest of pigeons, was to see Mr. Diehl, Superintendent of the Poultry Department of the Centennial exhibition. He showed me through the Pomological hall, where the exhibition is to be held. The building is 200 x 250, and admirably adapted for the show. Mr. Diehl hopes to have a large show of good birds, and promises them every comfort and the best of care. As England is to be very largely represented, it will be to the interest of American fanciers to do the best they can, and to show all the good birds in their possession.

BARB.

A CURIOUS SUGGESTION IS MADE

By a correspondent, in view of the rapidly increasing quantities of poultry of late years bred in this country—who asks "Is there no apprehension that we may have too much of this thing, in America? Is it not probable that this rapid multiplication of chickens may be carried too far? And may we not get over stocked, at the increasing rate we are now going in this business?"

We do not as yet discover that the production of poultry and eggs among us is so increased as to be noticeable, from the prices demanded in our markets. Eggs are no cheaper year by year, and chickens bring on the average quite as good figures as hitherto

—among consumers. The demand is the regulator of all supplies. We see more *good* poultry in market than formerly, but we do not find it, generally speaking, any cheaper than it has been for a decade of years.

A great monarch in former times, speaking of the better comforts he desired to procure for his people, declared that he "would be rejoiced to know that poultry was so plentiful within the limits of his realm, that every peasant might be able to put a good fowl or two in his pot, at least every Sunday in the year." And surely every dweller in the country, in the United States, would be able to do this, if all our farmers and out-of-towns people bestowed a fair share of their care and leisure in rearing poultry among us.

No! We see no need for alarm. It may be that an undue share of attention may be given to mere "fancy breeding," with the expectation of realizing upon the sale of the product continuous extravagant prices. But all this will regulate itself. Within less than ten years, enormous strides in actual improvement of the breeds have taken place, and breeders have multiplied wonderfully.

We are now reproducing annually quadruple the number of *good* birds that were raised of indifferent breeds a dozen years ago. And where half a score of years since we had one known fancier or poultry-breeder, we now have scores who have been hard at it, many consecutive seasons, and who are still busily engaged in the work, and who continue to find satisfaction and profit in it. First or last all they can produce are disposed of. There is no glut in the market. Some do better than others, for various good reasons, and under more favorable auspices in trade.

But, as a general rule, the good work goes forward, constantly. And we see no occasion to anticipate, for many years yet, that the trade in poultry will not continue to improve, and that the more *good* fowls we can turn out, either in bulk for market, or in lesser quantities for dissemination as breeding-stock, among the continually increasing number of eager amateurs and fanciers—the better it will be for the community, and the more profitably it will result to those who devote their attention to the business judiciously, in a large or small way.

THE "HARD TIMES" WE HEAR OF

In business circles generally, do not seem to have affected the poultry and live-stock traffic as seriously as might have been expected. The call for *good* stock is steadily improving; and our best breeders have large orders to be filled, at remunerative prices.

Those who have dealt with the public honorably, have already done well, and will continue to prosper in the future.

The "hard times" do not reach them, sensibly, and their trade continues to average good returns from year to year.

This is as it should be, and as the event will continue to prove, while such men prosecute their business honestly and fairly. We have no means of knowing in any particular instance that one of this mentioned class, more than another, has been singularly fortunate—but we can say in general terms that where they have given their time and attention to the work, our best fanciers have found their business steadily increasing, and we know many cases where the busy, honorable workers have been handsomely remunerated.

With the increase of population, and the constantly increasing demand there is for poultry, both for breeding and for market, the interest in breeding and raising poultry must also increase. As it is—new societies are being formed, new men are entering into the traffic constantly, and we feel assured that the prospects of all concerned must continue to improve as long as we all strive to excel in each one particular fancy, and as long as we work with the Golden rule for our motto.

SPORTSMAN'S DEPARTMENT.

(For Fanciers' Journal.)

HUNTING THE DEER IN SOUTH JERSEY.

A week's shooting once a year among the pines of southern New Jersey, is all the vacation my employer and my meagre salary will allow. There is a quaint, old-fashioned village called Tuckahoe, nestled on a curve of a river of the same Indian name. Tuckahoe contains one low whitewashed tavern, whose creaking sign board bears a huge yellow star on a blue background, with Star Tavern, Zach. Bushy, Prop., in flaming crimson, painted beneath. At this tavern I made my headquarters, making occasional sallies about the country in search of game and fish. Quail, woodcock, snipe, hay-birds, pheasant, squirrels, rabbits, etc., abound on the outskirts of the village. Deer, too, in some seasons are quite plentiful in the swamps and thick uplands, and I thought, Mr. Editor, that a sketch of a Jersey deer hunt, as participated in by myself last November, would not, perhaps, be unacceptable to your readers.

It had been arranged the night before that we were to meet at the Star Tavern, the next morning by four o'clock, and here I was up at three, standing on the tavern porch blowing my blue fingers and impatiently awaiting the arrival of the party. The November moon was at its "full," and beamed brightly and coldly on a brown landscape which was as visible as by sunlight. Mists, in low ragged blotches, were scattered over the ground. Soon I espied a ragged hut underneath which was a brown scarred face, approaching the tavern. The head, to which there was no perceptible body or legs, was smoking a clay pipe in a most life like manner. The pipe disappeared and the head shouted, 'Helloo, Logic! be that you?' Before I had time to reply, a body and legs attached themselves to the head, and Gruff, the one-armed deer hunter, emerged from the mist and stood before me. He was a man about forty years old, with an habitual stoop in his shoulders, and long shaggy red hair which evidently had not felt comb or shears for a long time. He lost his left arm during the rebellion, and had as a substitute a wooden one with an iron hook, with which he hauled about his wife and children in a most lively manner when intoxicated. Gruff was a man of peculiar ideas, and one of them was an abomination for doubled barreled guns. He always used a gun with but a single barrel of that type known among sportsmen as a "poke stock." Gruff claimed to have once killed with this gun, a doe and her fawn at one shot. He related this exploit to me before a crowd of gunners, some of whom were on the hunt that day. I believe it to be a fact. But I am digressing.

Following Gruff was his son, a little fellow so short in stature that his head had not appeared above the mist, leading ten or twelve dogs, mostly Virginia deer hounds, secured with thongs of raw hide.

One by one the gunners arrived, until the whole party—six in

all—assembled. After partaking of some “home distilled,” we trudged briskly down the road, led by Gruff with the dogs. A walk of four miles down a road over which pine trees mingled their foliage, shutting out the heavens, brought us to where a cow path led to the stand which I was to occupy. Wishing a “lucky shot” to the others, with a companion to direct me, I turned into the woods. The huckleberry bushes (of which the brush was mostly composed) were wet, and I was compelled to wrap the tail of my coat around the gun locks to keep them dry. Squirrel chattered and barked in the tall trees; an occasional pheasant (?) would jump up with a *whirr*, causing me to shiver with sudden fright, and fly into a swamp along whose borders we were traveling. My “stand” was a gum tree stump, standing some dozen yards from a ridge which skirted the swamp along its entire length. About a hundred yards distant was another ridge over which my companion mounted guard. Deer, gentle reader, always select ridges for running, when disturbed by dogs. We heard the baying of the dogs when the deer was “jumped,” and an occasional shot as the deer passed by a stand, but not the signal of his death—a blast on a fog horn, carried by Gruff. The shadow of a lightning stricken cedar which stood in the sunlight, grew smaller and smaller, but still the cry of the dogs came no nearer. I danced wonderful “double shuffles” and jigs to exercise my wearied legs.

I was aiming for amusement at a red squirrel that was sitting on his haunches a few yards off, grinning and chattering at me in a most spiteful manner, when a most terrific crashing of the bushes caused me to look, and there was the long-looked for deer—a buck—with tongue hanging out one side of his mouth, bounding swiftly by me. At sight of the deer, a terrible nervousness seized me, and in vain I tried to bring the gun to my shoulder, my arms refused obedience. “There goes the deer, shoot Logic, shoot!” shouted my companion. “Wait a minute,” I replied while great drops of perspiration gathered on my brow. I was seized by that curious disease, the “buck fever.” At the sound of voices the buck stopped forty yards distant, trembling and head erect as if listening. With no small effort I shook the “fever” off, and bringing the gun hastily to my shoulder, fired while the deer was motionless, taking no aim, however. The buck sprang several feet into the air, and like a flash of light disappeared in the swamp.

I was sitting mournfully on the stump thinking of what a superb opportunity for killing a deer I had missed, when the dogs ran yelping by. Gruff soon after passed on a long easy gallop, and as he passed he cried, “Missed ‘im, Logic, just as expected.” A quarter of a mile, judging by their sound, the dogs stopped as if the deer had been brought to bay. Soon Gruff returned to where I leaning in a melancholy state of mind on my gun, and said, “You’ve killed ‘im, by Ghoul!” And so by some unexplainable accident I had hit the deer, though I am positive that I took no aim when I fired. I did not tell my fellow gunners this, but bore the honors as if I deserved them.

A blast on the horn brought the party together at the spot where the buck lay dead. He was a large buck with five prongs to his horns, and would weigh (on the authority of Gruff) near two hundred and thirty pounds. He was hit behind the fore-shoulder with three buck shot, two of which had passed entirely through him. As the successful shot, I was entitled to the choice piece—the hind quarters—and the horns. The hide belonged to the dogs, or rather to Gruff, their owner. The other parts were equally divided among the rest, by myself, blindfolded. The horns, nicely polished and mounted, now adorn the cornice of my book-case.

PAUL LOGIC.

KENNEL NEWS.

I have waited to write to you about my puppies until it was publicly announced that both “Leo” and “Luticè” had taken first prizes, at the Centennial Dog show, which was done yesterday. Luticè had ten puppies, seven dogs and three sluts, and being born Sept. 2d, they were but two days old when put upon exhibition.

One dog died the day it was born; another died the second day of the show; maybe Luticè had laid upon it, or it had been hurt by her chain; and still another dog died last Saturday. “Luticè” killed it, I think, by trying to remove it into a manger, or it may be she had lain upon it.

Mr. P. R. Scherr’s “Zoe” was also there, and she also took a prize. She was only a year old the 22d of this month, so was classed among the puppies.

Mr. Charles Lincoln told me he had written an article for the *Forest and Stream* about them, and Thos. Nast, after looking at them, took my address. They received a great deal of attention.

EDW. B. D’ESTVILLE PICOT.

QUAIL SHOOTING.—The *Calaveras Chronicle* has the following pointed suggestion for those who shoot quail in an unsportsmanlike manner: “At the commencement of the quail season we have a word or two to say to hunters: Give the birds a chance. Don’t assassinate them by lying in ambush at their watering places and roosts. That is murder in the first degree and ought to be punished by imprisonment for life, at least. No sportsman shoots at a bird sitting, to say nothing about taking a meaner advantage of them. Give the birds a chance.”

A WILD TURKEY SUGGESTION.—The Pogoip Club of Santa Cruz propose providing a small sinking fund with which to send East to purchase a few wild turkeys and prairie chickens; \$150 will purchase a sufficient number with which to swarm our woods in three or four years. They of course will have to be protected by an act of the Legislature for that length of time. Our mountain sides and canyons abound in berries of all kinds on which the turkeys would keep rolling fat, and the stubble fields in the valleys would furnish splendid forage for the chickens. Every sport and hunter in the county should contribute liberally towards it.—*Santa Cruz Courier*, Sept. 8th.

INSTINCT.—Professor Hammond, of New York, relates many instances of instinct in animals: “If the entire brain be removed from a frog, the animal will continue to perform those functions which are immediately connected with the maintenance of life. If the web between the toes is pinched, the limb is immediately withdrawn. If the shoulder be scratched with a needle, the hind-foot of the same side is raised to remove the instrument. If the animal is held up by one leg, it struggles. If it is placed on its back, a position to which frogs object, it at once turns over on its belly. If one foot is held firmly with a pair of forceps, the frog endeavors to draw it away. If unsuccessful, it places the other foot against the instrument and pushes convulsively to remove it. Not succeeding it writhes the whole body from side to side, and always in a forward direction. All these, and even more complicated motions, are performed by the decapitated alligator. I have frequently seen the headless body of the rattlesnake coil itself into a threatening attitude, and when irritated, strike its bleeding trunk against the offending body. On one occasion a teamster on the Western plains had decapitated one of these reptiles with his whip, and, when bending down to examine it more carefully, he was struck full in the forehead. So powerful was the shock to his nervous system that he fainted, and remained unconscious for three minutes. A natural historian relates that a viper whose head had been cut off moved determinedly towards its hole in the wall.

Nature is a perfect housekeeper; she knows better what is wanted in her house than any one can tell her.

EDITORIAL DEPARTMENT.

WHAT WE MAY EXPECT.

Judging from the condition and high class of the pet stock that we have seen in the yards of the prominent fanciers lately, and from the reports that have come to us of the extensive preparations being made, we are confident that the larger exhibitions for the coming season will be upon a grander scale than have ever before been attempted.

The veterans are not to be alone in the field, they will have quite a number of new men to contend with; some new only to the show-room, others but tyros as breeders, but showing by the specimens their yards contain that they have entered heart and purse into the cause. Some of these we know of as having in their yards, birds that are coming on splendidly for the coming season, and they are birds too, if beaten, the fight will be so close and the winner so good, the defeat will be a glory.

We are glad to chronicle these facts. This fresh competition is needed to keep the old prize-winners up to their work. So long have they won the laurels, that they consider it almost as a matter of course that 1st, 2d, and specials shall be theirs. The prospects are that the new comers will push the old war horses into doing their level best.

We welcome these new breeders to the brotherhood, their fresh blood will give new life to the stream that sometimes ran sluggish. It has been our labor of love to help bring about this desirable end—to keep up the old interest and awaken in fresh hearts the desire for this work in all its manifold particulars. For the furtherance of the good we solicit for THE FANCIERS' JOURNAL—the only weekly devoted to the fanciers' interest in America—the patronage of fanciers, new and old, as subscribers, advertisers, and as contributors to its columns of their experience, to the end that its weekly issues may be constantly more acceptable as guide books to the tyro, that he may learn where he may best obtain the stock he desires, and how he may successfully care for them when obtained.

NATIONAL ASSOCIATION OF FANCIERS.

We are informed by the secretary, Mr. C. J. Ward, that the second annual exhibition of the N. A. of F. will be held at Chicago, Illinois, commencing Feb. 12th, and continuing to Feb. 18th, 1877. Mr. Ward says the prospects for a large and successful exhibition are very flattering, and it is the hope of the managers to

be able to meet all obligations promptly, and also to pay off the balance due exhibitors at the show of last winter.

We hope our eastern fanciers will bestow a liberal share of patronage on the show at Chicago. It is not only best they should do so, but it is to their interest. The managers will no doubt be very careful that no mistakes occur to mar the good-feeling of the fraternity.

LITERARY NOTICES.

By the mail for this week we have received the first number of the first volume of the Dominion Poultry Gazette, published by the Associated Fanciers of Ontario, with Capt. R. H. T. McMillan as business manager. We wish this new journal success.

"Wallace's Monthly," devoted to domesticated animal nature, also came to hand. One of the best of its class we have ever seen.

By the same mail we received the "Guide to the Zoological Garden of Philadelphia"—the resort with which the ready pen of Huon has made our readers so pleasantly familiar. This little guide should be in the hands of every family, whether they have access to the "Zoo" or not, for, aside from its character as guide book, it is replete with interest to the lover of Natural History. Its price in paper covers is but twenty cents.

That most interesting monthly, the "Semi-Tropical," came also to hand—reminding us of days spent in the land of the orange, the olive, and the banana—with the memory of the delicious guava still upon us. The luxuriance of the semi-tropical forests with their bewildering rank growth of foliage, gorgeous blossoms redolent with perfume, the note of the mocking bird in our ear, and the brilliancy of the wonderful birds upon our memory like some wild dream; what wonder that we welcome this paper, the report from this wondrous and almost unknown land, to our table. The paper itself is worthy of patronage. It is printed in good style, is well edited, and contains a mass of information valuable alike to North and South. Terms, \$3.00 a year, post-paid. Published by Chas. W. Blew, Jacksonville, Fla.

The "German town Telegraph" is always welcome as one of the very best family newspaper we have ever seen. We are always sure the selections we place before our readers from its columns will not only be acceptable, but instructive and worthy of attention.

C. B. Elben writes us that his stock of Black African Bantams are, if anything, better this year than ever before. He had extraordinary good luck last year. All birds he sold for show birds taking first premiums at the different shows throughout the country. Mr. Elben is very thorough in what he undertakes, and has no doubt as good specimens of Black African Bantams as can be found even in England. He has made a specialty of this breed and deserves a liberal patronage. He will deal justly by all who patronize him.

We would take this opportunity to caution our subscribers to be careful of their copies of THE FANCIERS' JOURNAL if they wish to have them bound, as some of the editions are already exhausted.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—It is a good year for marvels. Large quantities of wheat were destroyed by fish last winter in California, this singular fact being explained by the submersion of the fields by high water, during which the fish luxuriated on the tender grain shoots. C. R. P.

—A beautiful shrub grows in Santa Cruz Co., California called, white red wood. It is called red wood because the limbs and leaves are identical in form and character with those of the ordinary red wood, except in the color of the leaves, which in this case are lily white, and of a beautiful waxen appearance. It has been said in

one instance, near Duncan's Mill in Sonoma County, shoots bearing colorless leaves sprang from the ordinary red wood root. Some have supposed the cause was being grown in the shade, but research proved that the situation of the plant made no difference. Rats are very fond of the young shoots, and destroy them wherever found.

—Prof. E. S. Morse says, "Only the female spiders spin webs. They own all the real estate, and the males have to live a vagabond life under stones and in other obscure places. If they come about so often as to bore the ruling sex, they are mercilessly killed and eaten. The spider's skin is as unyielding as the shells of lobsters and crabs, and is shed from time to time in the same way, to accommodate the animal's growth. If you poke over the rubbish in a female spider's back yard, among her cast-off corsets you will find the jackets of the males who have paid for their sociality with their lives,—trophies of her barbarism as truly as scalps show the savage nature of the red man."

—SPANISH MOSS.—*Tillandsia usneoides*.—So named after Prof. Tillandsia of Albo. It is a genus of *Bromeliaceae*, grows on the boughs of trees, notably on those of the evergreen oak. It hangs like a tuft of long gray hair, in somewhat the same fashion as certain lichens-usnea, in European forests, giving to the trees a sombre, strange, and weird aspect. This moss does not increase much from seed, but by pieces blowing on the other branches, and thus new colonies are formed. With yards in length of this "moss" hanging in every direction from a grand live oak tree, it seems to make the perfection of arborescent beauty.

J. M. McCANN.

—The decorations of the Jewish temple Emanu-El, of San Francisco, for the Centennial services, were unique as well as elaborate. From the ceiling to the gas jets in the gallery, were suspended twenty-five streamers seventy-five feet long. Arches of evergreens and flowers rose gracefully between the organ gallery and the altar railings. In front of the organ a twenty foot flag was draped in the form of a shield,—and 2,000 yards of flag cloth was used to make gorgeous with festoons, the magnificent edifice.

The inside of the Holy Ark was draped with stars, and on the heavy curtains that covered the Ark were hung two immense flags. On top of the Ark was an elegant life-sized painting of Washington.

—We were reading lately in the *Times* of a scene at the Zoo that was at once interesting and curious.

The nursing of the pheasant chicks by the cock pheasant. The old bird was a hybrid between a Reens pheasant and a Cheer, and a large dirty blotched plumaged bird. The cock pheasant rose from its bed when it saw me, and the babies scattered themselves in the grass. A lady approaching us, the cock pheasant made a great fuss clucking and running round and round like an old hen with a disturbed brood.

Another time the cock pheasant was reposing in the grass hovering the baby pheasants, while the hen was walking about a short distance off and paying not the slightest attention to her family.

—The common red squirrel is said by Professor Storer, in *Nature*, to be exceedingly fond of flowers, and it is thought that he destroys far more flowers than any bird. The flower is bitten from the stalk precisely as a nut would be, and held between the paws of the animal, while the little ovary at the base of the blossom is eaten. It has been observed by Thomas Belt that in England the humble bee (*Bombus terrestris*) does more harm than good to the red clover, since it bites a hole through the corolla and extracts the nectar, so that it is of no use in fertilizing the flowers. That the bees undergo a process of education is shown by the fact related by Mr. Belt that at the beginning of the season these bees visit the flowers of the scarlet runners in a legitimate manner; but soon learn that it is easier for them to get at the nectar by cutting holes at the base, and later on their acquired experience teaches them to attack the buds in the same manner.

—AMPHIBIOUS FISHES.—In the swamps of the Gambia, after they have been dried by the tropical sun, there are to be found here and there beneath the surface, clods of earth, uniform in shape and usually about the size of a man's two fists. These clods inclose living animals, which have been led by instinct to hide themselves away towards the close of the rainy season, and before the coming of the season of drought, by burying themselves in the mud while it was yet soft and before it had been hardened by the scorching rays of the sun. On breaking one of these lumps of mud it is found to be a sort of pouch or cocoon, with thin walls, and with projections here and there corresponding to the form of the animal concealed within. Its larger end is rounded, but its narrower end is closed by a slightly convex lid with a

narrow opening in the center. If the surface of the cocoon be even gently touched a pretty loud cry is heard, which Natterer has compared to the mewling of a cat.—*Popular Science Monthly* for September.

—Some time ago, writes a veterinary surgeon to a Chicago paper, I was requested to perform a singular operation. I had to cut two coins out of the flesh of a living horse. Both were healed in the connective tissue just beneath the skin; the one on the right shoulder a few inches above and behind the shoulder-joint, and the other a little deeper, a few inches below and behind the shoulder-joint.

The first one proved to be a Papal silver coin, with the likeness of Pio Nono, and the other a simple American dime with the Goddess of Liberty. Both coins, according to the information given me by the owner of the horse, were inserted there by a quack for the purpose of curing the animal of his lameness. Neither of these coins, however,—neither that with the portrait of His Holiness, nor that with the image of the Goddess,—proved to be as infallible a remedy as the quack may have expected, for the horse was lame yet, notwithstanding that the coins had occupied their peculiar purse under the skin of the living animal for over two years.

—THE POTTERY TREE.—Among the many vegetable products of Brazil the pottery tree of Para is not the least worthy of note. This tree, the *Mogileia utilis* of botanists, attains a height of 100 feet up to the lowest branches. The stem is very tender, seldom much exceeding one foot in diameter at the base. The wood is very hard, and contains a very large amount of silica—not so much, however, as the bark, which is largely employed as a source of silica in the manufacture of pottery. In preparing the bark for the potter's use it is first burned, and the residue is then pulverized and mixed with clay in varying proportions. With an equal quantity of the two ingredients a superior quality of ware is produced. It is very durable, and will bear almost any amount of heat. The natives employ it for all manner of culinary purposes. When fresh the bark cuts like soft sandstone, and the presence of the silica may be readily ascertained by grinding a piece of the bark between the teeth. When dry it is generally brittle, though sometimes hard to break. After being burned, if of good quality, it cannot be broken up between the fingers, a pestle and mortar being required to crush it.—*Engineer*.

—"In middle and northern Chile, generally in the fall and during the dry weather, may be seen 'cobwebs' covering some of the banks of the creeks, and many times on the flat lands. These webs are filled with innumerable red ants. By close examination it is found that the ant makes this web as a protection against a voracious enemy, a worm of light yellow color, with a black head and about one-quarter of an inch long altogether. This worm ejects a fluid over the swarms of ants, and after destroying them in this way swallows them at his leisure. Cattle in feeding upon the grass sometimes with their tongues take up also the cobweb with the worm inside, and the worm taken alive in the stomach, or the fluid swallowed, is positive death. The animal becomes stupid, the eyes red and blood-shot, and in a little while it lies down upon its side, where in a short time it expires. Upon examining the intestines they are found destroyed as if by acids, and the paunch is affected in the same manner. The lung is inflamed and the body of the animal is very warm. The legs become stiff before death takes place. All the usual remedies for poison have been tried without effect.

—"The following question is one that the uneducated often asks himself without being able to find a satisfactory answer; and the learned have not been more fortunate in their interrogations: Whence comes the salt and other substances held in solution in the ocean? In other terms, what is the cause of the saltiness of sea water? Some persons take delight, very foolishly, in satisfying childish curiosity by silly answers. Born near the shores of the Mediterranean, with the sea always before my eyes, I once, when quite a child, addressed this question to those who were near me. Some persons who pretended to be very clever, told me that the sea was salt, because certain ships were charged to throw into it regularly large pyramids of salt like those we see heaped up on the banks of our salt-pits. It is not irrelevant to say that the theories presented by certain savants to account for the saltiness of the sea are not much more to the purpose than the naive explanation with which I was answered in my childhood. Some of them, indeed, state that the salt is engendered spontaneously at the bottom of the sea; others that the tributary rivers are sufficient to supply it. If our readers will turn back to the first few pages of "The World before the Deluge," they will understand the very simple geological explanation that we are going to give of the origin of different substances dissolved in sea water. In

the first stage of our planet, before the watery vapors contained in the primitive atmosphere were condensed, and before they had begun to fall on the earth in the form of boiling rain, the shell of the earth contained an infinite variety of heterogeneous mineral substances, some soluble in water, others not. When rain fell on the burning surface for the first time, the waters became charged with all the soluble substances, which were reunited and afterwards deposited; accumulating in the large depressions of the soil. The seas of the primitive globe were thus formed of rain water, holding in solution all that the earth had given up, collected in large basins. Chloride of sodium, sulphate of soda, magnesia, potassium, lime, and silicium, in the form of soluble silicate; in a word, every soluble matter that the primitive globe contained formed part of the mineral contingent of this water. If we reflect that through all time up to the present day none of the general laws of nature have changed—if we consider that the soluble substances contained in the water of the primitive seas have remained there, and that the fresh water of the rivers constantly replaces the water which disappears by evaporation—we have the true explanation of the saltness of sea water." "It is a simple theory, it is true," adds M. Figuer, "but one that we have found nowhere, and the responsibility of which we therefore claim." The chloride of sodium is by no means the only substance dissolved in sea water. It contains besides many other mineral substances; in short, every soluble salt on the face of the globe, and, along with them, portions of different metals in infinitely small quantities."—*Figuer, in Ocean World.*

—KISBER IN HUNGARY.—We have received from Captain Anstey, R. E., now in charge of the renovation of the cemeteries at Sebastopol, the report of the Hungarian stud-farms which he made for our government, as official delegate, in 1873. Inasmuch as the Derby winner, Kisber, originally Mineral colt, which received its Hungarian name only a day or two before running, was foaled in these stables, a few extracts cannot but fail to be interesting. Kisber, signifying "the home farm," is near the famed fortress of Komorn. It comprises about 1500 acres of good soil, but in the absence of rain, becomes too caked for the horses; and after much wet, too muddy. The buildings are by no means favorably spoken of, and Col. V. Soest, the commandant, complains of its exposure to the prevalent east winds, and the consequent colds and influenza, which have necessitated the removal of weaned foals to more sheltered stables three miles off. Formerly there was a training ground here. This, however, has been done away with, and now all the thoroughbred yearlings are sold by auction—subjects of the Austro-Hungarian empire being alone allowed to bid for them. The estate was bought in 1853 from the Bathany family, and the first stallion, Deerslayer, was purchased along with five brood mares, five younger ones, and eleven colts, fillies, and sucklings for £1400. In 1854, the stud was largely increased from the Piver stables. In 1855, came Revolver, Grape-shot, and Chief Justice; in 1862, Teddington and Daniel O'Rourke, with several brood mares. When Sir Tatton Sykes' stud was sold, the Austrian government bought thirty-six brood mares; and in 1864, The Pride of England, a roan Norfolk horse, was a noteworthy accession, in color and quality, to the already splendid haras. On Captain Anstey's visit, Mineral colt appears on the list of those that were then at their dam's heels; little, however, thought he then, that this comparatively insignificant youngster would one day gain the easiest Derby victory since that of another foreigner, Gladiator. Kisber's sire, Buccaneer, he describes as the best stallion in Austria; indeed, large extra sums were, at the time of his purchase, offered in order to get him back again to England. He had developed in Austria most dangerous man-eating propensities, however. Though quiet in his stall, he was not to be trusted in the riding school, where, shortly before the visit of Captain Anstey, he had bitten off the fingers of his groom."—*Land and Farm.*

—ORNITHOLOGY AS A RECREATION.—It is easy to see several reasons which account for the popularity of ornithology as a rural recreation. In the first place, it can be pursued everywhere. Even the barest common has its birds, and yet there is just such sufficient diversity among the birds which haunt similar localities in different countries to interest the mind and induce philosophical reflection on the causes of this variation. Indeed, the number of problems which the study of birds presents, is another reason why it is so generally fascinating. The mere dilettante can amuse himself in solving these, while the professed student finds many which baffle his closest scrutiny. The migrations of swallows, for instance, were until recent years beset by the same haziness which attended them in Gilbert White's mind. People, sensible enough on other points, gravely affirmed that the approach of winter drove the *hirundines* to their hibernating quarters, hollow trees or

the bottoms of rivers. The claims of overlapping species, of partial migration, of the abundance or paucity of allied species in different years, of the curious changes of color in the plumage of many shore birds without their undergoing a molt, together with that special *crux*, of most departments of natural history, what constitutes a species? are specimens of the speculations to which ornithology addresses herself. But even more difficult and delicate inquiries remain on such points as the presence of instinct and violation of bird life. The disappearance, whether partial or total, of different species from the several provinces of Great Britain, forms another interesting branch of study, and others might be indicated if the extent and variety of questions which imperatively demand an answer from the scientific ornithologist had not been sufficiently demonstrated. Perhaps the being brought face to face with nature while prosecuting these and the like inquiries, and freedom from the drudgery involved in the use of the microscope indoors, enter largely into the pleasures of the bird lover. And yet ornithology demands in the open air minute and extended observation, large powers of discrimination and comparison, and an enthusiasm that never flags at disappointment. The ornithologist might almost be weighed against the comprehensive standard of virtues required of the angler in the seventeenth century. He must be untiring and eagle-eyed, sanguine yet disciplined to believe on insufficient premises, a clever antagonist, a well taught disciple of the inductive method, skillful at forming an hypothesis, but slow to admit its truth without the most rigorous collection of instances and testing of their agreement. Such an "admirable Crichton" is the scientific ornithologist of the nineteenth century, and among our countrymen such men can be counted on the fingers.—*Cornhill Magazine.*

—WILD CATTLE OF CHILLINGHAM.—At the first survey we made from a vantage-ground we saw the white forms of the animals we were in search of, in a little valley dotted over with thorn-trees at no great distance off. And as we hastily arranged our plan for circumventing them, a figure emerged from a neighboring copse, who proved to be no other than our ally cattle-keeper. Under his experienced guidance we made our approaches with extraordinary good luck. Threading a convenient plantation as gingerly as if we were after moose in a Canadian forest, with the breeze blowing steadily in our faces, we found ourselves standing under a screen of saplings within some sixty yards of the herd. There they were, feeding in peaceful unconsciousness, cows and bulls and a couple of nursing calves. Very graceful and game-looking animals they were, and certainly well worth the long journey. Near as we had approached, we were too far off to distinguish those pink ears that are the special mark of the Chillingham breed. But we could admire their muscular shapes, their small, well-shaped head, their clean-cut limbs, and free spry action. The wind came straight from them to us, and there was not a touch of taint in the air. But at last a group that were feeding a little apart from the others grew restless and uneasy. Having seen some fallow deer, who had been disturbed by our passage, trotting leisurely down the park, they had taken the alarm; and it was a piece of our marvellous good fortune that they had had no warning otherwise. The flushing of a pheasant or even the twitter of a startled blackbird is quite sufficient to spoil a stalk upon them; and it is no little matter following them afterwards, up hill and down dale, when they have taken refuge in the recesses of the woods. Now they moved leisurely away, suspicious of they scarcely knew what, switching their cream-colored sides with their tails, and snatching at the herbage as they went along. The master bull gave the lead, another and a heavier, with a powerful barrel, and pendant dewlap, brought up the rear at some little distance. As the park-keeper told us, this straggler had been the sultan of the herd till only a couple of days before, when he lost the supremacy in fair fight. As a rule, the beaten bull withdraws himself apart like a rogue elephant, and becomes dangerous. But this fellow was supposed to be meditating vengeance, watching his opportunity to surprise his successful rival at a disadvantage and maim him with a sudden rush. Generally speaking these cattle are harmless enough: at the sight or scent of an intruder, their shyness sends them off in a stampede. But there is always a risk when they have got little ones with them. Like deer, they hide their calves in the grass or the bracken; and should the nursing be startled suddenly or awoken with a cry, the whole of the herd will charge to its rescue. When the bulls are brought to bay too, they make some savage charges; and the present Lord Tankerville had a narrow escape when he went to dispatch an unlucky brute that had put out his shoulder by an accident. They are literally wild cattle, for it is absolutely impossible to tame them. Their keeper has tried repeatedly, and failed invariably; and animals who have been familiar with his appearance since their birth are just as shy of him as of any other mortal.

At present they number nearly sixty, so it is happily probable they will go on increasing and multiplying. But at one time, according to the legend, the famous stock had been brought so low that the sole survivor was a cow in calf, which calf, most providentially, proved a male.—*Blackwood's Magazine*.

—THE KIWI-KIWI.—We learn from the *Christian Weekly*, that the home of this strange wingless creature is in New Zealand, and there it is much sought for, inasmuch as only royalty is allowed to appear in the mantles manufactured from their skins.

Study for a moment the strong feet, outspread, firm. With these they secure their in-set foot, jumping with great force upon the ground, and so starting from the rich mould of the wild-wood, the crawling busy creatures, just beneath its surface. The kiwi-kiwi has its home among the tree-roots in the recesses of the forest, where it dives down into the richness of the fern-leaves with

singular adroitness! It is a fleet-footed traveler, and can during the day elude pursuit; the natives hunt it most successfully during the night, when with torches and spears they worry it down, confusing it no doubt with their yells and flashing lights.

The plumage is formed of curiously shaped flat feathers, each being wide and furnished with a soft, shining, silken down, for about a third of its length, and then narrowing rapidly towards the extremity, which is a simple shaft, with hairlike webs at each side.

The quill portion is small and short, and is overlapped by the down when the feather is removed from the bird. The prevailing color is chestnut brown, each feather being tipped with a darker hue, the under parts being lighter than the upper. Imagine its beauty and glossiness. Truly, royal taste is to be commended!

The kiwi-kiwi must look droll enough when out on a merry chase; it steps over the ground almost as rapidly as the ostrich, and with head "set back," neck raised, and long beak extended, plies its sturdy legs with right good will. The hunter must look carefully, for the ins and outs of the wilderness are better known by bird eyes than by human vision, and the wild-wood creature has some reserved strength, a pretty determined will, and love of life.

Until quite lately the Apteryx, (which is its other name,) was regarded as a fabulous bird, but when specimens were taken to England, and inquiries led to a knowledge of its life and habits, its name and uses were entered upon the list of other recognized bird families. But the isolated strangers preserve a natural shyness, hiding during the day among the straw, (as at home the frequented ferns gave pleasant shelter), often looking puzzled with the ways of things, and keeping out of sight almost constantly.

The eggs of the Apteryx are something wonderful; the bird weighs a little over four pounds, and each egg weighs between fourteen and fifteen ounces, its length being four inches and three-quarters, and its width a little more than two inches, thus being nearly one fourth the weight of the parent bird. The long curved beak of this bird has the nostrils very narrow, very small, and set on each side of the tip, so that the busy seeker can pry out the

worms and other food, without being dependent upon the eyes. The height of the kiwi-kiwi is about two feet.

Three species of Apteryx are known—one most remarkable for the puffy downiness of its plumage.

—Yesterday, August 2d, a visit to Penn's Grove, the country residence of Mr. Woodward, editor of the *Alta California* gave me a chance to examine closely a Century plant while in blossom. The plant in question is but thirty years old, and was moved to where it now stands twenty years ago. It has been wonderfully prolific, as the young plants, children and grand-children, that border the walks and drives through the extensive grounds prove.

The plant gave the first signs of blossoming early in June, and now boasts a peduncle thirty-nine feet in height, with a circumference where it first appears above the leaves, seven feet from the ground, of twenty-eight inches. Besides this main flower-stalk eleven others have shown themselves, the tallest, being scarcely half the height of the central. A cluster of seven buds and blossoms, which the wind had kindly broken off, was given me to examine at my leisure, and, though the blossoms contained not an element of beauty, and their odor was disagreeable in the extreme, I found much in its study, of interest. Of the seven, one is a blossom past perfection—one has just opened, the remainder are buds that, I am assured, will open one each day until all are done. The flower in perfection is eight inches in length, and as I see it in the vase before me, seems all calyx and stamens. The long and thick calyx I find upon close examination to be in three parts, the receptacle, the flower-cup and the long, thin, irregular sepals that give the flower its ragged appearance. The receptacle is of light green color, while its continuation, the flower cup, is of a dusky yellow. This flower-cup I note in the freshly opened blossom is filled to the brim with a transparent gelatinous mass, disagreeable alike to taste and smell. In the fading blossom, I notice this is reduced to an almost gum, and thickly covered with pollen, and scarcely more than covering the bottom of the cup. (Query: has it been absorbed for the nourishment of the seed, or has it evaporated?) The pistil of to-day's blossom is but half the length of the stamens, while in the flower of yesterday it exceeds them by one-half an inch. The stigma is three cleft, the fissures being filled with a sticky pulp which glistens in the sunshine, and to which I notice much pollen adhering. Opening the pistil, I find three tiny ducts leading through to the center of the receptacle, surrounding and adhering to which are numerous flat, circular, white-seeds in six long rows. The anthers, six in number, are of bright yellow, and are rich in pollen. Their length in the perfect flower is seven-eighths of an inch, and they describe but a slight arc upon the slender filaments; whereas in the blossom of yesterday the filament has lost nothing in length, but is shriveled to almost a hair's breadth, and upon their tips the anthers dried and withered, hang in little rings.

The blossoming of the Century plant is said to be its death, and it may prove so here, though now not an appearance of decay is to be seen. Indeed, within the slight paling that surrounds the wonder, I noticed four scions just pushing above the soil. Mr. Woodward has always been proud of his plant, because of the exceedingly rank growth which characterized it above all others in its neighborhood, and more pleased is he now than ever that it should have put forth its glory in this Centennial year.

PACIFIC.

—THE BALTIMORE ORIOLE.—Cecilius Calvert, second Baron of Baltimore, has a hold upon the recollections of mankind far surpassing that secured by any monument in the noble city he founded, in the fact that the most charming bird that makes its summer home in the parks of that city bears his name. That bird is the Baltimore oriole—*Icterus Baltimore* of Linnaeus. Its plumage is patterned in orange and black, the baronial colors of the noble lord's livery, and Linnaeus only paid an appropriate compliment to the source to which he owed his specimen of the new species when, in 1766, he recognized the coincidence in the name.

Then, as now, the orioles were among the most beautiful and conspicuous of woodland birds. From their winter retreat under the tropics they return northward as the warm weather advances, arriving in Maryland during the latter part of April, and reaching Central New England by the middle of May. In these migrations, performed mostly by day, they fly continuously and in a straight line high overhead. About sunset they halt, and uttering a few low notes, dive into the thicket to feed, and afterward to rest. They do not go in flocks, but singly, or two or three together. The males come to us in advance, and instantly announce their presence by a loud and joyous song, in the execution of which they continually emulate one another during the week or more that elapses before the arrival of the females. But

this emulation does not end with vying in song; they have many pitched battles, chasing each other from tree to tree and through the branches with angry notes. The coming of the females offers some diversion to these pugnacious cavaliers, or at least furnishes a new cause *belli*; for while they devote themselves with great ardor to wooing and winning their coy mistresses, their jealousy is easily aroused, and their fighting is often resumed. Even the lady-lovers sometimes forget themselves so far as to savagely attack their fancied rivals, or drive out of sight the chosen mate of some male bird whom they want for themselves. This is not all fancy, but lamentable fact.

Mademoiselle Oriole is not so showy as her gay beau. Persuade the pair to keep quiet a moment, and compare them. They are in size between a blue-bird and robin, but rather more slender than either. The plumage of the male is of a rich but varying orange upon all the lower parts, underneath the wings, upon the lower part of the back, and the outer edges of the tail; the throat, head, neck, the part between the shoulders, wing quills, and middle tail feathers are velvety black; the bill and feet are bluish; there is a white ring around the eye, and the lesser wing quills are edged with white. In the female the pattern of color is the same, but the tints are duller. The jet of the male's head and neck is rusty in his mate, and each feather is margined with olive. The orange part of the plumage is more like yellow in the female, and wing and tail quills are spotted and dirty. Three years are required for the orioles to receive their complete plumage, the gradual change of which is beautifully represented in one of Audubon's gigantic plates. "Sometimes the whole tail of a (young) male individual in spring is yellow, some times only the two middle feathers are black, and frequently the black on the back is skirted with orange, and the tail tipped with the same color." Much confusion arose among the earlier naturalists from this circumstance.

The singing of the males is at its height now that the females have come, and they are to be heard, not only from field and grove and country way-side, but in the streets of villages, and even in the parks of cities, where they are recognized by every school-boy, who calls them fire birds, golden-robins, hang-nests, and Baltimore birds. The lined avenues of Philadelphia, the elm-bordered precincts of New Haven, the sacred trees of Boston Common, the classic shades of Harvard Square, and the malls of Central Park, all echo to their spring-time music.—*Ernest Ingersoll, in Harper's Magazine for September.*

SMALL PET DEPARTMENT

AND YOUNG FOLKS' CORNER.

(For Fanciers' Journal.)

THE SILKWORM.

The Silkworm (*Phalena Bombyx*) came originally from China, in which country the art of making the fibrous substance of the cocoon, available for textile purposes was known and practiced by the Chinese 2,700 years before the Christian era. It was not until the sixth century that the silkworm was introduced into Europe by two monks who brought some eggs from India to Constantinople.

The eggs of the silkworm are of a pale slate color, semi-transparent, about the size of a mustard seed, and flattened on top. They are deposited upon paper or cloth by the female butterfly, who dies immediately after performing this, the sole object of her existence. In Japan, paper is specially prepared for this purpose; though a sheet of white writing paper will answer very well. As soon as the eggs are laid they are wrapped in thin paper and placed in a cool and well ventilated chamber, until the following spring.

The eggs are hatched in various ways according to the climate. In China and Japan, the papers of eggs are taken from the chamber in which they have been kept since they were laid, and hung up in sacks, care being taken that all are equally exposed to the atmosphere, so they may hatch at about the same time. In Europe artificial heat is used in hatching, and in California they are placed in a room heated by the sun's rays. In about three days after exposure the good eggs will hatch. The worms at this period of their existence are very small, (about one-half of an

inch long) and of a dark color. They are voracious feeders however, and grow rapidly if well and carefully fed. The principal food of the silkworm is the leaf of the Mulberry tree (*Morus alba*) though they will eat lettuce and other plants. As soon as the worms appear they are placed on open trays or boxes made of paper, and fed frequently, giving them small quantities at a time. At the end of the third day they become torpid, assume a whitish hue, and refuse to eat. This is their first moulting and they must not be disturbed until they awake. After passing this stage, the color of the worm changes to a dark ash color and they must be plentifully supplied with food. They pass through four moults or sleeps, and at the expiration of the fourth moulting, are of a dark grey with a reddish hue. They continue to grow lighter for about seven days when they assume a yellowish color, their backs taking on a shining, and their mouths a reddish hue. A great quantity of food is now needed, and they will devour an almost incredible quantity, and must be kept supplied with food constantly. At this time the worms, which have now attained a length of about three inches, are seen to crawl around, and frequently raise their heads as if looking for a place to construct their nest, that is to spin the cocoon in which they envelop themselves. They must now be provided with something to which they can attach their cocoons. In the large cocoonereries in China and Japan, mats are used for this purpose, upon which the worms crawl and perform this, their last and most important work. A very good receptacle for the worm when ready to spin is formed by twisting one-half a sheet of note paper into a cone (similar to those used by grocers and others), and after placing the worm therein, tacking them to the side of the wall.

At the expiration of about eight days, the cocoons can be gathered and dried in the air; they are then placed in warm water and the silk unwound, the chrysalis being placed in bran.

For seed, the very best cocoons should be selected, that is, the largest of them and such as are firm and of a bright color, and so far as possible an equal number of each sex. The male cocoon is slender, pointed at both ends; the female being larger and oval shaped. In about ten or fifteen days after the silk has been taken off the cocoon, a moth will emerge (from the bran in which the chrysalis was placed,) in the shape of a large butterfly of a greyish white color, having four wings, two eyes and two feathery plumes or horns. The male usually appears first, and is known by his small size and the continual fluttering of his wings. The female is larger, of a lighter color, and seldom moves. These are to be paired and placed on sheets of paper, and left in darkness; as soon as pairing and mating is concluded, the female deposits her eggs and dies immediately. One ounce of eggs will produce about forty thousand silkworms. The length of the thread on the cocoon varies from six hundred to a thousand feet.

BRAVE CARLO'S ADVENTURE.

Editor of Fanciers' Journal:

Seeing the account in your pleasant weekly of the performances of certain pet dogs, &c., I send you an interesting episode in the history of my own canine—a fine large Newfoundland, so-called, though I think probably he is a cross of this breed with the Shepherd dog.

During my former residence in the country, for Carlo is now nine years old, we resided near a broad river, where this animal, who is very fond of the water, often resorted for a swim. He is an unusually strong dog, and weighs now 115 pounds. He had been taught to fetch a billet of wood that was thrown out into the stream, and when the children went to bathe, he always accompanied them, enjoying the sport in the water amazingly.

I thought to teach him to swim by the two little ones, and to catch their bathing-dresses and assist them in deep water; so if

they chanced ever to be in danger, he might help them out. Not supposing, however, that the case would ever arise where Carlo's aid would be needed.

One warm afternoon, my little son six years old, (a great favorite with this dog) shied down alone to the river with him, and began to pitch sticks into the water from the bluff, sending Carlo after them. His feet slipped when too near the brink, and the boy went into the river. The nurse had missed him a few minutes previously, and having seen him with Carlo, she ran towards the water just in time to see him tumble over the bank.

He could not swim. The water was eight or nine feet deep where he fell, and he went under! Nurse rushed to the edge of the stream and set up a howl of fright and agony: "Billy was drowning!" "Catch him, Carlo!" she shrieked. "Quick, Carlo! seize him!" she yelled, as the little fellow sank and rose, and struggled.

The dog was returning shoreward, with a stick in his mouth. He dropped it the instant he heard nurse's shout, and made for the spot where Billy was in trouble.

The bank was so high that he could not mount it, but he caught the child by the skirts at first, and Billy's body was so turned by this movement that he could seize the dog's neck—which he did, right vigorously—though this forced Carlo's head and muzzle down quite into the water.

Still the faithful brute paddled away, and bore the baby down stream two or three rods—where the water was shallow. Here he quickly got his feet upon hard bottom, and with a snort took the almost exhausted boy up and safely ashore; to the great joy of his alarmed and distressed nurse, who told us the story half an hour afterwards, as I have now related it.

Carlo is not for sale, as you may well understand. But I thought this brief record of his bravery and usefulness would not be uninteresting to your readers. And so I have written it out for your "Young Folks' Column."

PORTLAND, ME.

B. B. W.

FAITHFUL UNTO DEATH.

I will tell you a little story of the fidelity of a dog to his master. It was told me by my guide as we sat for a little rest upon the mountain which divides the Beaverkill from the Neversink, and while my own faithful dog Jack rested his head upon my knee.

"Your dog seems to love you?" said my guide.

"Yes," I replied, stroking his silken ears while the animal looked into my face with his large brown eyes. "I never gave him a kick or a cuff in my life," I continued. "I appeal to his sagacity and intelligence, and govern him by the law of kindness."

"He would lose his life for you, no doubt," said Arnold.

"Yes," I answered; "I have no truer friend."

"Do you see that farm-house at the base of yonder mountain?" said Arnold, pointing in the distance.

I shaded my eyes and looked in the direction named.

"Yes," I replied.

"Well, my father lived and died in that house," said Arnold; "and if you will listen while we rest, I will tell of how there was mourning in that house once over the death of a faithful shepherd-dog who died by his master's hand."

"I will listen with pleasure," I answered.

"My father," said Arnold, "was a drover who purchased stock, and when a herd was collected drove them to tidewater, and then shipped them to New York for sale. He usually rode horseback, and was always accompanied by his faithful shepherd dog Prince."

"My father was a man of warm heart. He never was cruel or unreasonable, and his faithful dog was his constant companion. One day he mounted his horse, to return from Rondout to his home in Delaware Co. He had realized more than three thousand

dollars from the sale of his herd of stock in New York, and had placed his money in a portmanteau, which he had securely fastened, as he thought, to his saddle. Father had ridden many miles, and was nearly to his home," continued Arnold, "when he shot his dog."

"Shot his faithful dog?" I said with astonishment.

"Yes," said Arnold; "but he did it innocently, and the deed made mourning in his home. The old man got nearly crazy over it, for his heart was as tender as that of a child. You see," continued Arnold, "when a few miles from home the dog commenced to bark and bite at the horse's fetlock. Father spoke sharply to the dog, saying 'Prince, be quiet.' The dog cringed to the earth for a moment, but soon continued his antics again, and barking more furiously than before. As it was in the heat of August, and the dog never was known to act so strangely before, the thought flashed to father's mind that the poor creature was affected with the dreaded hydrophobia."

"Prince," said he, "what makes you act so?" The animal once again cringed to the earth, while his eyes flamed with excitement. Father spurred his horse, the dog followed with quickened pace, and when he jumped and bit at my father's feet the dreaded thought came with full force that the dog was mad—that his death must follow the stern fact. He pulled his pistol from his pocket and pointed it at the cringing brute. Loth to shoot his faithful dog, he replaced the weapon, and once more hurried away. Again the dog followed and renewed his attack, but in a fiercer manner; and when father saw the saliva flowing from his mouth, all doubt as to the poor animal's madness disappeared. Once more he pulled his pistol from his pocket; once again the dog cringed to the earth; father took deliberate aim, and the poor brute gave a cry of pain as the hot blood spouted from his breast. Again the unerring bullet went to the dog's heart. Father rode quickly away, sickened with the sight. When a mile away from the spot where he had shot his dog, a thought flashed upon his brain. He felt for his portmanteau, containing his money. *It was gone.* It had become unfastened and was lost. All was clear as a noonday sky to his mind then. The poor, faithful dog had quickly noticed his master's loss, and had recourse to the only means within a brute's power to convey the intelligence to his master. Sick and faint, he rode to where he shot poor, faithful Prince, but no dog was there. A trail of blood lay in the sand for a long distance, and father followed it, humbled and dispirited. In the dim distance he saw his dog lying in the road, and as he drew nearer he saw his portmanteau covered by his body. He alighted from his horse and saw the blood still oozing from the faithful creature's wounds. He called him by name, and the dying brute looked to his eyes while gasping for breath, and seemed to say 'Good-bye, master; you cruelly killed me because I could not talk. Don't tell the little children at home how I died.' The hot tears came to father's eyes as he smoothed poor Prince's head. His eyes soon closed, he gave a convulsive gasp for breath, and all was over. Poor Prince was dead.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"TO EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

"No Exchange or Want" will be inserted unless accompanied with 25 cents.

OLIVER D. S. HOCK, Hamburg, Bucks Co., Pa., will exchange Fancy Pigeons and Game Chickens, for a "No. 2, 751, Geo. Parr Excelsior Scroll Saw," with attachments and saws, or a Fleetwood Scroll Saw.

ELMER SMITH, Milton, Northumberland Co., Pa., has one pair of Black Tumbler Cocks, 1 pair White Fans, 2 pair Brown Tumblers, 1 pair Dutchess, 1 pair Balheads, 1 trio White Ducks, 1 Seven-shooter Revolver, 1 Accordeon, for which I want Fancy Pigeons, or a Scroll Saw. Stock must be good, as mine is.

JOHN CUSTER, No. 921, 21 St., Harrisburg, Pa., will exchange 1 trio Sultan, 1 trio Brown Leghorns, good fowls, for a male Mocking Bird; also 1 Italian Greyhound, worth \$38.00, for anything but live stock.

W. C. EATON, Newark, N. J., will exchange Lt. Brahmas, P. Cochins, Felch & Williams stock, and a Graves' Incubator, for a small Black and Tan Dog.

A. A. WYLLIE, Bowmanville, Ontario, has a long Silver Chain, one Printing Press, will print a form 21 by 31, with two Fonts Type and Type Cases, one Printing Press, for printing cards, clothes, &c., three Fonts Type; will exchange for Fancy Pigeons. What offers?

W. E. TERRELL, Middlefield, Conn., will exchange German Silver Cornet, B, cost \$45, very little used, for nice Brown Leghorn Pullets, (and a cockerel, if not related) Must be fine stock. Write at once.

C. E. L. HAYWARD, Peterboro, N. H., will exchange one trio or more of strictly first-class Partridge Cochins, White Leghorns, or Black Bantams, for Poultry of other varieties, or Pigeons. Also have for exchange a fine lot of White Footed Bantams, and Yellow Fantail Pigeons.

J. R. HOLTON, 40 State St., Batavia, N. Y., will exchange a pair of Blue Bald-head Tumblers, (breeders); also White Fans, for Black or Blue Fans, or a good pair of Pouters. Write at once.

T. H. CONNOR, Blackinton, Mass., will exchange first-class White Leghorns, or beautiful Pekin Ducks, for Plymouth Rocks, or any kind of Bantams, excepting Black Reds or Red Pile.

H. BURCHARD, Box 737, Corry, Pa., will exchange one good pair of P. Rocks, well grown, for a pair of good Canaries, (male and female, old birds); also 1 pair of Mexican Game Bantam Cockerels, (game to the last), for offers; 1 trio of extra good Dominique Leghorns, for Mocking Bird or Red Bird.

A. C. VAN BORN, Washington, N. J., will exchange one Cock and three Hens, B. Red Derby Game, for three Strutchine Game Hens, marked as near alike as possible, and first class as mine are.

ELMER SMITH, Milton, Northumberland Co., Pa., has to exchange 2 B. B. Red Game Cocks, 1 B. B. Red Game Stag, 2 Black Red Hens, 1 Blue Hen, 1 Black Hen, 3 young Game Hens, 1 Bull Pug Bitch, 1 House Dog, 2 pairs Maltese Kittens, 1 trio silver Spangled Hamburgs, for Partridge Cochins or Brown Leghorns.

WEATHERLEY, Druggist, cor. Huntington and Coral St., Philadelphia, wants to exchange Solid Yellow Fantails, Solid Yellow Turbits, Yellow Owls, and 2 pairs of extra young Antwerp Carrier Pigeons, bred from my imported birds, and brothers to those I used in the ball one ascending from the Centennial grounds. It is unnecessary for me to mention about the duty they performed, as all the newspapers gave full account at the time. Make offers.

O. S. RACKLEFF, Deering, Me., will exchange one pair of Yellow Wing Swallows, for a pair Blue Barless Swallows, Red Swallow Hens, for male. The Swallows are good birds. I expect the same. Postal card answered.

P. H. HORNE, Stoneham, Mass., will exchange No. 1 Brown Leghorn Chicks, (suitable for exhibition), or double-barrelled Shot Gun, un-injured, but little used, cost \$18, for small sized English or German Beagle Hounds, or Harrier, or others; also one Fox Hound, for any of the above.

A. C. HELLTZ, 807 N. 2d St., St. Louis, Mo., will exchange an Italian Greyhound dog, small and fine, one and a half years old, half brother to "Agnes," winner 1st prize at Springfield Bench Show, for an equally good Italian Hitz Pup four or five months old, Dark Brahma Chicks, Angora or Dutch Rabbits.

A. M. CAREY, Salina Grove, Pa., will exchange four beautiful Maltese Kittens, and a lot of desirable Fancy Pigeons, for choice Pullets or Hens of following breeds: B. L's, W. L's, L. B's, P. C's, B. C's, S. S. H's, or Houdans or others.

J. W. HARTMAN, Westchester, Pa., has Owls, Yellow-wing Turbits Hens, Dutchies, Blue Autwrens, Trumpeters, Carriers in colors, Red Barbs, 1 Young Blue Pouter Cock, Blue winged White Hens and 1 mated pair, (outside Tumblers in colors, Jacobins in colors, Mooreps, 1 Hen and 1 mated pair, Archangels, and many odd birds of the different kinds; also one Chester White Boar, eleven months old; wants in exchange, Yellow and White Barbs, mated, 1 good size pocket Seven-shooter, Earth Closet, or Commode, or offers.

F. G. PATTERSON, Portland, Me., will exchange pearl case opera glass, in good order, that cost \$15.00, for offers; also - Guinea Pigs. Fancy and Common Pigeons, at their value, for Pullets of any good breed for laying. "Postals" solicited.

BOX 869, Rockville, Conn., will exchange a C. Cornet, cost \$60, for a first-class Central fire Shot Gun. Must be in good order, as the Cornet is.

MAPLE GROVE YARDS, Sullivan, Ohio, has 4 Pekin Drakes, Yearling Am. Merino buck, two Berkshire boars, Land and Water fowl, 30 varieties to exchange for good Sewing Machine, double Harness, Corn-sheller, popular books or offers. Fair exchange or none.

W. J. ROW, Greensburg, Pa., will exchange a Thoroughbred Berkshire Sow or a Jersey Bull calf for a pair of Prince Albert Suffolk pigs, 6 mo. old or over. All letters &c. answered.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 43 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

WALLACE'S AMERICAN TROTTER REGISTER—Box 85, Blacking Ridge, N. J., wants Volume I of the above, in exchange for other books.

AUDUBON WANTED—Jos. M. Wade, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

HISTORY OF THE EARTH AND ANIMATED NATURE, by Oliver Goldsmith—Oliver D. Feckel, Hamburg, Berks Co., Pa., wants Volume II of the above. State propositions and condition of work.

RED BARB COCK. (See description on page 477.)

FATE.

BY BRET HARTE.

The sky is clouded, the crows are bare,
The spray of the tempest is white in air,
The winds are out with the waves at play—
And I shall not tempt the sea to day.

The trail is narrow, the wood is dim,
The panther clings to the arching limb;
And the lion's whelps are abroad at play—
And I shall not join the chase to-day.

But the ship sailed safely over the sea,
And the hunters came from the chase in glee;
And the town that was built upon a rock
Was swallowed up in the earthquake shock.

THE INDIAN CROW.

[Continued from p. 462.]

Crows are gregarious in the hour of danger; let one of their number be injured, and all the crows in the neighborhood will flock to the spot, to help or sympathize, and evince their interest by loud caws. This peculiarity often gives occasion to a cruel joke at their expense; after some maneuvering, a crow will be shot, and instantly his brethren, now unmindful of the gun, will flock to his rescue, wheeling around with loud cries; and so solicitous are they, that two, and even three barrels may be discharged into their midst with fatal effect; and only then will they vociferously adjourn to the nearest tree, and thence pour out their torrents of corvine abuse. A milder joke consists in capturing a crow, and releasing him with a colored rag tied to his leg. As usual, his brethren have assembled in angry numbers; but he is in no hurry to rejoin them; glad to escape at any price, he bolts away in the nearest direction, and perhaps one or two give chase, to ascertain all particulars; but there is no falling upon and smiting the liberated captive, who soon returns, rag and all, to his original haunts. The natives are very fond of running a feather through the nostrils of the crow or stringing a cowry (a small shell, current as money) through them, and I have even once caught a crow on to whose neck a cervical vertebra of a camel had been forced. In each case the individual gets accustomed to the ornament, and his friends do not exclude him from their society. As regards the crow with the bony necktie, I had to break the ring with some force before I could liberate the animal; and then he departed rejoicing.

The crow is not gregarious in building; each pair builds apart, and pays but little attention to the structure or locality of the nest. Trees of all kinds are equally handy, and the proximity of dwellings is not objected to. Building operations are carried on soberly and noiselessly during the latter half of February and the whole of March, and the labors of incubation are mutually shared. I have ascertained as an undoubted fact, that crows, while incubating, leave their nests largely during the day; that is, they perch outside, keeping watch, but at night they sit closely. The same remark applies to sparrows, minas, and kites; and in corroboration of this, I will mention a singular fact. On one occasion I made a collection of eggs; and one day some crows' and minas' eggs were brought from a distance, and rather roughly, all huddled together in an earthen pot. They were placed in a drawer until I had leisure to blow them; but professional engagements caused me to overlook them. On the third day I heard mysterious sounds in the drawer, and on opening it found a young crow and mina chirping piteously. I tried hard to rear these strangely-hatched birds, but both died. When the young—generally three or four—are hatched, the parents are indefatigable in their feeding attentions, and necessarily so, for more voracious nestlings can hardly be met with. Long after they have left the nest, you will meet a family, say on the high-road, the

parents busily analyzing the chance food, and the young birds clustering round them with flapping wings and gaping beaks, crying loudly for choice tidbits, which are continually being dropped into their mouths by their faithful parents. The enemy of crows during incubation, is the koël, or Indian cuckoo, which chooses the nest of the crow for his nefarious purposes, as the European cuckoo generally does that of the hedge-sparrow. Consequently, the koël is invariably mobbed by crows whenever they come across it, although the imposed upon and bereaved parents nourish the changeling most affectionately. As the koël is smaller than the crow, its young one does not eject more than one or two young crows from the nest. It screams wildly while pursued by the crows, as if fully conscious of the punishment it deserves.

Crows are not at all amusing in captivity, and, unlike their English congeners—the magpie, raven and jackdaw—seem to lose all their cunning and knavery. I tamed one once; but the only faculty he exhibited was insatiable hunger combined with imbecility; the other crows seemed to despise him, although he flapped his wings impudently to them; but they helped themselves unreluctantly to his food.

Let me now record some corvine anecdotes which came under my own observation. I was enjoying *chota hâzee* with some friends on the *chabootra* (a masonry platform) just outside the veranda of their house, and a plated egg-stand was on the table. All this while, and unknown to us, a crow had been watching us from a closely adjoining tree; we had occasion to go indoors for a few moments, and, on returning, found an egg and its cup missing. On inquiring, the *khidmatgar* (table attendant) said: "Kâ-wa lé giya"—a crow has taken it away. (Natives always ascribe breakages and pilferings to crows, as English servants do to cats.) Hardly crediting this, we were discussing the probability; when lo! the plated egg-cup came rattling down the tree; and the emptied egg-shell soon followed; and then friend crow slunk abashed, as if detected. He enjoyed his egg all the same. On another occasion an English dog of mine was enjoying a bone out in the open, and in close attendance were two crows, who made several futile attempts to pilfer the bone. At last, after a distinct consultation, one crow hopped off with dejected mien, and then, unconcernedly, approached the dog from behind. Suddenly he seized him by the tail, and the dog at once viciously snapped backwards, to avenge the insult. In a moment the crow in front flew off with the bone, followed by its able ally; and so, like Mother Hubbard's disappointed pet, "the poor dog had none."

Here is an instance of how a crow was once outwitted. One day a young fish-alligator (*gaviá*), about four feet long, was brought to me; and I directed it to be placed in a small tank fairly stocked with fish. He evidently enjoyed himself; and in a month I was told that the tank was fishless. Shortly after, the hungry alligator was seen to seize and devour a paddy bird (one of the egrets), which came to fish for frogs; and two days after, *mirabile dictu!* an unlucky crow which came to drink was seized and devoured. After this feat the alligator remained dinnerless for some days; but, fortunately for it, the rains set in, the tank overflowed, and our saurian friend floated away to the Ganges.

I must conclude this account by describing the amusing pastime of crow-hawking with a bird not much larger than the sparrowhawk. As it is not allowed to kill, the crow is either captured or allowed to escape, none the worse for the encounter. On this occasion it was beautiful to observe the birds trying to outwit each other. The crow, never losing its presence of mind, dodged and counter-dodged the hawk, but without avail; and after an exciting aerial combat it was borne to the ground, but only to renew the fight with "beak and claw" until separated by an attendant. True to its salt, a brother crow came cawing on to the scene, to see what the hubbub was about (we were on a bare plain, miles away from the station), when it in turn was flown at by the hawk with the same amusing result.

Much more might be written about the Indian crow; but I think I have sufficiently shown that it is one of the most knowing and most knavish birds in existence.—*Chambers' Journal*.

POULTRY DEPARTMENT.

THE WORK OF THE DAY.

At this season, above all others, the watchful eye of the poultry breeder is needed everywhere. Not only must the diseases peculiar to the atmospheric change from the extreme heat of summer to the frosts of winter, be guarded against, but any falling off in condition, incident to the decrease in the supply of food afforded by nature, must not be permitted. From this on, the time for preparation for the show room is limited compared with the work to be done, and the experienced breeder well real zes, that, having every element of nature to work against, only the most constant and unrelenting care will result in success. The old breeder knows this, doubtless he has learned it by hard lessons. But the beginner cannot realize it. He does not understand that extra care in providing against the elements, in furnishing more food and of a more nourishing character, will keep his fowls up in condition and save much disappointment and expenditure a couple of months hence. He does not realize that it is easier to *keep up* than to *bring up* the condition of his stock. Then too, the work of preparation for winter must not be neglected. Here again the lessons learned by experience are not forgotten. The fancier, who last year had not provided sufficient house-room for his birds, and in consequence had them plucked and, that evil of all others, feather-eating engendered, this year has commodious quarters. The one who last year, for lack of place, must keep his sick and diseased fowls with the healthy, this year has a hospital pen or house. If last year he was obliged to be at the mercy of the retail dealers, having to pay the highest prices for grain because he bought in dribblets, and of course was out of feed when feed was highest; this year he has his bins constructed, and, watching the markets, has laid in his stock when he could buy reasonably. When his family stores are garnered for winter, he has a store of small potatoes and loose-headed cabbages put aside for his poultry. A supply of sand and gravel too, is placed under cover, to spread beneath the roosts, also to form the feeding places for his poultry.

Some put aside a stock of hay, others save the falling leaves, to throw in the pens when the birds are kept prisoners by the storms of winter, among which the grains for food are scattered; thus compelling the fowls to take the exercise they otherwise would not, and thereby preventing much of the mischief that follows in the train of idleness. Some have barrels and boxes, convenient and sheltered from the action of the weather, in which to save the droppings either for use in the garden next spring, or to sell, thereby adding no despicable sum to the credit side of the poultry account. When in the fall cleaning, the straw beds are renovated, they do not permit the straw to be burned, but put it carefully away in barrels or bags for the nests for sitting hens; saves it not more for economy's sake, than because being broken and worn fine, it is superior to anything else for the purpose. These are but items in the long list of preparations needed for winter, and with so much to do there is no time for delay.

SOUTHERN TIER SOCIETY.

At a regular meeting of the Southern Tier Poultry and Pet Stock Society, held July 6th, 1876, the name of the Society was changed to the Southern Tier Poultry Society.

C. J. WHITE, *Secretary.*

YOUNG BROWN LEGHORNS.

EDITOR FANCIERS' JOURNAL:

I recently saw an enquiry in your paper respecting the appearance of young Brown Leghorn chickens. To which I reply: Brown Leghorn chicks, when about one week old, should have the center, or back stripe, a very dark brown, as well as the two narrow stripes on either side; while the two intermediate stripes should be brownish white, and where the edges of these different stripes join, the down will show nearly the same color as the general back plumage of the mature fowl.

The stripes on the heads of cockerel chicks will not extend up so far, nor be so clearly defined, as those of pullets, though there are exceptions; the cockerels will have a more reddish appearance, and will lose their tail feathers; but a rich appearance of red at a few yards distance, speaks well for the stock.

As the chicks fledge, the primary and secondary wing feathers should show a dark slaty brown, the ends of feathers showing a light spot, making a dotted appearance.

Young B. L. chicks not unfrequently show white spots on or near the ends of the feathers; these will grow off, but not so if on whole or half of the larger end next the body. B. L.

FATTENING DUCKS AND TURKEYS.

In preparing poultry for either the table or market, says the *Rural Home*, it must be remembered that their flesh will be found to partake, to a great extent, of the flavor of the food on which they have been fattened; and as they are naturally quite indiscriminate feeders, care should be taken, for at least a week or so before killing, to confine them on selected food. Boiled potatoes are very good feeding, and still better is ground corn and oats cooked with the potatoes, and fed warm. This feed gives the skin a golden hue, and the flesh a sweet, juicy and nutritious taste.

BERKS COUNTY FAIR.

READING, Sept. 25th, 1876.

MR WADE:

DEAR SIR:—You will please find a list of premiums awarded to exhibitors at the Berks Co. Agricultural fair, held in Sept. 1876. The display had been better this year than heretofore, owing to the stimulus of the Berks Poultry and Pet Stock Association.

White Leghorns—Dr. Heckman, 1st prem. fowls.

" J. Dorwart, 2d prem. chicks.

Brown " Dr. Heckman, special.

Partridge Cochins—Dr. Heckman, 1st prem. fowls.

" L. Roland, 2d " "

Light Brahmas—J. Rehner, 1st " "

" 2d " chicks.

Buff Cochins—J. Gottshall, 1st " fowls.

Pl. Rock— " special.

Dark Brahmas— " 2d " chicks.

" —Nicholas Vogel, 1st " fowls.

Houdans—J. Gottshall, 1st " "

S. Spangled Polish—Mr. Marshall, 1st " "

Silver Penciled Hamburg—Mrs. Grim, special.

Silver Spang. " Wm. Lighthuis, 1st " "

" J. Gottshall, 2d " chicks.

White Holland Turkeys—Mr. Potts,

Chester Co, 1st " "

W. F. Blk. Spanish—Dr. Heckman, 1st " fowls.

" Mrs. Goodhard, 2d " "

Pekin Ducks—Wm. Lewis, 1st " "

" Mr. Potts, 2d " "

Pigeons, mixed coop—Win. Dickel, 1st special.

" Fantails—Jos. M. Freese, 1st "

" Tumblers, Blk.—Nich. Vogel, "

" Speckled—" " 2d "

Rabbits, Himalayan—Wm. Dickel, 1st "

There was a four-legged chicken, of Buff Cochlin Mixture, on exhibition, and was a real curiosity.

I remain yours,

DR. HECKMAN,

Sec'ty Berks Co. Pet and Stock Association.

A HEN THAT MEANT BUSINESS.

About a year ago, says the *Ventura Signal*, a hen laid a number of eggs in a warehouse in this city, and with a yearning for motherhood, she immediately commenced sitting, and in due course of time brought out a brood of fourteen chickens. As no one came to claim the hen and her progeny, the owners of the warehouse gave the chickens to a notable housewife, who took both until the chickens were old enough to wean. The hen was then returned to her old haunt, when she immediately commenced making her second deposit. With her usual success she again brought out thirteen chickens. This time one of the clerks took them home. After weaning the chicks, the hen was again returned to her old trysting place. True to her instincts, she laid her third litter of eggs, and again hatched out thirteen chickens. This time another clerk has taken her home and is rearing her young.

CAN A POULTRY FARM PAY?

This question has been fully answered in the affirmative by our neighbors the French. Hitherto with us the attempts have ended more or less in failure; but is that a reason, if a proper method is adopted and due care and supervision exercised, that we should not succeed in the future? From the accounts I have before me of the French poultry farms, I gather that if we follow their example and breed for sale, just as ordinary farmers do their sheep and oxen, there is no apparent reason why a fairly remunerative profit should not be realized by poultry farmers in this country. My belief is that all attempts hitherto in Great Britain have been undertaken and carried out on fallacious bases. The mania for prize-winning and fancy exhibiting has helped to bar success. Again, too expensive and elaborate buildings, &c., have been another cause of failure. Look at some of our most successful breeders; ordinary wooden houses have been enough for them, and their birds have everywhere gained commendation. Let, therefore, economy and real, not elaborate, efficiency be our aim.

1st, Let there be plenty of space in the open runs. The poultry will find for themselves much good and wholesome natural food, and so save extra feeding. 2d, Let the home feeding be regular and liberal, but not excessive; your birds then will always be in good health and condition. 3d, Whether you purpose producing eggs or meat for the table, choose suitable breeds for each object. Do not, however, use too many different breeds, as that involves complications in your houses, yards, and accommodation generally. 4th, Let your personal supervision be constant, and employ only the best and most trustworthy assistants.

To take another line of argument. A farm, say, of fifteen or twenty acres will only support a certain number of sheep or oxen according to its fertility of soil; all other feeding stuff, oil cake, &c., will have to be paid for extra, and that in high proportion. Calculate out the product of this in beef and mutton for the market. So many oxen or sheep of such and such weight can be raised, but what can we say of poultry? In this case so much does not depend on the quality and richness of soil; and a greater weight of poultry at less cost, as I purpose showing in my next article, will be raised than could be of beef or mutton.

Poultry, it is true, are liable to disease, so are sheep and oxen. With twenty acres, too, if properly managed, nearly every requisite might be raised for the stock kept. Could this be done in ordinary farming? Barns, cattle-sheds, granaries, etc., would, in the case of an ordinary farm, be on a much larger and more expensive scale than need be for a poultry farm.

There is only one question that seems to me of vital importance now left for consideration—Is there a good and conveniently situated market for your poultry, easy of access, and where fair wholesale prices can be obtained? If so, I can see no reason to doubt success.

I have for the last eight or ten years raised poultry in a large way for my own consumption (selling only at times the surplus), frequently having three or four hundred birds young and old in my yards, and averaging over five thousand eggs per annum, with always a fair supply during winter from young pullets. The direct gain in money was comparatively small, inasmuch as my runs were contracted, so entailing extra feeding, and little produce went to market, and that not of the best description; but indirectly my butcher's book was greatly relieved, and I always had a pleasant variety of food for the table. I bred Houdans, Brahmas, Chinese and common Geese, Peruvian and common Ducks.

As to the question of breeding for actual profit, I have not hitherto tried it; but so convinced am I, from my past experience as an amateur, that it will or should pay, that I intend shortly, in conjunction with a friend of mine, to undertake poultry farming on a fairly large scale, beginning moderately at first, and eventually, if successful, extending our sphere of action.

So far I have given you and your readers my ideas and experience, hoping that others will take up this question and give us the benefit of their advice; in any case they must look upon the question in the proper light—viz., profit and loss.—*Journal of Horticulture*.

A CROWING HEN.

A writer on superstitions says: "All along the border between England and Scotland a crowing hen is regarded as a portent of death. A few years ago an old woman, in the parish of East Kilbride, heard one of her hens crow near the house. She mentioned the circumstance to a neighbor, saying that no good would come of it. Not long afterwards her husband died. A month passed by, and once more she heard the fatal sound, which was followed in a few days by tidings of the death of her son. A week later the hen crowed again, and the eldest daughter died. The old woman could stand this no longer. In her desperation she seized the unlucky fowl, wrung its neck, and threw it into the fire. Wiser people have burned men and women with less show of reason."

A WONDERFUL BIRD.—Extraordinary is the rooster now residing at Grand Rapids, Mich. Generally these pugnacious birds contend only with one another, but this cock flies at higher game. First, he wrestled with a three-year-old colt, hitting him with his spurs and flying at his nose, and finally compelling the colt to retreat. Then the victorious rooster tackled a cow. She tossed him on her horns like a plaything, but he invariably comes up smiling and renews the combat. 'Tis a drawn battle, thus far, with odds in favor of the rooster. The same proud bird fears not the face of any man, and lately compelled one who interfered with him to retreat in a very demoralized condition.

Rain water will, after having stood some time, be found by examination under a microscope, to contain worms identical with those taken from the throat of a chicken suffering from gapes.

PIGEON DEPARTMENT.

(For *Fanciers' Journal*.)

OUR ENGLISH LETTER.

No. 2.

ENGLAND, Sept. 16th, 1876.

MY DEAR MR. WADE:

In my last I wrote about the cleaning and disinfecting of the pigeon house. In this letter I propose to write on the treatment of the birds, and the prevention of disease. After the house has been thoroughly dried, and the floor well sanded, the birds may be put back in it, but such as have the discharge at the mouth and nostrils should be kept separate from the healthy.

TREATMENT:

Wash out the mouths, nostrils, and throats of the birds with a strong brine made of clean salt and as much hot soft water as will dissolve it. Use the brine warm. If the bird is weakly the brine must be weakened. In about an hour's time after the brine washing, again wash out the mouth with pure, soft, warm water, and immediately anoint the mouth and nostrils with Condyl's red fluid. If the bird is strong it is best to use the undiluted fluid; but if weak, use a solution of one part of fluid to four of soft water. If the disease has gone so far as to make the bird's breath have a bad smell, or the discharge to become yellow, take an old bread crust—quite old and dry, and free from mould—soak the crust in hot water, add enough vegetable charcoal to make the sop as black as good black ink—take care to have the bread thoroughly saturated with the charcoal—and fill the pigeon's crop half full of the mixture, giving it in a warm state. If the bird is weak it will require to be kept in an artificially warmed place. If the bird is in good flesh a black pepper-corn or two may be given it with advantage, but beware of over stimulating a weak bird.

Some birds with a thick, yellow discharge and bad breath are in good flesh and strong. Such subjects should, after the brine washing, Condyl's fluid and powdered charcoal treatment, be given a small capsule or two of castor oil.

Charcoal treatment should be used in all cases in which there is a foul breath, and given as above; it is good for a bird either in health or sickness. By all means beware of administering pure vegetable charcoal unmixing with bread, biscuit or meal, as I have found to my cost it is very likely to kill the bird by stoppage in the small intestine; but when mixed with food there is no such danger.

Carbolic acid is an excellent disinfectant for the floors and walls of any place, but my experience is against its use as a medicine for any living thing; however much it may be diluted, it is still a poison. For the dressing of all wounds, canker and sores, on animals as well as pigeons, I would use the undiluted Condyl's red fluid, as it disinfects without poisoning.

Many fanciers may not have the opportunity of buying vegetable charcoal. I have found the home made article better than any I could buy, made as follows:—Cut willow twigs, (other similar

shrubby will do) into lengths of three or four inches, (the thin ends are the best, as the bark makes the best charcoal) put an inch of sand on the bottom of an old iron pan, put in the twigs, cover with an inch or two of sand, and put the pan on a hot fire until the charcoal is made.

The treatment indicated will be found efficacious in most cases—of course when the system is too weak, no treatment will avail.

After disinfecting and cleaning the house, securing it from damp and drafts, the next important matter is food, on which subject I propose to write in my next.

Yours truly,

MANCHESTER FANCIER.

RED BARB COCK.

Our illustration this week is a life like representation of a Red Barb Cock, owned by our artist, Henry Erdmann, of Philadelphia.

Mr. Erdmann not only knows how to illustrate a good bird, but how to breed and appreciate one when bred. The illustration is a portrait in every sense of the word, as every part of head and body was carefully measured to get the correct proportions. The front view of the head is in every point drawn from exact measurements, and any one doubting the statement can test the matter by examining the bird at the coming Centennial Pigeon and Poultry Exhibition. Mr. Erdmann is one of the fanciers who places his pets above a money valuation; in fact, it is not safe for him to see a good bird for sale, even when his loft is fully stocked; as ten chances to one he will own the coveted bird. The question will not be "can I afford it?"

MATING EXTRAORDINARY.

Seeing in many numbers of your invaluable paper, invitations to fanciers to send you accounts of extraordinary matching or mating among birds, I take the liberty of sending the following as likely to interest brother fanciers. I have now in my loft an African owl cock that I mated with a hen of the same kind; they lived harmoniously together, and raised last season five pairs of young. During the winter I had the misfortune to lose the hen, when the cock, being a lively little fellow, set about finding another wife for himself. After a few days he succeeding in finding a wife in an unmated agate hen, who in due course of time laid the usual couple of eggs, he (the owl) assisting her regularly in incubating them; but when flying about the loft I noticed he was paying marked attention to a blue Antwerp hen, who, in a fortnight after the agate laid, also laid him a couple of eggs, the owl, in the most exemplary manner, assisting both his wives; the result being that the agate's eggs are hatched, and the young ones are progressing favorably, the owl regularly feeding them, and also assisting the Antwerp in incubating her eggs, which are due in about four days. If they also hatch, I will write you further on the subject; but I think that, as the young already hatched get bigger, the owl will find plenty to do to help the one hen.—N. in *Poultry Review*.

A good idea is being carried out in England, says the *Semi-tropical*:—Carrier pigeons are being trained in some of the light-houses, so as to adapt them to the service of pilot boats. After a while, numbers of these pigeons will be distributed to pilots, who, in case of an emergency when help is needed, can send a dispatch to the light-house for what is required. The dispatch will be sent at once to the nearest telegraphic station, and the needed assistance be at once rendered. This is no doubt an innovation which promises to be the means of saving both life and property, and deserves imitation among all civilized maritime nations.

EDITORIAL DEPARTMENT.

HERRON VS. WARREN.

A lengthy letter for publication from Mr. Herron of Indianapolis, relative to his controversy with Mr. Warren of Worcester, Mass., has been upon our table for some little time. This letter contains many original affidavits and much matter of interest to the case. But, as Mr. Herron proposes to bring it all before the American Poultry Association, and as, if they take action upon it, the whole will be given to the public in their report, we shall not publish it entire. A little part of it, however, in relation to the action of the *Poultry World* in the matter, taken just now, when the publishing of Mr. Warren's letter in that paper for September is fresh in mind, we propose placing before our readers that they may draw their own conclusions.

As to the controversy proper, we have not, nor do we intend to give an opinion editorially. We do not consider ourselves called to judgment. Our mission is ended, when, having placed the matter squarely and fairly before our readers, each one is left to judge for himself.

"Mr. Herron writes:—'It is a rule of mine never to pay for anything until I receive it, and as a business man I feel like offering an apology and an explanation for treating Mr. Warren differently from the rest of mankind.

"I wanted some choice game fowls; seeing Mr. Warren's glaring advertisement in the *Poultry World*—an apparently respectable, high-toned paper, and considering the fact of Mr. Warren's advertisement appearing therein, a guarantee on the part of the editor and proprietor to its subscribers, that Mr. Warren was what he claimed to be, I sent him my money. After returning the bird, because he was very far from what he was represented to be, I was cheered by seeing the following in the March number of the *World*.

DISHONEST DEALERS.—Those dealers in poultry who fail to do as they agree are, fortunately, few and far between. We have as good an opportunity to know whereof we affirm in this matter as any one; and it is our deliberate conviction that poultry fanciers, as a class, are as honest as any other class of men living; but there must be a black sheep occasionally, and our object in this paragraph is to request all who have dealings with any dishonorable dealer to report delinquencies to us. All such complaints shall be placed on file at this office for reference, and we will do all in our power to co-operate with our friends to expose offenders. Such an union will do much to deter as well as expose. Let the would-be dishonest dealer feel that he is compassed about by a great cloud of witnesses leagued against him.

"I immediately wrote to Mr. Stoddard, Ed. and Prop. of the *Poultry World*, as follows: 'I desire to call your attention to my statement in THE FANCIERS' JOURNAL of June 12th, relating to some of A. D. Warren's transactions, and request you to publish the same. I am a subscriber to the *Poultry World*, and was induced to send Mr. Warren my money from seeing his advertisement in that paper, feeling satisfied that you, at least, thought he would deal honestly.

"To which I received the following reply: 'We are sorry to disappoint you, but we could not print such a long statement, and especially against a man who has dealt so long and had in the main given such satisfaction to a multitude of customers.

H. H. Stoddard.'

"Had Mr. Stoddard replied, 'We cannot admit controversy to our pages,' and then have left this letter of Mr. Warren's unpublished, his course would have been consistent with his continued, in fact persistent, indifference to the standing of those advertising in his columns.

"As long as the amount due for advertising has been paid, it is all right. The people must find out by trying what the advertisements amount to. Such a course may do for a general newspaper, claiming to be no more than a directory, but for the organ of a fraternity like the poultry fancy, it seems scarcely the thing."

Let us look at Mr. Stoddard's treatment of the case. Can we not almost read his opinion? Had he regarded his patron as maligned, would he not have invited the controversy to the *World* that the calumny might be refuted? Do you, Mr. Warren, value the judgment that professes itself biased? and that will note the facts of but one side of the case? What does he mean by "such satisfaction? such as Mr. Herron complains of? Had Mr. Herron been the larger income to the purse of Mr. Stoddard, would Mr. Stoddard have refused his case a hearing? These are questions that will arise. The letter in the Sept. number of the *Poultry World* by Mr. Warren, we may possibly review, giving some correspondence—as Mr. Warren believes in publishing private letters—that we have at hand to show Mr. Warren's opinion of our action in the matter when it was a little less warm for at least one of the contestants than it is now. We shall withhold it unless driven to it. Feeling ourselves in the right, we are prepared to defend the position we take, always.

At the New London Co. Agricultural show, held at Norwich Sept. 19th to 21st, Gates, Tweedy & Co., secured 1st premium for largest and best collection of poultry, 1st on each Light Brahma fowls and chicks; 1st on each Partridge Cochins fowls; and chicks; 1st on Black Leghorn fowls and chicks, also 2d on chicks; 1st and 2d on Leghorns; 1st on Brown Leghorns; 1st and 2d on Plymouth Rocks, and 1st on Pekin Ducks.

TO ALL WHOM IT MAY CONCERN.—Especially those to whom we have sent bills of late. Will you not remit the amount due us for advertising, subscription, or books ordered, at your earliest convenience? Remember that we, to furnish you with the periodical and to place your advertisements before the public, are at a great expense, and an expense which we must meet without delay. If it is impossible to meet the bills presented, or if time will be required, do us the favor to so inform us, that we may know upon what we may depend. To those who have met their bills promptly, and those who have paid in advance, we return our thanks.

ERRATA.—For Edw. B. D'Estinville Picot, page 465, line 19, column second, read Edw. B. d'Espinville Picot.

In Centennial letter, No. 39, page 463, read Gaddess for Gladdess.

AN ISOLATED FANCIER.—Mr. D. A. Cowell, one of our *live* subscribers, writes us from Lake City, Hinsdale Co., Colorado, where he has recently removed: "I am the only subscriber to your Journal in this San Juan Country, and have the only lot of fine bred chickens. Common eggs are worth \$1.00 a dozen, and will remain high for years to come, as it is over two hundred miles to a railroad station. This is a mining camp of over 2,000 inhabitants, everything is lively, the mines are wonderfully rich. Any information I can give you, would be pleased to do so."

[We cheerfully accept the offer of Mr. Cowell for we know that there is much transpiring around Lake City that would interest our readers.]—Ed.

By a misprint we gave the 1st premium on Houdans, at the Conn. State Fair to Mr. Waterhouse, whereas it was awarded to Mr. Chas. B. Davis, of Higganum.

CORRESPONDENCE.

MR. EDITOR:

Can your correspondent "Collie," in No. 12 of your Journal, (March 23,) inform me where I can procure a young Scotch Collie answering to the description given by him.

Yours very truly, JNO. W. TRAFTON.

BOSTON, MASS., Oct. 2, 1876.

MR. WADE:—

There's a question come up in our poultry club, in all this talk about Herron vs. Warren. We wonder if them gold bands on the legs of Mr. Warren's birds look just the same to him as they do to us. And we wonder, if the judges are expected not to know who any of the birds' owners is, how they manage to know that those with Warren's mark on ain't Warren's. Maybe you can give us some light. I was just thinking about that Buffalo show two years ago. I could'n't go. I was lame, laid up with rheumatiz. Johnny P——, he went, and came down to my house straight from the show the first night, because he knew I was rather anxious about it and worrying because I could'n't get out. So says I "Johnny, whose got the best birds?" "Don't know, there ain't no names on the coops, nor there ain't any catalogues going to be sold till all the judgin' is done. I didn't know nothing only Warren's birds, *he's got his'n* all tricked off with brass rings, or copper or something round their legs."

Now we just wonder why, if Mr. Warren can fix his birds up so, the man that has the next coop could'n't tie a string with a tag with his name on, round the leg of his bird? J. H.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

BEFORE THE LEAVES FALL.

I wonder if oak and maple,
Willow and elm and all,
Are stirred at heart by the coming
Of the day their leaves must fall.
Do they think of the yellow whirlwind,
Or of the crimson spray,
That shall be, when chill November
Bears all the leaves away?

"If die we must," the leaflets
Seem one by one to say,
"We will wear the colors of all the earth,
Until we pass away.
No eyes shall see us falter;
And before we lay it down,
We'll wear, in the sight of all the earth,
The year's most kingly crown."

So, trees of the stately forest,
And trees by the trodden way,
You are kindling into glory
This soft, Autumnal day.
And we, who gaze, remember
That more than all they lost,
To hearts and trees together
May come through ripening frost.

—Putrid blood injected into the veins of a living animal is not mortal unless several drops are used; but the blood of an animal thus poisoned causes death in less than two days, in such minute quantities as a trillioth of a drop.

—Professor Bloch reports that a piece of meat, through which a constant electric current was allowed to flow, remained unchanged in color and smell after six days' exposure to atmospheric influence; whereas another piece similarly exposed, but without the current, became putrid at the end of the six days.

—A correspondent of the *Slatington News* writes to that paper from Weatherly that a man named Buck, while out berrying near that place, came across a rattlesnake, which he killed, and which upon being measured was found to be seventeen feet and three-quarter inches long. That beats the Welsh Mountain snakes.

—According to Pettenkoffer, the air in our houses becomes unwholesome when the carbonic acid in it, provided it be derived from the respiration of animals, rises from the normal proportion of 4 parts in 10,000 to 1 part in 1,000. The experiments of Dr. Angus Smith, and Dr. Hammond, have shown that the organic matter in the air, which increases in proportion to the amount of carbonic acid, is by far a more deadly impurity than the gas.

—Accustomed as may be the dwellers in large cities to the constant rumble of vehicles over the stones in the streets, it is pretty certain that such disturbances are not without their consequences on the nervous centers. M. Fousagrives asserts that he cannot consider such perpetual vibrations as harmless even for those born and bred in cities, and that it is very assuredly a genuine cause of eristhisme, and that to it may be ascribed that prevalence of nervous temperaments and diseases peculiar to the inhabitants of large cities.

—"The idea that the Judicial officer is supposed to be vested with ermine, though fabulous and mythical, is yet most eloquent in its significance. We are told that the little creature called ermine is so sensitive to its own cleanliness that it becomes paralyzed and powerless at the slightest touch of defilement upon its snow-white fur. When the hunters are pursuing it, they spread with mire the pass leading to its haunts, to which they then drive it, knowing that it will submit to be captured rather than defile itself. And a like sensibility should belong to him who comes to exercise the august functions of Judge."—Judge John L. T. Sneed.

—GRASSHOPPER GRASS.—Wherever the pastures of Western Missouri have been destroyed by the grasshoppers new varieties of grass have sprung up, which the oldest inhabitant never saw before. The principal of these is a green bunch-grass of luxuriant growth, which now covers pastures and door-yards where only blue grass has grown for many a year before. Stock eat it with avidity. Some persons assert that it is buffalo grass, while others see in it a resemblance to other grasses of the plains and mountains west of us. We hope that its development will be

studied by some expert in the botany of this continent, for its origin may throw a new and important light upon the origin of migration of the locusts. The seed was evidently brought here and deposited by the swarm that laid eggs in this region last fall. If brought here from Kansas or Colorado only, its identity would surely have been determined ere this by old plainmen who are so numerous hereabout. It has put forth no seed-stalk as yet, and perhaps in this climate it may not go to seed this year. Who will first inform us whence it came and what may be expected from it?—*Kansas City.*

—The Spanish Government has appointed a commission to inquire into the physical conditions and possibilities of the Philippine Islands. A professor of botany is to accompany the expedition to report on the nature of the flora of the interior, and on the condition and extent of the forests. A careful survey is to be taken of the entire group, and a map, drawn up on a large scale, is in consequence to be published. The mountain ranges are to be the objects of a special investigation; the height of all the salient points is to be accurately ascertained, and all traces of metallic products to be noted. The officers in charge of the expedition are to take such notes of observation as shall enable them on their return to draw up an exhaustive monograph on the entire physical condition of the islands. It is to be expected that many branches of scientific inquiry will profit by this research in a so long neglected and most interesting region.—*Phil. Ledger.*

—A NEW WORM.—A disagreeable reptile, known in Turkish as the calcale, has lately made its appearance in the cotton plantations in the Thracian Chersonesus. The calcale is a species of worm represented as being especially fond of the cotton and melon plant and being likewise partial to the vine. Its feeding hours, like those of "good society," are during the night, when it crawls up the stem of the plant and sucks out the juice. In the daytime it lies hid in the earth, and the peasants are consequently obliged to hunt for it at night. When the calcale appears in cotton and melon fields, its total extermination is only to be compassed by planting the field with grain, which it will not touch; and this process must be repeated during at least two successive years. In vineyards the remedy employed is to dig up the earth to a considerable depth around each plant. The villages on the European coast of the Hellespont produced large quantities of cotton for exportation, and the appearance of the calcale worm in their plantations is therefore looked upon as a real disaster.

—A FISH STORY.—A Florida correspondent of the *Atlanta Herald*, in the course of an interesting communication regarding Florida fisheries, says: "The best fishermen in Florida are the pelicans and ospreys. A pelican consumes about a peck of fish a day. They flock about the straits and inlets by thousands. Supposing there are 2,000,000 pelicans in Florida—and there are certainly more than that—they would eat 500,000 bushels of fish each day, or 182,500,000 bushels per year. The millions upon millions of white and blue cranes, herons, curlews, gulls, fishhawks, kingfishers, and other water fowl, devour thousands of bushels of fish every twenty-four hours. An experienced cracker estimates that 700,000 bushels of fish a day are required to feed the birds of Florida alone. This would make 225,500,000 bushels each year. Add to this the billions of fish swallowed by sharks, bass and others, and the sum total will reach nearly 2,000,000,000 bushels destroyed by feathered and finny fishermen on the peninsula in twelve months'. At first glance these figures appear enormous, but let any man make his own estimate, and carefully figure it up, and he will find them under instead of over."

—FROSTY MINES.—The *American Journal of Science and Arts* contains an account of a curious fact that the miners in Clear Creek county, Colorado, have discovered. It is particularly noticeable in the Stevens Mine, about 12,500 feet above the level of the sea, on McClellan Mountain. After a depth or distance of ninety feet from the surface, the crevice matter, in which the silver is found, is frozen solid. Summer and winter have no visible effect to change its temperature, nor is there ever any perceptible thaw. Pick and drill fail to work the frozen mass, and the only way the workmen proceed is to kindle a large fire at night against the matter and in the morning to pick at the disintegrated ore. After this curious fashion the mine has been profitably conducted for two years. From ninety feet, where the cold was struck, the tunnel has proceeded inward, now nearly 200 feet, and the cold is in no way diminished as yet. Other mines in the neighborhood show the same singular condition, and in all of them the depth under ground is such that the frost cannot possibly penetrate there. The conclusion reached by the contributor of the article is that it is a relic of the glacial era. Whatever its origin, it is

certainly a singular and interesting fact, and the method of mining, although profitable, is as simple and primitive as could well be devised.—*Phil. Ledger.*

—HERÉDITÉ.—The *Bangor Whig* has this report from Orono, Me.: "Some four years ago Mrs. B., living on that part of Marsh Island now known as Webster, visited her neighbor, Mrs. P., one afternoon, for a social chat, and was ushered into the parlor by the attendant to await the arrival of Mrs. P., who soon made her appearance. The ladies conversed very freely for a few minutes; when suddenly a novel sight attracted their attention, and on stepping to the mantel they discovered that eleven mice had during the preceding cold day coiled themselves up on the warm chimney, and their tails stuck out upon the mantel, through a crack in the finish of the room. As quick as thought Mrs. P. left the room, and returning with a carving knife, deliberately cut off the tails of every one of them, with evident satisfaction, and kept them to show to her husband as proof of the truth of the story, when he should return home at night. The next day she performed the same operation upon four more, and our informant adds that for the next three years the cat would bring in, occasionally, young bob-tailed mice."

—An interesting plant is a native to California, and there bears the name of Soap root. It is interesting from the uses to which the root and its fibrous covering are put. Its blossoms are of a delicate creamy white, and bear much resemblance in their form and fragrance to the blossoms of the hyacinth. Blossoming, as it does the first after the rains begin, and covering field after field with the delicate beauty, it is of all flowers an especial favorite.

Its root is a tunicated bulbous, covered with a thick fibrous mass of a deep brown color. The solid part of the bulb possesses soporific qualities. It was first used by the Indians, later by the Spanish, and later still by miners as a substitute for soap; while at the present time one of the most popular washing fluids, which form so important a part of the Californian economy, has professedly, this root for its base. Within a few years the preparation of the husk, stripping the wiry hair-like substance from its covering, and preparing it for the use of the upholsterer and cabinet maker, has become in San Francisco an important local industry, and one which, as it affords a cheap substitute for and is fully equal to hair, and for the very objectionable pulu—dust of the pulu or tree fern of Australia—the people are not slow to recognize.

PACIFIC.

—THE TRUFFLE.—The truffle is a species of underground fungus largely used in French cookery to give a peculiar rich flavor to meats. It comes principally from France, where it is always found in oak or beech woods, and can only be gathered through the agency of the keen scent of dogs or pigs especially trained to hunt for it. Both from the difficulty of obtaining the fungus, and from the fact that it is a delicacy highly prized by epicures, it brings in all markets a large price; and thus truffle-hunting has long been a remunerative calling for the French and Italian peasantry. In appearance, the truffle is a blackish mass, covered with protuberances and weighing from an ounce to several pounds; when cut open it presents a marbled appearance, and its reproductive portion (it is sexless) is found in the veins in the shape of minute sacs which never open, each containing several spores, possessing spine-covered or honey-combed surfaces.

Numerous attempts have been made to cultivate these fungi, but with little or no success. Sprinkling the earth with water, in which the parings of truffles have been steeped, has resulted, it is stated, in producing them; and they have likewise been obtained by the slow process of planting calcareous soil with acorns and waiting for the saplings to reach a few years' growth, when the truffles could be gathered among the roots. Still, no particular method of cultivating the truffle is in existence; and since they are found completely isolated from anything that could produce them, we are left in the dark as to how they are originated, or at best with merely the supposition that, at an early period of their development, they are parasites of the tree roots, or the theory that, like oak galls, they are due to the stings of insects.

The truffle is to some extent found in this country, principally in Virginia.—*Ger. Telegraph.*

—INSTINCT OF FISHES.—I have seen (writes Mr. Kidd, the eminent naturalist) some singular instances, mentioned in various works, of the tameness of birds and beasts, and I well know, from oft-repeated experiments, what may be done in this way. My object, on the present occasion, is to direct your attention to sundry experiments I have been making with fish. Of minnows I had, two years ago, no fewer than thirteen, ranging about in a large glass globe, and I taught them not only to know me, but to recognize the sound of my voice, whilst I whistled to them some

lively air. On such occasions they would all rise to the top of the water, salute me by touching my lips as I bent closely over the bowl, and actually leap up and play with the extremity of my nose! They would, moreover, fondle over me, by rubbing their silvery sides against one of my fingers, which I purposely dipped into their watery habitation—in this particular imitating the fondness of a cat, when she pleasantly purrs, erects her tail, and draws close to your person, to evince her perfect state of happiness. The usual fate, however, peculiar to all pets awaited mine; one by one, as the heat of the weather increased in intensity, they gave up the ghost, and my glass globe was consigned to the silent shelf. A few months since, my eye chanced to rest on the same globe, and there was awakened in me the fondest remembrance of my former tiny friends. You may guess the consequence. I have procured more, confining myself, however, to three only; and I have actually accomplished with these what I did with the others, or very nearly so, for they every day become more and more affectionate and attached. How their exquisitely delicate structure, and still more delicate constitution, will bear up against the coming dog-days I cannot say. I fear the worst. I keep them in cold well-water, fresh twice a day; and they suffer themselves most willingly to be taken in the naked hand, whilst being transferred from the globe to a basin, during the change of water. Surely the law of kindness is all powerful. Would that it were more universally tried.

PETS AND THE FATE OF SOME OF THEM.

BY HUON.

NO. 4. THE PET TIGER.

"You are more inhuman, more inexorable—
Oh, ten times more—than tigers of Hyrcania!"

SHAKESPEARE—HENRY VI.

In the great carnivora house of the Zoo, Fairmount Park, Philadelphia, resides a fine specimen of the Royal Bengal Tiger, man-eater of the first quality, and known, to distinguish him from another tiger in the same building, by the name of "Jim," who on a late occasion made himself a first-class tragedian, and though "Jim's" victim is the principal subject in this paper on pets, yet must a few words be said about "Jim" himself by way of preface.

"Jim" is now a full grown tiger; he has never eaten a man himself, nor any part of one, as he was taken out of his native jungle when he was but four months old, but his father and mother, grandfather and grandmother before him, were for years and years respectively the scourge of more than one Bengalee village.

Halchen. "How came he to leave home at such a tender age?"

Grampy. "Some natives, exasperated at the numerous outrages and murders 'Jim's' parents had committed, went for them on a certain day, and finding the old gent some distance from home, shot him, and carrying his head to the proper officer received the government reward, \$25, for it; they then returned for his gentle lady-wife, who they knew would not forsake her young cubs, or even leave them alone for a moment, except in search of food. It was but a matter of short time before the mother was served as the father—her head taken to the government office, and her cubs, two in number, (sometimes there are four or five in a family) carried away captive to a tiger school in Calcutta, there to be trained to menagerie life, or fitted for a Zoo Garden, and there 'Jim,' remained until he had cut his teeth, when he was sent marked 'C. O. D.' to Jamrack, the London animal dealer, and from there to the 'land of the free,' though Jim, behind his iron bars says "he don't see the free."

Halchen. "What a cruelty to kill the father and mother—making the poor cubs orphans?"

Grampy. "No! 'Jim's' father and mother had made several orphans in their time, and perhaps had eaten the orphans themselves afterward."

Halchen. "Did 'Jim' come to our Zoo direct from Jamrack's?"

Grampy. "No, he has been traveling round some. He seems to like the country. Most foreigners when they arrive here, walk at once to the polls and vote, and ask for an office, but Jim has done neither, and will most likely end his nine lives in his present home in the Zoo."

Halchen. "What became of the other cub?"

Grampy. "Ah, thereby hangs the fate of a pet, and the tragedy I have mentioned already. The other cub was sold to a gentleman, an American, residing in Calcutta, for the sum of twenty rupees (\$10), who desired it for a pet."

Halchen. "A pet? What a strange pet!"

Grampy. "No! pets have been made of all creatures from snails up."

Halchen. "Snails for pets! Those cold, damp, slimy things we find in our cellars, and kill with a pinch of salt?"

Grampy. "Oh, no, my verdant Halchen, those are slugs, quite different creatures. The pets were the vineyard snails (*Helix pomatia*), an edible which the French like as well as you do oysters. I once knew a gentleman who petted a dozen of them for four years, when much to his regret one spring night they all made their escape, each carrying away his house on his back! Yes, pets have been made of spiders, snakes, lizards, turtles, lions, tigers,—in short of every thing—from a Zoophyte up. Every one to his taste. Let us proceed with our pet tiger; which I should have told you was a female, and had been given the name of 'Nena'. Being in the sucking stage of existence 'Nena' was brought up by hand, and soon grew quite playful, amusing and very fond of her master, following him round the house mewling all the time, cat-like. When 'Nena' became a year old, her play got somewhat rough. A very young tiger has some fun in its nature, but after it is a year old there is none. By that time he begins to know he has razor claws that will make terrible gashes, and, as his heart is getting as hard as was Pharaoh's after the first plague, he feels like using them. One of 'Nena's' particular sports was to lie on her back with paws in the air, waiting to be caressed by her master, while day by day, the silky coated brute grew larger, stronger, with play rougher and fiercer, until the tap of her paw, though sheathed in velvet, was no joke. The servants of the house had never taken kindly to 'Nena,' nor had she to them, and now when she opened her mouth, her long, sharp, white teeth struck terror to their hearts, and as her temper was getting very uncertain there was no knowing on whose head she would empty the first vial of her wrath. Savage as she was however, there seemed one soft spot in 'Nena's' heart big enough to hold a pet, and this was apparently filled by a house dog with whom she would romp and play for hours at a time as two kittens might with one another. Doggy however had but his day, for in one of their plays, when 'Nena' was about thirteen months old she became offended at something, and in the midst of the romp she suddenly sprang upon her poor playfellow and with one savage bite killed him on the spot. After that the servants were in bodily fear, and begged that 'Nena' should be caged, which being done, so enraged her, that her master in pity set her free again, saying 'she was only a child tiger, would do no harm if let alone—it was the fault of those who teased her if 'Nena' behaved ill,' and once more she was the terror of the house. You see her owner, as with all owners of pets, only saw her fair side—to him the brute appeared gentle and even grateful. Every evening, early, she would lie in the veranda on a piece of carpet spread for her; later, as the nights grew cooler, she would quietly creep inside the house, and when the nights became too cool—there is a winter in Calcutta, in February the thermometer falls to 70°—then Nena would mount to the foot of her master's bed, and cuddling up to his feet, lie there the whole night long! Still to the servants the brute grew fiercer and fiercer, her play rougher, her temper more fitful, and her sweet voice now grown to a roar,

comprised a double octave, extending from the lower C to the upper, and when going through her scale she would shake the very marrow in the bones of the servants, while the green glare of her flashing eyeballs would freeze them with terror. More than once had she knocked some one of them down, and one day her conduct became so *deadly* comical that all in a body revolted against her, one and all declaring they would live no longer in companionship with such an unmitigated fiend.

"That fixed the fate of 'Nena' as far as her master was concerned, and next day the poor dear girl was shipped off to Jam-rack, where, by a strange coincidence she again met her brother 'Jim.' With him she was sent to America, and finally they both came to take up their residence side by side in 'our Zoo,' and here was enacted the tragedy which ended the poor thing's rather eventful life.

"For some reason or other 'Nena' had taken a dislike to her brother 'Jim,' a fact very apparent when they were first placed in the Garden, and that was the reason that strong iron bars separated the two, though they did not prevent the assault by 'Jim,' which caused ultimately the death of 'Nena.'

"The way of it was this:—You see, 'Jim' each day used to promenade for several hours all round the four sides of his iron-railed cage, and he never came on that side nearest 'Nena,' but what she would set up a snarl and a growl of the most ill-natured and savage kind.

"One morning, I can't tell what had provoked the brute more than common, but seeing the long, beautifully marked tail of 'Nena' protruding through the railing on his own domain, he with solid grip seized it between his teeth, and a fearful uproar was the immediate consequence! The initiatory yell of pain was of course given by 'Nena,'—in the next instant it was echoed by 'Jim' the other tiger—was taken up next by 'Pompey' and 'Minnie,' and now, leopards, jaguars, cougar, ocelots and lynx, were all yelling, making a perfect pandemonium of the place, driving one half of the visitors from their almost fiendish presence. Poor 'Nena'! This was the roughest treatment she had ever met with; to escape it, she seemed willing to sacrifice her beautiful tail, and for that purpose she braced herself square against the bars that she might have the greater power to free herself. This brought her hind legs into 'Jim's' cage, which no sooner did the infuriated beast see, than, quick as lightning, he seized upon one of them and sinking his terrible teeth into his victim's flesh and bone, he, in a moment, crushed one third of her leg to a mass of pulp. By this time the yelling and uproar was perfectly fearful. Every animal in the building, even to the hyenas, and some squalling macaws which were outside of the building, joined in the infernal uproar.

Halchen. "Were not the keepers on hand?"

Grampy. "Of course they were, from the first of the fray, and had been endeavoring but in vain to separate the brutes. None dare enter the cages however, and blows from the long iron scrapers were of no more account with Jim than pounding him with a boiled carrot would have been! Finally, the ring end of a long iron scraper was forced into the brute's mouth, which was turned round by the united strength of two men, thus forcing him to open his jaws and free the imprisoned and now thoroughly mince-meat leg.

"Poor 'Nena' howling with pain and rage, she hobbled back to the farthest corner of her cage, and there lay down to examine her wounds, which were—the lower part of her leg entirely chewed up, and her thigh torn almost into shreds, and denuded of skin by the terrible razor claws of 'Jim!' And now commenced that instinctive act of self amputation, by which, when wounded, the tiger in his native jungles saves his life. 'Nena' deliberately ate up, save the mere skin and its beautiful striped fur covering, all that was left of what, but a few moments before, was an active and

powerful limb! Then she laid her down to sleep as indeed 'Jim' had already done, as though nothing strange had happened to either!

"Next morning, however, there were evident signs of mortification taking place, and cold water through a hose was copiously poured upon the wounds of 'Nena' at intervals of 30 minutes through the day, but all in vain. A consultation was called of prosector Chapman and the keepers.

"Result.—Musket loaded and executioner appointed. Superintendent objected—said the report of a musket would be injurious to the other animals—besides it was shooting away \$3,000! Could not the animal be saved? Other animals in other 'Zoos' had had false limbs made, and thus had hobbled through life! and so the musket was set aside, and 'Nena' had a respite from death. But 'Jim' had not got over his spite yet, and the very next day after the respite, finding 'Nena' lying up against his side of the cage, with her tail protruding under the lower bar, he again seized that already wounded caudal ornament between his teeth, and this time stripped it off fur and flesh from root to point.

"Woe's me now for 'Nena'—leg might be mended but tail never! No false tail maker has yet opened shop hereabouts, and consultation No. 2 was held. 'Strychnine' was the verdict. So a basin of water well seasoned with that delectable drug was given her, of which, unsuspecting soul, she drank *quantum suff* to send her to the immortality of tigers. In an hour from the time she drank of the poison, her groans commenced, first loud and strong, then weaker and weaker, and at the end of the sixth hour after she had taken the poison, poor 'Nena,' who but for the decrees of fate might have been the pride of the jungle, was gathered to her fathers."

ITEMS.

Our graces, like evergreens, grow most in the low vale of affliction, even as the stars are most luminous and lovely when nearest the horizon.

"Patience is always crowned with success. This rule is without an exception. It may not be a splendid success, but patience never takes anything in hand that it does not succeed with in some form."

Every parent is like a looking glass for his children to dress themselves by. Therefore, parents should take care to keep the glass bright and clear, not dull and spotted, as their good example is a rich inheritance for the rising generation.

There is a native dog in Newfoundland now 16 years old. He is gray, and his fangs have fallen out; but he is provided with a cozy kennel and food that does not need much mastication. Around his neck is a glazed collar bearing three medals, one of silver and two of gold. One of the latter is from the Royal Humane Society of England, the other is a gift from an American captain, and the silver medal is from a former Mother Superior of St. Michael's Convent in St. Johns. All three testimonials are in recognition of the animal's sagacity in saving lives.

THE BIGGEST SNAKE STORY YET.—Some time ago, says the *Owen News*, Mr. Robert Williams, near this place, heard one of his wife's ducks making a noise as if something was after it; he got out of bed and went to where she was, but could not see or hear anything. He went the second time, but with the same result. He told his wife he guessed the duck had gone crazy. Next morning he went to where the duck was sitting upon her eggs, under a brush-pile, and, imagine his astonishment, he saw a large black snake coiled up under the duck, his snakeship having swallowed twelve eggs. Mr. Williams cut his head off, cut him open, took the eggs out and placed them under the duck, and eleven of that dozen eggs hatched. Mr. Williams' word is as good as his bond.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged. "To Exchange for Cash" or "For Cash" or "To Obtain a Purchase" or "Wanted an Offer," etc., etc., cannot under any circumstances be admitted to the **Exchange** or **Want** column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

FANCER, Box 612, Williamsport, Pa., has Partridge Cochins Fowls and Chickens; La Picheo Pouter, cock, he beat; also Fout, 50 L. Brahms Fowls and Chickens, Felch, Williams & Plaiet-st. one Black and Tan Pup; one King rater Pup, very fine. Make offers of L. Brahms Cock or Cockerel, fit to win first; Golden eubant Bantams, or anything that you'll est. Postals answered.

J. H. ROBERTS, 4507 Rubicum Ave., Germantown, Pa., will exchange for W. C. B. Polish or Brown Leghorn chicks, a pair of fine English Greyhounds, thoroughbred; full pedigree.

F. D. BAILEY, St. Clairsville, Ohio, will exchange one trio White Leghorns, for nickel-plated Revolver, seven-shooter. Must be good, as my fowls are.

W. C. EATON, Newark, N. J., will exchange Lt. Brahmas, P. Cochins, (Felch & Williams stock), and a Graves' Incubator, for a small Black and Tan Dog.

O. S. RACKLEFF, Deering, Me., will exchange one pair of Yellow Wing Swallows, for a pair Blue Barless Swallows, Red Swallow Hen, for male. The Swallows are good birds. I expect the same. Postal cards answered.

A. C. HELTZELL, 807 N. 2d St., St. Louis, Mo., will exchange an Indian Grayhound dog, small and fine, one and a half years old, half brother to "Agnes", winner 1st prize at Springfield Bench Show, for an equally good Italian Blue Pup four or five months old, Dark Brahma Chickens, Angora or Dutch Rabbits.

F. G. PATTERSON, Portland, Me., will exchange pearl case opera glass, in good order, that cost \$18.00, for offers; also various Pigs, Poney and Common Pigeons, at their value, for Pullets of any good breed for laying. "Postals" solicited.

BOX 869, Rockville, Conn., will exchange a C. Cornet, cost \$60, for a first-class Central-fire Shot Gun. Must be in good order, as the Cornet is.

D. R. WIDMER, 43 Mill St., Germantown, Penn., will exchange for good bred Newfoundland pup, from 2 to 6 months old, good bred Game Chickens, either Black Reds, Brown Reds, or some that I have which is a cross between Brown Red and White Duckies. All warranted as represented.

E. J. CRAWFORD, Middlefield, Conn., will exchange 6 good Pullets and one Cockerel, Light Brahmas, for P. Cochins, W. or Brown Leghorn Pullets, or for early Pullets of any breed or cross.

F. M. LOWE, Fitchburg, Mass., has for exchange Light Brahmas, Partridge Cochins, Black Leghorns, and B. R. G. Bantams, all first-class birds, some of which have taken first and special premiums. Make offers.

S. B. HATTON, Monroe, N. Y., has 10 Tumbler Pigeons, 1 pair mated, the rest old and young, six young Roken Ducks, a trio Muscovy Ducks, and 1 pair of Light Brahmas, early hatch, to exchange for Bronze Turkeys, Fancy Pigeons, Books, or something useful that don't eat.

LOUIS E. SMITH, 375 West Church St., Elmira, N. Y., has to exchange one pair of Blue Pied Pouters, for 2 Jacobin Cocks, 1 White and 1 Yellow; or a Blue Pied Pouter Hen, a German Nun Cuck, for either a White or Yellow Cuck; and 1 pair White Fans, for either Black Jacobins, Carriers, Turbids, or Barbers.

PHIL M. SPRINGER, Springfield, Ill., will exchange one pair of Pea-comb Partridge Cochins Fowls, or one Outward Run Lamb, or Scotch Collie Pups, or Light Brahma Chickens, for White Carrier Pigeons, Canary Birds, Terrier Pups, or Maltese Kittens.

GEO. F. SEAVEY, Cambridgeport, Mass., will exchange the following Cocks for Hens of the same kind: Blue Carriers, White, Black, Blue, and Red Fantails, Black, Red and Yellow Jacobins, White and Blue Berlin Button Hen 4 Tumblers, Red-wing Turbids. None but first-class birds wanted; will give the same.

GEO. F. SEAVEY, Cambridgeport, Mass., will exchange the following Hens for Cocks of same variety: Blue-crested Fans, Red-crested Fans, Red Mottled Fans, Dun-wing Turbids. Must be first-class.

G. A. STOCKWELL, Worcester, Mass., will exchange Delec's Works, 1 vol., \$1.50; Swift's Works, 1 vol., \$1.50; Modern Origin School, Zander, 32; Half Hours with the Best Authors, 2 vols., \$4; 10 vols. Dickens, and 5 vols. Scott, at \$1.50 each, for P. Rocks, Cochins, Brahmas, Leghorns, Turkeys.

O. H. MOORE, Tanques, Pa., will exchange Light Brahmas, (Williams strain), or S. S. Bantams Fowls, for Pekin Ducks, or offers.

"TROUBLE" care "Fred," Box 508, Rochester, N. Y., wants a good Blith Cox, Horse, Real Estate, Carriage, Baggy, Cuts, Harness, or offers, for Lumber Wagon, Marble-top counters, Show Cases, Soda Fountain, &c. Offers for P. Cochins, Young Cuck; 2 Bitch Pointer Pups. Postal cards? Oh! Don't.

I. W. WOODFORD, Vienna, Trumbull Co., Ohio, has one pair of first-class Dark Brahma chicks to exchange for B. Leghorn, Creve Coeurs, or offers in Polish Chicks; also one good Game Pit Fowl, one year old, to exchange for P. Rock Cockerel. Postals accepted.

J. P. FERRIS, 74 Lexington Ave., New York, will exchange fifty good White Leghorn Cockerels, value \$2 to \$5 each, and one hundred Pulets, value \$3 to \$10 each, for offers of saleable merchandise. Lots of stock of every kind to trade. No trouble to write.

A. SEE-ER, P. & R. Express Office, Harrisburg, Pa., wants to exchange 25-ster Pups (Dogs), 3 months old, bred from thoroughbred English Setters, for Fancy Pigeons, or offers. Satisfactory reference given to pedigree of Setters.

G. DILLENBERGER & SON, 69 Clifford St., Providence, R. I., will exchange 1000 lbs. of the Vermont and Lo-son Hamlets, from imported stock, for A No. 1 B. R. Game Pullets, Warren stock, or Homing Antwerp Pigeons, or Belgian long breed Canary Cocks, or good singing German Canary Cocks.

L. R. SPONG, West Fairview, Pa., will exchange 1 pair Splashed Pouters, 1 pair Blue Pied Pouters, 1 Blue Pouter Hen, 1 pair Tumblers, 1 pair Fantails 1 Trumpeter Cuck, lot of 3-bushel Burlap Bags, lot of Connecticut made Baskets, 1 Cheese Case, (wire sides), 1 Tobacco Knife, 4 lbs. Pepper, 1 lb. cloves, lot of Demijohns, all sizes, for White Leghorns, B. L's., L. B. & C., Turkeys, C-ee, Ducks, &c., &c., or anything at all.

A. E. ARBOTT, East Hampton, Hampshire Co., Mass., will exchange 1 pair S. S. Hamburg chicks, 1st premium; 1 S. S. H. Cuck, three first premiums; 1 pair G. S. Hamburg chicks, 1st premiums; and a few cross-bred Game Chickens, for offers.

JACOB L. OTTO, Washington St., Easton, Pa., offers the following in exchange: 1 Houdan Hen, nearly white, (Bickell), 1 plain S. S. Polish Cuck, 2 each G. and S. S. Hamburg Cockerels, 1 pair White Chicks, 1 pair Golden Polish Pullets, 2 pair Ring Doves, Churchill's System Midwinter, by Huston, Treatise on Diptheria, by Dr. Teal, Rudolph's Pharmacological Dictionary, Sugar Lighting Machine, 1 new Silver-plated Call Bell, 5 new popular-nike Base Balls, 2 Wax Dolls, real hair and moveable eyes; for Poultry Books, Printing, Bantams, Pigeons, Games, or offers.

G. C. PEASE, Reading, Pa., will exchange Fancy Pigeons, for small Printing Press, Cage Birds, Parrots, or offers.

B. HULNE, Box 23, Altontown, N. J., will exchange Fancy Pigeons in variety, for No. 1 P. Cochins or L. Brahms Cockerels, Black Africa or Japan Bantams, or R. and P. Ducks; and Essex Pigs for Yorkshire Pigs.

T. H. HAYDEN, West Stafford, Ct., will exchange a few singing Canaries, 1 pair Ring or Turtle Doves, 1 B. R. G. Game Bantam Cuck, 1 Black African Hen, for Fancy Pigeons. Write soon. Do not care for premium birds.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

AUDUBON WANTED—Jos. M. Ware, Rockville, Conn., wants a copy of the above Work. State condition and lowest cash price.

WANTED.

1. A Treatise on the Art of Breeding and Managing Fawns, Domesticated, and Fancy Pigeons; by John Matthews Eaton, and published by the author, 7 Islington Green, London. 1852. Illustrated. The Treatise of 1858 is not wanted.

2. A set of Six Matchless Engraved Colored Portraits, Life Size; by Wolstenholme, viz: The Almond, Black Mottle, Red Baldhead, Yellow head Tumblers, Black Carrier, and Blue Pied English Pouter.

3. A colored Diagram, or a plan of Building or fitting up a Pigeonary, embellished with Tumblers, Carriers and Carriers.

We think there are several different diagrams, and would like all of them.

4. A set of six splendid Life size engraved Portraits of the Fancy Toy Pigeons, colored, viz: The White Fantail, Yellow Jacobin, Silver Owl, Blue Turbit, Black mottled Trumpeter, and the Black Barb.

All of above pictures published by J. M. Eaton.

A liberal offer we will be made for any of the above in good order.

Any information regarding John Matthews Eaton's life and works would be gratefully received.

WM. GARDNER BARTON, Salem, Mass.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

GEO. F. SEAVEY, Cambridgeport, Mass., wants solid Black and Red Turb. Hens, Dun Crested Tan Hen, a pair each solid Yellow, Blue and Dun Turbit, pair Yellow-tail Turbids, Blue-tail Turbid Hen, Dun wing Turbid Cuck, Yellow and Dun Berlin Button-hed 4 Tumblers.

J. S. E. MOND, Schenectady, N. Y., wants a second hand breech-loading rifle, (a repeater preferred), and a muzzle loading double shot gun, No. 12 bore.

PEDIGREE A NO 1

I have shown L. and D. Brahmas, and Pen-Comb Partridge Cuck 17 times, and have won 16 1st, 12 2nd, and two special premiums; stock from Felch, Williams, Hortsmans, and Edmunds not d'trains. Eggs \$3.00 per 15. H. FARHAM, Lima, O.

THE FANCIERS' JOURNAL.

J. H. SCHOCK, S. W. corner Tenth and Buttonwood Streets, Philadelphia, Pa., dealer in Segars, Weekly Papers, Stationery, etc.; will also supply *Fanciers' Journal* promptly by mail or at the store.

VOL. III.

HARTFORD, OCTOBER 23, 1876.

No. 41.

PEOPLE WILL TALK.

You may get through the world, but 'twill be very slow
If you listen to all that is said as you go;
You'll be worried and fretted, and kept in a stew—
For meddlesome tongues must have something to do,
And people will talk.

If quiet and modest, you'll have it presumed
That your humble position is only assumed—
You're a wolf in sheep's clothing, or else you're a fool,
But don't get excited—keep perfectly cool—
For people will talk.

And then, if you show the least boldness of heart,
Or a slight inclination to take your own part,
They will call you an upstart, conceited and vain,
But keep straight ahead—don't stop to explain—
For people will talk.

If threadbare your dress, and old-fashioned your hat
Some one will surely take notice of that,
And hint rather strong that you can't pay your way,
But don't get excited, whatever they say—
For people will talk.

If your dress is in fashion, don't think to escape,
For they criticize then in a different shape:
You're ahead of your means, or your tailor's unpaid,
But mind your own business—there is naught to be made—
For people will talk.

Now the best way to do is to do as you please;
For your mind, if you have one, will then be at ease.

HUON vs. McCANN.

Mon ami Huon, "Zoo Notes," No. 23 makes use of the following language—the italics are mine—"To his hole in the ground the skunk retires *when winter sets in*; he does not lay up any food, but being in excellent condition at the time he stows himself away, he lives on his own fat, dozes out his life till the *warm sun of spring* calls him forth." This language can only be made to mean that the common skunk does this *every where*, and *invariably*—whether among the snows of the north, or in the warm and balmy winter air of southern lands. In proof of his assertion in No. 37 FANCIERS' JOURNAL, he quotes *The American Cyclopædia* as saying—"they remain in their burrows from December to the middle of February." It will be seen that this is essentially different from his original statement—that he "dozes out his life till the *warm sun of spring* calls him forth." His authority was no doubt speaking of the skunk dwelling in high northern latitudes. My friend Huon quotes that very pleasant writer, Prof. Goodrich, as saying: "During the winter in the *cold parts* of the country, these animals keep close housed in their burrows, in a dozing, but not torpid state." Here again Huon has not followed his authority—what the Prof. says of the animal living in a land of ice and snow—*mon ami* says of him *every where*, and thinks there would be no difference in the habits of a skunk during the winter season in the frozen regions around Hudson's Bay, and one living among the orange bowers of Florida, or the hills of Tennessee! Surely there are intelligent readers of this JOURNAL, living in various sections of the

Union who could set this question, concerning one of our most common animals, at rest for ever. I see no necessity of applying to the English savants for information on the subject. Here in West Virginia I know that the skunk leaves his foot-prints in the snow, and roams through field and forest all the year. I reaffirm that I have *often* seen the skunk abroad by day, and I know that his habits are *not* strictly nocturnal. I repeat my former assertion—no animal *ever* digs a horizontal burrow, and assert that many do live in perpendicular ones—the *craw-fish* being a well-known example.

This line would represent a horizontal burrow.

Now let us look for a moment at some of the subterranean "homes without hands," and see if they will answer to this description. "The burrow of the chipping squirrel is rather complicated in structure, and is always made under the shelter of a wall, an old tree or a bank. The hole descends almost perpendicularly for nearly a yard, and then makes several devious windings in a slightly ascending direction."¹ Would any one think of calling this a horizontal burrow? Would any one assert that the labyrinths formed by rabbit, or prairie-dog, with rooms above rooms connected with each other by perpendicular galleries were merely horizontal tunnels?

And again—"The burrow of the woodchuck is rather long, running to a distance of twenty or thirty feet from the entrance, which is almost invariably placed under the shelter of a projecting rock, or on the side of a hill. It descends obliquely for a few feet, and then rises gradually toward the surface of the ground."²

Speaking of the elephant shrew, the same author says, "it forms its home by first boring a nearly perpendicular shaft, and then driving its burrow at an angle."³ But how does the armadillo build his palace under the earth? "They are mostly nocturnal animals, concealing themselves by day, and coming out at night in search of food. The burrows in which they live are generally about thirteen or fourteen feet in length, descending in an abruptly sloping direction for some three or four feet, and then taking a sudden bend and inclining slightly upwards."⁴ "That part of the tunnel of the duck-bill just above the water's edge is almost perpendicular."⁵

Have we found a horizontal burrow yet?

Huon says in "Zoo Notes," No. 25, that the home of the skunk, "which is always built with an eye to murder, consists of a *horizontal* hole, *always* dug near a pond or still pool of water." In No. 37 he ventures the opinion that "he does go near the water, now and then." So he does when he wants a drink. I live beside a beautiful stream of water flowing on through meadow and woodland, but I have never found the burrow of a skunk near it—they are back on the hills. The skunk is *not* an aquatic animal. I wrote "that I know of no purely carnivorous mammal that hibernates." I did not assert that there were none that did so.

In regard to the "offensive secretion," in *Chambers' Encyclopædia*, page 762, we read—"So confident does the skunk seem of the

¹ Homes Without Hands, page 50. ² *ib*, page 52. ³ *ib*, page 32. ⁴ *ib*, page 60. ⁵ *ib*, page 71.

efficacy of its peculiar mode of defense, that it permits itself to be approached till it is just on the point of being seized, which, however, is only attempted by the inexperienced, when the battery is discharged. Dogs flee at once, and rub their noses on the ground till they bleed." Doesn't every one know that the skunk uses this "offensive secretion," as a means of defense? Was he ever known to attempt any other? It may have other uses too, but the skunk can't help that. I see the bison defends himself from a pack of wolves with his horns—*ergo*, I conclude they were given him for that purpose, though many feebler animals have none. Would Huon say that they were intended only to be made into knife-handles and combs? I see a rattlesnake save its life by striking its poisonous fangs into its assailant; I conclude that they were intended not only to enable it to procure his food, but as defensive weapons also—though I know that the black snake is without them though he has the same enemies to contend with in the struggle for life.

JAMES M. McCANN.

[We hope our readers distributed over the States and Territories will give us the benefit of their experience with this interesting (at a distance) animal, as Mr. McCann says, they could easily settle this question of its habits.

Our own knowledge is very limited. Early in the fall of 1856 while passing over a meadow a few miles north of the city of Lowell, Mass., in broad daylight we noticed a black and white animal about the center of the meadow, and made for him. He did not move but stood his ground ably until we got within about 12 yards, when we concluded that was near enough and sent a heavy charge of shot through him. He dropped at the mouth of a hole. It would have been an easy matter for him to escape had he cared to do so—but he acted as though he had "rights which we were bound to respect."—ED.]

IMPORTANCE OF SALTS IN FOOD.

Mr. Foster has made some interesting experiments on dogs and pigeons which show that animals suffer and die when inorganic salts are altogether absent from their food, although the other nutritive constituents may be abundant. In all the animals tried, there was a condition of muscular weakness, tremor, and general exhaustion. In the dog, the muscles of the posterior extremities, from the second week of the experiment onward, gradually assumed a paralytic character, as when the function of the spinal cord is weakened. The activity of the cerebrum was also impaired, as was evident from the bluntness of the senses and apathy of the animal. Later on, increased excitability often appeared; the dogs were terrified at any quick motion; one had a brief attack of madness, but soon crouched down, trembling and growling. On being taken out, it ran forward and knocked its head violently against a wall. After the animals had been deprived of salts for some time, the juices of the intestinal canal either lost their digestive power or were not secreted in proper quantity, and nutrition was thus interfered with. Death took place, however, from the alterations in the nervous system, before there had been time for it to occur from inanition. The quantity of salts necessary to life is smaller than is generally supposed, but the exact amount required is still to be determined.

The experiments amount precisely to a scientific exposure of the unnaturalness and consequent abnormality of the use of sifted wheat-flour, the principal food of women and children, and of too many men. The inorganic salts are almost absent from this artificial food, the chief material weakness of modern pseudo-civilization. Mr. Foster's experiments are contributed to the *London Medical Record*.

Those writers who lie on the watch for novelty can have little hope of greatness; for great things cannot have escaped former observation.—*Johnson*.

THE ANTS OF AFRICA.

I do not think (says a traveler) that they build a nest or home of any kind. At any rate, they carry nothing away, but eat all their prey on the spot. It is their habit to march through the forests in a long, regular line—a line about two inches broad and often several miles in length. All along this line are larger ants, who act as officers, stand outside the ranks, and keep this singular army in order. If they come to a place where there are no trees to shelter them from the sun, whose heat they cannot bear, they immediately build underground tunnels, through which the whole army passes in columns to the forest beyond. These tunnels are four or five feet underground, and are used only in the heat of the day or during a storm. When they grow hungry, the long file spreads itself through the forest in a front line, and attacks and devours all it overtakes with a fury that is quite irresistible. The elephant and the gorilla fly before this attack. The black men run for their lives. Every animal that lives in their line of march is chased. They seem to understand and act upon the tactics of Napoleon, and concentrate, with great speed, their heaviest forces upon the point of attack. In an incredibly short space of time the mouse, or dog, or leopard, or deer, is overwhelmed, killed, eaten, and the bare skeleton only remains. They seem to travel night and day. Many a time have I been awakened out of sleep, and obliged to rush out of the hut and into the water to save my life; and, after all, suffered intolerable agony from the bites of the advance-guard, who had got into my clothes. When they enter a house they clear it of all living things. Cockroaches are devoured in an instant. Rats and mice spring round the room in vain. An overwhelming force of ants will kill a rat in less than a minute, in spite of the most frantic struggles, and in less than another minute its bones are stripped. Every living thing in the house is devoured. They will not touch vegetable matter. Thus they are, in reality, very useful (as well as dangerous) to the negroes, who have their huts cleared of all abounding vermin—such as immense cockroaches and centipedes—at least several times a year. When on their march the whole insect world flies before them, and I have often had the approach of a bashikouay army heralded to me by this means. Whenever they go they make a clean sweep—even ascending to the tops of the highest trees in pursuit of their prey. Their manner of attack is an immense leap. Instantly their strong pincers are fastened, and they only let go when the piece gives way. At such times this little animal seems animated by a kind of fury which causes it to disregard entirely its own safety and to seek only the conquest of its prey. The bite is very painful. The negroes relate that criminals were in former times exposed to the path of the ants as the most cruel manner of putting them to death.

OYSTERS.—The oyster, when spawning, does not cast its eggs like other fish, but dissolves, as it were, a part of its own body, which passes off in long, slender threads, as fine as a spider's web, upon which are congregated millions of little eggs, not visible to the naked eye, but which, when put under a powerful magnifying-glass, astonishes the beholder by their number. It is estimated that about seventy per cent. of the spawn is destroyed by fish, and about ten per cent. from other causes, leaving twenty per cent. to find their way into market. These little seed cling to whatever they touch, generally old oysters; and the many little shells one often sees clinging to large oysters are but the growth of these seeds. When oysters have spawned in a clear space, and free from fish enemies, their growth is very rapid until they attain the size of a quarter of a dollar, and it is at this period of their existence that the oystermen take them for transplanting. The shells are very thin, and the inside meat scarcely larger than a shirt-button, and having the rest of the shell filled with a milky fluid, which in time, forms the body of the fish. Oysters, after they are transplanted, are, with a few exceptions, not fit to eat under three years. It might be supposed that the oyster, with its hard shell, was free from danger, but such is not the case. He has two deadly enemies—the star-fish and the borer. The former will fasten on the mouth of an oyster, and in a short time suck the life out of him. The latter, with his little saw and gimlet bill, bores through his shell, and, once through, the oyster is soon destroyed.—*Exchange*.

POULTRY DEPARTMENT.

"TO THE INEXPERIENCED FANCIER."

"A man should learn to detect and watch that gleam of light which flashes across his mind from within, more than the luster of the firmament of birds and sages. Yet he dismisses without notice his thought because it is his. In every work of genius we recognize our own rejected thought; they come back to us with a certain alienated majesty. Great works of art have no more affecting lesson for us than this. They teach us to abide by our spontaneous impression with good-humored inflexibility most when the whole cry of voices is on the other side. Else, tomorrow a stranger will say with masterly good sense, precisely what we have thought and felt all the time, and we shall be forced to take with shame our own opinion from another."

The above extract from the writings of one of America's greatest minds is a good prescription for those persons in this world who are afflicted with the disease of self-depreciation, of a sort of morbid modesty, of a want of confidence in the suggestions of their own minds; which state tends to produce a willing dependence, an exaggerated receptivity in the individual. I don't think I would take ground against the statement that the fault in people is oftentimes the opposite one, that most people have too much respect for their own opinion, and that simply because it is their own. If that is the truth, I do not refer to most people. I will refer to the exceptions. I am the more willing to write these thoughts because I do not doubt that many of the self-distrustful people possess excellent ideas, and, if they would cherish them and speak them, might increase their own usefulness without becoming too bold and overweening, as they may dread. I request the editor to give these remarks a place in this paper because I think they may apply to the case of individuals who might offer suggestions in matters to which this paper is devoted, but who keep silent because they despise their own "flashes," and are lighted (or fancy they are) only by the "luster of the firmament of the birds and sages." In plainer English, there are multitudes who might give us the benefit of their thinking upon pigeons, fowls, pets, and the heeding of them, would do much good, even to the professors and old heads. I know that editors have large waste-baskets; for many people write for the sake of seeing in print what they wrote on a sheet of note-paper, and not because they have taught to say. I do not wish to be the cause of burying Mr. Wade beneath a heap of ill-spelled manuscript; nor do I say that he will not fill up his waste-basket partly with these same writings. But I do say this to you, my fellow fancier, tho' you be but a beginner: if you have a notion pop into your head some day, hold to it, and if you find it at all tangible, tho' you do not succeed in carrying it out, send a word about it to THE FANCIERS' JOURNAL. Don't despise your own thought because you have not yet read it written by the "bard," Wright or Burnham, or the "sage," Eaton or Tegetmeier. May you not have a clew which will lead another, if not yourself, to a discovery? Don't despise your thoughts because they are your own. I would not have the self-confident people more self-confident. But let us get hold of what the bashful

ones think and we may get jewels. Don't go to the other extreme, and despise others' thoughts which do not chance to agree with your own. P. B.

[We hope every reader of THE JOURNAL will give the above careful consideration, and send their "Flashes" to the Editor of this JOURNAL, who will see that, no matter how crudely it is written, it will be put in proper shape to be presentable to its Readers. Ed.]

WHEREAS.

Whereas L. E. Lang had in his possession a Partridge Cochon pullet belonging to D. G. Eacker of Havana, N. Y., and was stolen from his coop during the last show of the Southern Tier Poultry Society, held in Elmira, N. Y., Jan. 5th to 8th, 1876,

And whereas L. E. Lang refuses to appear before the Executive Committee to answer charges preferred against him by Mr. Eacker, and admits that the pullet was stolen and he knew it, and knows by whom stolen, but says he will not "squeal" on them.

Therefore, Resolved, that L. E. Lang, of Elmira, N. Y., be expelled from the Southern Tier Society, and that he be debarred from ever being an exhibitor at any future poultry show of this society.

Resolved, that these resolutions be published in all the poultry papers.

C. S. WHITE, Sec. S. T. P. Soc.

ELMIRA, N. Y., Aug. 25th, 1876.

POSTAL CARDS!!!

These unique cards were invented for the accommodation of the public as well as to satisfy the growing demand for a cheap transmission of brief messages. It is not always necessary for a person to give the why and wherefore of advertising: "No postal cards answered." I never did so advertise but sincerely believe it to be a safeguard against interrogative correspondents, who don't mean business; there are a great many cheap poultry "fanciers" in this land; that particular class who purchase "fancy eggs" for \$1.00 per doz. and think that is "too high;" who buy Pouters for \$5 or \$10 per pair, and think that is awful; who can't see how people will make such fools of themselves as to pay \$20 for a pair of rabbits, or \$25 for a young "well broken setter."

If I should say that Brahma cock cost me \$50, that Setter \$100, that pair of Pouters \$75, that pair of Rabbits \$35, and \$12 per doz. for the eggs from which chicks were hatched, they would move farther and farther away, fearing me to be an incubate or lunatic. Now this class of human beings delight to ask questions, and if they write you on a postal and get a postal in return, they are so much "in," and "a penny saved is a penny gained" you know. If it was simply to order, I don't think very serious objections would be raised against postal cards in poultry dealings, but when it comes to unnecessary, provoking questions, then patience ceases to be a virtue. I well remember the first time I saw this advertisement ("no postal cards answered") of a Connecticut gentleman, I thought he must be a "snob," one of your "swells," but upon having an introduction at one of the shows, I formed a very different opinion.

When I receive a postal, my Postmaster presents it with a "smile so childlike and bland" and I read the P. card: "Please inform me by return mail your lowest cash price for a pair of S. S. Hamburgs? I want to take 1st premium at our show, and want Standard of Excellence fowls; state your cheapest price quick."

The next card reads thus:—

"The setting of eggs you sent me didn't hatch well, got only 10 chicks out of 13 eggs, ain't you going to send me another set ting?"

And the next card thus:—

"The rooster you sent me wasn't spotted according to Standard; if you ain't going to make it right I'll expose you."

It isn't very nice to have my business of that nature on a postal card for the P. M. to scan and peddle my bad luck (?) to every loitering P. O. individual. *No sir*, I don't want the patronage of your penny men, if they can't expend six cents for *information* concerning your fowls they might as well stay on the other side of the river, and yet some who send these little missives are earnest and sincere in the matter. I have had orders on them and sent fowls through them, but as a GENERAL RULE it don't pay, so now I use my judgment about answering, and while some receive prompt attention, others are as quickly tossed into the waste basket.

I well remember how I was "worsted" in a trade (poultry) and to give all who might see the card the benefit of a laugh, I briefly wrote my complaint on a card and mailed it. A few days elapsed when I received the following, verbatim reply, ending thus:—"Can't you afford any thing but postle cards?" The P. M. must have seen it, and reported to interested friends, much to the disgust of this reliable (?) breeder, and the satisfaction of myself.

QUILLIBET.

[There is a side of this P. C question not yet touched upon by our contributors. Many fanciers are engaged during the day for other parties, and their correspondence passes their employers hands. When P. C's are used they would be very likely to be read, commented upon, and as all are not fanciers, their subject-matter might prove a source of ridicule to the recipient. An envelope with a large rooster upon it is a terror to some would-be fanciers.]

Our advice is, do not use postal cards except for a brief yes or no. The fancier using a plain return envelope is more likely to make a customer, than one sending an illustrated one. This matter of printed envelopes is very much overdone.—Ed.]

MY EXPERIENCE.

"Amateur," in Vol. 2, page 691, says: "Some say corn is not fit to feed hens. Some say it should only be fed in small quantities; but I say let them have all they want of it, and the more they want of it the better, in cold weather." You should have added to such a statement, Amateur, your residence and the object you have in keeping poultry, as a beginner, residing in a climate differing from yours, or desiring to keep poultry for a purpose other than yours, or keeping a bird differing from those you fancy, taking your experience as advice, might follow it and be the loser. For in nothing is the old adage "What is *one's* meat, is *another's* poison," more applicable than in poultry. The feeding of corn depends 1st, upon the kind of fowl kept; 2d, upon the season of the year and the changes of temperature to be endured; 3d, upon what the birds are kept for.

My ideas are not obtained alone from reading, very far from it. From the very beginning I have kept a record of my day's doing, and looking back, by being able to balance effect by cause, I have found the bottom of what others have seen but the surface. Now I don't approve of feeding corn the year round. Corn, if it be broken, is very good for a feed once a day during cold weather; but as egg food, or for keeping a fowl in condition and in plumage it has not the material in its component parts.

One rule will not apply to the feeding of all kinds of poultry, because what would produce eggs in the nervous, active birds, would produce fat in the Asiatics, rendering them useless.

It is this trying to care for all by one rule that has brought into saying, "the big birds eat the most, and make the least return." It may be true that they will eat the most, if they can get it, but actual experiment has proven to me that an Asiatic is profitable on less than would keep one of the smaller kinds in condition.

As to climate, observation and experiment have also proven to

me that poultry in the Southern States and California can bear different treatment from those having to endure the changes of season in the Eastern and Middle States. I think the feeding of corn during the heat of summer is one cause of the dreaded chicken cholera. Corn is heating and hard to digest. During the heated term, the system of a bird is wholly relaxed, digestion is very slow. I think the corn produces a fermentation that poisons the blood. Nor is this thought alone, it is the result of careful study, comparison and experiment.

In the extreme west and south, where, though warmer, the temperature is more equable, birds keep their tone, and corn could be given the year round, and prove neither healthy nor profitable.

My way of feeding my poultry is the result of much experimenting. My object has been to obtain the greatest amount of good for the least expenditure of time and money. In my poultry house are two bins; one sufficiently large to hold the wheat for at least a winter's use. The other smaller, and used for a mixture of bran, middlings, coarse oatmeal, and during the winter, corn meal. To this second bin I add one-half ounce of best cayenne pepper to every 100 pounds of meal.

I feed but twice a day excepting when the birds are confined indoors by winter storms, then I add a noonday meal of cracked corn, whereas always at night I feed only wheat, and that neither screenings nor damaged grain, but good clean wheat. On the back of the kitchen stove is always a kettle, which my wife calls the "stock-pot." It is washed out every day, and so keeps perfectly clean and sweet. It has a tightly fitting cover of tin, made on purpose, with one half so it can be raised with a hinge—so it can be opened readily, yet the cover taken off easily, and still the aroma be prevented from passing off with the steam.

Into this kettle all the scrapings of the plates are put, also the potato parings and the waste of vegetables. Into it the water from the boiling potatoes and vegetables is drained. All the odd bits and bones that would otherwise be thrown to the dog, cat, or left to attract rats, find there a place. Leavings of milk, in fact everything eatable that would otherwise be thrown away goes there. If odd bits of meat and bones are not plenty, the order to the butcher includes a few cent's worth of waste meat or a sheep's pluck. As I said before, the kettle is on the stove all day, and after dinner, if it is not already full, boiling water is added to bring the contents within two inches of the top. Of course by night the "soup" is thoroughly cooked. When the fire is made in the morning the kettle is put over the blaze and its contents very soon are scalding hot. I then empty it upon a pan of the mixed meal I brought in the last thing at night, mix thoroughly and take to my chickens, dogs, and cat for their breakfast.

I have certain places in each run where I feed in the morning, and once a week I make upon those places, bonfires into which I rake the bones that have accumulated through the week, adding a few oyster shells, thus removing the litter, and furnishing charcoal, calcareous matter and ashes to my poultry. It is curious how little will be left of the ashes, after the birds have rolled in and picked them over. As soon as I have emptied the kettle it is washed, and with a little water in, again put upon the stove, ready for the scraps that might come with the getting of breakfast. To be sure this looks like a little trouble, but it is like everything else there is system to; working by rule it all comes in right and easy.

A neighbor of mine was troubled very much by feather-eating fowls. He says he found his remedy in pounded borax, which he discovered by a mere accident. He had been pounding some borax in a wooden box, and leaving it for a few moments he found his Black Leghorns eating it greedily. Afterwards, seeing it did them no harm, he furnished it to them, and very soon after

feather-eating ceased entirely. Query, what did the birds find in the borax that satisfied the craving that they had had before for the feathers or blood? You've noted a great many remedies in your paper for vermin, but I have not seen a mention of carbolic powder. I have used it and found it perfect as both disinfectant and vermin exterminator. I merely dust it through the feathers of a bird, using a common flour dredge. With that so applied, with coal oil used freely over the roosts, by burning out the nests of sitting hens after each hatching, by whitewashing twice in the twelve months, and making a smudge once, I have kept my premises perfectly free from vermin of all sorts.

You see I make a business of this my pleasure. I introduce regularity, economy, and cleanliness. Were it not play it would be termed work. But profitable play I have found it. Play to my mind in affording relief from the cares of business; and profitable from the well-filled credit side of my poultry account.

THE JOURNAL has seemed to me a sort of lyceum where we could give each other our views and experiences, and make comments as well, not in a quarrelsome or self-sufficient way, but with the desire to enlarge our knowledge. As at the Farmers' Club, no one should hesitate to express an opinion, so, brother fanciers, use pen and ink freely; always giving speaker Wade the privilege of bringing down the gavel when we get long winded, or to speak more correctly, to use the manipulator when we are too long drawn out. And yet don't be kept down. Come to the surface every chance you can get. You will wonder at the extent of your experience if you once begin to tell it. Try and see.

ELIPHALET STOWELL.

SUNDAY IN THE BACKYARD.

No boy to-day to feed chickens. He is busy now with his Sunday-school lesson and teacher. One of these days he will be older and tougher; then he won't be frightened at going up stairs in the dark, but will "lie around loose" during the sunlight of the Sabbath, and visit the teacher in the evening. It's a labor of love to care for the birds one whole day in the week. Even Brahmas get surfeited with what we consider the choicest of offerings, and march off for their dessert, consisting of worms and other mysterious, delicious morsels, which their sharp eyes discover but ours do not. Wish some good souled fancier would come around to-day and talk chicken. Is it not a hardship to show people fowls, who do not pretend to know one variety from another, and after "trotting out" your best bird (an old prize-winning veteran,) to have them ask, "What breed it is?" This fever is a queer one. Why is it that one fancier likes Brahmas, another Cochins, another Games, another Bantams, &c. & each seems to take little interest in any except his favorites. You are correct, Unicorn, each fancier should not abuse his brother's favorites. But what's a fellow to do, if his toes are trodden upon? We feel, Unicorn, that you are one of the right sort, and we would be much pleased to make your personal acquaintance. There's Vidette—he's a trifle on his high-heeled boots. The word "endwise" seems to stick *endways* in his own crop, where it must have originated, as it cannot be found in our article in THE JOURNAL or the same copied in the Bulletin, which leads us to soothingly enquire, does not Mr. Vidette sometimes "go off at half-cock?" Then, too, having possessed himself of a couple of hairs, (probably trophies from his boarding-house hash) he with knife (and fork) brandished aloft, boldly proclaims himself a scalper, terrible to be encountered. Let us suggest to Mr. Vidette not to "buy" this season, but to wait a couple of years and at the end of that time, if he has accumulated knowledge of the Brahma, as he seems to have done this year, it may be time then to "buy," and if the breeder who sells, mates them up well, and the eggs hatch, and the boy feeds 'em, and the rats don't catch 'em, he may, perhaps, produce some chicks fit to be shown somewhere back in the country where they

don't use any Standard. In Mr. Vidette's dainty pursuit of knowledge, and his exultation over the discovery of facts which ought to be part of the practical knowledge of any one who has bred Light Brahmas two or three seasons, pausing over and deliberating upon the items of information, which he "likes or does not like," he forcibly reminds us of the old fable of the ass betwixt the two bundles of hay. As to the ultimate destiny of said ass, and all asses similarly situated, he will undoubtedly through the columns of the Bulletin, seek the information of Mr. James Best, and Mr. James Best being the best known expounder of such problems, will probably afford the information to the best of his ability. But as a subscriber to the Bulletin we hereby respectfully request of the editor thereof, that these innocent questions and answers of Mr. Vidette, and Mr. James Best, concerning Light Brahmas, be conducted by private correspondence, or, at least, that a sort of Primary Department be established in the Bulletin, say opposite one of the pages devoted wholly to cuts, where these two gentlemen while ventilating themselves, each for the other, may at the same time be amused by the pictures.

YOUNG BREEDER.

MORE POSTAL CARDS.

Yes, let us have them by the hundred and we have the satisfaction of knowing that at most we can be only one dollar out on each hundred. Why, my dear reader of THE FANCIERS' JOURNAL, I have been guilty (!) of using a P. C., on which to give the price of a trio of my fowls, even after my correspondent had enclosed a three cent stamp to me for an answer; he found no fault with the P. C., nor with his trade after being effected through their medium. I received a letter to-night from "Way down in Alabama," and the writer uses these words: "Please give FANCIERS' JOURNAL notice of our trade and hit Young Breeder a lick or two about postal cards. We made a trade through the medium of P. cards, didn't we?" Yes Mr. Editor we did, and through the medium of the exchange column in F. JOURNAL, too. I saw his offer to exchange and sent a postal card, and he, like a gentleman, answered it, and to-night he is glad he did. Just think what "good times are coming," a gentleman fancier, away down in Alabama, who of course takes THE FANCIERS' JOURNAL, offers an exchange, and for 25 cents, plus two postal cards, total 27 cents, he makes a trade with another fancier away up in the corner state (Maine), and he would not give up his trade for the price of subscription to F. J. for three years.

P. C. ARD.

ERIE COUNTY AGRICULTURAL SOCIETY

List of premiums awarded at the above show, held at the Hamburg Driving Park, Hamburg, N. Y., September 12th, 13th, 14th, 15th, 1876:

CLASS 19—POULTRY.

Brahmas. Light—Chicks, 1st, J. R. Elliot, East Hamburg; fowls, 2d, C. B. Paxson, Eden.

Cochins. Buff—Fowls, 2d, A. D. Ellis, E. Hamburg. Partridge—Fowls 2d, Milo Canfield, Eden. White—Fowls, 2d, Fayette Reed, Evans.

Dorkings. Silver Gray—Fowls, 1st, William W. Wood, North Collins. White—Fowls, 1st, William W. Wood.

Black Spanish. Fowls, 2d, William W. Wood.

Leghorns. White—Fowls, 1st, Milo Canfield. Brown—Fowls, 2d, Milo Canfield.

P. Rocks.—Chicks, 1st, Milo Canfield; 2d, Fayette Reed.

Houdans. Fowls, 1st, W. W. Wood; 2d, A. D. Ellis.

Polish. W. C. Black—Fowls, 2d, W. W. Wood. White—Fowls, 2d, W. W. Wood. Golden—Fowls, 2d, Milo Canfield.

Games. B. R.—Fowls, 2d, W. W. Wood. Duck Wings—Fowls, 2d, W. W. Wood. Blue Pile—Fowls, 2d, W. W. Wood.

Samatra—Fowls, 1st, W. W. Wood. Brown Red—Fowls, 2d, Fayette Reed.

G. Bantams. B. B. R.—Fowls, 2d, W. W. Wood.
Turkeys. Bronze—1st, C. B. Paxson. Grey—2d, C. B. Paxson. Black—2d, C. B. Paxson.
Guineas. Pearl—2d, J. E. Elliot.
Poa Fowls. 1st, G. H. Addington, Aurora.
Geese. Wild—1st, C. B. Paxson. White China—1st, W. W. Wood; 2d, Milo Canfield. Mongrel—1st, Wm. Clancy, West Seneca; 2d, C. B. Paxson.
Ducks. Rouen—1st, Milo Canfield; 2d, W. W. Wood. Aylesbury—1st, Milo Canfield; 2d, W. W. Wood. Pekin—1st, Gardner & Williams, E. Hamburg; 2d, Milo Canfield. Cayuga, B.P.K.—1st, W. W. Wood; 2d, C. B. Paxson. Top-knots—1st, W. F. Sykes, Evans; 2d, C. B. Paxson. Muscovy—1st, Fayette Reed; 2d, Emily Pickert, Buffalo. Mongrel—2d, W. Abbott, Concord.
Pigeons. Pouters—1st, W. P. Hewson, West Seneca; 2d, Godfrey Heiser, Hamburg. Tumblers—1st, W. P. Hewson.
Collection. Pouters—1st, Henry Prion, Hamburg. Tumblers—1st, W. P. Hewson.

THE WASHINGTON COUNTY FAIR.

The second annual exhibition took place at Kingston, R. I. Sept. 12th, 13th and 14th, 1876. The show of poultry was very good considering the time of the year.

The list of awards on poultry is as follows.

Asiaties. Light Brahmas—Fowls, 1st to E. C. Tefft of Wakefield, R. I.; 2d to Geo. L. Stillman, of Westerly, R. I. Chicks, 1st to Geo. Easterbrooks; 2d to E. C. Tefft. Dark Brahmas, Fowls, 1st to E. C. Tefft; 2d to J. H. Caswell. Chicks, 1st to E. C. Tefft, 2d to same. Partridge Cochins fowls, 1st to C. W. Wilcox; 2d to S. A. Caswell. Chicks, 1st to S. A. Caswell; 2d, Julius Burdick. B.P.K. Cochins fowls, 1st to D. A. Segar. Buff Cochins fowls, 1st to S. J. Champlin. Chicks, 1st to J. H. Caswell.

Hamburgs. Silver Spangled fowls—1st and 2d to J. H. Palmer. Chicks, 1st and 2d to Geo. L. Stillman. B.P.K. H. chicks, 1st and 2d to G. L. Stillman.

French. Houdan fowls—1st and 2d to C. W. Wilcox. Chicks, 1st and 2d to N. C. Armstrong. La Flèche chicks, 1st to M. L. Rodman.

Spanish. White Leghorn fowls—1st to E. A. Kenyon; 2d to H. G. Peckham. Chicks, 1st to W. H. Okell; 2d to L. J. Arnold. Brown Leghorn fowls, 1st and 2d to W. S. Holland. Chicks, 1st to W. S. Holland; 2d to W. H. Okell.

Polish. Silver Spangled fowls—1st to D. A. Segar. Golden Spangled, 1st and 2d for fowls, and 1st for chicks to Elmer E. Pollock.

Game. B. B. R. fowls—2d to P. E. Browning, and 1st for chicks to same. B. B. Bantam fowls, 1st to W. S. Holland; 2d to D. H. Brown. Chicks, 1st and 2d to same. Mexican Gray chicks, 1st to D. A. Segar. Sebright Bantam fowls, 2d to J. P. Brayman. Plymouth Rock chicks, 1st and 2d, J. B. Brayman. American Dominique fowls, 2d to W. H. Partlow, and 1st and 2d for chicks to same.

Turkeys. White—2d to N. F. Dixon. Grade, 1st to J. Hazard, 2d to William Merchant.

Ducks. Aylesbury—1st to P. A. Sucker. Rouen, 2d to H. H. Clarke. Pekin, 1st to E. B. Pendleton; 2d to J. D. Cranston. Cayuga, 1st to L. A. Knowles.

Geese. Hong Kong—2d to J. S. Perkins. Wild, 1st and 2d to J. M. Taylor. Bremen, 1st to Wm. Merchant.

Poa Fowls. 1st to B. B. Moore; 2d to W. H. Rose.

Guinea Fowls. 1st to B. B. Moore.
 Best display pigeons to W. H. Okell.

"GAME COCK."

In No. 38 of the JOURNAL, "Greenhorn" asks "what we are to understand by the term 'Game Cock.'"

On page 279 of Wright's new work, there is a good definition of the word "game." I reproduce it for the benefit of "Greenhorn."

"In familiar speech we use the word to express all that we are able to conceive of a dogged courage, brutal it may be, but which can not fail, no matter what the hopeless odds against it, or the suffering to be endured."

It naturally follows that a "Game" Cock is a cock possessed of this quality, in short a bird that will suffer death rather than yield to his opponent. J.

PIGEON DEPARTMENT.

PIGEONS.

Happening lately to become the possessor of an English work, by Bonnington Mowbray, Esq., published in 1834, we propose to give to our readers the chapter upon pigeons, as the ideas of a very practical fancier forty-two years ago. He says: "The pigeon is recorded as one of the most ancient inhabitants of all climates, excepting those in the vicinity of the poles; it prospers abundantly in temperate regions, but in a still higher degree under the burning sun of the tropics, no heat being too ardent for its natural constitution. The wild pigeons of cold countries are said to emigrate towards the south on the approach of the winter. Pigeons exhibit a satisfactory proof of the superiority of the civilized over the savage or mere natural state, in their multitudinous increase and endless varieties, in a state of domestication, under the fostering care and all-subduing art of man. From their peculiar beauty and innocence, they have always ranked among the chief feathered favorites of mankind; and in the eastern countries the dove has ever been a great object of veneration, as an emblem of something divine.

But to proceed to a far more material point, the NATIONAL PROFIT of encouraging the breed of pigeons to any great extent, has long been the subject of much dispute.

Mr. Duhamel, the apologist of these beautiful favorites, I apprehend, has not been a successful advocate. He avers that pigeons do not feed upon green corn, that their bills have not sufficient power to dig for seeds in the earth, and that they only pick up scattered grains which would else be wasted, or become the prey of other birds. From the season of the corn appearing, he says, pigeons subsist upon the seeds of weeds, the multiplication of which they must, in consequence, greatly prevent.

Another writer has of late introduced a story of the farmers in a certain district in England, who, finding their corn and pulse crops greatly reduced, attributed it to the vast quantity of pigeons kept among them, which, on such account by a general resolution, they agreed to destroy.

A few seasons afterwards, it seems, they found their land so exhausted, and their crops so eaten up by weeds, that they came to a general wish for their pigeons back again. Now this is either a lame story or the farmers implicated were very lame farmers, as being ignorant how to weed their land, without the assistance of instruments, the use of which must cost them so considerable a part of their crops. Last year a farmer in Kent shot a wood pigeon, from the crop of which he extracted 926 grains of wheat, which he sowed and obtained from them a harvest of one gallon three quarters of fine wheat.

Pigeons often fly to a great distance for their food, and when they can find corn to eat, seldom prey upon anything else. They begin to eat corn about the middle of July, and rarely want the same food at the stacks in the straw yards, or in the fields, until

the end of barley-sowing, which is about old May-day, and which includes a period of two hundred and eighty days, or better than three quarters of a year; the rest of the time they live upon the seeds of the weeds and bentings. It is stated that in England and Wales there are twenty thousand dove houses, averaging at least about one hundred pairs of old pigeons. We will take this estimation at three-fourths which will equal one million, one hundred and twenty five thousand pair of dove houses in England and Wales. These, to speak moderately, will consume with what they carry home to their young, one pint of corn per pair daily, and which, for 140 days, being half the period they are supposed to subsist upon corn, amounts to 157,500,000 pints of corn consumed annually, throughout England and Wales.

* * * * *

Buffon enumerates upwards of thirty varieties of the pigeon, which, according to his usual systematic plan, its convenience being perhaps more obvious than its accuracy, he derives from one root, namely, the stock dove, or common white pigeon. All the varieties of color and form which we witness, he attributes to human contrivance and fancy. There exists, nevertheless, essential specific differences in these birds, which seem rather attributable to the nature of the region, soil or climate, to which they are indigenous, than to the art of man.

The stock dove or original of the pigeon genus, in its natural or wild state, is thus described; of a deep blue and ash color, the breast darkened with a fine changeable green and purple; the sides of the neck of a reddish gold color; its wings marked with two black bars, one on the quill feathers, and the other on the covert; the back white, and the tail barred near the end with black.

The RING DOVE is yet held by naturalists to be distinct from the stock dove, and it would seem that the turtle dove is equally so from both. In this country, the BLUE DOVE HOUSE PIGEON is the most common and the only wild species are the ring doves, or wood pigeons, and the turtle doves, which are to be found in all parts of South Britain, breeding through the spring and summer, and retiring to the deepest recesses of the woods in the winter, whence, probably, the turtle dove has been supposed to emigrate. I am assured by a Spanish gentleman that in Barbary they have pigeons equal in size to fowls, but incapable of flight. On the domain of Warwick castle, there is, perhaps, a greater number of turtle doves, than in any other part of Britain. They abound in multitudes through the woods and plantations (1829), flying in pairs, and lighting on the turrets of the castle. Their loud and mournful cooing is heard on the road at a considerable distance. Much pains have been taken hitherto to reduce their numbers.

(To be continued.)

A MONKEY'S HOUSEKEEPING.—I was making cake one day, preparing for company, and the monkey followed me into the pantry and watched everything I did. Unfortunately, dinner was announced in the midst of my work, and I left it, making him go out, too, rather against his will. I knew him too well to trust him in the pantry alone. After dinner I returned to my cookery. Having carefully locked the door, I was surprised to see my pet there before me. His attitude was ominous; he on the top of the barrel two-thirds full of flour, and busily occupied. He had got hold of my egg box, broken two or three dozen, smashing them into the flour barrel, with all the sugar within reach. These he was vigorously beating into the flour, shells and all, stopping now and then to take a taste, with a countenance as grave as a judge's. In my dismay and grief I did not scold him; yet, to see my materials so used up, and we living in the country, and guests coming! He had the most satisfied air, as if he meant, "Look! the main operations of the party are now over." I had forgotten the broken pane of glass in the window.—Anonymous.

TURBIT.

In looking over the back numbers of the defunct English Poultry Review, we find the following in reference to our favorite pigeon, the Turbit. It is from the pen of O. E. Cresswell, who evidently is no novice with this variety:

"The first point of form to which one looks in a Turbit is the head, which may be either plain, peaked, or shell-crested. The plain headed variety is the rarest in my opinion, but attractive. The heads of all three varieties should be round, very broad and high over the eye, with short face and short beak. In the best birds the "gullet," a kind of dewlap, reaches from below the

beak to the throat; this increases with age, and is at present little developed in the bird engraved. Shell-crested birds seldom have it in perfection. Of whichever type of head a bird may be, it should be distinctly of that type. Birds are often seen peak-headed and partially shell-crested, and are very ugly; an intending purchaser should look out for this, as such birds are frequently plucked in the crest and made to appear peak-headed. The peak should be a neat and straight point, rising from the back of the head; for my own part I prefer it set on high, so that from the top of the head there is an almost unbroken line to the top of the peak; the breadth of the skull is then well shown off; some good judges prefer the peak set on low, thus showing the roundness of head. The shell too, composed of curling feathers, running evenly round the back of the head, may be set on higher or lower, according to the taste of the fancier. The next great distinctive point is the "frill" or "purle" (as the old fanciers call it), a line of feathers down the breast, standing out well; in some of the best birds it is double, i.e., turns out both ways, but this is not essential. Color comes next, which, of course, is a matter of taste, as long as the bird has no foul feathers, and the color is in itself clear and bright. The shoulders alone must be colored, black, red, yellow, blue, or silver, all the rest of the plumage pure white; the thighs are a difficulty and will frequently show some color, especially in blues; perfect birds have none, but they being rare creatures, a small amount is often overlooked, when not obtrusive to the eye, from the great difficulty of breeding otherwise perfect birds with clear thighs. The under part of the shoulder, when the wing is closed, frequently shows some white; this is a great disfigurement and must be avoided in breeding stock. The production of color in breeding is somewhat uncertain unless the pedigree of each bird is known; reds will produce yellows and vice versa; red blood will improve the color of yellows, and black of reds; a blue or silver, paired with a red or yellow will generally produce a kind of silver dan with red bars. Pure white Turbits are very beautiful, and occasionally met with. In all its types and colors, when good of their kind, the variety is a most attractive one, and a fine collection of birds of all the colors, well blended, is a most lovely sight."

EDITORIAL DEPARTMENT.

THE SHOW SEASON.

Already most of the poultry and pet-stock associations have sent the notices of their shows to the press, and in several instances the lists of prize awards have been made public. The Centennial will open the ball, and the Canadian show of Ontario will close the season.

The executives of the different societies have very much to consider in making their arrangements. Those experienced will profit by the failures, mistakes and wants developed by past exhibitions, to make the coming shows excellent. Of this we have no doubt, as it is conceded even by those who have suffered most severely by the errors and mismanagement, that the intentions of the managers were honorable, and the mistakes were either the result of inexperience or the desire to overdo, or rather *outdo* what had been done.

Our columns have already contained much upon prize awards, and may contain more. Our purpose now is to consider the show business generally. Why are these shows held? What are the ends the different associations have in view? What means are to be considered as conducing to those ends? And whose opinions should have most weight in the executive committees' decisions? are the questions to be answered.

The first reason for holding these shows seems to be the same for which our Centennial Exhibition has been held; to show to what perfection scientific breeding may attain, to show what progress has been made, also to show the world at large the magnitude of the fancier's operations, and by proving him a public benefactor remove the opprobrium which as "hen man," "chicken man," "fancy farmer," and the like, has often clung to him. Second, the show-room is a sort of sample room, where by comparing the different varieties, their size, shape, and color, and learning their general characteristics the tyro can procure such as suit the purpose he has in view. Then, too, the careful fancier having in his mind certain points he wishes to carry out in the next breeding season, knowing the stock he has and what he wants to obtain, to carry out to the desired end, by observation and study of the different specimens before him, he can get together exactly the material he requires, and which otherwise could only be obtained through wearisome travel or extensive correspondence, and then might only result in failure and disappointment.

Then, too, the exhibitors have their interest, they have birds to sell, and they wish also to sell eggs of birds they wish to keep, so the shows prove to be for them grand advertisements for which they pay with their entry fees. Their first return being the gaining of the prizes offered, and second the notoriety their fowls get by having entered into the competition.

The competing for, and giving of, the prizes is in reality the least of the objects served. Now comes the question, if prize giving and gaining be the least, do the executives do right in withholding the names of owners from the coops? But upon this subject our ideas are well known, having been clearly expressed in the past.

In every business in life there are to be found fault-finders, like the parasites that science has proven to exist upon every living thing. Nothing is right to them which does not move in the orbit of which they are the grand center. Now is it right to set aside, to hinder, the principal workings of the shows for such as these? If the associations procure men of known verity as judges, and if they place upon each coop the record of the judges' work, the points each portion of the bird scores, and their sum total, so if the amount be questioned it can be proved, have not the associations done their duty?

Our "instructions to" associations would be simple in the extreme: Look carefully into the reasons for which your show is to be held, then make your arrangements to carry these reasons to the full. Let the interest of the multitude rule you, and, feeling you are right, do not yield an atom to the spirit of fault finding or jealousy. "Be sure you are right, then go ahead."

We are advised by Mr. Phil. M. Springer, of the offering of a premium of \$100, by the American Berkshire Association, for the best approved Essay on the Diseases of Swine, their Causes, Preventives, and Remedies. Said essay to be practical and exhaustive. The competing essays to be forwarded to the office of the Association at Springfield, Ill., on or before the 1st of January, 1877. The award will be made and the money paid at the annual meeting in February following. All competing essays will be the property of the Association.

Competition is invited from all practical men who have given attention to the diseases to which Swine are subject. Prof. Law of Cornell University, N. Y.; Prof. Smith of Toronto Veterinary College, Canada; Hon. T. C. Jones of the "National Live Stock Journal," and E. G. Bedford, Esq., of Kentucky, have kindly consented to act as the Awarding Committee.

THE SHIP.

The Wind cries out to the Waters :

" However this thing began,

I do not know,

But I find it so—

We are but the slaves of Men.

"The pigmy builds him a monster

By the might of his puny hand;

It carries things

Like a sea gull's wings;

He rides it from the land.

"He catches my breath to waft him

As he dances over your waves;

The wounds ye feel

Of the mighty keel—

And the Wind and Sea are slaves."

Harper's Weekly.

—ODDS AND ENDS.—Pay down and you will never be dunned to pay up.

—In 1868 Seth Green hatched shad in a common salt box, in General Spinner's office in Washington, and also in the Capitol. They were the first shad ever hatched indoors. Mr. Green discovered the principle in the previous year.

—Something similar to the meat showers of Kentucky are the worm showers in Norway. The *Morgenblad* of Christiania states that this singular phenomenon was observed there after a recent violent storm, a number of worms were found crawling on the snow, and it was impossible to find any crevices in the ground from which they might have crept out, as the earth was frozen. The explanation of the Kentucky meat shower as of the presence of the worms is the same. Both the frogs or lizards were lifted up by wind-storms, having their centers in distant localities, carried up in the air, and dropped again in other places.

—BLUE LOBSTER.—A few days ago Robt. T. Morris, of New Haven, received a lobster the color of which was a beautiful sky-blue with the usual markings a shade or two darker on the back. The under sides of the large claws were creamy white. He killed it, and before it had time to assume the red color which appears soon after death, had taken out all the fleshy parts. Mounting it and drying quickly he succeeded in preserving the blue color with the exception of slight fading. Only one fisherman had ever seen a similar variety, which is in the nature of an albino.

—At a meeting of the Asiatic Society of Bengal, in Calcutta, says *Chambers' Journal*, a piece of telegraph cable was exhibited, showing that the India rubber covering had been pierced by grass. The piercing was so complete, and the contact of the grass with the copper ore so perfect, that "dead earth," as it is technically called, was produced and the efficiency of the cable destroyed. The species of the grass, owing to its dried-up condition, could not be determined. It was suggested as a probable explanation "that the seeds had become attached to the core when under water, and had afterwards germinated when the core was stored."

—Now at Woodward's Gardens at San Francisco is to be seen a rattlesnake, which is said to be one of the largest ever captured on this continent. It measures a little short of five feet in length, and in its thickest part is eight inches in circumference. It is possessed of forty-two rattles, and shows evidence of having lost two others. As rattlesnakes are two years old before they bear their first rattle, this reptile is consequently forty-six years of age. It was captured on the 12th day of April, 1875, on Eel River, Mendocino County, by W. H. Johnson, while prospecting for quicksilver. It was dug out of a crevice in the rock far below the surface, in which it had evidently been imprisoned for a considerable length of time. Its present owner informs us that his snakeship is fed but once in six weeks, and evidently thrives on such dieting.

—A SOUTH AMERICAN PLANT.—The plant from which the coca leaves are obtained thrives best in the elevated forests of the Andes. In time it is covered with delicate white flowers, which are succeeded by red berries. The leaves can be stripped from the plant three times a year, and thoroughly dried. When the packages of coca are opened they emit a powerful tea like odor. Mr. Christison has tried the effects of the leaves upon himself.

He has taken long and fatiguing walks, living at the same time after his usual manner; then he has repeated the walks for even greater distances, and, when overcome with fatigue, at some resting place he has chewed thoroughly and swallowed eighty grains of the coca. No real effect was observed until he went out of doors and resumed his rapid walking; then all sense of weariness disappeared, and he could walk not only with ease but with elasticity. At the end of the walk the pulse was ninety, and in two hours fell to seventy-two. At dinner time there was neither feeling of hunger nor thirst after abstaining from food for nine hours, but upon dinner appearing ample justice was done to the meal. No unpleasant effects were felt the next day. Mr. Dowdeswell, in an article in the *London Lancet*, has the same idea as to the great and wonderful power of endurance gained by its use,

—INTELLIGENCE OF ANTS.—Referring to the singular sagacity of these little creatures, a story is told of Huber, the younger, who one day took an ant's nest to populate one of those glass contrivances which he used for making his observations, and which consisted of a sort of glass bell placed over the nest. He set at liberty one part of the ants, which fixed themselves at the foot of a neighboring chestnut tree. The rest were kept during four months in the apparatus, and at the end of this time Huber moved the whole into the garden, and a few ants managed to escape. Having met their old companions, who still lived at the foot of the chestnut tree, they recognized them. They were seen, in fact, all of them, to gesticulate, to caress each other mutually with their antennae, to take each other by the mandibles, as if to embrace in token of joy, and they then re-entered together the nest at the foot of the chestnut tree. Very soon they came in a crowd to look for the other ants under the bell, and in a few hours our observer's apparatus was completely evacuated by its prisoners.

—Tapioca is the product of a plant that is cultivated very extensively in the Malay Peninsula, where its growth is almost entirely in the hands of the Chinese. The tubers of the plant, (*Manihot utilisima*) which weigh on an average from ten to twenty-five pounds, are first scraped and then carefully washed, after which they are reduced to a pulp by being passed between rollers. This pulp is carefully washed and shaken up with abundance of water, until the fecula separates and passes through a very fine sieve into a tub placed beneath. The flour so obtained is repeatedly washed, and then placed on mats and bleached by exposure to the sun and air. It is finally converted into the pearl tapioca of commerce by being placed in a cradle-shaped frame covered with canvas; it is slightly moistened and subjected to a rotary motion, by which means it is granulated. It is next dried in the sun, and finally over the fire in an iron pan greased with vegetable tallow, and is then ready for the market.—*Ex.*

—As long ago as 1855, a correspondent of the *London Times* predicted that with the immersion of gutta-percha in the depths of the sea, for telegraphic purposes, an animal created expressly for the purpose of eating that apparently indigestible substance would be found or produced. "As a mite would in all probability never have been seen but for the invention of cheese," this correspondent wrote, "so it may be that there is some undeveloped creation waiting *perdu* for the first piece of gutta-percha which comes down."
* * * a gutta-percha boring and eating *teredo*, which has been waiting for its meal since the beginning of the world." The *Popular Science Monthly* tells us that this enemy of submarine cables has actually made its appearance; that he is a crustacean less than a quarter of an inch long, with a name greatly longer than himself—*Limnoria teredo*, to wit. The writers who have described him seem to attribute the frequent interruption of cable communication to his propensity to order gutta-percha instead of poached eggs for breakfast.

—CAN A DOG SWIM?—Captain Bunce, of the *Leonida*, is the owner of a large Spitz dog named Jack, that was picked up in the middle of the Sound, several years ago, as he was swimming about several miles from land. On Tuesday the captain left the faithful creature on the East Neck wharf by some mishap, and Jack, seeing the vessel some distance out in the bay, decided to follow. As the vessel was under good headway little notice was taken of his jumping off the wharf, as it was supposed that he would soon return. The vessel reached New York that night. Nothing was seen of the dog about here during the following day, but what was the astonishment of the captain and crew, on going up to the deck while the vessel lay in her dock in New York, on the morning of the second day, to find the faithful creature at his post watching over the vessel in his usual manner. He was thoroughly exhausted by his long swim of over forty miles, however, and could do nothing but lie about and recruit his strength for two or three days.—*From the Huntington Long Islander.*

SMALL PET DEPARTMENT

THE CAT AND THE CANARY.

MR. EDITOR:

Your column devoted to the young folks is generally so entertaining to our little people at home, that I am prompted to relate an incident that occurred with us, this summer, that may amuse the juveniles, and induce those who have pet birds under their care to exercise the caution we have been taught, by the circumstances of this case.

My daughter had a fine male canary bird I presented her with on her tenth birth-day, to which she became fondly attached. He proved a splendid singer, and as we lived in the country, a few miles from town, in a retired cottage, the cage was hung beneath the piazza, outside the parlor, during the bright warm days—where "Tommy," as they call our songster, enjoyed himself—and warbled famously from sunrise to dark.

At sunset, he was removed to the sitting-room, for safety over night, and we thus had no care about him, usually. But early one morning in July last, a racket was heard upon the piazza, and our youngest boy was soon overheard to shout at the side-chamber window, "come out, father! Tommy's cage is knocked down, and he is gone. The cat's got him!"

The canary's cage had been forgotten on the previous night, and we shortly found the little gilded prison turned upside down upon the piazza floor—and empty. Tommy had gone, and the neighbor's cat who had done the mischief had also hurriedly disappeared. This occurred on a Thursday, and great was Miss Minnie's lamentation upon discovering the disaster that had followed her neglect to take the bird-cage into the house, the evening before.

But, alack! it was too late to recover Tommy now. He was a goner, surely—as we could plainly see. The ugly cat was anathematized—but to no good purpose, and Minnie had a good long cry over the result on this unlucky occasion.

The following Sunday morning, (three days afterwards) the door-bell rang, and a neighbor enquired mysteriously for Minnie.

"I heard you had lost your favorite bird," he said, "and I've brought you one to take his place."

Then drawing his handkerchief gently from the ample straw hat he carried under his arm, he exposed a poor little stupid canary that he had caught upon a tree that morning, in his garden.

"Why—it's my Tommy!" shouted Minnie, amazed and delighted—as she tenderly took the tiny, half-starved bird in her little hands." Where'd you get him, pray?"

The story was soon told. "Tommy" had escaped the cat, it appeared, and had flown away. But having been raised in a cage, he knew nothing about hunting for food, and had well nigh starved—when the gentleman saw and easily caught him.

He was quickly provided with safe quarters and food—and about a week afterwards commenced to sing and warble again, as usual. His cage has never been left out after dark since, and the neighbor's cats have not been seen about—while Minnie has learned a lesson she will not soon forget, I assure you! R.

A BLUE BIRD AND STEP MOTHER CAT.

One day little Charlie went to mother and asked for a strong string, which he obtained, as mother was always famous for saving strings. We took but little notice of his plans at the time, as he was always busy at something which disclosed his ingenuity; but we were astonished an hour later to see that he had climbed the apple tree nearest the house and carried with him his rude preparation for a bird's nest, and had succeeded in tying it fast to the

tree. We were hushed to silence in our demonstrations of surprise, as he was watching and persuading the very bird for which the nest was made, and was afraid our thoughtlessness would frighten her away. He succeeded perfectly. The bluebird accepted the nest, and as soon as it could be lined by herself and mate eggs were deposited therein, and little Charlie was really very happy for some days. But there came a sorrow which was provoking to even the sweet-tempered portion of us. Our cat Sue, who kept the mice from mischief was so mischievous herself as to watch the bird during her incubation, and one night she went to the tree and stealthily took the unfortunate bird for her supper. This, however, does not finish my story, as I think the funniest part is what I shall now relate. We did not know how soon the bereaved mate learned the fate of his companion, but found him early the next day alighting near by with becoming grief—not a word of song. What thoughts passed through his little brain we have no means of knowing, but we had good reasons for believing that he suffered a fatherly anxiety and already began to feel his need of a helpmate to take care of the eggs. He took much pains with his toilet, plumed himself for the occasion, and then was missing for a short time. Charlie said that he went to the brush, a half mile distant, and that he saw him there hunting a mate. Although we laughed at his solution of the matter, we found that he understood Birdie pretty well, for during the day back came the little widower with one whom he fondly hoped would give the necessary care to that little nest of eggs. She behaved with becoming grace, but not all the entreaties of her lover, and they were many and varied, could induce her to sit upon that nest. He would gaily hop from her side to the nest and sit on the side of it chattering lovingly; but his labor in that line was lost, as his new wife had an instinct which taught her that the eggs were beyond her saving, or else she preferred a home of her own selection, and before dark of the same day they abandoned the nest in the apple tree and disappeared.

I hardly feel like dismissing this scrap of history without holding up poor old Sue in a better light, as she had redeeming qualities which were almost uncalkable. Some of these were her step-mother proclivities, brought out by my little brothers bringing some young squirrels and placing them with her kittens, all of which she took care of with astonishing tenderness. When the boys brought the young broods out together from the barn for the inspection of friends, old Sue, as soon as they were laid down at liberty, would first take the squirrels, one at a time, by the nape of the neck (a difficult task, as the skin is not loose like a kitten) and carry them back to the barn, leaving her own progeny for later trips. This was fun for its children, you may believe, and more than once was old Sue called upon to fill the office of step-mother—a mission which she appeared to delight in and always satisfactorily performed—*Rural New Yorker*.

THE PERFECTNESS OF GOD'S WORKS.

Upon examining the edge of the sharpest razor with a microscope, it will appear fully as broad as the back of a knife—rough, uneven, and full of notches and furrows. An exceedingly small needle resembles an iron bar. But the sting of a bee seen through the same instrument exhibits everywhere the most beautiful polish, without a flaw, blemish, or inequality, and it ends in a point too fine to be discerned. The threads of a fine lawn are coarser than the yarn with which ropes are made for anchors. But a silkworm's web appears smooth and shining, and everywhere equal. The smallest dot that is made with a pen appears irregular and uneven. But the little specks on the wings or bodies of insects are found to be an accurate circle. How magnificent are the works of God!

J. H. SCHOCK, S. W. corner Tenth and Huttonwood Streets, Philadelphia, Pa., dealer in Segars, Weekly Papers, Stationery, etc.; will also supply *Fanciers' Journal* promptly by mail or at the store.

HARTFORD, OCTOBER 30, 1876.

No. 42.

VINO SANTO.

Once I read a strange, sweet story,
Of a sacred snowy wine,
Made by peasants on Lake Garda,
Brewed beneath the cross's sign;
Vino Santo called forever,
Sealed with seal of things divine—
Vino Santo, Holy wine!

On the first days of October,
Only in a shining sun—
Only in the dew of morning,
Clusters lifted one by one;
Thus begins the solemn vintage,
Vintage with the cross for sign—
Vino Santo, Holy Wine!

Pales the autumn, falls the winter,
Lie the grapes, untouched and still;
No man hastes, and no man hinders
While their subtle juices fill,
Till the sacred day of Christmas,
Day of days, of joy divine,
Then is brewed the Holy Wine.

Past the winter, past the spring-time,
Into summer far and late;
For the joy of Vino Santo long
They who long must long and wait;
Only glowing heat can ripen—
Glowing heat and cross's sign,
Vino Santo, Holy wine.

Dear to-day, the strange, sweet story,
Sudden seemeth thine and mine;
Thine and mine and all true lovers,
Sealed by seal and signed by sign;
Silence, patience, from Love's Vintage
Drink at last, in joy divine,
Vino Santo, Holy Wine!

—H. H. in *February Galaxy*.

THE BEAUTY OF MEN OF GENIUS.

J. M. MCCANN.

"Time, place, and action may with pains be wrought
But genius must be born; and never can be taught."

Dryden.

"Between genius and talent there is the proportion of the whole
to its parts."

From the French of La Bruyère.

"Talent lying in the understanding, is often inherited; genius
being the action of reason and imagination rarely or never."

S. T. Coleridge.

"Genius is supposed to be a power of producing excellences
which are beyond the rules of art; a power which no precepts
can teach, and which no industry can acquire." *Sir J. Reynolds.*

"Every man cannot say, write, discover something new. Nature,
that loving mother, has sown original genius of that sort
very sparingly, and if in a century, on any special subject, more
than one springs up, it may be regarded as a miracle."

From the German of Forster.

Under this heading, page 373, "Fancier's Journal," I use the
following language:

"Not satisfied with endowing her favorite sons with the sublime
gift of genius, nature has in many instances lavished upon them
the charms of personal beauty." I did not say that every man of
genius was remarkable for either grace of form, or beauty of fea-
ture. I know some of these "favorites of the gods" have been
disfigured and deformed. Æsop was a hunchback. Byron and
Scott were lame, Pope and Voltaire were feeble and diseased. My
purpose was only to prove that the master of beautiful thoughts
have also very often been the possessors of personal beauty. If
it were necessary I could greatly extend the list already given—
Waterton, Audubon, Shelly, Petrarch,¹ Azio, Hawthorn,
Irving, Kosuth, Loyola, the "admirable Crichton." Writing
about men of genius, I did not enumerate any of the beautiful
women who have filled the earth with the perfume of noble deeds,
and left as an heirloom for us their thoughts—wrought in marble
—on canvas, or woven into the undying melody of song. As
among the gifted sons of genius we have seen that some of the
greatest have been the most beautiful. So here we find that the
wisest of women have been as well the fairest.

Hypatia, Vittoria Colonna, Lady Jane Grey, Joan of Arc, and
Mrs. Browning, were almost as much distinguished for their
beauty of form and features, as for the marvels that they wrought.
Can we believe that the gifted and unfortunate L. E. L. was so
very homely, when we hear the Ettrick Shepherd exclaiming in
rustic astonishment, on being introduced to her, "I did nae think
you had been sae bonny." The features of Mirabeau were dis-
figured by the small pox, and those of "Ursa Major," by disease
and suffering. Neither Henry Clay, John Randolph, Charles
Henry Lee, or Abraham Lincoln, were men of creative genius—
that they had great talents none will deny. Hugh Miller says of
Wellington and Cæsar, "had they all been brethren the family
likeness could not have been stronger. There is the same hard
mathematical cast of face, the same thin cheeks and prominent
cheek-bones, the same sharply defined nether jaws, the same bold
nose—in each case the indented aquiline—and the same quietly
keen eye. In the countenance of Cromwell, though more over-
charged, as perhaps became his larger structure of bone and
muscular frame, we find exactly the same lineaments united to a
massiveness of forehead possessed by neither Washington nor
Wellington."

With a simplicity, that were it not ridiculous it would be sub-
lime, Huon asks, "which Cæsar?" Could it mean other than
the great Cæsar—Julius—the poet, the orator, the historian, the
statesman, the commander?

Why not have asked "which" Cromwell, Oliver, Richard, or
Henry? or which Washington, Bushrod, John A. or George?
Huon very kindly informs us that there were twelve Cæsars, all of
them, he says, "men of genius." These masters of Rome are
known in history under the various names of Augustus, Tiberius,
Nero, Caligula, etc. The first was a patron of genius, and

¹ He was so handsome as frequently to attract observation as he passed
along the streets. "Lives of Eminent Men of Italy," Vol. 1, page 76.

² Essays, page 50 51.

although he did not possess the "divine afflatus," *himself*, was a man of talent. Tiberius was a cruel and blood thirsty tyrant; and Huon, I believe, is the first to discover that *Nero* was a *genius*. Caligula erected a temple to himself, and ordered an effigy of his head to be placed on the images of the gods, while he wished to imitate the thunder of Jupiter. He appeared in public places in the most indecent manner, and committed the worst of crimes. He rejoiced when great disasters befell his subjects, and "wished that the Romans had but one head, that he might strike it off at a blow." The wild beasts in his "Zoo" were constantly fed with human victims, and he made his horse "high priest and consul,"—kept him in marble apartments, adorned with the most valuable trappings and pearls which the Roman Empire could furnish. He attempted to destroy the writings of Homer and Virgil, and was the enemy of all mankind. Yet, Huon says Caligula was a genius, too! I know of no good reason for doubting the accuracy of the bust of Shakespeare in the church at Stratford. From this his portraits are taken. Sir Francis Chantrey the sculptor, declared that "the face afforded in itself internal evidence of being an accurate resemblance, probably copied from a posthumous cast."³

Huon in attributing to Samuel Johnson great genius, differs very much from the opinion of Taine. In fact, my friend makes no distinction whatever, between *talent* and *genius*.

Sidney, Lady Morgan, Lady Blessington, Ida Pfeiffer, Charles Henry Lee, *all* are geniuses!

The Greeks were the most beautiful people that ever lived—intellectually they were far superior to every other, either before or since. "The average ability of the Athenian race is, by the lowest possible estimate, very nearly two grades higher than our own—that is, about as much as our race is above that of the African negro."⁴ Is there not then a relation between genius and beauty? "There certainly have been some singular looking mortals among great men, but it was some eccentricity of feature that distinguished them, rather than downright ugliness."⁵ Huon says Scott, Burns, Hugh Miller, and Hogg, *all* had pug noses! Those having their portraits can see for themselves. Prof. Wells would decide differently.

Huon it seems, does not know what beauty is, yet there are certain opinions entertained on this subject, both in this country and in Europe, that enable the most intelligent people to agree upon a beautiful object.

J. M. McCANN.

THE SKUNK.

In one of the late numbers of *THE JOURNAL*, we see Huon endeavors to prove the veracity of the following facts about the skunk.

1. It is a hibernating animal.
2. Its habits are strictly nocturnal.
3. Horizontal holes are dug by the skunk, prairie dog, &c.
4. The "offensive secretion" is not used as a weapon for self-defense.

Proof to the contrary.

1. The American cyclopædia says, "The skunk is not a hibernating animal." Goodrich, and all other good authorities say, "They (the skunk) are active throughout the whole year in the South and in most of our northern states; if at any time they retire to their burrows on account of severe weather, they remain in a dozing but *not* torpid state."

As far as my experience goes I have found them active most of the winter, with the exception of a few cold weeks when even the dogs and cats remained in a decidedly dozing state.

Therefore we come to the conclusion that the skunk can not be a

hibernating animal *when* it does not hibernate as a rule; and *when* it is forced to remain within its burrow through excessive cold, it is not in a torpid condition.

2. Can the habits of the skunk be strictly nocturnal when they are seen in broad daylight robbing the poultry yard, or plundering wild pigeon roosts? We saw them do both this year, while in Michigan. Was it a phenomenon of nature, when this summer, whilst watching a deer runaway (a name given to a path made by deer) adjacent to a small pool of water, we saw several skunks come to the aforesaid pool and quench their thirst? No, we think not, but believe that it was simply because they were *unmolested* by man.

Therefore we draw the second conclusion, that the skunk is not strictly nocturnal in its habits when it commits its depredations and collects its sustenance "in the broad glare of the sun."

3. Huon remarks, "They (the skunk) are not such fools as to think they can live long in perpendicular holes, therefore dig what must (?) be called a horizontal hole."

Why not oblique? or curved? or any other kinds of holes that can be dug without being either perpendicular or horizontal? There is a geometrical axiom which says, "The sum of all the parts is equal to the whole."

That suits this case exactly, for as Huon says, "no animal will live long in a perpendicular hole," neither will he live long in a horizontal hole, for that being a continuous straight hole, it is disliked equally as much as the other, indeed no animal *will* live in such an abode. Therefore we draw the third conclusion, that no animal will select a horizontal hole for its residence, unless it be a zig-zag horizontal, or other broken and curved line taken together, then they will be equal to the *hole*.

4. Concerning the "offensive secretion," we will simply say it is quite wonderful that every time a dog or any other hostile animal is about making an attack, they are either rendered blind, (generally the blindness lasts but a few moments, but in some cases for life) or the unbearable smell makes them bite the ground in horrible agony while they vomit forth their—last meal. Meanwhile the skunk walks off, (no doubt happy on account of heaping coals of fire on its enemy's head by giving it a *scent*) its life being saved by an accident, of course (*a la* Huon).

Goodrich says: "This gift is the animals' shield and buckler, and nature in her infinitely diversified acts of defense, appears no where, not in trenchant teeth, or rending claws, not in overpowering strength, or ferocity, or even in deadly venom, to have given any creature a more effective protection than is bestowed upon the skunk by this syringe."

Huon seems to base his argument on the fact that because the pine-marten, weasel, &c., haven't this wonderful weapon, therefore it was never intended as a weapon for the skunk. How about the rattle and garter snake?

Well, this is enough "Huon cry" about the skunk; we are satisfied if Huon is.

TERRE FILIUS.

ANTLERS.—Some time in June last Mr. George Curtis, living on the Willamette river, Oregon, discovered in the woods near his place the antlers of a deer protruding from an oak tree eighteen inches in diameter. Mr. Curtis had the tree cut down, and sent it to the Centennial exhibition. It is evident that at one time the tree was forked, and the deer, in rubbing his antlers against the tree, must have been caught, and either died at the foot of his involuntary hitching post, or else broke away, leaving his antlers. Time passed and the tree grew, and strange to say, so closely as to entirely conceal the place where the fork had formerly been, giving it the appearance of being a solid tree with the antlers of a deer growing out of its side. Houseworth has photographed this curiosity.

POULTRY DEPARTMENT.

ONE BREEDER'S WAY.

We have been surprised of late, in visiting the yards of some of the large and small breeders, to find the fowls, adult and young of both sexes mingling freely. Our opinion is well known: that the sexes should be kept separate after the breeding season, though young and old may be together. One dealer we know of, not advertising with us however, keeps five different breeds. From these he sells eggs for hatching "warranted pure," up to the first of June, for \$5 00 per doz., after that he turns his birds all together, and calls the eggs "thoroughbred but crossed for market purposes, for \$2 00 per dozen." We would like our correspondents' opinions upon such a course.

TWO SIDES TO EVERY CASE

A correspondent of *Capital and Labor* says the *Globe* (English) brings forward several interesting facts to disprove the assertion that cultivation on a small scale cannot be profitably carried on in England. A peasant farmer in Suffolk, with whom he has been acquainted for a quarter of a century, has maintained himself and family on two acres of land during the whole of that time without any difficulty. After providing food for his household on an ample scale, this small agriculturist estimated his average balance of profit at more than £70 per annum, and gave every detail necessary to prove the soundness of the calculation. Having chanced upon Cobbett's assertion that a cow might be kept on half an acre of land, John Sillett, the farmer in question, tested the statement by practical experiment, and found it perfectly true. At only twelve quarts of milk per diem, 4d. per quart will bring in about £72 yearly, while by converting it into butter, even larger profits result. Then, too, if a peasant farmer has a thrifty industrious wife, she will add considerably to his income by paying attention to sources of profit which large farmers neglect. Poultry and eggs, under good management, might be rendered as profitable in England as they are in France, where they are regarded as very important items of farming produce. Again, by incessant hard work, and by keeping the hoe, dibber, and digging fork constantly at work, a great deal more can be made out of land than when subjected to the ordinary processes of cultivation. No doubt it is quite true, as recently alleged by the *Times* agricultural commissioner, that to present a peasant with a few acres of barren heath land would be equivalent to bidding him starve. Soil of that sort can only be rendered profitable by the expenditure of infinitely more capital than peasants possess. What with breaking up the ground, cleaning, manuring, and draining, a large outlay would be necessary before there was any chance of a return, and in the meantime a comparatively poor man must starve. But it still remains to be proved whether thrifty, industrious peasants, possessing practical knowledge of agriculture, could not make a fair living for themselves and families out of three or four acres of good land. As the question

is at present surrounded with doubt, each party maintaining its own opinion with persistent dogmatism, it would be well if some philanthropic landed proprietor tested the matter by practical experiment. If he selected the best conducted farm hands on his property, and granted each a lease of half-a-dozen acres of good land at their market value, the result would set the vexed question at rest for ever.

TRIPS AMONG THE FANCIERS.

Having a wish to visit the Pennsylvania head-quarters of the Plymouth Rocks, one pleasant morning found me en route for Doylestown. But arriving there, remembering that the Hamburgs of Willow Lane were on my way, I made my first call upon Mr. Wm. T. Rogers. I was just in time, and with appetite whetted by the early ride through the bracing air, I was quite ready to do justice to the bountiful repast to which my bachelor friend, in genuine hospitality, invited me. After lingering long over our coffee, chatting of fanciers and fancies, reviewing the past and hoping for the future, we finally adjourned to the yards, where the feathered beauties awaited us. It is not necessary to tell that Mr. Rogers makes a specialty of Silver-Penciled Hamburgs. He loves his pets, and devotes his entire time and skill to their breeding and care.

He shows four yards of adult fowls, each containing about a dozen hens and a cock, remarkable for the uniformity of color and markings. Among them I noticed the "Sophie" and "Tammany" that have won so many prizes, and "figured" so perfectly in the different poultry journals. Of birds of so much notoriety, my expectations were raised to the highest, nor was I disappointed, for in accuracy of marking, perfection in color, symmetry of form, they are unexcelled by any pair of Silver-Penciled Hamburgs I ever saw, and I have seen many. "Tammany" the cock, well deserves his score of 93 points, so does "Sophie" hers of "98," given by two different judges, neither being aware of the other's scoring. In fact (excepting Hans Schneider's L. B. hen), "Sophie" is the only bird that ever beat the *American Standard of Excellence*, she having received a score of 105 points, by a judge appointed by the A. P. A. Mr. Rogers feels proud of his birds, and with reason. He expects to exhibit them at the coming Centennial, when, as he says, "some of us will have to look sharp, or we'll be in a pickle (Pickles, you know, is coming). When I think of those Penciled Hamburgs Pickle & Belden have shipped from England, I say: Ah, my boy, the medal of honor will never hang in your office. Never mind, if it don't, I shall do what every other true American ought to, exhibit my stock, and if I am defeated I shall be made aware of the fact, that England, France, or some other country has better stock than mine." In my comfortable quarters and pleasant company, I should have forgotten the main purpose of my visit, had not my host mentioned Dr. Dickie, and then have offered himself as escort and guide to Pine Run Poultry Yards, where our mutual friend greeted us warmly. Several years have passed since my last visit. Then the Dr. was breeding eight or nine kinds, but, like all who aim at success, he has now discarded all but two, and, I think, eventually his success with Plymouth Rocks will induce him to give up all for them.

Now he has two yards of Brown Leghorns and three of Plymouth Rocks.

With Plymouth Rocks, Dr. D. has been remarkably successful, breeding them carefully and successfully, wishing to preserve their usefulness, and at the same time to bring forward their æsthetic points. A great many have misunderstood Dr. D. He has been interested heart and soul in the experiments he has been making. To those that scoff at his earnestness, or doubt his motives, a walk through his yards would be convincing that the bird he favors, is

what he says it is, and to his honor, is what he has made it. And a glance at his order book would convince them also that they were rapidly growing into public favor. Particularly was our attention called to several broods of chicks, whose uniformity of color and markings was quite equal to those of Dark Brahmas of the same age.

We spent a very agreeable afternoon with Dr. D., and beg leave to digress from our subject to say that he does not "live adjacent to the national gas regions," and he never sought to "gratuitously advertise" his stock, and to our mind, his communications to THE FANCIERS' JOURNAL have been of more value to its readers than those of Pedagogue or Young Breeder.

W. E. FLOWER.

ESSEX AGRICULTURAL SOCIETY.

PREMIUMS AND GRATUITIES AWARDED AT DANVERS, MASS.,
SEPT. 27th, 1876.

POULTRY, FIRST CLASS.

Brahmas. Light—Fowls, O. Gowen, West Newbury, 1st prem. \$2; chicks, George Hobbs, Salem, 1st, 2; C. P. Jacobs, Peabody, 2d, 1. Dark—Fowls, C. P. Jacobs, 1st, 2; chicks, C. P. Jacobs, 1st, 2.

Cochins. Buff—Fowls, T. P. Hale, Rowley, 1st, 2; Arthur Elliott, Peabody, 2d, 1. Partridge—Fowls, H. A. Southwick, Peabody, 1st, 2; chicks, H. A. Southwick, 1st, 2. Black—Fowls, C. O. Putnam, Danbury, 1st, 2; chicks, C. O. Putnam, 1st and 2d, 3. White—Fowls, G. O. Walton, 2d, 1; chicks, Neal Maynards, Danvers, 2d, 1.

Grease. Hong Kong—Lewis P. Hawkes, Sangus, 1st, 2; Robert G. Buxton, 2d, 1.

Lucks. Lewis P. Hawkes, Sangus, 1st, 2; Oscar Gowen, West Newbury, 2d, 1.

Turkeys. Geo. B. Dodge, Hamilton, 1st, 1.

POULTRY, SECOND CLASS.

Plymouth Rock. Fowls, Geo. D. Walton, Peabody, 2d, 1; chicks, A. S. Hill, 2d, 2.

Dominique. Fowls, John Swinerton, Danvers, 1st, 2; chicks, do. 1st, 2.

Leghorns. White—Fowls, Jos. Bushby, Danvers, 1st, 2; H. A. Southwick, Peabody, 2d, 1; chicks, Jos. Bushby, Danvers, 1st, 2; H. A. Southwick, 2d, 1. Dominique—Fowls, G. D. Walton, Peabody, 2d, 1. Black—J. Dominque—Fowls, G. D. Walton, Manchester, 2d, 1; chicks, Abram J. Welch, Georgetown, 1st, 2; Allen Lee, Manchester, 2d, 1.

Spanish. Geo. D. Walton, Peabody, 2d, 1. Black—Fowls, D. B. Burnham, Essex, 1st, 2.

Poland. Golden—H. M. Larkin, Beverly, 1st, 2. Silvered—Fowls, H. A. Putnam, Danvers, 1st, 2.

Dorking. Fowls, W. H. Allen, Manchester, 1st, 2.

Game. Fowls, A. A. Fowler, Danvers, 1st, 2; chicks, do. 1st, 2.

Bantams. Fowls, G. D. Walton, Peabody, 1st, 2; Thomas C. Berry, 2d, 1.

Duckwing. Silver—Fowls, Chas. H. Farmer, Peabody, 1st, 2; Oscar Gowen, West Newbury, 2d, 1.

Pigeons. Jerry Monigan, Beverly, 1st, 2; J. S. Ives, Salem, 2d, 1.

Rabbits. Chas. D. Winchester, Peabody, 1st, 1.

WISCONSIN POULTRY SHOW.

The Wisconsin State Poultry Association will hold its annual show at Milwaukee, from Jan. 18th to 26th, inclusive. Premium lists will be sent out in due season.

W. H. SPEAR, Secretary.

CENTRAL CONNECTICUT ASSOCIATION.

The Central Connecticut Poultry Association will hold a fair at the Town Hall in Bristol, from Dec. 19th to 22d, 1876. No effort will be spared to make it surpass the exhibitions heretofore held.

Geo. A. GOWDY,
Recording Secretary.

WESTCHESTER POULTRY SHOW.

The Westchester County Poultry Association intend holding a show from Dec. 5th to 8th, 1876, at Mt. Kisco, on the Harlem R.R.

C. W. BOLTON, Secy.

THE SPANISH FOWL.

BY W. J. NICHOLS.

No. I.—EARLY POPULARITY—WHERE IMPORTED FROM—FORMER EXHIBITORS—SUITABLE FOR TOWN FANCIERS—CAPITAL EGG PRODUCERS.

Between twenty and thirty years ago, before the Cochins made their debut, Spanish were the reigning favorites in the poultry world. They headed the catalogue of every show, their admirers were very numerous; and they often mustered as many as thirty or forty entries in one class. Fierce and frequent were the controversies between the Spanish and Cochins breeders when the Shanghaes, as they were then called, first made their appearance, as to which was

the most useful fowl to keep. The Spanish fancier stated that the Cochins ate too much food, and did not lay nearly so frequently as the Spanish; while those who kept Cochins affirmed that their birds occasionally laid two eggs in 'one day'! Many other amusing and absurd stories were related about the Cochins to the disparagement of the Spanish; but both varieties have outlived all such nonsense, and each still have their circle of admirers.

Old fanciers tell us that the birds exhibited then were much better than those seen at the present day. But we think they are mistaken in their opinions, for we well remember the time when the majority of the birds exhibited had patches of red over the eye and coarse ugly combs, often falling over on one side; and we know within the last ten years the purity of the white, the size of the face, and the length and openness of the lobe have all been vastly improved; and now we seldom meet with a bird at a show with a pinky face or a drooping comb.

It is pretty generally admitted that these birds were originally imported from the Mediterranean, but, as with most other imported varieties, it was not until they arrived in this country that they were carefully and systematically bred up to their present standard of excellence. Some years back a number of birds were imported from Holland and Belgium; these had coarse, rough, and small faces, but they were almost free from redness; but they were mostly small in body, and wanting the style and carriage so characteristic of a well bred bird.

Coming as Spanish do from a much warmer climate, the birds are naturally somewhat more susceptible to cold than many other varieties; and to exhibit them to perfection it is absolutely necessary to keep them warm and sheltered from the wind and sun. This has led some writers to suppose that they are very delicate; this, however, is not the case—at least not to the extent generally

imagined. In cases where the birds have been pampered and reared in artificially heated houses, and never exposed to a cutting northeast wind, no doubt they are delicate, as are all fowls reared under similar conditions; but when treated in an ordinary way they are found to be less subject to many diseases than either Cochins or Brahmas.

At the time when Spanish were at the height of their popularity Admiral Hornby was the most successful exhibitor; then came Mrs. Stowe; next we go to Bristol, and here Mr. Rake and Mr. Heath formed their famous stud of birds, and it is to these two gentlemen that the breeders of the present day are principally indebted for the beautiful smooth face so much more common now than formerly. Next followed Mr. Parsley, who was invincible in the show pen for some years, but his birds were more of the cauliflower face, and when he disposed of them at Steven's, by auction, we doubt if they did much to improve the variety, although there was a keen competition amongst buyers to possess some of his stock. Since then Bristol has been the home of Spanish, most of the winners, having been bred there by well-known exhibitors, although occasionally a Londoner has bred and exhibited birds which have even been victorious at Bristol shows.

There are always a number of people living in large towns or in the suburbs, who would very much like to keep a few fowls for the sake of a new laid egg, and who at the same time would like to enter into the excitement of exhibiting their birds, but, from want of sufficient room, and the absence of a grass run, are deterred from making a start. Now it is astonishing what a small space is sufficient to keep Spanish in the most perfect health and the brightest of plumage. A run only a few yards square will be ample if proper attention is paid to their wants, and they are kept clean, and their sleeping places well ventilated. When poultry can be kept, and even successfully exhibited under such conditions, it is not surprising that all the best Spanish are bred in or near to large towns, as there are so very few varieties of fowls which can be kept satisfactorily by an amateur not living in the country. We do not wish to mislead our readers, or for them to imagine that there are no difficulties in breeding and rearing these birds, and we will at once state that Spanish require more attention and care than any other variety we know of, that is, if a fancier intends to enter into successful competition; and unless he is endowed with an unusually large amount of patience and perseverance, and a real love for poultry, we should not advise him to attempt to keep them, as these qualities will be well tested when the birds get heavy in face, large in comb, and in trimming them for exhibition; but to the fancier who is fond of being with his birds, and studying their habits, they will be a continual source of amusement and relaxation.

For eating, their flesh is somewhat drier, and wanting the luscious flavor of the Dorking, Game, and French breeds; but as egg producers, there is not another fowl that can equal them, although they do not begin to lay quite so early in the season as some other varieties. Pullets, however, if well fed and cared for, will mostly commence to lay when about six or seven months old, and they will continue laying almost without intermission for eight months, producing from four to five eggs per week. Hens do not lay quite so freely, but with good feeding they will generally lay every other day for seven or eight months in the year; and when it is remembered that anyone living in the midst of London can obtain a plentiful supply of very large new laid eggs, and can successfully compete for prizes, it is not surprising that Spanish are such great favorites with town fanciers.—*The Country.*

(To be Continued.)

PIGEON DEPARTMENT.

WOOD-PIGEONS.

FROM BOWINGTON MOWBRAY'S WORK,

PUBLISHED 1834.

The Autumnal markets in London and most large towns, generally exhibit a considerable supply of these birds.

They assemble in large flocks for the night in thick coverts, perching on the middle branches and the tops of the oaks.

Windy and boisterous evenings in November are most appropriate to the sport of shooting wood-pigeons which always roost with their faces to the windward, and the gunners generally approaching behind them, hidden by the remaining foliage, and aided by the murmuring of the wind, obtain a fair chance of success, though the ring-dove is particularly shy and watchful. This is a sport for a company of gunners, each choosing a different stand in the twilight, by which plan, taking the birds sitting or flying, the bags may be well filled. As the game is large, shot-guns and heavy shot are the best adapted. The flesh of the wood-pigeon is in perfection in the latter summer and the autumnal months, from their ability in those seasons to obtain the best food. During winter, feeding on coleworts or any green food they can find, their flesh is loose and bitter. At Pamber House, Hants, there has been immemorially an annual nest of wood-pigeons in a large yew tree, said to be three centuries old, which grew in the garden within a few yards of the house. We seldom saw the old birds, which used the utmost vigilance. We were well supplied with them from the neighboring forest. In 1827 immense flocks of wood-pigeons, to the computed number of 2,000 in one field, were seen upon the lands near Chichester. Sir H. Fisher's keeper killed 60 couple in one day.

But both in the ancient and modern world, this beautiful and variegated genus of birds has been cherished by man as a source of amusement, and of gratification for the eye, as well as of profit, in the article of provision for the table. Among certain of the nations of antiquity, moreover, pigeons were held sacred and their lives no one dared assail. The useful qualification of *Messenger*, appertaining to the Asiatic and African species of pigeon, is of high antiquity, and we read in the time of the Crusades, of an Arabian prince, who had a sort of telegraphic communication kept up in his dominions, through the instrumentality of pigeons, which carried letters, and were regularly relieved at appointed posts. From those, doubtless, the breed celebrated in Europe, under the name of *THE CARRIER* has proceeded. In modern times, those varieties which are kept for the purposes of amusement and show, are styled *FANCY BREEDS* and they form a distinct article of commerce in cities and great towns, the varieties, as they chance to be in fashion, bringing a considerable price.

In London, the pigeon fanciers immemorially, I believe, have had a club, in which premiums are awarded, and the notable science of the fancy, through the medium of crossing colors and forms, is promoted and perpetuated. The chief objects of the fancy

—A WONDERFUL BUT INEXPLICABLE PUZZLE is the fact that in the microscopical cavities to be found in rock crystal a molecule is always to be seen in motion.

have hitherto been those varieties styled ALMOND (probably ermine) TUMBLERS, CARRIERS, and the birds with great crops, the most fashionable variety of which is the PONTING HORSEMAN. The specific merits of these breeds are indicated by their names. The tumbler exercises that faculty in the air, but is chiefly valued for his peculiar form and variegated plumage. The carrier, as a messenger cuts the air with almost inconceivable swiftness; this is the *Columba tabellaria*, the famous carrier or messenger, between *Aleppo* and *Alexandria* in *Egypt*. The pouter distends his crop to a size attractive to curiosity, and by grotesque attitudes, and familiarity with man enjoys his attention. Upwards of half a century past, the pigeon fancy was in higher estimation in this country (England) than at present; and the almond tumbler was then in the greatest vogue; sums probably to the amount of twenty or thirty guineas each, being the price of superior cocks of that breed, such as at the present time would not produce more than five. The pigeon shops generally seem the abode of poverty and misery, of which the poor unfortunate birds, crammed into baskets and narrow coops, obviously partake in the fullest measure. This fancy is a great favorite with certain of the lower classes in London and perhaps too generally injurious to their better interests. Their common method of entrapping stray pigeons, the property of other people, does not well consist with an honest principle, takes up too much of the time of those who practice it, and leads to loose, irregular habits. The *British Field Sports* says: "Few people, even those accustomed to reflect on animal sufferings, are aware of those of the wretched town pigeon, harassed about from its first quitting the nest, through the rough hands of scores of unfeeling blackguards; its feathers pulled, its wings braced, starved, and forced to fly against its inclination, matched, then unmatched, and its dearest ties broken; sold, re-sold, exposed in cages, immured in cellars, coal holes, and loaded with every misery which can be inflicted by the wanton caprice, neglect, and beastly ignorance of the two legged race, its tyrants."

To be Continued.

"Man indicates his profoundest needs by his highest ideals. That which is farthest from his grasp is brightest to his vision. And so the cravings of his soul are betrayed in his associations with the idea of "Rest." For he makes it the synonym of supreme good. The conception over-arches the trouble and effort of his daily life, as the deep, serene sky over-arches the earth. It is to "Rest" that he looks forward in his most eager pursuits. This is to be the end of wealth, of power, of lofty fame—some niche of glory where he may repose upon his honors; some sunny retreat, in which his later life may slowly burn away like a summer evening.

What a blessing does he acknowledge in *literal* rest; in the sleep whose soft oblivion makes an island of every day, and breaks the hold of continuous care; that cools the hot brain, and bathes the weary eyelids, and lets the buffeted and foundering heart cast anchor every night in some harbor of happy dreams.

He feels the beneficence of that law which makes even misery halt, and besieging fortune strike its tents, and in the great democracy of nature levels the children of men in common helplessness and common need; finding no conditions so wretched, no spot so black, that even the most desperate cannot recline nearer to the common mother, and forget for a little while their sorrow and their shame.

And when, in the merely natural vein of things, man would soften the gloom of the grave and find some consolation in that which is inevitable, he thinks of it as a place of kindly rest—a port where the storms of life never beat, and the forms that have been tossed on its chafing waves lie quiet for evermore."

SPORTSMAN'S DEPARTMENT.

EXTRAORDINARY DOGS.

Rev. H. J. Borihwick has two dogs that spend the greater part of their time in fishing. His house is built on the bank of a bay where the water has backed in from the Rideau Canal, and the fish, which are very plentiful—chub, bass, and perch—come up within a few feet of the kitchen doors. The two dogs—one a Scotch terrier, and the other a cross between a Spaniel and a Newfoundland—commence fishing in the morning and spend the whole day at it. The terrier stands on a log, and when a fish comes near him he makes a snap at him with his teeth and sometimes succeeds in catching his prey. Frequently he gets so dizzy from watching the fish that he tumbles into the water, after which he has to get ashore and rest himself before venturing on the log again. The other dog takes a different plan; he wades out into the water until he is all covered except his head, and remains very quiet until the fish comes. The strange part of it is he never catches anything, and when the fish nibble at his nose he becomes so frightened that he leaps out of the water. Yet this sport has such a fascination for him that he remains for hours at a time in the water, until he becomes so stiff he can hardly walk to the shore, and he has contracted rheumatic pains that make him howl when he tries to get up after lying down in the sunlight to dry himself. The two animals are a curiosity, and they afford considerable amusement to the family by their eccentricities.—*Ottawa Citizen*.

Of all dogs we have seen in this city, says the *Globe-Democrat* of St. Louis, not one can compare with Pompey, the Franklin avenue dog. Pompey is ten years of age. He was born on the premises of his present owners. He stands about twenty-eight inches high, is of comely proportions, of very sedate manners, and has ever been averse to cultivating the acquaintance of other dogs. The little social courtesies which other less dignified dogs are wont to exchange whenever they meet, are beneath his dignity, and he will countenance no undue familiarity either from man or dog. By day he is a perfect hermit, hiding himself in the rear of his master's stables, and seldom coming from his seclusion even for food or drink; by night, even his owners are powerless to keep him from his "beat." When but two years of age he began a career of night-watching. Not confining himself to his master's premises, he included the entire neighborhood. Thus, in a few weeks, he became aware that policemen were similarly engaged, and he was not long in making himself acquainted with his blue-coated allies, with whom he soon became a constant nocturnal companion and a great favorite. In summer and winter, through rain and snow, when other dogs were comfortably crouched in their kennels, for eight years has Pompey, faithful to his duty and apparently conscious of his responsibility, paced his lonely beat side by side with the policeman. Though he never received the appointment, though the Commissioners have never officially recognized him as in the service, he has never faltered in his

fidelity. When on duty, at night, he oftentimes has met his masters on the street, but no amount of coaxing can induce him to give to them a single wag of recognition. Off duty, by day, he is equally indifferent to the salutations of his night companions. He knows perfectly the boundary of his beat, and the policemen have frequently passed the line to see if he would follow; but he invariably comes to a dead halt, and by his actions says—"You mistake your limit." The policeman relieved from duty at 11 o'clock is instantly ignored the moment his partner comes on duty, and no strategy can inveigle him into following his first companion. He is thoroughly familiar with the signification of the different "raps," and on several occasions when the Sergeant's challenge (two raps) was given, being for good and sufficient reasons in a semi-conscious state, the dog actually roused him from his nap by pawing and nosing at his hands! And it is well known by his owners that even in the day-time when he is off duty and when nothing else will move him, the sound of "three distinct raps" (a policeman's call for help) will instantly rouse him from his hiding place; and on one such occasion, being fastened, he broke his chain, and dragged the remnant of it after him to the scene of the difficulty, where it is needless to say, he rendered effective service.

There are several business places on his beat where a light is left burning all night, and where the policeman on duty occasionally takes a look in to see that all is right. At each of these places the dog invariably stops and, standing on his hind legs, takes observations with as much apparent concern as his partner—the other policeman!

For years it has been the habit of the policeman on duty to divide with him whatever they may have in the way of lunch. If by design or neglect a fair division of rations is omitted, he will promptly manifest his indignation by falling nearly a square to the rear of the offender, which distance he will doggedly maintain to the close of the rounds.

When an arrest is made, he always gets in position so as to place the prisoner between himself and his partner. But, perhaps, the most conclusive indication of intelligence is shown by his recognition, ever after, of any prisoner whom he has once accompanied to the lock-up. No matter when or where he may meet such a one, he seems to look upon him as an outlaw, and while never actually attacking, he will, by indescribable but eloquent actions, endeavor to hold him in durance.

His owners were at first greatly annoyed at Pompey's nightly wanderings, and made many efforts to keep him exclusively to his home duties; but they have long since concluded that the doctrine of Pythagoras is made manifest in their dog, and they have come to believe that the spirit of some deceased policeman has infused itself in the body of Pompey. Be that as it may, Pompey is one of the institutions of the city, and one, too, of which it may well be proud.

In conclusion, it may be of interest to naturalists to know that Pompey was born without a tail. The theory of Darwin on the "Origin of the Species" may still receive another confirmation."

THE ROPE OF OCNUS.—Ocnus was a poor but industrious Greek laborer who had a lazy wife, a very poor housekeeper, who wasted all he earned. The trials of Ocnus inspired the Grecian painter Polygnotus with the idea for a celebrated picture. He represented a man making a rope out of straw, whilst an ass beside him ate the rope as fast as it was woven, thus rendering the work of the rope-maker useless. This painting gave rise to a favorite proverb among the Greeks; for to say, "It is labor lost," they repeated enigmatically, "It is the rope of Ocnus."

DOMESTIC DEPARTMENT.

HOUSEHOLD RECIPES.

Having been requested repeatedly to continue this department as started in No. 11, Vol. I, and which was crowded out by other matter, we reply that having *made room*, each weekly issue will contain recipes warranted good, and we request all interested to aid us in this matter by contributions of proven recipes, and suggestions for the housekeeper.

Two secrets in the Roasting of Beef.—Not long since, at the table of a friend, a roast of beef was placed before us which was so juicy and full of flavor, we could not withhold verbal praise. "Yes," said our hostess, "I always get credit for my roast beef, but any body could cook it just as well if they would only use a little common sense. Now you see, almost every body will take a roast maybe an hour before it's time to put it in the oven, and rub it all over with salt and sprinkle on the pepper, some say 'so's to have it ready,' others say 'so it will be thoroughly seasoned.' Now just think of it. The salt extracts the juices of the meat. Fixing meat that way is like squeezing the juice out of a peach to mix in the cream, and giving folks the skin, fiber and stone to eat! To those that like the juice and flavor in the gravy that's all very well; we want *ours* in the meat. That's one of the secrets, and "the other is like unto it;" some folks will put a roast into an oven about half heated, taking time enough ahead to make up for the slow fire. The juices become melted and escape by the pores into the pan, and the meat will be served tough, fibrous and tasteless; as good as chips. My way is to have my oven so hot that the whole roast will be browned over in a minute, closing every pore; then I temper the heat down so the meat has a chance to cook just to our taste. I add pepper before putting it in the oven, but no salt until about five minutes before serving, then I add it first to the liquid in the dripping pan, so it shall be applied scalding hot at the last basting. You can see for yourself that there's reason in it."

The Omelet.—There are but few people that *know* a good omelet, and fewer still that *know how to make and serve* one. Most people imagine a mixture of milk, eggs and flour, if placed before them in a lengthy roll, nicely browned, is an omelet; but compare the soggy mass, the eggs overdone if the flour be cooked, the flour raw if the eggs be just right, with the delicate porous mass, the omelet proper, and the difference is clearly discernable.

1st. It takes *fresh* eggs and none but *fresh* eggs will answer, two to the person to eat of it—for it's an aggravation to any one to have less—with a table-spoonful of milk to each egg. Beat eggs and milk thoroughly as you would for sponge cake. Have butter hot, but neither browned or scorched, in the omelet pan; pour in the mixture, run a knife around the edge to keep it from burning; begin to roll it up from one side, at the last turn leave it an instant to brown; *then serve on a warmed plate.* The cooking, if your fire is right, will have taken about a minute. Don't wait for the whole mass to get thoroughly cooked, as the rest will cook by its own heat.

Yes, I left the salt out on purpose, it just spoils an omelet; and the flour,—Prof. Blot says "flour can't be cooked done, short of eight minutes," and the omelet cooks in one; so we "cook" the flour as hot rolls, and serve on a separate dish.

◆◆◆

From the "Garden" I get an idea too good to be lost. It says: "Among the prettiest things we have ever seen in the London flower-market, are small pots containing growing plants of forced lilies of the valley, and a few fine crimson tulips, growing out of a healthy little tuft of the common maiden-hair fern.

EDITORIAL DEPARTMENT.

GENERAL POULTRY KEEPING.

But few realize the value of eggs as an article of diet. They are accepted as a part of our daily food, but their worth is rarely unquestioned, and the thought is never raised as to what expense we would have to be to replace them if we could.

They are in truth animal food, and possess in their small compass more nutriment and less waste for their weight, than any other object provided for the sustenance of man. And nutriment, too, of a character suited to any age, condition, and requirement of life.

With eggs filling so perfect a relation to the existence of every one, is it not strange that their producers, fowls, are not more generally kept—when we also consider that their young form one of the chief delicacies of the market?—and that too when as they are omnivorous, they would produce if properly cared for, the eggs for the use of a family from scarcely more than the refuse from that family's kitchen—refuse that would otherwise be wasted or given for the support of the stock of more thrifty, careful owners? Is it because this question is not considered in its true light? Is it because it seems too small for consideration, or do some viewing the extensive yards, runs, and houses of the landed proprietors, think all these necessary to the work?

"But we can get eggs at any grocery!" Granted; but the beauty—the greatest worth of an egg is in its freshness. It is living food. When freshly laid its nutritive qualities are in perfection; as soon as laid it begins to die. The death is slow, and if the egg be kept in pure air, will be slower; but a taint in the atmosphere soon affects it, as breathing impure air affects the human system. It is not generally considered that the tiny dots upon the shell are breathing tubes, by which the life within is sustained. When placed or kept in vitiated air, the air within becomes poisoned. It is no more than hermetically sealing the eggs by closing those pores, keeping them from contact with the air, that permits them to be kept through a long season. The principle of life is destroyed, but the process of putrefaction delayed.

Large yards, runs, and expensive buildings are not necessary, but cleanliness is indispensable, and cleanliness may be carried to the same perfection in the corner of a woodshed, as in an elaborately planned poultry house, with every known convenience. In fact better, easier, and with what expense? the merest outlay,

and almost nothing if time be not money, that is if young hands can be employed. A little lime for whitewashing and disinfecting, a few bundles of lathes if there are any neighbors that may be disturbed, a bundle of straw occasionally for nests, and a load or so of sand or scrapings from the road or street if the soil be proper, to spread beneath the roosts, to catch the excreta. A five minutes work in the morning will keep the house of twenty fowls perfectly clean if sand or earth be spread beneath the roosts. This excrement with the earth if properly kept from the action of the weather, will soon fill a barrel. The earth will prevent any disagreeable odor, and the sale of both to a market gardener will pay for every extra we have above noted.

"But," says one, "I've tried it, and the pesky things would eat their heads off and never lay an egg except when eggs were worth nothing a dozen. More trouble than they were worth. Wouldn't keep one on my premises."

Then my friend, there's a mistake, a mismanagement somewhere. What kind of fowls did you keep? "Oh, I don't know, wife bought them of a farmer's wagon on the street, thought it would be nice you know, to have a fresh egg for the baby, and all that, so she got some hens. Its all the same, its hens that lays the eggs." Just this same argument of our neighbor will be found at the bottom of every failure. The subject is not given proper consideration, the place they are to be kept in, or the general habits of the different breeds looked out for. No one would expect a St. Bernard dog to go chasing rats in the cellar or to stand for game, or the rat terrier, or pointer to dig men out of the snow, but these facts have been drilled into the craniums of mankind from their primer up. The idea has become a sort of instinct, for a specific purpose and place, the breed or sorts adapted is procured. A man wishes to purchase a dozen chairs. He orders a dozen. The question comes first 'what kind.' What would the dealer say to the answer, 'oh, any kind. I want a dozen chairs.' Would he not ask for what place or purpose? Would he not consider the man lacking in sense that would not consider the object relative to the place it was to occupy; were he to put a scarlet brocatede in his kitchen, or a painted, wooden-bottomed chair in his drawing room? It looks equally so to the fancier, when a man with a small range, desiring fowls for eggs, purchases those fowls whose characteristic is flesh and motherliness, or one desiring a table fowl purchases the small, skinny, bony, nervous egg producers. It is to give information concerning these things that poultry papers are published. We propose to give a series of articles adapted to the beginner and would-be beginner, that this important item in domestic economy; turning the waste of a household into the most valuable and nutritive of food, may receive the consideration to which it is entitled.

PUBLISHING SHOW REPORTS.

In the list of Berks Co. premiums, we gave 1st prize on W. F. Black Spanish, to Dr. Heckman, whereas it was awarded by the Association to Oliver D. Schock.

Hereafter we shall not publish show reports unless verified by official signature.

CURIOSITY.

A correspondent, Mr. H. Bowers of Albany, N. Y., send us a (?) feather taken from the tail of a young mocking bird, being two feathers in one quill.

At the Oneonta, N. S. Agricultural Show, where over one hundred coops were on exhibition, the following of our subscribers were awarded premiums.

Lee F. Dawson, Oneonta, N. Y., 1st premium for best and largest display. B. B. R. Game, 1st; G. Bantams, 1st and 2d; W.

L., 1st; P. Rocks, 1st; S. Polish, 1st; W. Polish, 1st; Pigeons, 1st; Rabbits, 1st. G. R. Hay, W. Laurens, N. Y., P. C., 2d. S. D. Game, 1st; Houdans, 1st; B. B. R. Game, 2d. Fred. Hallock, W. L. 2nd; Br. L. 2nd.

CARDS AND CATALOGUES RECEIVED.

F. D. Pailey, dealer in Fancy Poultry, St. Clairsville, Ohio.
 Jno. R. Clancy, poultry dealer, 82 W. Genesee St., Syracuse, N. Y.
 Jos. Reibmeister, breeder of fancy pigeons, Batavia, N. Y.
 T. D. Adams, Lock Box 61, Franklin, Pa. Agent for Imperial Egg Food, and Home corn sheller.
 Geo. V. Flecher, Belmont, Mass. "Lt. Brahmas my specialty."
 J. H. Morrison, Breeder of Plymouth Rocks and White Leghorns, Marlow, N. H.
 Robert Lewis, breeder of P. C. and B. L's, Hope Hill Gardens, Castleton, N. Y.

CORRESPONDENCE.

Will ferrets kill rats?

H. BOWERS.

Yes, ferrets will kill rats, and when used for hunting rats, are kept muzzled to prevent their so doing, as killing and eating one, the ferret will be satisfied and give up the chase for the time. Ferrets are generally used with rat dogs; the ferrets driving the rats into the dogs' presence, or into nets made for the purpose.

EDITOR FANCIERS' JOURNAL:

I am a young poultry fancier, also a subscriber to THE FANCIERS' JOURNAL and POULTRY EXCHANGE. I like the paper very much, have learned a great deal about poultry from it already. I also like your exchange column very much. Enclosed find twenty-five cents, for which publish the enclosed in your exchange column and oblige.

Yours truly,

B. M. CROSBY.

YATES CO., N. Y., Oct. 16, 1876.

EDITOR FANCIERS' JOURNAL:

Greenhorn's question "what are we to understand by the term Game Cock?" is a hard one to answer. Perhaps some of the "big guns of the fancy" can give a correct definition, I cannot, but can tell him how to fix up one, such as win the prizes at our shows. Let him take one of those birds that the boys call "walk-up-the-creek," or "tipe-ups" (sand piper); fasten a rooster's tail on it and he will have a perfect model of the modern style of Game Cock.

Yours truly,

ROOSTER BEN.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

—It will be remembered that during the siege of Paris a good deal was done in the sending of photographically reduced dispatches by balloons. The inventor of the method of reduction, M. Dagron, has lately applied it to the production of maps. In this way the whole official map of France is brought into a form that can be easily carried in a pocket book; and maps of all the countries of Europe are arranged to be carried on a cartridge-belt along with the magnifying apparatus (*telemetre micrographique*), a joint invention of Dagron, Dallemagne, and Riboulet. The reduction of the maps can be on any required scale. The smaller this is the more convenient the magnification. The telemeter has the size and form of a stereoscopic apparatus. By means of it all the details of the original map are greatly enlarged and can be easily studied. In darkness the light of a match or even the glowing of a cigar suffices to enable one to read off the map at once. The French anticipate these maps will prove very serviceable in case of war and also for educational purposes.

—INFLUENCE OF SEASON.—Donhoff calls attention to the fact that the obvious difference between the fur of animals in summer and winter is associated with an equally striking difference in the texture or thickness of their skins. Thus, for example, the average weight of an ox hide in winter is seventy pounds; in summer fifty-five pounds; the hair in winter weighs about two pounds, in summer one pound, leaving about fourteen pounds to be accounted for by the proper substance of the skin.

These differences are quite as decided in fetal animals as in adults. Calves born in winter have a longer and thicker coat than those born in summer; moreover there is a difference of more than a pound in the average weight of their skin after the hair has been removed. Similar facts may be observed in the case of goats and lambs. That these differences are not to be ascribed to any corresponding change in the diet and regimen of parent animals is proved by the fact that they are equally manifest in the young of individuals kept under cover and on the same food the year round.

—STUDY OF BOTANY.—I see by this week's JOURNAL an article on botany, recommending all teachers to teach the same in their schools. This I think would be a very useful branch, as there are so few that ever take a thought for what all these varieties are intended for.

I believe there may be cures for all complaints, derived from plants, and if botany was taught in our schools I have no doubt but the medical properties would be learned to a great extent, as well as the nature, mode of growth, and sexual systems.

How many are there in this year of our Centennial, who can say that they understand the nature and manner of growth of our vegetable kingdom? I often hear it remarked that this or that plant is male, because it contains no seed or fruit. I have always been taught that all plants, from the sturdiest oak down to the smallest blade of grass are male, because they produce of themselves seeds only, and not new plants, as the formation of the seed is peculiar to the male, and the nourishment and expansion of it is peculiar to the female. It follows that all the subjects of the vegetable kingdom are males, because they are concerned only in preparing the seed for the production of the plant; and that the earth alone is the common female, the common mother of the vegetable kingdom, because she nourishes and expands the seed, and thus actually brings forth new plants.

ZOO NOTES, NO. 30.

BY HUON.

THE COUGAR (*Felis concolor*.)

SCENE in the Great Carnivora House, *Grampy* and *Halchen* in front of the Cougars' cage.

Grampy.—"Yes! *Halchen* that is our indigenous, long-tailed cat! You will observe that the lynx, and others of the wild cat tribe, have short tails, and of those there are three distinct species. But there is only one true representative of the long-tailed genus *felis*, and you behold him in the cage before us! You notice that he has no stripes, as has the tiger yonder, no spots as the leopard, nor no rosettes as the jaguar; consequently, naturalists have given him the name of the American lion, indeed, no animal has received so many names—among them being puma and panther."

Halchen. "But I think I have read of spotted cougars?"

Grampy. "Yes! but the spots can only be seen by a certain light—so nearly invisible are they. Upon the very young cubs such markings are quite plain; but they disappear before the animal comes to maturity, and, except in the light spoken of, are seen no more."

"No! there is not much grace about the cougar. Nature seems to have made him more for strength than for beauty. But what a tail has been *entailed* upon him! And how plainly he spoke with it just now, when that unlawful cane was thrust at him! Such a fellow as this is not to be found every day, though his family has a wide range—it being from Paraguay south, to the great lakes of America, north. It is well that he is rather scarce, he being one of those fierce creatures, a few of which go a great ways. Nocturnal in habit, he is only active at night, when mankind is, or ought to be asleep. Therefore he is not 'seen of man.' He is quite solitary in his habits, too; and, when civilization crowds him, he retreats to the more remote parts of the great forests. Squatters don't *pray much* for the presence of cougars among them; and the appearance of a single one is quite enough to throw a community into a state of excitement greater than that caused by the presence of a mad dog, or a drove of Texas steers, among us."

"The cougar is a splendid climber, and will run up a tree as lightly and as quickly as the liveliest cat of his family—not like the clumsy bear, by hugging, but by the use of his terribly sharp claws. Once up the tree, he will 'spread himself' on a horizontal branch, and quietly wait for his 'marketing' to come along. Woe, then, to the elk, antelope, or even buffalo, that happens to promenade under that tree—for no sooner does one come within 'range,' than the cougar, with one bound, is on its back, with his sharp claws sunk deep in his victim's flesh! Away bounds the poor elk or buffalo, as it may be, with its murderous rider, dashing through the bushes, now on this side and now on the other, in hopes to shake off its terrible assailant! All in vain! Closely claspings his victim's neck, the cougar clings on, tearing the throat of its prey and drinking its blood, all the while under a mad gallop. Faint and feeble, the poor ruminant plunges on, to stagger and fall at last, exhausted by the wild run and loss of blood. This is about the best and worst I can tell you of the American lion."

"Yas, mister! I've hearn your talk; but thur's one thing that kin git the kugur—es you call him," said a rough-looking man in a suit of "Kentucky jean," fur cap, and pantaloons tucked inside of his boots—face and hands copper or bronze color.

"A rifle, I suppose?"

"No, sur! A caquaw, or what you hyr call a Canady porky-pine. You're got two or thre on 'em in your Garding hyr."

"Oh! no, friend! you can't know much about cougars, or you

would not say that a porcupine would stand any chance wi h one of them."

"Thar's whar you're wrong, strengre! You're a sitty man, an' that's sayin' hunks; but you don't know nothin' 'bout woods an' perarie life, I reckon. I've known mor'n one paynter like this yer one to be killed by a porkypine. Ye see, strengre, when the paynter goes to gobble up the ugly little warmin't, he has his mouth wide open, and, jist at the right time, the porkypine gins one sling ur that tail o' his'n, an' strikes the paynter kerslap in the mouth, fillin' his tongue, lips, and jaws so full of his sharp stickers, that the beast can't shet his mouth! An' the more the paynter tries to get rid of 'em the more he don't—for they sink in deeper an' deeper, kase on the eend they're like a fish hook. Yas, sur! An' paynter sneaks off to sum hidin'-place, whar his tongue an' jaws swell till he dies—ded ez thunder. Oh! yas, strengre! I know a heap 'bout paynters! See hyr! Did you ever travel with one on 'em, near a hull night, on a log—you on one eend an' he on the other?"

"No, sir! Nor any one else."

"Wrong agin, strengre!—fur I did onst. An' I hed the pleasure o' his company fur a day an' a night arterwards, too!"

"I should like to hear the history of that adventure."

"Well, strengre! its too darn hot in hyr fur ennything but them g'riffs, or these thunderin' Australy grasshoppers. Less go outdoors, in the sunshine, an' I'll tell yer."

Desiring to hear the strange story, I complied. Seating ourselves under one of the leafless trees, on one of those warm *December* afternoons, I was told the following story, which I will give, as nearly as I can, in the speaker's peculiar vernacular:

"Strenger! I hev lived most of my life in the woods or on the peraries, an' hev seen a heap o' brute natur'. I've larned that the most ferociouset of animiles ain't allers ferocious. An' these paynters—the wust sarpents, a-most, what is in the woods—git 'em onst skeered, an' they'll behave equal to some Christians I've hearn on! An' the story I'm goin' to tell you, an' which is true as bre'-thin', will prove it. This is the second animile show shop I was ever in; an' I am goin' to tell you of the first one. I've telled it once afore, an a man by the name o' Mayne Reed hez put it in one o' his books, but I'm the man wot it happened with, anyhow."

"Well, strengre! I'm from Loozanny. An' we hev fluds thar as *is* fluds! Ev'ry year we hev one, tho' they ain't all sikh as the one I'm goin' to tell 'bout."

"Well, ten year ago I squatted out thar, an' hed jist finished my shanty, when what should come 'n'g but one of them durned fluds that kivered the country fur milds an' milds 'round! It was in the fed o' night, an' I was sound asleep. An' I tell yer whut! when I del the wotter soakin' thru my blanket, I wa'n't long gettin' awake an' makin' fur the door. I saw *sumthin'* when I looked out that door, I tell yer! In clearin' off I hed left some stumps 'bout three foot high. But thur wur nary stumps to be seen now—all under wotter. An' the way it was rollin' down was a caution, I tell yer! The nearest naylor I hed was ten milds off. I knew his shanty stood on high ground; but how was I to git thar? I cud swim, but not thar fur! 'Sides, to be knocked about by drift-logs an' trees! Howsumdever, thur must sumthin' be dun. *Git* I must, fur the wotter was risin' every minnit. The current was settin' right straight fur my naylor's shanty, an' I made up my mind that the fist big tree or l-g that kin 'long should curry me with it sumwhar. Well, jist then a log did cum. I hed 'bout light enuff to see that it was as big a one ez I could have wished fur. An' waitin' my time, ez it slid past I swung onto it; an', crawlin' up to the eend, I sot down straddle, up to my hams in wotter. Well, the durn'd thing dipt considable; an', thinkin' I'd be more comfortable to 'ard the middle, I made a chango o' base. All to onst I sed the other eend

was occupied too! What it was clumppin' up thar it wur too dark to determine; but I hed sense enuff to know thar it wur a warnint o' s'm kind—tho' whut, I couldn't tell. 'It mout be a bar!' I think; an' then, agin, I think it moutn't! Howsumdye, I warn't long left jubus 'bort the cussed thing—for the log, yer see, kep' makin' circles as it drifted. An' when the animile's end cum 'round in a certain way, whar thur was no sky back, I ketched a glimpse o' his eyes, an', durn my skin, ef it wusent a paynier—or whut you fellers here call a kugar!

To be Continued.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

For "TO EXCHANGE FOR CASH" or "FOR BENDS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

F. F. PRESTON, Candor, N. Y., will exchange one fine Silver L. Sebright Bantam Cock, for Golden, Black Africans, or Partridge Cochins Cock.

BOX 474, Orange, N. J., wants to exchange 1 pair Houdans, 1 pair Duckwing Geese, and Dark Brahmas, for Brown Leghorn Pullets, Single Hens, Jersey Gals, Sleight, Buggy, or others.

B. M. CROSBY, Barrington, Yates Co., N. Y., has a Houdan Cock which he wishes to exchange for Cock of a one kind—object, improvement of stock; also good Green Tea, to exchange for a trio of Brown Leghorns, Partridge Cochins, or others.

A. A. WYLIE, Bowmanville, Ontario, will exchange a set of Boxing Gloves, new Smith & Wesson Seven Shooter Revolver, Printing Press, prints one line with three fonts of fancy type, Ink Pad, &c., Mersham Begar Holder, nicely co-ored, for Fancy Pigeons, or others. Speak quick.

D. C. TOBIAS, Litz, Pa., will exchange P. and B. Cochins for W. or B. Lechons, or others. Games preferred. Stock must be good, as mine is.

F. O. CEFHART, Niles, Mich., will exchange one L. B. Cock, Felch strain, for C. Cock, Leghorn, or P. Cock.

E. C. SMITH, Bolton Hotel, Harrisburg, Pa., will exchange High-ryes, Isidie and Common Tumblers, for White Leghorns and Dark Brahmas, (hens or pullets.) Must be good stock, as mine are. What other offers.

THOMAS PARKER, Johnstown, N. Y., wants to exchange a trio of W. C. B. Polands, 1st prize winners, 1 trio S. S. Polish, imported 1875, for Breach-loading Shot-Gun, Breach-loading Rifle, or Hunting-case Watch. Polish valued at \$20 per trio.

JOS. N. SCOTT, Newtown, Bucks Co., Pa., will exchange Brown Leghorn Cockerels and three Pallets, pair Red Swallows, pair Black Magpies, 1 Lo k, White Fan, for Pair Ducks, China Geese, or Fancy Pigeons, or others.

ASA HOMER, Baldwinville, Mass., to reduce varieties, will exchange all of my premium White and Black Cochins, 1 pair G. S. Bantams, and 1 pair Red Jacobin Pigeons, for Plymouth Rocks, or Houdans, or others.

W. C. EATON, Newark, N. Y., wants Canaries, Singing Birds of any kind, in exchange for Light Brahmas, P. Cochins, and P. Rock Chickens. (Eggs from Williams.)

C. KING, JR., Plainville, Mass., has Black Carriers, Dun Carriers, Yellow Bards, Yellow Jacobins, Black Magpies, Black Fans, White Fans, Blue-pied Pouters, and old birds, for Rouen Ducks, Partridge Cochins, Black-tail Turbit, Short-face Tumbler, Pistols, Shot Guns, or others.

J. T. B. CULB, Franklin, Pa., has eight trios Black B. R. Game, '76 Hatch, \$10 per trio; Wright's Illustrated Book of Poultry, bound; long Silver Watch guard, \$15; Seven shot Revolver, \$10, to exchange for Breach-loading Shot-Gun, Winchester Rifle, Printing Press and outfit.

GEO. A. WILSON, Box 907, Fitchburg, Mass., has B. B. Game Bantams, 1 pair Fowls, 4 pair Chickens, Spaulding and Genning's stock, first twelve parts Wright's Poultry Book, in fair condition, for an old fashioned long-widen-case Eight Day Clock, in good order. Please give description. What offers?

JOHN BROWN, Hanoverville, Northampton Co., Pa., will exchange one pair of Black and White Muscovy Duck, 1 year old, for a pair of White Jacobins, or White Owls. Birds must be good, as mine are. All letters and postal cards answered.

O. S. KENE, Box 16, Auburn, Me., will exchange four pairs White Angora Rabbits, three of the best marked Himalayans in the United States, one Dutch Doe, Halsted stock, for White Rose comb, Black African and Silver Sebright Bantams. First-class stock only taken. Make offers at once.

C. W. MATTHEWS, Box 201, Milton, Northumberland Co., Pa., will exchange one Cock, one Hen, six Pullets, first-class L. B., one Cock and two Hens, first-class D. R., one Cockerel, two Hens, six Pullets, first-class P. Cochins, one Brown Lechons Cockerel, marked 100 points, for country Produce, Hares, Hogs, Pigs, or Cat, or others.

JOHN D. WHITE, Chicopee, Mass., will exchange 1 pair Black Mottled Inside Tumblers, 1 pair White Carriers, 1 pair Red and 1 pair Yellow Bards, B. B. R. Game Bantam, and Golden Sebright Bantam Cockerels, and some other Pigeons, for one first-class Dun Barb Hen, White, Black, or Yellow Owls, Sunbird Hen, Red Pigmy Pouter Hen, or Isabella.

IRVING H. ELMER, Chicopee, Mass., will exchange good Cockerels—Brown Leghorn, White Leghorn, Houdans, S. S. Polish, (Carwright's strain); for: Pullets of same variety, or Plymouth Rock Pullets, Rouen or Pekin Ducks.

GEO. O. BROWN, Brooklandville, Md., has 1 male Cal's Quail, 1 pair Red "West", (good), 1 Angora, and 1 Lop Duck, 1 trio P. Cochins, Black Red Game Bantams, and 1 Bue cap Mangel-Cock, premium bird, for exchange. Offers desired immediately. Postals or monogram note communications, either, solicited.

EDWARD A. FRY, Tamaqua, Pa., will exchange White Fantail Pigeons, and 1 pair Black-breasted Red Game Bantam Chickens, for White or Black Carriers, or others. None but first-class stock wanted. Will give the same.

BENNY C. WICKS, 71 West Clifford St., Providence, R. I., has a full blooded English Pointer Dog Pup, ten months old, marked liver and white, which he will exchange for an Irish Bull Dog, must be full-blooded, with ears cut, and well marked, or for others.

WINIF. LD., Box 110, McKeesville, Pa., will exchange Printing of any kind, also copy of Graham's Standard Photography, for offers in Fancy Pigeons. Send on postals.

W. J. ERENDEN, Williamsport, will exchange 6 thoroughbred Irish Setter Pups, seven weeks old, pair Red Carriers, and B. B. Red and Duckwing "same Bantams" for Breach-loading Shot-Guns, merchandise, or offers in anything that want eat, or will sell.

ISRAEL FESSLER, Rehrsburg, Berks Co., Pa., will exchange one pair Black Jacobins, one pair Blue-wing Turbits, one pair S. S. Haudburgs, for a good Seven-shooter Revolver, or others.

J. J. ARNOLD, Lockport, N. Y., contemplating a change of residence, will exchange one pair Black-winged Turbits, from E. C. Skinner; two pairs White African Owls, one pair, 1st at Pittsburg, other 2d at Buffalo, from R. F. Shannon and E. C. Skinner respectively, and several pair of Homings, for a first-class Central-fire Shot-Guns.

CHARLES W. HOIT, Nahua, N. H., will exchange his stock of red File Game Bantams, for Fancy Pigeons; Blue or Yellow Fans preferred. The lot consists of one Cock, (yellow legs), three Hens, two May-matched Pullets, ten small Chicks, from one to four weeks old. What offers?

C. T. G. CHASE, 206 Franklin St., New York, will exchange L. B. Chickens, Rouen, Aylesbury, and Muscovy Ducks, (Todd's strain), W. C. B. Poland Cockerels, for Brown Leghorns, B. Spanish, W. C. B. Polands, Pekin Ducks, Grease, Nursery stock of all kinds, Trees, Vines, &c.

BOX 869, Rockville, Conn., will exchange a C. Cornet, cost \$60, for a first-class Central fire Shot-Gun. Must be in good order, as the Cornet is.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

WANTED.

1. A Treatise on the Art of Breeding and Managing Tame, Domesticated, and Fancy Pigeons; by John Matthews Eaton, and published by the author, 7 Islington Green, London. 1852. Illustrated.

The Treatise of 1858 is not wanted.

2. A set of Six Matchless Engraved Colored Portraits, Life Size, by Wollenholme, viz: The Almond, Black Mottled, Red Baldhead, Yellow-bared Tumblers, Black Carrier, and Blue Pied English Pouter.

3. A colored Diagram, or a Plan of Building or fitting up a Pigeonary, embellished with Tumblers, Pouters and Carriers.

We think there are several different diagrams, and would like all of them.

4. A set of six splendid Life size engraved Portraits of The Fancy Toy Pigeons, colored, viz: The White Fantail, Yellow Jacobin, Silver Owl, Blue Turbit, Black mottled Traupeter, and the Black Barb.

All of above pictures published by J. Eaton.

A liberal offer would be made for any of the above in good order.

Any information regarding John Matthew Eaton's life and works would be gratefully received.

WM. GARDNER BARTON, Salem, Mass.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

G. O. BROWN, Brooklandville, Md., wants Angora and Lop Doe, Silver Sebrights, W. C. W. Polands, a good W. L. Cock, and Sultans. See exchange offers, or state lowest cash price and describe fully.

HOMING PIGEON.

ITS HISTORY, GENERAL MANAGEMENT,

AND METHOD OF TRAINING.

By W. B. Tegetmeier.

WOMENS' RIGHTS.

Sure the divinest rights are these—
(By all to women freely given,)—
To bring by goodness, love, and truth,
Earth nearer Heaven.

To plead for the oppressed. To aid,
And comfort those whose hearts are broken,
To bring the erring back with words
Tenderly spoken.

To share the bitter cup of sorrow,
To help in breaking sin's dark fetter,
To win to higher thoughts and aims,
And make men better.

Thus are ye God's best ministers,
Oh! faithful woman, true and lovely;
To raise and purify the world,
And make it holy.

Evening Star.

A HOUSE HUNTER.

With a propensity for moving equal to that of a New Yorker, and a taste as fastidious in selecting an abode, the little hermit-crab shifts from shell to shell, as his fancy dictates or increasing size suggests. He inhabits the deserted shell of some mollusk, and "toils not; neither does he spin!" No time of his is spent in boring, burrowing, or building; he simply chooses a comfortable-looking shell, and whisks into it, tail first. The reason of this backward and inelegant movement is to get as far into the house as possible his unfortunate shell-less tail. When unprotected, it makes a dainty feast for many a marine animal, and none seem to have a more realizing sense of the fact than the hermit himself.

When deprived of a house he has a most ridiculous and crest-fallen appearance, and crawls about, with a terrified air, as if expecting to be devoured each instant. In this unfortunate condition he will put up with anything by way of a house, and often takes a broken shell, or one so large that it cannot be dragged about but is rolled to and fro by the motion of the waves. When empty shells are numerous, the preliminary investigations that the hermit makes before choosing, are very ludicrous. He takes them in his feet one after another, and after twirling them around rapidly, throws them away. He then probes carefully with his fore legs; and in observing them, I have imagined that depth of shell, in which the defenseless tail can be safely buried, determined their choice. I have noticed, too, that the shell finally selected is examined longer than the rest; and when the crab at last shoots into it, he disappears so quickly that the eye cannot follow his movements.

One can see these singular creatures by watching a tide pool either at Governor's or Coney Island. The mollusk shells appear to be dead and empty at first, but if the observer will throw in a few clams (with piece of shell attached to sink,) the apparently lifeless shells suddenly run along at a much faster pace than when possessed of their original tenants. If a sudden noise is made,

they retreat abruptly and remain quiet. They quarrel about their food most fiercely and determined; also for the possession of a solitary shell, and have thus earned the name of "soldier crab." A combat often continues until one is killed, and, as with all crustaceans, the "victor eats his fallen foe;" even if he has lost a few legs, he "rolls the sweet morsel under his tongue," and eats away with a decided appetite. When the meal is finished he amputates the injured members up to the first perfect joint, and in the course of time he has new and perfect feet. While the new claws are forming he does not consider himself able-bodied, and refrains from all warlike engagements.

When a crab has once entered his shell it is almost impossible to coax or drive him out. The body is curved, fitting compactly around the inside of the shell, and if touched he retreats as far in as possible. Even if a claw be taken hold of he can scarcely be removed, and will often be torn asunder rather than loosen his grasp. He clings thus firmly by a pair of pincers, located at the end of the tail.

The hermits are very desirable in aquaria, as they are hardy, feed upon either animals or vegetables, and have the commendable quality of minding their own business. They give life to a tank by their numerous little tricks and peculiar motions, and are called by a friend of mine "aquarial monkeys." When sick they leave their shells and climb, to rest, upon the highest rock or sea-weed in the tank. These movements usually indicate impure water, and the tank should be seen to at once.

I had three in a salt-water aquarium for two years, and I used to spend hours in their society. Hermits are fond of sand, and I always placed a quantity to the front of the tank, so as to see their battles and general entertainments. I have often caused them to leave their shells by dropping them into impure water, and have been greatly amused by returning them to the tank with only one shell, for the possession of which a long battle usually ensued. It is desirable, in selecting crabs for an aquarium, that they be of similar dimensions, as in combat they do not "take a fellow their size," but pounce upon smaller ones which they are sure of conquering. If a person has not time to go to the shore for hermits, they can often be found among the silver shrimp at Washington Market, in shells of Buccinum. Speaking of these shells reminds me of an incident that occurred in Barnum's Museum during the war. The Manager of the Aquarial Department had crabs in the Buccinum shells, but he obtained some young *Pyrula* shells and painted them in stripes of red, white and blue. He put them in water for about ten days to get a slight green coating, then got the crabs out of the Buccinums and gave them the painted shells; their patriotic appearance attracted a great deal of attention.

Many fishermen on the shores think the hermit-crabs are young lobsters, and that when they become large enough to protect themselves they leave their shells, get a hard tail, and become perfect lobsters.—*Ida B. Roberts in Baldwin's Monthly.*

Canada peas are excellent as feed for bantams when preparing them for exhibition purposes.

POULTRY DEPARTMENT.

(For Fanciers' Journal.)

STRAY NOTES.

Dominiques.—It would be valuable poultry literature if we could get every breeder to give to the public his experience with the different varieties, particularly if in his experience any variety of fowl should fall below the published estimate of its character. Public advertisements are not always trustworthy, because unprincipled men will make unprincipled statements of the virtues of stock, leaving the faults untouched. Believing that it is dishonorable and unwise to conceal the fact that a particular variety or breed of fowl has serious faults, the writer was induced a few years ago to say what he thought of the Black-Russians, and he now desires to say a word or two of the *Dominiques*. He has not had enough experience to say whether they have positive faults or marked virtues, but certainly they do not come up to the public estimate of their worth as published by many of those who breed them. The writer, a few years ago purchased an elegant cock, one which had carried off the first prize successively at Buffalo, Boston, and Hartford, and with him three hens, paying twenty dollars and expressage. He now has one of the hens which he has repeatedly offered for two dollars without finding a purchaser. The most serious objection he finds to the stock, so far as his experience goes, is that it does not breed true. Out of all the young stock bred the first season, at least one-half bred with single comb instead of the pure rose comb, and so utterly valueless was the stock considered in this respect, that it was all consigned to the pot,—but that hen, which is still for sale. Will others give their experience in this matter?

Postal Cards.—I have been reading with some interest the articles lately published in the Journal on the postal card question. It does seem to me that these articles would be of much more value if the writers would attach their names instead of *nom de plumes*. My own practice has been to deal with those only who are willing to show and describe their stock at their own expense. When a man sells a trio of fowls for \$10 or \$15 which do not cost him more than one-tenth as much to produce, in all conscience, can't he afford to pay his own postage? Why, I would as soon think of asking my patrons to pay my advertising as my postage, and when I see a man advertise "no postal cards received," I never think of dealing with him, because I fear he wants the whole loaf. It is true it is expensive to produce first-class specimens, but does the breeder who thus argues expense forget that many of his inferior specimens are sold for at least three times the cost of production, and none of them for less, for even those unsalable, when consigned to the pot are worth as food more than the cost of production. To the purchaser who pays the fancy price, runs the risk of getting stock that is not first class, and submits to the extortion of express companies, it is a hardship which ought not to be borne, and it ought not to be asked of him that he pay the postal expenses of the man with whom he deals, and who makes the profits on the stock which he has for sale.

A. N. RAUB.

A FEW QUERIES

FOR YOUR CORRESPONDENTS TO APPLY THEIR EXPERIENCE TO.

I. Is there any better way to remove a wart from a dog's lip than by tying a piece of silk thread about it tightly near the root?

II. What probably ailed a cat that swelled in the belly until it was with difficulty that she moved about? Her belly became hard, and felt to the touch as if distended with wind. She was unable to lie down upon her side, and would vary her position from lying on her back with her feet in the air to the reverse, and thus take her repose. She appeared not to suffer pain, but after a considerable time, became poor in the portions of her body not affected, and was finally purposely killed. She drank a great deal of water. Was it a case of dropsy?

III. Of what benefit are Walton's roup pills, when pigeons treated with them are seen immediately to vomit them up?

IV. Who can give any trustworthy evidence that shall help to establish or disprove that cats inhale the breath of infants, and that this is injurious to the latter?

V. What fanciers have found the use of hemp seed as occasional food for pigeons more beneficial than its disuse.

VI. Who has ever seen a feed-hopper which will afford pigeons easy access to the grain, and at the same time prevent their scattering it about?

P. B.

GOOD ADVICE.

BY GEO. P. BURNHAM.

In all doctoring of badly distempered fowls, I commend to the attention of those who have the work to do, that they handle the diseased birds with leather or thin india rubber gloves—lest from a previous fresh cut upon the fingers, or an open scratch on the hands even, their flesh be inoculated with the pus often present upon the birds' foul sores or wounds. Several cases are authentically reported, where attendants upon horses or cattle, affected with glanders or epizootic diseases, have thus been seriously injured. And we are personally knowing to more than one instance where poultry keepers, in doctoring sick fowls, have contracted a troublesome affection, which required weeks of subsequent care to remove from their flesh. One person within our knowledge at this writing is suffering with a diseased eye—of which he has nearly lost the sight, caused by carelessly rubbing it with the edge of his hand while manipulating some roup-y chickens. And the humor thus generated may entirely destroy the sight, in his case, it is feared.—*Diseases of Poultry*.

POULTRY AT BASKING RIDGE.

At the Farmers and Manufacturers Association, of Somerset Co., held at Somerville, N. J., October, your subscribers at Basking Ridge took 1st premiums as follows:—

Partridge Cochins, W. F. Muchmore.
White " F. Peppard.
Black " Wm. Dunham.
Dark Brahmas, L. A. Thompson.
Silver Gray Dorkings " "
Brown Leghorns, W. F. Muchmore.
Silver Polish, Wm. Dunham.

We did not expect to show until a day or two before the opening, but upon considering the matter ("caucus in the back yard") we thought it would be well to show a sample. A larger variety could have been shown, but business and politics seemed to take the lead.

I may say the hen-fever at times is very bad here, a few investing in one egg at twenty five cents, and if it did not hatch, they are broke (so is the egg). No more chickens for them. Others sparing neither time or money, and we boast of now having a very fine lot of fowls in and near our town.

PILLS.

THE SPANISH FOWL.

BY W. J. NICHOLS.

NO. II.—HOUSES FOR SPANISH.

I STATED in my last that Spanish do remarkably well in small places, and I really believe there is not another variety which will bear confinement so long, and that without suffering in the least, for they keep in the most perfect health and in the finest condition, and are ready at almost all times for exhibition! I have had birds confined in pens for months, which never had a run or a change except when they went to a show, and I seldom exhibited a pen without winning. I have also kept them in a cellar in the center of London, and exhibited them in such form as to beat exhibitors who had every convenience for keeping poultry. I simply state these facts to show what can be done with Spanish under the most difficult circumstances.

To exhibit these birds, however, with any degree of success, it is necessary that they should be sent out in the very best condition, for with Spanish this is of greater importance than in most other breeds. Many

times have I seen inferior birds carry off a cup entirely owing to the capital condition in which they were exhibited, although there were far better birds in the class. It is, therefore, absolutely necessary that these birds should be exhibited without being pinky or scabby in the face, and with a bright coral redness in the

comb, hard, glossy appearance of the feathers, which can only be accomplished by having a house properly constructed for them. This must be so arranged that the birds are sheltered from the cold winds, the heat of the sun, and from damp or rain, but, more especially, from the effects of the sun during the summer, when the weather is very hot; while in the winter they require to be kept moderately warm, though at the same time plenty of fresh air is most essential, or their combs will lose their ruddy appearance and turn pale.

The Bristol fanciers have always been famous for the splendid condition in which they invariably exhibited their birds; it may therefore be interesting to some of your readers if I briefly describe the late Mr. Henry Lane's poultry houses. This gentleman was a most enthusiastic admirer of Spanish, and spared no expense in buying the very best birds obtainable; and he also went to a considerable outlay in providing his birds with every accommodation for keeping them in health and ready for exhibition.

If I remember rightly, for it is now some years since his stock was publicly disposed of, the houses were built on one side of the garden against a high brick wall; between this and the roosting places was a covered passage running the whole length of the houses. These were built at right angles to the wall. Next came the runs for each pen of the birds, and beyond all these was a

grass run, where the various birds were occasionally allowed to run when the weather was fine. The great advantages of this passage leading direct into the house, and heated with hot-air pipes, are very obvious, for in all weathers and at all hours of the day and night (for it was lighted with gas) the birds could be visited with very little trouble or inconvenience to those who had to feed and attend to them. All this, of course, involved the outlay of a large amount of capital, and it also required a good deal of space to carry it out as thoroughly as it was done by Mr. Lane; and I must confess on my first visit there I thought there was little use of my attempting to exhibit Spanish with even the remotest chance of winning a prize. I, however, saw other fanciers' yards in Bristol. Some of them had been equally as successful in the show pen, and in two or three cases had bred the birds with which Mr. Lane won so many prizes; and I found their places were not so elaborately planned or so large in extent.

Another old and a most successful breeder and exhibitor of Spanish, is Mr. Edward Jones, who last week, for the eighth consecutive

year (I think it is), again carried off the Spanish cup at the Bath and West of England show, a feat which few other exhibitors have succeeded in accomplishing.

He, too, has a nice place for breeding Spanish; most of the houses in his yard are placed on the side of a steep incline, facing nearly south. These houses can also be heated when

SPANISH POULTRY HOUSE.

necessary, hot water pipes, slightly embedded under ground, run through the buildings. All of these are boarded and fitted with windows, which can be closed when the weather is cold. The grass runs are on the side of the hill, and nicely sheltered from the cold winds; and the ground being well drained makes it a capital place for rearing chickens.

Mr. Teabay, who used to exhibit some beautiful Spanish in his time, totally ignored houses, only letting his birds roost in the trees through the whole year, merely confining them for a short time before they were wanted for a show. The Hon. Miss Douglas Pennant also treated her birds in a similar way. By adopting this plan Mr. Teabay attributes the absence of roup in his birds, a disease, as most fanciers know to their loss, is very troublesome when it attacks Spanish.

It will be seen from what I have stated that these birds can be successfully reared and exhibited under the most variable conditions. The drawing which accompanies this article is the plan of a house I have found to answer uncommonly well, and which has, with a few modifications, been adopted by several fanciers residing in and around London. It provides accommodation, as will be seen, for a number of birds in a very small space; its great advantage is, that you have a place for your breeding birds, and also a number of pens for keeping those intended for exhibition,

the two occupying no more space than an ordinary house. The height is 7 ft., the length will depend upon the number of birds intended to be kept. In my case I had five pens, as at A A, in the doorway, each 2 ft. 6 in. in breadth, and as the house was 4 ft. 6 in. in depth, each of these pens was 2 ft. 6 in. by 4 ft. 6 in., and in height 3 ft.; this afforded plenty of room for a single cock or a pair of hens. Each pen had two doors, the outer one of wood with a piece of glass let in at G, to give light, the inner door of wire; at F is another small door, E, about 3 in. broad, for ventilation. Underneath these pens is a roosting place, C, with nest boxes, a roost, and ventilated and lighted from the side. B is a run with a dust bath, and fitted with windows; this is for the use of the birds kept for breeding purposes, and those confined in the pens should occasionally be put in here, to dust and free themselves of insects. By having two doors to each of the pens, and the run, B, glazed, it enabled me to exclude the cold winds, and by fixing a blind from the top, with supports from each side, and opening the wooden doors of the pens and the windows, all the places can be kept cool during the hottest day in summer. Recently a gentleman had one of these houses built; but he, as well as others, have improved upon my plan by having a large shed, and then fitting up the interior after the plan I have suggested, omitting the wooden doors and the glazed windows. By this arrangement a dry, warm shelter is provided, in which to feed and admire the birds, and these are less exposed to draughts and the keen winds; on the other hand, more space is required, and the expenses of building are greater.

The pens should be covered three or four inches deep with fine dry earth, mixed with a little chaff, or the birds will soon get corns on their feet; the earth, &c., should be changed at least once a fortnight, and the droppings removed each day. A mixture of old mortar, dry earth, and coarse sand, answers uncommonly well for the bottom of the run, and the whole place requires plenty of air, and to be kept scrupulously clean.—*The Country.*

CHEMUNG CO. FAIR.

Premiums at the Chemung Co. Agricultural Fair, held on State Fair Grounds, Elmira, N. Y., Oct. 5, 6, 7, 1876.

Brahmas. Light—W. W. Albro, Elmira, 1st; G. W. Chidsey, Elmira, 2d. Dark—W. W. Albro, 1st and 2d.

Cochins. Partridge—G. W. Chidsey, 1st; H. B. Batterson, Elmira, 2d. Buff—S. Brink, 1st; John McCann, 2d. White—M. J. Emhoff, Elmira, 1st and 2d.

Game. B. B. Red—G. W. Chidsey, 1st; Danl. Boyle, Chemung, N. Y., 2d. G. W. Chidsey received first premiums on Brown Red, Ginger Red, Red Pile, White Pile, and Spangled.

Bantams. Black Red Game—W. W. Albro, 1st. Brown Red Game—G. W. Chidsey, 1st. Red Pile Game—G. W. Chidsey, 1st; Geo. Peters, 2d. Silver Duckwing and Yellow—G. W. Chidsey, 1st on each. Golden Sebright—G. W. Chidsey, 1st.

Hamburgs. Gold Spangled—Jake Mortimer, Elmira, 1st and 2d. Silver Spangled, Benj. Blamford, Elmira, 1st and 2d.

Leptorns. White—G. W. Chidsey, 1st; Bishop, 2d. Brown—G. W. Chidsey, 1st; D. P. Billings, Elmira, 2d. Black—M. Thurston, Elmira, N. Y., 1st and 2d. Black Spanish—H. B. Batterson, 1st and 2d.

Polish. Golden—M. J. Emhoff, 1st; Jesse Lyon, Catharine, N. Y. 2d. White—G. W. Chidsey, 1st.

Houdan and P. Rock. Jesse Lyon, 1st.

Ducks. Pekin—H. B. Batterson, 1st. Common—Geo. McCann, 1st.

Turkeys. Slate—D. T. Billings, 1st. Black—Eddie Sayre, 1st.

To determine the age of eggs, the *The Live Stock Journal* says: Dissolve about 4 oz. of common salt in one quart of water, and immerse the egg. If one day old it will sink to the bottom; if three days old it will float in the liquid. If more than five days old, will come to the surface and project above in proportion to its increased age.

PIGEON DEPARTMENT.

THE MEAL-WORM.

BY F. B.

Almost as soon as a person has established a coop of pigeons he becomes conscious that he not only keeps *pigeons*, but that he is also keeping—helping to a livelihood—other creatures as well. Every living thing is so closely related to many other living things, that we find it next to impossible—nay, impossible to cherish any one of them without thereby enabling others to exist.

Will you cosset plants in your window? The aphides, the mildew, the bug, will find them out. Will you keep a dog? He will soon begin to scratch. Are you preparing a place for pigeons? Take thought also of the lice, ticks, maggots, mice, rats, "bugs," meal-worms, which will be in haste to take up their abode with your pets, if possible. We find in the pigeon books a good deal said of the lice and the rats, and but little of that interesting insect, the meal-worm. The young fancier will very likely be somewhat surprised, when he sees one of them for the first time.

The maggots, which neglect will render welcome, he has seen on a decaying carcass in the woods, or in the squirming grease-pot, a dirty appurtenance to many households. The lice he recognizes from the descriptions in the books. I have found nothing about the meal worm in any pigeon book, with one or two exceptions, which I will speak of farther on. The novice will first encounter them, either when he moves a box or board, which has been lying in the coop, or possibly not before he removes the manure. He will at first dislike very much to see them, will view them with a feeling akin to disgust, and will be reluctant to handle them. They are so smooth and finely polished, it is difficult to pick them up, and, by bending quickly, they almost leap from the hand; but they are not remarkable for a rapid locomotion, though they are not long in crawling away. After he and they become better acquainted, he may not dislike them so heartily, unless he is more successful than I have been in finding them productive of harm. There is a cleanliness to their hard skins, which renders them very different from the wet, loathsome, and filthy maggot. Even before he sees the meal-worms he may discover—what are the same insects in their mature state—black "bugs" under boards, the feed-hopper, drinking-fountain, which, when uncovered to the light, are in tremendous haste to find a new hiding place:—so much better than light do they love the darkness, tho' their deeds are not so very evil. The young fancier, and many old ones, call these creatures respectively, *worms* and *bugs*. The former is not a worm at all, nor is the latter in any sense a bug. In general, all insects pass through three stages in their life; that of the *larva*, the *pupa*, and the *imago*, the adult or perfect insect.* This is plainly exemplified in the case of the moths. The caterpillar, the cocoon with its enclosed chrysalis, and the winged adult, of various kinds of moths, are familiar objects. The meal-worm, then, is the caterpillar, or larva; then

* To Harris' *Insects Injurious to Vegetation*, pp. 10 and 11, the reader is referred for good illustrations of the insect in its three states.

follows the pupa; then, the black beetle called a "bug," which corresponds to the moth in the example cited above. On the other hand, I presume a true worm is always a worm. The common earth-worm is a real worm; and the squash-bug, [not the striped cucumber beetle,] and the nameless creature, which is apt to cause wakefulness in the lodger in unclean beds, both of which have an offensive odor, are true bugs.

In the first place, then, let us "give it a name." The aristocratic name of this insect is *Tenebrio molitor*, a very significant name, as we shall see. *Tenebrio* is a Latin word meaning *one who shuns the light*; and *molitor*, in the same language, signifies *a miller*. The first word is derived probably from a word meaning *darkness*, and the latter, from a word meaning *to grind*, as corn. So that our friend, the subject of this sketch, might be called in English, the *dark-loving miller*, or the *miller who shuns the light*.

He is a Coleopterous insect, that is, he belongs to the order *Coleoptera*, which word signifies sheath-winged; for all insects, or nearly all, are first classified according to some peculiarity they possess in the number or quality of their wings. Bear in mind all the time that the black beetle is the perfect full-grown insect, of which the meal-worm is merely the young. He is, then, a beetle—an insect with his gauzy wings neatly folded, and perfectly covered by two horny sheaths, to protect them as he crawls about in places where ordinary wings might be injured.

Beetles are subdivided into many families, according to their habits, etc. The name *Tenebrionidae* once embraced a large family, but the term is now, I believe, strictly applied to a few species. However this may be, we may say in few words, that *T. molitor* is one of many species of beetles which love the darkness, and which, when exposed to the light, do all they possibly can to get back into the darkness again. These have been called *darkling-beetles* on this account.

From Westwood's "Introduction to the Modern Classification of Insects," I quote: The larva of *T. molitor* is an "inch long cylindrical and linear, very smooth and glossy, of a fulvous color, consisting of twelve segments exclusive of the head, which is provided with short trophi and a pair of very small antennae; the first segment of the body is larger than the following; the terminal segment is semi-circular, slightly serrated at the edges and terminates in a single point. On its under surface it is provided with a small anal proleg; the ordinary legs are short."

From Cuviers' "Animal Kingdom:" "Its larva is cylindrical, ochreous, scaly, and very smooth;" also, I think from the same book, speaking of the whole family: "Their larva resembles a scaly worm. It is about an inch long, and rather narrow. Its body is composed of twelve rings, and covered with a yellowish skin, tolerably hard and scaly. The head is oval, a little flattened, furnished with mandibles, antennae and antennule. The first three rings are provided with six scaly feet—the last is conical." He then speaks of "two scaly nipples," which appear to be two small feet, near the hinder extremity of the body; also, of the perfect insect: "The *Tenebrionidae* have the body more or less elongated, smooth, and usually of an obscure color. Their gait is lively, and they fly tolerably well, but rather in the evening and night than in the middle of the day." I myself never saw one fly; and, I would say in this connection, that there are beetles closely allied to this species, which have no wings, and the wing-covers soldered together, thus forming one shell over the back.

In J. G. Wood's "Insects at Home:" "The thorax is squared, and its base is as wide as the base of the elytra. The color of this beetle is shining blackish-brown, and the body is rather flat and very thickly punctured. Each of the elytra has one very short stria next to the scutellum, and eight others reaching to the apex. It lives in corn-mills, flour-stores, bake-houses, and similar localities, and in consequence is often called the *flour-beetle*. The cream-colored larva is popularly known as the *meal-worm*."

(To be Continued.)

PIGEONS.

Continued from page 502.

The pigeon is monogamous, that is the male attaches and confines himself to one female, and the attachment is reciprocal; the fidelity of the dove to its mate being proverbial. Young pigeons are termed squakers, and begin to breed at about the age of six months if properly managed; their courtship, and the well-known tone of voice in the cock, just then acquired and commencing, are indications of their approaching union.

Nestlings, whilst fed by the cock and hen, are termed squabs, and are at that age sold and used for the table, the dove house pigeon is said to breed monthly, being well supplied with food, more particularly when the ground is bound with frost, or covered with snow. At any rate, it may be depended on, that pigeons of almost any healthy and well established variety will breed eight or ten times in the year; whence it may be conceived how immense are the quantities which may be raised. It is nevertheless, with difficulty that one can give entire credit to the calculations, in such respect, on pigeons and rabbits.

But I suppose we must not question the positive testimony of Stillingfleet, who asserts that 14,760 pigeons were produced from a single pair in the course of four years. To class things of a similar bearing together, it has been calculated, but I know not by whom or on what practical ground, that a single pair of rabbits may in the same portion of time, viz: four years, produce 1,274,840 of their kind.

The dove cote or pigeon loft, as to situation or extent, must necessarily depend on convenience; one general rule, however, must be invariably observed, that every pair of pigeons have two holes or rooms, to nest in. Without this indispensable convenience there will be no security, but the prospect of constant confusion, breaking of eggs, and destruction of the young. Pigeons do well near dwellings, stables, brew houses, or such offices; or their proper place is in the poultry court. A dove cote is a good object, situated upon an island in the center of a piece of water: indeed such is a proper situation for aquatic poultry, and rabbits also; and may be rendered extremely beautiful and picturesque, by planting, and a little simple, ornamental, and useful building. Where pigeons are kept in a room some persons prefer making their nests upon the floor, to escape the danger of the young falling out; but in all probability this is to guard against one risk, and incur a great number, particularly that of rats and other vermin.

FEARLESS PIGEONS.

A letter to the New York *Sun* says: "Sir—Mr. E. T. Shaw, agent and operator in Linden, N. J., was the owner of a pair of tame pigeons that were seemingly afraid of nothing. They were observed by Mr. Shaw sitting on the railway track one day picking gravel, when the lightning express came thundering along at the rate of forty miles an hour. The pigeons evidently saw the train approaching, but paid no further attention to it, and sat perfectly still between the ties and allowed the train to pass over them. After the last car had passed the pigeons raised their little heads, looked back in the direction of the receding train, and then began picking gravel again. The birds have since been killed by the cars, presumably in undertaking a similar experiment."

G. W. V."

CARRIER PIGEONS.

Daniel Porter, foreman of Larrabee's cracker bakery of Albany, has a large number of pure carrier pigeons, the sagacity of which he has lately been testing. During the summer a traveling agent of the bakery has taken one of them with him to Poughkeepsie and written an order for crackers which he tied to the leg of the pigeon,

and sent it home. It reached Albany in less than two hours after its departure from Poughkeepsie. Mr. Porter recently took one to New York, and it arrived safe at Albany in four hours twenty minutes. A number have also been sent from Waterford. Their time from the village to Albany is from five to nine minutes. Three were let go at 12 o'clock yesterday and after a little maneuvering they departed for home—*Waterford Advertiser*.

SALAD FOR PIGEONS.

Pigeons need some green food, and especially when they have been long deprived of it, devour eagerly tender and succulent leaves. A year or two ago my flock of Tumblers cultivated a close acquaintance with a bed of young beets in the garden, not assisting greatly thereby in the successful cultivation of those vegetables. Pigeons, however, are almost harmless in this respect, when compared with fowls; but the kitchen-garden will flourish as well some distance from a loft containing a large flock at liberty, as near it—provided the soil is as good. I have also known a plant in a flower-garden to be much injured by them, owing to its possessing such tender and succulent leaves, when all the many plants around were untouched. A head of lettuce occasionally given is recommended for birds that cannot get young beet-tops in a neighboring garden; and fanciers sow rape or other seed for them, that they may peck at the young plants as the latter stand in the earth. I should think it would be a good plan to plant the seeds of some tender vegetable in boxes, at such times that the plants may attain the height of several inches, at different periods through the winter. These may be placed in the loft in the succession in which they were planted, say at intervals of a week or two. This would be somewhat laborious. In the summer I find the common purslane or "pusley," answers excellently for a salad. It is abundant, and eaten with a relish by the pigeons. I reserved a small corner of the garden for its growth, and now and then threw a bunch or two into the loft, where my pigeons were confined. The stems are about all they leave untouched. It is a troublesome weed; but cherish a few roots of "pusley" for your cooped-up pigeons. Don't allow it to go to seed, unless it is scarce in your neighborhood.

P. B.

THE RACE NOT ALWAYS TO THE SWIFT.—A fox came one day at full speed to a pond to drink.

A frog, who was sitting there, began to croak at him.

"There," said the fox, "be off with you, or I'll swallow you."

The frog, however, replied:

"Don't give yourself such airs; I am swifter than you."

At this the fox laughed; but as the frog persisted in boasting of his swiftness, the fox at length said:

"Now, then, we will both run to the next town, and thus we shall see which shall run the faster."

Then the fox turned round, and as he did so, the frog leaped up into his bushy tail. Off went the fox, and when he reached the gate of the city, he turned round again to see if he could spy the frog coming after him. In doing this, the frog hopped off his tail to the ground. The fox, after looking all about without being able to see his competitor in the race, turned round once more to enter the city, when he beheld the little croaker.

"So you have come at last, Master Reynard. I am just going back again, for I verily thought you meant not to come at all!"
Such is the world, and the men in it—a tissue of deception throughout.

How often do we try, and persevere in trying to make a sort of neat show of outer good qualities, without anything within to correspond, just as children will plant blossoms without any roots in the ground, to make a pretty show for the hour! We find fault in our lives, and we cut off the weed, but we do not root it up; but we find something wanting in ourselves, and we supply it, not by sowing the divine seed of heavenly principles, but by copying the deeds that the principle ought to produce.

DOMESTIC DEPARTMENT.

HOUSEHOLD RECIPES.

Chili Sauce.—I'm afraid it is too late for my receipt for CHILI SAUCE to be of use in the Eastern states, but it will still be good for the Southern states and California. We all like it better than Catsup, and it is no trouble at all to make.

It takes twenty-four ripe tomatoes, twelve green peppers, eight large onions, eight large spoons sugar, four large spoons salt, four teaspoons ground cloves, four teaspoons ginger, though to tell the truth I put in the spices to my taste. Peel the tomatoes and cut them fine; while they are cooking chop both peppers and onions fine, add to the tomatoes. Let all cook together thoroughly for an hour, then add spices, half an hour later add two quarts of good cider vinegar. Put the kettle on top of the stove where its contents will just simmer (take care they don't burn), and let it cook away about one third. Bottle, cork and seal.

I'm much obliged to you for adding the "Domestic Department." We can't afford to take but one paper besides our Daily, and husband and the boys think they can't get along without THE JOURNAL. I shall think so too, now that there is going to be something specially interesting to me.

A FARMER'S WIFE.

Cold rare done Roast Beef, if cut in slices and placed upon a broiler over a bed of coals until heated through, then served with butter and seasoned to taste, is, by many, thought to be superior to broiled steak; at any rate *Cold Boiled Ham*, dished in the same way, is the most delicate in which it can be served, and particularly is it worthy of note as an addition to an invalid's bill of fare; butter must of course in such a case be used with judgment.

Eggs.—An egg boiled an hour is more digestible than one cooked but three or five minutes. In the former case the yolk instead of being a heavy mass, becomes mealy. Always boil them an hour for lunch baskets.

Poached Eggs.—Have a clean stew-pan with boiling hot water, add to it a little salt; break the eggs one at a time into a cup, and from it slip them into boiling water; when the white is set and firm, which it will be after about five minutes, take each up with a skimmer, and lay it into a dish over a pot of boiling water; cover the dish; when all are done, put a bit of butter, and if liked, sprinkle pepper over them, and serve; in this way they may be kept hot and soft for a long time, so that you may do any number of them.

Boiled eggs, when quite cold, are nice if you take off the shell, and cut them lengthwise in two; then cut each half in two or three. This looks well over spinach or lettuce or boiled fish; or cut them in slices across; or the white may be cut in long slips, and the yolk in slices or quarters.—*Selected*.

A PET QUAIL.

J. E. Youngs, writing to the Forest and Stream, says: I have a quail that I caught in Riverhead nine years ago and brought home. My mother has tamed her so she will sing for anyone that comes in the house. You can hear her all over the house. She laid 37 eggs last year. She is so tame that if you ask her if she wants her dinner she will follow you all over the house in expectation of it. She eats almost anything you can mention, and will fight like a game rooster. If anybody would like to see this bird they can call at No. 66 Ridge street, New York City.

ALGERIA has 10,000,000 acres of land yielding a spontaneous growth of the alpha plant, which is now being exported for the manufacture of paper.

ITEMS.

WORK.—To make work pleasant, it must be varied. A constant round of hard physical labor many hours each day, dulls the comprehension, blunts the sensibilities, obscures the perceptions, and begets moroseness and discontent; while continual association with coarse and crude materials, distorts and brutalizes the features, and lowers the status of the individual. Although work is essential to sound mental and physical development, yet it must be diversified and made agreeable if we wish to obtain its good effect.

SILENT MEN.—Washington never made a speech. In the zenith of his fame he once attempted it, failed, and gave it up confused and abashed. In framing the Constitution of the United States, the labor was almost wholly performed in Committee of the Whole, of which George Washington was the chairman; but he made two speeches during the convention, which were of a very few words each. The convention, however, acknowledged the master spirit, and historians affirm that, had it not been for his personal popularity, and the thirty words of his first speech, pronouncing it the best that could be united upon, the Constitution would have been rejected by the people. Thomas Jefferson never made a speech. He couldn't do it. Napoleon whose executive ability is almost without a parallel, said that his greatest trouble was in finding men of deeds rather than words. When asked how he maintained his influence over his superiors in age and experience, when commander-in-chief of an army in Italy, he said, by reserve. The greatness of a man is not measured by the length of his speeches and their number.—*American Journalist*.

THE POOR MULE.—The amount of fatigue, exposure, and abstinence, which a mule will endure, says a writer, seems almost fabulous. Making long marches across dusty, shadeless plains, going for long intervals without water and with very little food, obliged to pull loads sometimes amounting to five thousand two hundred pounds, up steep hills and through heavy sloughs, subject to cruel treatment and neglect from the teamster, the life of an expedition mule is miserably enough. No wonder that when the mule returns, he looks woefully angular and thin. The poor animal is frequently driven until he completely gives out, when he is thanklessly turned into the herd of broken-down mules.

There is scarcely a more melancholy sight than such a herd. It is a moving bone-yard. Gaunt, lean, with drooping ears, hips that rise like promontories above the general desolation, a disconsolate tail, and a webbed visage which would frighten an inexperienced ghost—the poor, bankrupt mule is the most wretched parody on Gothic architecture that was ever forced on the public attention. Every vestige of meat has fled from his bones. He is a wailing transparency, an animated hat-rack, and I have actually seen his hip bones irreverently used to hang teamsters' hats on. During our homeward march from the Black Hills, more than one such starved victim laid down his tired frame on the earth which had refused to nourish him, and the benediction of a soldier's bullet called the raven and coyote to a meal which it cost the government one hundred and forty dollars to procure.

AN ENCOUNTER WITH A GORILLA.—He was about twenty yards off when we first saw him. We at once gathered together; and I was about to take aim and bring him down where he stood, when Malaouen stopped me, saying in a whisper, "Not time yet."

We stood, therefore, in silence, gun in hand. The gorilla looked at us for a minute or so out of his evil gray eyes, then beat his

breast with his gigantic arms—and what arms he had!—then he gave another howl of defiance, and advanced upon us. How horrible he looked! I shall never forget it.

Again he stopped, not more than fifteen yards away. Still Malaouen said "not yet." Good gracious! what is to become of us if our guns miss fire, or if we only wound the huge beast? Again the gorilla made an advance upon us. Now he was not twelve yards off. I could see plainly his ferocious face. It was distorted with rage; his huge teeth were ground against each other, so that we could hear the sound; the skin of the forehead was drawn forward and back rapidly, which made his hair move up and down, and gave a truly devilish expression to the hideous face. Once more he gave out a roar which seemed to shake the woods like thunder; I could really feel the earth trembling under my feet. The gorilla, looking us in the eyes, and beating his breast, advanced again.

"Don't fire too soon," said Malaouen; "If you don't kill him he will kill you."

This time he came within eight yards of us before he stopped. I was breathing fast with excitement as I watched the huge beast.

Malaouen said only "steady," as the gorilla came up; When he stopped, Malaouen said "now!" and before he could utter the roar for which he was opening his mouth, three musket balls were in his body. He fell dead almost without a struggle.

He was a monstrous beast indeed, though not among the tallest. His height was five feet six inches. His arms had a spread of seven feet two inches. His broad, brawny chest measured fifty inches round. The big toe of his foot measured five inches and three-quarters in circumference. His arms seemed like immense bunches of muscle only; and his legs and claw-like feet were so well fitted for grabbing and holding, that I could see how easy it was for the negroes to believe that these animals, when they conceal themselves in trees and watch for prey, can seize and pull up with their feet, any living thing, leopard, ox, or man, that passes beneath.

The face of this gorilla was intensely black. The vast chest, which proved his great power, was bare, and covered with parchment-like skin. His body was covered with gray hair. While the animal approached in its fierce way, walking on its hind legs, and facing us as few animals dare face man, it really seemed to me to be a horrible likeness of man.—BY PAUL DU CHAILLU, in *Stories of the Gorilla Country*.

A DOG THAT SINGS.

A gentleman in this city, says the *Troy Whig*, is the owner of a small Scotch terrier that shows a decided taste for music. A young lady, his daughter, is taking lessons on the piano, and many hours are given to practice. One day when the dog was in the room he showed great interest in the piano. He jumped upon the table and looked at it, ran under and around it, and leaped upon it and peered into it, as if trying to find out where the sounds came from. One day when the young lady was playing the dog tried to imitate the notes. Afterward, while she was practising, the dog almost daily would try to sing. He did not bark nor howl, as dogs will often do at the sound of bells. Although he could not pronounce fa, sol, la, si, do, etc., he succeeded in a good imitation of the sounds, and could cause his voice to rise and fall with the notes. All this was at first in the presence only of the young lady. When she told her mother and invited her to be present the dog would not sing. By and by, whoever, his fondness for music overcame his bashfulness, and he would sing in the presence of the two ladies. Afterward other members of the family were called in, and now the dog, having conquered his modesty and gained confidence in his own powers, will exhibit his musical talents in the presence of any company.

EDITORIAL DEPARTMENT.

"FIAT JUSTITIA RUAT CÆLUM."

We have read the extract from your letter, Mr. C. J. Ward, as published in the *Poultry World* for September, and we cannot but wonder, knowing your good sense, at your persistent enmity.

The brave hand does not strike back-handed blows—nor does the true cause need to fight in the dark. The course you have taken does not hurt us, but weakens the cause which as poultry journals we both espouse. Your course last Spring in your editorial, heaping with abuse of us and our words but not giving our editorials which you condemned, that the truth might be known, sending it as you did broadcast through the West, to those that had neither heard of you or your paper before, and where we by no chance could defend ourselves. That was not just.

You have mistaken us. Unlike either you or Mr. Willard we did not make the show of the N. A. of F., a personal matter. Our word was against the action of the Association as a body, and we simply let in the light of public opinion that their ways might be mended for future walking, and your late able editorial proves to us that we did not write in vain.

Our interest is not for East or West, but for the Fanciers, and as they extend over the country it is for every where. Where we find good we make it known. Where evil, or error, or unsafe ways, there our work is, and we never hesitate in the doing. In times past you called us friend and commended our course. We have not changed an iota in either way or principle. "Be just though the Heavens fall" is good, let us live up to it. Let there be an end to personalities—the field is broad enough for you, and us, and all. We need not feel each others' elbows unless we go out of our way to seek for them.

This quarreling is not productive of good, and is therefore evil. Unite with us in avoiding it, and whatever else shall be of injury to the Fancier, or bring the name into disrepute, and in striking by fearless exposure the death-blow at whatever shall savor of dishonest or double dealing—not considering ourselves at all in the matter.

TRANSFER OF STOCK.

Mr. John D. White, of Chicopee, Mass.,—we are informed by Mr. J. Van Winkle—has purchased the latter's entire stock of Pigeon pouters, also his 1st premium Blue Owls and White Jacobins.

DISEASES OF POULTRY.

We have given "The Diseases of Poultry," by G. P. Burnham a careful perusal, and find it to be what we might expect from the pen of that careful observer and veteran fancier: a work that being entirely practical and perfectly comprehensive—a work treating as much upon the prevention as the cure of disease—is necessary as a hand book of reference to every fancier and poultry keeper.

CARDS, CATALOGUES, ETC., RECEIVED.

We would advise those of our readers who have not been favored with the poster, issued by the United States Centennial Commission, of the Exhibition of Poultry now being held at Pomological Hall, Philadelphia, to obtain one if possible. For truly, aside from its worth as emanating from the Centennial precincts, as a work of art, unrivalled as it is in the rare elegance of its design and the richness of its coloring, it is invaluable.

Obtaining one, frame it, and hang it upon your walls between the Declaration of Independence and the 5th day's work of Creation—for truly it is a declaration of independence that should be recorded that could send to the world such a proof of the artist's creative powers as the gorgeous trio, which is its adorning—that in after years your children, and children's children may realize what wonders were achieved in this the great Centennial year. That they may know when and by whose might job printing was crowned as a fine art.

CORRESPONDENCE.

Your paper is a gem in its way, and I would feel much disappointed not to have its weekly visits. The monthlies seem so far apart compared with the weekly.

W. C. KIDDER.

Enclosed please find subscription price for another year for THE JOURNAL. I like THE JOURNAL, and the way you act, so you are welcome to the little that I send you. Wishing you good speed and a broad field. I remain yours truly,

JOHN HOGAN.

Why should we not feel encouraged to go on with our work. Not a mail comes to us that does not contain expressions of cheer and confidence from the veteran fanciers, while those that are strangers to us personally—whose names are upon our subscription books—when they send their renewals, express their approval of our paper and the course we have taken and maintained. We could fill our pages with their letters.

We shall try for the future as in the past to be ruled by nothing but the love of justice, shall be true only to the right. Thus working for the good of those who honor us with their patronage.

PECULIAR CASE OF ATTACHMENT.

PENLYN, Montgomery Co., Pa., Sept. 8th, '76.

JOSEPH M. WADE, Esq.:

DEAR SIR:—Last winter, and early this spring my stable was overrun by rats. I had a fine sky terrier bitch to wage war against them, and later a neighbor lent me a cat famous for her vermin destroying powers. She and the terrier could not agree, and the latter quickly took possession of the lower floor, while the dog ruled the loft. Neither animal dared to encroach on the other's sovereignty. In a little while the cat had a litter of kittens, and they were duly provided for in the carriage room adjoining and opening into the stable. Now came a curious state of affairs. The bitch took a great fancy to the kittens and, watching her opportunity, during the temporary absence of the mother, stole them, carrying them to her nest in the loft where she lavished every care on them. After a while, the cat returning missed her young, and, much disturbed, hunted them far and wide. Ere long she discovered their whereabouts and, waiting for a favorable chance, while the terrier was away, took them one by one back home.

This mutual playing at cross purposes continued from time to time, deadly enmity increasing between the mother and dog. As the kittens grew they would wander into the stable and play about the horse's feet, and were one by one trodden on and killed. One morning the terrier entering the stable, discovered one of her pets lying stiff and stark near a horse. She sniffed at it, was apparently much distressed and, at last, picked it up in her mouth carrying it out to a field opposite the barn where, at some distance from the scene of its death, she dug a hole near an old stump, and deliberately buried the kitten!

In this case I think decided reasoning powers were displayed by the little beast who is altogether one of the most intelligent animals I have known.

Yours truly,

I. R. CARPENTER.

WEEKLY GOSSIP.

Contributions to this department respectfully solicited from all.

Man's a fool!

When it's hot he wants it cool;

When it's cold he wants it hot;

Ne'er contented with his lot.

When it's dry,

He for showers is heard to sigh;

When—to meet his wish—it rains,

Of the wet the fool complains.

Hot or cold, or dry or wet,

Nothing suits that he can get;

I consider, as a rule,

Man's a fool.

LIST OF PLANTS IN FAIRMOUNT PARK, 1876.

Anemone—nemorosa, wood anemone; do. thalictroides; do. pennsylvanica; do. virginiana.

Aquilegia—canadensis, (wild columbine).

Arabis—lyrata; do. thaliana; do. canadensis, sickle pod; do. levigata.

Ascyrum—crue-andree, St. Peter's-wort.

Abutilon—avicennae, (sida abutilon) indian mallow; do. sida spinosa, thorny.

Ampelopsis—quinquefolia, ampelopsis virginica.

Amygdalus—pumila, dwarf, double, flowering almond.

Amelanchier—canadensis, shad berry, wild service berry.

Agrimonia—eupatoria, agrimony.

Eriogonum—hiemalis, common, evening primrose.

Aralia—nudaicaulis, wild sarsaparilla; do. racemosa, spikenard; do. spinosa, angelica tree.

Aster—corymbosus, corymbed aster; do. cordifolius heart-leaved; do. patens, spreading; do. paniculatus, red-stalked; do. prenanthoides, prenanther-like; do. miser, starved; do. simplex, willow-leaved; do. praeclaus, willow-leaved.

Antennaria—common, life-everlasting; do. plantaginifolia, mouse-ear life-everlasting.

Ambrosia—trifida, tall ambrosia; do. artemisifolia, hogweed.

Anagallis—arvensis, scarlet pimpernel, poor man's weather-glass.

Berberis—vulvaris, hollyberry bush; do. atropurpurea, dark purple.

Barbarea—vulgaris, winter cress.

Baptisia—tinctoria, wild indigo.

Bidens—frondosa, leafy burr marigold.

Bignonia—radicans, trumpet flower.

QUAIL AND POTATO BEETLE.

—It is said, by one who knows, that quail are an enemy to the potato beetle. A man who killed one a short time ago (not with intent so to do, probably!) found in its crop twenty two full grown beetles and a number of the grubs, besides seeds, etc. If that is the case better spare the quail.

Finding the above in the *Rockville Gleaner*, we at once wrote to the editor, and received the following in reply:

"Have just read yours of the 6th, and in reply will say that the item about the quail is no doubt correct, as I had it from the person who killed the quail and was dressing it for eating, but threw it away when he found the bugs. He is one of our young men who is considered reliable, and I have no reason to doubt his statement, though I did not know that quail ate anything but vegetables or grains." Ed.

RAINBOW IN THE DARK.

ROCKVILLE, CONN., Oct. 23d, '76.

Editor of *Fanciers' Journal*:

DEAR SIR:—about a ½ of 8 this evening, and during a heavy shower, the heavens being overcast, and very dark, a brilliant rainbow appeared in the East, stretching from North to South. It was a sight so unusual that a great many people turned out to witness the phenomena. Can you or any of your scientific readers explain why this rainbow appeared in the dark.

Respectfully yours,

PETER COSTELLO.

—CATS AND CHOLERA.—The *Lancet* not long ago had an interesting article on an epidemic resembling cholera which appeared among the cats in Delhi last year. The disease was not known to extend beyond the walls of the city, nor was it confined to any quarter; and it gradually declined and fully disappeared about Sept. 20th, although the cholera did not cease till near the end of November. The number of cats carried off by the disease was estimated at 500; and the symptoms were, in almost every respect, identical with those of cholera. Experiments were made with cholera virus, which was found to communicate an analogous disease to the cats, resulting in death in the usual choleric way.

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending Oct. 25, 1876.

- 1 Macaque Monkey (*Macacus cynomolgus*). Presented by Gen'l A. T. Torbert, Milford, Del.
- 2 Prong Horn Antelopes (*Antilopae americana*). Purchased.
- 1 Short-eared Owl (*Brachyotus palustris*) (?) Presented by John Pearsall, Phila.
- 2 Blue-headed Ground Doves (*Sturnelas cyanocephala*). 1 Key West Pigeon (*Geotrygon martinica*). 2 Carolina Doves (*Zenaidura carolinensis*). From Cuba. 2 Zenaida Doves (*Zenaida amabilis*) (?). 1 Ground Dove, and 2 Cuban Quails (*Oryz cubanensis*). Presented by E. F. Cabada, Esq., Phila.
- 1 Bittern (*Ardetta exilis*) (?). Presented by Geo. De Haven, Jr., Phila.
- 1 Ring Dove (*Turtur risorius*). Presented by Dr. Noah Martin, Phila.
- 1 Rhesus Monkey (*Macacus erythraeus*). Presented by Moses Johnson, Yardleyville, Mercer Co., N. J.

ARTHUR E. BROWN, Gen. Sup't.

(For Fanciers' Journal.)

ZOO NOTES, No. 30.

BY HUON.

Continued from page 507.

"Did I feel queer? Strenger, you bet I did! I didn't go much nearer the middle o' that ere log! No, sur! Not much, I didn't! But I jist squizzled back to my old 'humsted' on the eend! Yes, sur!—to the plum' butt-eend—jist as far, too, ez I could git fur the wotter. An' thar I sot. Nary hand or foot did I move. Talk uv Quaker meetin'! I tell yer, strenger, I kep' one, jist then—all to myself! You see, I dassent make a move fur fear the infarnal warmint would attackt me. I hed no weepion but my knife—fur the flud cum on me so suddent I hed no time to git my rifle. 'Sides, it ud a done me no good of I'd hed it, with all the wotter 'bout me an' the all-fired log a-pitchin' an' a-rollin' like sin! I tell you, strenger, I warn't in no kind uv condition to wrassel with a paynter, no how you cud fix it!

"Well, we drifted fur about an hour 'thout eyther uv us stirrin. Thar we sot, face to face. An' now an' then the current ud set the log in a sort uv a up-an'-down motion, an' then me an' the paynter would play 'see-saw,' an' bow werry perlately to each uther. The hull time was the willin's eyes fixed on mine! An' I know'd the only way to keep the warmint still was to stare back with all my might. An' you bet I did—never losin' sight o' them 'ar two coles uv fire o' his'n!

"Well, I was prospectin' what ud be the eend o' this 'venture, when I seed sumthin' 'pear ahd, lookin' like a island. An' I recollected I'd seed a mound 'bout thar, onst, which I'd s'posed was riz up by Ingins. It was thar 'ar mound, sure enuff! An' right onto it the log an' us were driftin' kerslump! I knew the way we wur goin' we'd soon be near it. An' thinks I, 'Paynter, you kin 'go it alone' when we git within twenty yards uv it—fur I'm goin' to git!

"Well, putty soon, ez I hed kalkerlated, we got nigh enuff, an' off I rolled—easy, I tell yer! No noise or fuss did I make; but I fell like a drop o' grease in the wotter! But—bless yer soul, strenger—I was hardly overboard 'fore I hearn sumthin' go 'kersplash;' an', lookin' 'round, thar wur the durned paynter! He'd took the wotter, too, an' with tail up was makin' fur the Ingin mound!

"At fust I think he wur arter me, an' I drewed my knife in one hand and swum with the other. But the warmint didn't say 'fight' onst, nor could he swim much; an' so he was durned glad to git to dirt, I tell yer! As he didn't molest me, howsumdever, neyther did I him! But, ez I didn't want him to git at my legs, I let him forge ahead an' land fust; which he did—an' by the infarnal noise he started up, I knowed thar wur sumthin' else in persession o' that 'ar mound 'sides the paynter!

"Here was a go, strenger! But land I must—fur I was clean tucker'd out, bein' so long in the wotter. So I kep' 'round a ways, so that I mouten't land near the paynter. An' when I could tech bottom I quietly crep' up on the monud, an' looked 'round to see what kind o' kumpany I'd got into. Daylight was peepin' onto me, an' I could see a little more every minit. I tell you, strenger, you'll hardly b'lieve me when I tell the concatenation uv warmints that wur slung together 'top o' the 'ar mound! I cud hardly b'lieve it myself! I swow! I think I'd got inter Noer's Ark—durn of I didn't! Yer see, the top o' the mound which were abuv the wotter, worn't over half an acre in big, an' it was as cleer of timmer as the back uv yer hand. So I cud see every inch uv it, an' all that wuz on it as big as a tummelbug! Now thar wur on it, as the lawyers say, 'the follerin,' to whitt': Thar wur myself—an' I wish't to thunder I wur enny whar else, you bet; then thar wur the paynter—my old acquaintance; then thar wur four deer—a big buck and three does; then

thar wur a bar, as black as Kain an' ez big ez a buffalo; then thar wur a 'possum or two, a coon, a couple o' wolves, two or three swamp rabbits, and, durn his pictur'! a stinkin' skunk—the wust infarnal beast fur a smell ever made! All these animals had been driven thar by the flud. An' thar we had to stay 'till the wotter sided—or drown!

"I tell you whut, strenger, ef I wuz flabbergasted when I fust seed this clamjamfey uv critters, I wuz dumfounded when I seed how they behaved to each uther—knowin' theyr different natur's an' gifts as I did! Thar wur the paynter layin' right 'longside the deer, his nat'ral food! Thar wur the wolves stannin' within three foot o' the swamp rabbits! The bar was between the 'possum an' the cunnin' ole coon! An' none o' 'em no more mindin' each other than ef they'd all been drug up in the same pen! 'Twas the queerest sight I ever seed! An' it jist put me in mind o' that part o' the Bible my poor old muther used to git over, whar the lion an' the lam' laid down together—tho' I allers thought, when I heerd her say it, that the lam' laid down *inside* uv the lion! Durn ef I didn't!

"The fact here, was, strenger, the animles all 'peared 'down in the mouth.' They'd hed too much wotter to theyr grog, sartin—ez the saylors say. But fur all that, knowin' warmint natur', I hed sum skeer in me about the paynter an' the bar! The rest I didn't keer a peeled beaver fur! But the bar an' paynter might begin to feel theyr oats before the flud fell. So I kept mighty quiet the hull time I wuz in theyr cohute, I tell yer!

"Well, it ud tire you to hyar all the mives that tuk place among them durned insecs the hull uv thut dey, an' the night thut follered. But nary one on 'em laid tooth or nail on t'other! I wuz ez hungry ez a steel-trap myself, an' would a-liked to hev cut a stake out o' the deer or bar; but I dassent do it. Hed I broke the peace, it might a-led to a gen'ral jamram. An' glad enuff wuz I, when the dey broke, on the next mornin', to find the wotter wuz fallin' as fast ez it hed riz. Ez soon ez it wuz shaller enuff fur me to wade, off I scuted 'thout shakin' hands, or any kissin' good-byes—you bet! I bent my course fur my naylor's shanty, which I could now see, an' which wuz 'bout three milds away. But the wotter an' mud I hed to percolate thro' made me think it wuz 'bout twenty milds. An' it tuk me mor'n an' hour to reach hiz door.

"Well, yas! I did eat some lunch, strenger! An' then my nabor an' me, we loded up our rifles, an' moutin' a hoss a-pence, we ramskadded to that 'ar mound whar the mensagerey wuz. Thet paradise wuzent quite ez I hed left it—fur you see, the paynter, bar, and the wolves, hed cum to the natur's which the wotter seemed to hev washed out! The 'possum, rabbits an' coon whur no whar!—'cept some bits of skin, fur, and har, which were layin' 'round loose! One o' the deer, too, wuz mor'n haff chewed up. But the stinkin' skunk they hedn't tech'd! I reckon' they hed a reason fur it!

"Well, yas, I did plug that 'ar bar. Ye see, strenger, bar meet is good—wuz made fur man—an' squatters must live as well as uther people! But the paynter he'd lef' me 'lone in my time o' trouble, an' so I think I'd let him 'lone in his'n! But, strenger, it went agin the grain! An' mor'n onst I drew a bead on him. But we couldn't eat him, and we hed ez much bar meet ez we could carry—fur we jedged he'd weigh 'bout four hundred. An' so he did. We lef' the paynter thar to keep kumpany with that 'ar darned skunk!

"Now thar 'ar mound wuz the fust Zoological Garden I ever seed, an' 'this hyar one is the last. So, hevin' tell'd you my story, I'll jist take a dig over that 'ar tall bridge o' yourn, an' make fur me hore!

A few moments later I saw my strange "Loozanny" acquaintance crossing the beautiful Girard avenue bridge with a stride which gave evidence of "snap" enough within his bony frame to warrant another adventure with a "paynter" or two more—if they should fall in his way, or be in theirs.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line after the first 10 cents will be charged. "TO EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

H. H. CLINGAN, Hubbard, Ohio, will exchange S. Poland's, S. and G. F. Hamburg, S. B. Spanish, for White or W. C. B. Poland, Brown or Dominique Leghorn; also have a Creve Coeur Cockerel, fine, for one of another strain, or offers. Mine are good birds: want the same.

J. S. GOODNOW, Millington, Me., will exchange one trio P. Cochius, Buff Cochius Fowls or Pullets, or Dark Brahma Fowls or Chicks, for a Buffalo Robe. My fowls are good. Write.

W. H. V., 10 4th Avenue, N. Y., wants to exchange 1 set light Harems, complete, silver mounted, hand made, but little used, cost \$40.00, (fine), for B. Leghorns, or P. Rocks. Good stock given. Good stock expected.

GEO. B. COHE, Lake View, N. J., has to exchange White Leghorns, (Pittin's stock), or Brown Leghorn Cockerels, from a superior imported Cock, for Light Brahmas, Plymouth Rocks, or B. B. K. u. Bantams—good breeding stock. Write full particulars.

F. PEPARD, Basking Ridge, N. J., will exchange a \$90 self inking Press, for a No. 1 Winchester Rifle, or a Breech-loading Shot Gun; also some White and Cochius for a second hand Valise, in good order. Press warranted and references given. Write at once.

S. B. SMITH, Roxbury, Conn., will exchange extra fine Houdans and P. Cochius Hens, Pullets, and Cockerels, three pairs nice Pekin Ducks, for White Cochius Hens or Pullets, Creve Coeurs, LaFleche, or offers, of anything choice. Want nothing but first-class stock.

CHAS. F. THOMPSON, Wadley's Fall, N. H., has fifty good Brown Leghorn and Plymouth Rock Cockerels, to exchange for Hens or Pullets of any kind, native or pure bred, or Ducks or Turkeys, or Hens and Agricultural Books. Make offers at once. Postals answered.

JNO. F. HOUSER, Tamaqua, Pa., will exchange 1 Harp, Piano, 3 good Violins, 1 10-keyed Accordeon, 1 Evan & Watson's Sale, 1 Pocket, and 1 large Case of Homeopathic Medicines, filled and labelled in good condition, 1 Florence Sewing Machine, 1 bound vol. Wright's Illustrated Book of Poultry, 4 Fount Type, assorted, 1 Single Silver-plated Buggy Harness, good as new, 1 Electrogon and Target, 1 Red Bird and Cage, 1 Rabbit Hutch, 1 Electric Battery, for Alderney or Jersey Cow, or Double Breech-loading Shot Gun, or offers.

JAS. DENISON, Findlay, Ohio, will give a No. 1 early hatched Black or Partridge Cochius Pullet, P. Williams' stock, for either a Black or White Cochius Cockerel, equally as early hatched, and good stock.

B. E. SMITH, Potts Grove, Pa., will exchange B. B. Red Game Stage and Pullets, S. S. Hamburgs, ditto, and Aylesbury Ducks, for Red Bird and Cage, Bronze Turkeys, Hong Kong Geese, or male Canary and Cage.

J. H. MORRISON, Marlow, N. H., has for exchange three P. R. Cockerels, for the same number of Hens, (light plumage), or one of Shepard's best Foiding Coops, or G. S. Bantams, Hamburgs, or offers. Not afraid of postal cards.

JOHN F. BARDILL, Nazareth, Pa., will exchange 13 Black Barbs, 12 Tumblers, all colors, 5 Snells, yellow head and tail, 2 Carriers, all in one lump. These are good birds, for offers.

R. COMEYGS, Greensboro, Carolina Co., Md., has for exchange 100 gallons of Concord Wine, (pure juice of vintage of 1875), for second-hand Piano, Furniture, Watches, &c. Will send sample desired.

E. KRAUSE, Zanesville, Ohio, wishes to exchange a fine Maltese Kitten (male), one tame Sparrow Hawk, for offers; also one Lup-eared Doe Rabbit, for one good Lup-eared Buck, or a young pair of Himalayan Rabbits or Singing Birds.

R. R. C. BORDWELL, M. D., Penn Yan, N. Y., will exchange Books, one Trotting Sulky, one Rabbit Hutch, made for six kinds of Rabbits, S. S. Poland's, S. S. Hamburgs, L. Brahmas, and Bremen Geese, for one car load Hemlock Lumber, one good Rifle or Shot Gun, and Golden Sebright Bantams, B. B. R. Game Bantams, W. Cochius, and P. Cochius.

W. W. DEWEES, Street Road, Chester Co., Pa., will exchange Mitchell's new General Atlas, \$12; Burrill's Geography of the Heavens, \$15.50; Knight's Crown History of England, \$2.00; Hawthorne's Scarlet Letter, and Blithedale Romance, 1 vol., \$2.00, and other books, for Singing Canaries, Plymouth Rocks, Rose-comb Dominiques, or White Leghorns. No postals.

A. W. BESSEY, Box 545, St. Catharines, Ont., has to exchange a Knitting Machine, in good order, cost \$25.00, for American Rose-comb Dominiques. None but good birds wanted, or offers.

E. S. FISHER, Laurens, Otsego Co., N. Y., will exchange Light Brahmas, (Plaiated stock), White Leghorns, P. Rocks, P. Cochius, B. Cochius, for a Silver American Watch, hunter case, nearly new, or offers. Write soon.

S. F. HALLECK, Oriskany, N. Y., will exchange a St. Bernard dog for a good Double-barreled Shot Gun; Light Brahmas, or Plymouth Rock Fowls, if good. The dog is a large, beautiful animal, and is admired by all who see him. What other offers.

NIMROD, Traders Point, Marion Co., Ind., wants to exchange pair of White Leghorns, six months old, J. Boardman Smith strain, worth \$10.00, for Setter Pup. State breed, age, sex, and color. Must be good.

A. J. LIGHT, Sherburne, N. Y., would like to exchange one pair of B. B. Red Game Fowls, premium and pedigree birds, for a pair of the same variety. Write and describe your fowls.

J. P. THOMAS, West Whiteland, Pa., has Carrier, Fan and Tum-bler Pigeons, to exchange for a Setter or Beagle Dog, or Leghorn Pullets.

D. PORTER, 151 Second St., Albany, N. Y., will exchange a pair of his Long-distance Homing Antwipers, or pair of Short faced Show Antwipers, for a pair of Belgian Canaries, or French Canaries, or good Black English Carrier Hen.

FANCIER, Box 1041, Williamsport, Pa., has book, "Handwriting of God, in Egypt, Sinai, and the Holy Land," \$4.50; also Where to Emigrate and Why, \$2.50; Cocker Spaniel Slat, liver color; and three good White Leghorn Pullets. Any of the above for first-class Brown Leghorn Pullets.

J. S. HOFFMAN, Williamsport, Pa., has 30 Light Brahma Chicks, worth \$5.00 each, and upwards; one pair LaFleche, \$10.00; two Partridge Cochius Hens, \$2.00 each, to exchange for anything, not live stock, that is useful; or one-half above value in Grain, Potatoes, or Fat Hog.

BOX 474, Orange, N. J., wants to exchange 1 pair Houdans, 1 pair Duckwing Gamers, and Dark Brahmas, for Brown Leghorn Pullets, Single Harems, Jersey Gals, Sleigh, Buggy, or offers.

JOHN BROWN, Hanoverville, Northampton Co., Pa., will exchange one pair of Black and White Muscovy Ducks, 1 year old, for a pair of White Jacobins, or White Owls. Birds must be good, as mine are. All letters and postal cards answered.

GEO. O. BROWN, Brooklandville, Md., has 1 male Cal's Quail, 1 pair Red Priests, (good), 1 Angora, and 1 Lop Buck, 1 trio P. Cochius, Black Red Game Bantams, and 1 B. ae-cap Magpie Cock, premium bird, for exchange. Offers desired immediately. Postals or monogram note communications, either, solicited.

N. VARNUM, Atoe, N. J., will exchange first-class Concord Grape Vines, for pure bred Poultry of any breed. Send on your postal cards.

C. A. PERLEY, JR., Haldwinkle, Mass., will exchange Brown Leghorns, Black Cochius Chicks, for Java Games, Light Brahmas, or offers. Speak quick.

FANCIER, Box 314, Worcester, Mass., will exchange one trio Brown Leghorn Chicks, price \$15.00; one trio Brown Leghorn Fowls, price \$12.00; one pair White crested Fantail Pigeons, price \$10.00; one pair Smooth-neck do., price \$5.00, for Cabbage Roses or Blankets, Jewelry, nursery stock, or offers. Write description and price of articles.

E. M. PEASE, 35 Grand St., Hartford, Ct., wishes to exchange a set of Key Check Dies, Letters and Figures, (steel); also good assortment of German Silver Key Checks and Rings; also complete works of Artemus Ward, 4 vols., also dried, for Harriet Beecher Stowe, 2 vols., for W. Leghorns, or any other kind. Write.

BOX 869, Rockville, Conn., will exchange a C Cornet, cost \$60, for a first-class Central-fire Shot Gun. Must be in good order, as the Cornet is.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

G. O. BROWN, Brooklandville, Md., wants Angora and Lop Doe, Silver Sebrights, W. C. W. Poland's, a good W. L. Cock, and Sultans. See exchange offers, or state lowest cash price, and describe fully.

BOOK EXCHANGE.

R. R. C. BORDWELL, M. D., Penn Yan, N. Y.

WANTED.

1. A Treatise on the Art of Breeding and Managing Tame, Domesticated, and Fancy Pigeons; by John Matthews Eaton, and published by the author, 1 Islington Green, London. 1852. Illustrated.

2. A set of six Matchless Engraved Colored Portraits, Life Size, by Wolstenholme, viz: The Almond, Black Mottle, Red Baldhead, Yellow-beard Tumblers, Black Carrier, and Blue Pied English Pouter.

3. A colored Diagram, or a Plan of Building or fitting up a Pigeonary, embellished with Tumbler, Pouter and Carrier.

We think there are several different diagrams, and would like all of them.

4. A set of six splendid Life Size engraved Portraits of The Fancy Toy Pigeons, colored, viz: The White Fantail, Yellow Jacobin, Silver Owl, Blue Turbit, Black mottled Trumpeter, and the Black Barb.

All of above pictures published by J. M. Eaton.

A liberal offer would be made for any of the above in good order.

Any information regarding John Matthew Eaton's life and works would be gratefully received.

WM. GARDNER BARTON, Salem, Mass.

BOOKS TO SPARE.

1. Handel's Israel in Egypt.....Novello's.
2. Haydn's Creation....." "
3. Mendelssohn's Elijah....." "
4. Mendelssohn's St. Paul.....Ditson's.
5. Handel's Messiah....." "
6. Life and Writings of Charles Dickens, by Phoebe A. Hansford.
7. Pevergine's Fiddle.....Geo. Routledge & Sons.
8. The Works of T. Smollet.....Lee & Shepard
9. The Portrait: a Romance of the Cayahoga Valley. By A. G. Riddle.
10. The Sexes Here and Hereafter, by W. H. Holcombe, M. D.
11. Our Own Birds, by Wm. L. Bulley.
12. The Romance of History: England. By H. Neale.
13. Cyclopaedia of the Best Thoughts of C. Dickens, by F. G. DeFontaine

BOOKS WANTED.

1. Nuttall's Ornithology.
2. Bryant's Poems.
3. Drake's Biographical Dictionary.
4. White's Natural History of Seabourne.
5. Walton's Complete Angler.
6. Poems by "H. H."
7. Shelley's Poems.
8. Drake's Nooks and Corners of New England.

Some volumes of Harper's Monthly, and many other books.

Correspondence solicited on the subject of Pigeon Books.

HARTFORD, NOVEMBER 13, 1876.

No. 44.

THE TIDES.

I saw the long line of the vacant shore,
The sea-weed and the shells upon the sand,
And the brown rocks left bare on every hand,
As if the ebbing tide would flow no more.
Then heard I, more distinctly than before,
The ocean breathe, and its great breast expand,
And, hurrying, came on the defenceless land
The insurgent waters with tumultuous roar.
All thought and feeling and desire, I said,
Love, laughter, and the exultant joy of song,
Have ebbed from me for ever! Suddenly o'er me
They swept as if from their deep ocean bed,
And in a tumult of delight, and strong
As youth, and beautiful as youth, upbore me.

LONGFELLOW.

DUTCH BULBS.

The fall of the year, says the Maryland *Farmer*, is the proper time to plant hyacinths, tulips and crocuses, which are the chief roots known as Dutch bulbs. In Holland, where they seem to grow to greater perfection than in any other part of the world, they are raised in a sort of black soil, reclaimed by draining from the sea. This is something similar to our salt marsh mud. It may be that a little salt mixed with a sandy soil would benefit these roots in our culture, but this is a mere suggestion, which, as the lawyers say, must be taken for what it is worth.

In regular garden experience these bulbs are found to do well in any rich garden soil. In planting they are set about two inches beneath the surface, with a little litter of some sort thrown over them to keep them from being drawn out by the frost in the winter season. The named kinds are, as a general thing, much the handsomest, and they offer one better chance to make a nice selection of various colors and shades. It requires more labor to keep these kinds separate and to name them afterwards and so they are more costly than the mixed unnamed kinds. As a more matter of quality, the unnamed ones are generally as good as those which are sold as first quality roots.

The growth of hyacinths in pots and glasses of water is always of interest. Few things give more pleasure in the floral line than they do. The best results in this way are obtained when the roots are planted early in the fall, and set in as cool a place as possible, so as to give time to the roots to grow before the plants are introduced to warm rooms. If brought into these warm places before they have time to root well, their bloom is rather small. Those who grow them for forcing, and in these days of winter cut flowers, they have become popular with florists for this purpose, the best results are had from roots set singly in four

inch pots at this season, and the pots plunged in sand in the open ground. If not put into too great a heat when taken into the house in October they will flower by Christmas, when flowers are in most demand. Others are kept in the pots buried in the sand in cellars or sheds, where they can be got at easily in the frosty weather, and in this way they can be had to flower in succession all through the winter.

When in glasses they are not plunged, of course, but it is usual to keep them some time in cellars or closets, as the roots always grow best in the dark.

NOTES FROM A PRIVATE CORRESPONDENCE.

Charley is talking some of going into business in Boston. If he perfects his arrangements I may look in at your office at Hartford some of those fall days, but I expect it will end in talk. I want to go down the Santa Barbara way, have our home in a grove of walnut trees, have a ranch, with here an orange grove, there a group of olives, and over yonder the almond orchard, and "all that you know." Charley don't. He says he's "sick of these barren sun-burned hills, of the trade winds that blow so surely every afternoon, finding the marrow in one's bones that the fogs at night may chill it." He says "we will go East, where, when it is cold everything out of doors bears you out in your shivering, and you can make and enjoy a rousing fire with a clear conscience, can draw the curtains close, and snug up to the stove and be cozy-like. How can a body do so here, where tea roses, fuchsias, heliotrope, and the like are in blossom out of doors, but the air so damp, so chilling, you feel it ten times worse than the severest frost? It's just about so. California is disagreeable now—the hills brown and bare that surround our cabin, seem like walls of granite; not a vestige of green anywhere except in the stretch of valley down below, and that the green of the horrid "sticky tar weed." "When e'er I take my walks abroad" and come back with my clothes stained—irrevocably stained—with this tar weed, with seeds in their ten thousand and two burry forms clinging to my garments, with myself dust-covered, my lips and hands chapped by this strange wind, I too am quite ready to begin my packing for "the States." But, do you remember those beautiful spring days, when earth, and air, and sky were so glorious in their perfectness? When I felt there was too much of good, it made me feel that I was lacking in my capabilities for appreciation. California is like Mother Goose's little girl,

"When she's good she's very very good,
But when she's bad she is horrid."

And how delightful to think of no more fleas! I'm afraid I was not thankful enough for their absence during that last visit East. When I make a geography I shall give the exact condition of

things. California has two seasons, summer, when there are fleas, and winter when there are none. Sometimes, however, there is but one, and that is summer.

I had a letter from Fan. yesterday. She intended to make it lengthy, but as she says: "I've oceans to say to you, but the fleas are holding a fandango, with me for ball-room, and they create such a confusion I must delay for a season." I sweep car-bolic powder into my carpets and put flea-powder in the beds, hang boughs of the bay tree every where, but when there's such a mighty reserve force out of doors, it makes a body discouraged to think of it. Yes, I know you eastern folks don't say "fleas" out loud. I well remember how horrified I was when we first "landed," thirteen years ago, and an old resident asked me had "the fleas troubled me yet?" But I was not long in learning them to be common property. I remember once seeing Dr. Bellows in the midst of a sermon just give the place on his shoulder a bit of a pinch where one was.

We go to Sonoma to-morrow. Charley thinks he can't, so Annie will take me over. I'd just as lief that Charlie shouldn't go. They're too hospitable over there in those wine vineyards and cellars. They'll show a body everywhere, give them a taste of new wine, then of a little older, and so on, "only a taste you know, that wouldn't hurt nobody," until they've sampled the cellar. Then when they feel "tired," as if they'd like to rest awhile, they lay them carefully away, and charge nothing for the headache they permit them to take with them upon their departure, so I've heard!

Annie is a splendid driver, and her pair of Morgans is as natty a team as I ever rode after. They are in splendid condition and feel good, so the slightest excuse will take us for a drive. All California ladies are good drivers, and riders; children are too. You know the district school is just on the corner from us, and I declare if my hair didn't use to stand on end to see the children, boys and girls both, ride. Most of them lived at a distance and came horseback, and such performances as they used to have at noon and recess! it was as good as a circus. A certain circus manager once said "it don't make much difference what kind of a clown I've got or what sort of a menagerie, but if my riding ain't good, first class, tip-top, I may just as well shut up shop." Why, I've seen little Fred, when he was four years old, get Nettie between him and the fence, rest a board on her back, climb up the board, and with his hands fast in her mane start her off on a run, without saddle, bridle or blanket. Annie and I were out this morning, down to the lower ranch, only six miles, but like every other ride that can be taken in California it was full of delights. We got off about eight o'clock. I can't find words to tell you how delightfully fresh the air seems in the early summer mornings. Last night was foggy and cold, this morning the sun shone brightly, the air seemed pure and gratifying, it seemed strengthening. One might almost think the soft gray mist had purified the earth, taking the noxious and noisome with it in its flight. For two miles the road is level, along the creek shore. The scene would interest you, the long stretch of salt marsh with its sapphire beds, the long-legged sand cranes standing so patiently and watching so steadfastly and earnestly the hole of maybe a gopher, ready with lightning like rapidity to spear him through with that long sharp bill; the flock of sea-gulls, brown and white, that were sailing idly against the clear blue sky; here a flock of mud hens, or of curlew. It is constant change and constant interest. How many, many times I've been over this same way, and always to find something new. The first two hills are tritles, the next is ugly; here's where those gentlemen that Annie was taking to the ranch begged of her to stop and let them get out and walk. They were "afraid, indeed they'd rather walk than ride." Oh how Annie laughed at them. "The very idea! two

great men afraid to go, where I, a girl, could! As if I didn't have my own precious neck along, the very idea!"

It is frightful to one not used to hills; a narrow road upon a hill-side, not only very steep but with two crooks in it and ending with a railless bridge over a torrent. But my! that's nothing to some of the hills. I know one back of Oakland where for more than two miles it winds around and around, a single road-way, only once in a while a chance for a team to pass you, when up, straight up, it is solid rock, or looks like it, and straight down ditto, ditto. The first time I went over it I wished I hadn't come, but over it once I was quite ready to try again. Midway down that road a stream of cold clear water trickles from out the rocks. There we always rested and ate our lunch, and Charley never dared to say Maraua Valley, unless he wanted to find me ready waiting in the buggy for him. But one time he did fool me the nicest; I was provoked enough about it, but can laugh now. It was the 1st of April, but I'd forgotten it. I heard him say to Mary, I thought as if he didn't want me to hear, "have my lunch ready by ten o'clock, I'm going over to Maraua. Supposing he was in the stable getting his team ready, seeing the buggy was out, I hurried into my hat and duster and out into the buggy, and there I sat and waited. I saw Mary smile through the window, but says I to myself "Let those laugh that win." Finally wearied with waiting, and fearing the horse might have killed him or something I went out to reconnoiter, when lo! no Charley was to be found. Making inquiries I found the dear innocent had gone with a neighbor and been gone two hours. Coming on the day it did, they were long in being wearied of the joke.

Past the "gulch hill," as we call that ugly place, our road is through a grove of live oaks, and grand old trees, some a mass of mistletoe, others hung deeply with a drapery of moss. I told you once about that moss didn't I? Well it isn't moss at all. It isn't a bit like that which grows upon the trees of the South. Ours in California is a Lichen simon pure, and the Lace Lichen at that. The fronds are delicate webs like lace, the apothecia are found along the center sort of thick leather like substance to which the fronds are attached. The other day I was up at Penn's Grove and I found upon different trees in the grove there, seven distinct kinds; some were different in the apothecia, and the rest in the shape of the fronds. Maybe they only differed in being of different stages of growth but it seemed to me not. But right here I must tell you a little joke; its a "Who shall decide when Doctors disagree." I was at the academy of Natural Science, in San Francisco. I talked with a professor down stairs, and in the converse said lichen (*lichen*). "Don't say that madame, I pray you, say *liken*. It is from a Greek word, etc., etc." Very well thinks I, I've learned something; lichen is prettiest but *liken* is proper, so *liken* goes. Bidding the professor adieu I went up stairs to speak with the dear good professor of botany; wishing to air my newly found learning, I said something upon *likens*. "Oh don't! That isn't proper, *liken* is the word." Then I told him, and he, calling to the professor, how we all laughed.

Now the stuff, Florida moss I believe they call it, down South, isn't a lichen, it has a flower, a real flower. We can stop pillows and chair cushions and the like with ours, and as long as they are kept dry they are all right, but once wet they're about equal to wet feathers; but we use ours direct from the trees, whereas down in Florida there's a world of work to be done to prepare it. But then the most of them down there show real Yankee wit in the preparing of it; they make it "pay its board while it's hanging round getting ready," and I am not sure but its *getting* ready is worth as much as it is when ready. The soil and climate down there are not favorable to potato growth—it is too dry—potatoes need moisture, so the farmers get the ground all ready, put in the potato eyes, lay over them a covering of this moss, then put on the earth. The sun upon the earth sweats and rots the moss, and the moisture it gives out is favorable to the growth of the tubers. At "potato digging" the long trenches are uncovered, the fibrous mass lifted and lo! a splendid crop of potatoes, all ready to be picked up; the moss is taken to the water, washed until only the fibrous hairy substance remains, which is then spread in the sun. When dried it is baled and sent North to be prepared for the upholsterer's use.

August 1st, 1876.

PACIFIC.

POULTRY AND PIGEONS.

(For *Fanciers' Journal*.)

ABOUT THAT CORN.

In a recent number a writer complains that Amateur did not state where he lived, as that might make some difference in his fowls doing so well on that awful corn. Now I will tell him where I live; it is in the town of Wyoming, County of Stark, and State of Illinois, 41° north latitude, 13° west longitude, and will also state that it is extremely cold here in winter, and hot as — in summer. Would say that my fowls are at present in very fine order, and the hens are laying the best I have ever known them to. Have nearly all moulted, and come out in nice glossy plumage, especially that Yellow D. W. Game cock, "Johnny." At present every thing is quiet, business fair, nice weather, and a good show for Johnny to come out victorious this winter.

As some one in a recent number of *THE JOURNAL* used my signature, I will now with best wishes for *THE JOURNAL* sign myself.

WING SHOT.

CENTENNIAL COMMISSIONERS.

Allow me through the *JOURNAL*'s columns to inquire of the Centennial Commissioners, of what value they imagine the award of a medal received at their Poultry and Pigeon show can be, if, as I understand, every exhibitor of a fair specimen is to be honored (?) with at least one, and perhaps three, (first, second, and third) should he show a sufficient number of birds. If my information is correct, the question of which is the best bird of its kind, remains an open one, and cannot but prove unsatisfactory to many, who like myself exhibited with the hope of receiving a premium that would, as at all other shows, determine the standing of the winner of it, in comparison with his competitors.

Perhaps, however, we have been altogether wrong in our method of making awards heretofore, and that it has been the good fortune of the Commission to inaugurate a new and correct one.

That their system should not be credited to the very courteous superintendent, Mr. Diehl, I am sure, and I think that all exhibitors will join with me in paying tribute to his efficiency and urbanity.

CARRIER.

CURING A BAD HABIT.—A correspondent in a late number of *Forest and Stream* says: "I once owned a cocker spaniel that had a perfect passion for killing chickens, and by the advice of a friend broke him of the habit by beating him with the dead chicken and then tying it by the legs to his neck, and compelling him to carry it around a couple of days."

A wag, who had wrapped a piece of cloth having the word "Centennial" on it around an egg, and boiled it so that the word appeared plainly on the shell, sadly deceived a Portland (Conn.) farmer, who took it out of the nest where it had been placed and exhibited it at the office of a local newspaper as a wonderful manifestation of the hen's intimate knowledge of the history of the United States.

THE SPANISH FOWL.

BY W. J. NICHOLS.

NO. III.—SELLING EGGS AND BIRDS—POINTS OF SPANISH.

After having provided a house, the next thing which naturally suggests itself to one's mind is the occupants; then follows the question, how best to proceed in procuring a stock which shall be both good in quality and moderate in price; and I would just state that I should not advise anyone to pay a large sum for a bird simply because it was a prize winner, before first learning something of the breed and its management, otherwise it will only lead to disappointment and vexation. Many a new fancier of Spanish, and of every other variety too, who has perhaps paid a long price for a pen of birds with the idea of winning a prize,

exhibits them and finds they are not noticed, and throws up the whole thing in disgust; whereas, if he had previously obtained a little practical knowledge of what he was doing, the result would often fully realize his expectations.

In commencing with any breed of poultry, the cheapest plan would be to buy a sitting of eggs, if we could only be certain we really were getting what they were represented to be. This, however, is seldom the case, and if we consider for one moment the time, trouble, and expense it takes to breed a winning bird, it is unreasonable to expect for a guinea a sitting of eggs from really first-class birds which have taken prizes at a large show; and yet we find a number of exhibitors who do advertise eggs from cup birds, but I can most positively assert that very few indeed send out eggs from the same birds as they themselves are breeding from; and I cannot help expressing my dissatisfaction at such proceedings, for in the great majority of cases egg selling is nothing less than a swindle. My advice to all amateurs who are thinking of buying a sitting of eggs is not to waste a guinea on them, for few send out the same as they advertise. I do not mean to say that all are alike, but first ascertain the character of the man whom you are about to make the purchase of, for I am sorry to say there are a great many swindlers as well as dishonest men in the poultry fancy. Lest my remarks on this subject should be misunderstood, I would state they are only intended for those who act as I have described, and not for those who really sell them as they advertise.

I much prefer the plan of buying birds as this is far more satisfactory both to the buyer and seller. The price depends entirely upon the quality of the birds; a cockerel good enough to win a prize at a moderately large show can generally be obtained for

£5, and they can often be bought out of a selling class for £2. Good hens or pullets can mostly be had for £5 apiece; and these, too, can often be picked up at a selling class for a pound apiece.

The principal point in Spanish is the face, and I cannot help thinking too much has been sacrificed to this alone. I am a great admirer of a large face, but then it should be of a nice soft smooth texture, free from a blush or a blackness, which is common in heavy-faced birds, more especially in cocks; the white a clear opaque color, and the more seen between the wattles the better bred is the bird and the purer the white of the face will be. Of late years birds with very long broad lobes, hanging in ugly folds, and with rough and wrinkled faces, almost obscuring the sight, have been exhibited. Then there is the ribbon lobe; this is generally very long and narrow, terminating almost in a point, the face being very small and the eye clear, the lobe good in width at the top and bottom, but narrow and pinched in the middle. All of these fall far short of my idea of a good lobe or face. I prefer a bird which shows the greatest width of white between the beak and the back of the head, nicely arched and free from folds or creases.

Very few birds are seen without ugly wrinkles over the tops of the eyes, which increase very quickly, and often prevent the bird seeing upwards and if not properly attended to soon produces blindness. The eye, clear and open and not sunk, with a lump of white projecting in front of the eye, so as to prevent the bird seeing its food. The lobe as free from folds as possible, hanging loose, and well opened at the bottom, without being pinched or tucked in the middle; the greater the length the better, but it must be well shaped. Mr. Edward Jones exhibited a bird at Hereford, I am told, with a very large face; but instead of having only one lobe on each side, it appeared as though there were two, and Mr. Hewitt, who knows a good Spanish cock as well as anyone, passed it over, much to the surprise of some people.

The next thing is the comb; and Mr. Wood, in his admirable drawing, gives a very good illustration of what a Spanish cock's

comb should be in shape, although perhaps it might have been made to fit a little closer to the back of the head, and the serrations would be better if they were a trifle finer. Still, his drawing of the comb and face are the best that have ever appeared, while the illustration of the pullet which accompanies this article is as near perfection as possible. She belonged to

me, but is now the property of Mr. F. Waller, of Wood Green, an old fancier of Spanish, who very kindly allowed her to be sketched for the present illustration. Whilst in my possession she won the cup at Ashford and second at Norwich. I am, however, somewhat digressing, and will return to the question of comb. At the base they should be as broad as possible, for this gives greater stability—neither too high nor too large, and without sprigs or creases in front. I like them small and pretty, in preference to the great coarse things so frequently seen both in cocks and hens; this results, in a great measure, from giving prizes to birds with nothing to recommend them except the superabundance of white. The wattles should not be too large, nor should the lobe run into them.

Style and carriage are another very important point with these birds, for nothing looks worse in a show pen than some of those heavy-faced monstrosities which are nearly blind, and all huddled together in a heap? They should be active and graceful when moving, standing high on the leg, with a full prominent

chest, and head well carried back. Tail moderately large, and carried somewhat high, but not approaching to a squirrel tail, which is a very common fault with Spanish. The legs of a blue or slaty color. I like to see the small scales on the inside of the legs slightly tinged with red, as it shows quality in breeding. With regard to the shape of the face in the hen, I cannot do better than refer my readers to the illustration; at the same time I would say the larger, smoother, and rounder the face is the better; that neither a cock or hen with a tucked lobe should be used for breeding purposes, and that I should also prefer to see them out of the show pen; but I shall touch upon this in my next, which will be on the breeding and exhibition of Spanish.—*The Country.*

To be Continued.

THE MEAL-WORM.

BY F. B.

Continued from page 513.

The Meal-worm, of course, lives on meal, as its name indicates; but it also feeds upon bran and flour, and, it is related that some ships' biscuits packed in casks were found, when opened, to be eaten through in holes by these insects. One authority to which I referred, states, that "these larva live in flour, bread, sugar, and even in dead and carious wood;" [this of the family] continuing: "those of *T. molitor* which are found in this last substance, etc." They frequent pigeon coops, probably for the fine grain spilled around—as the dust from cracked corn; but I am compelled to consider whether they do not also feed upon the dung of the pigeons, or at least upon the indigested grain and farinaceous matter which it contains. I have found them apparently living at home in dry manure, through which there were holes, evidently made by them. The pigeon fancier naturally wishes to know whether they are friends or foes, whether he must destroy them or favor them. One of my correspondents wrote that he considered them friends, because he thought they were the cause of the diminution in the number of lice in his loft, which was very perceptible when the meal-worms and the black beetles appeared. I doubted very sincerely that the beetles were the cause of this—indeed, I did not believe it. In reply to the question whether he had ever seen a meal-worm or a beetle devour a louse, he was obliged to answer in the negative. He thought perhaps they drove the lice away. Upon the second day of August he wrote that he had not fed his birds in the loft with grain since the first of May, and that he had cleaned out his coop weekly. What could have nourished the beetles, if not the lice? His loft had been badly infested with lice; the beetles appeared, the lice rapidly decreased in number. Dr. A. S. Packard, Jr., told me he did not believe they devoured the lice, but that it was possible they might have done so. W. A. Burpee, in a little book called "The Pigeon Loft," speaks almost in horror of the meal-worms, and gives an anecdote of their having "eaten alive" a young squab. In another place he writes of them as "those most dreadful of vermin." I have many of these worms in my coop, and I never had any experiences to warrant such expressions. I have raised a number of birds upon the floor in the immediate vicinity of these insects, and have repeatedly found the worms in the rough wooden nesting-boxes in my loft, and never had a squab devoured. I would like to hear the opinion of more experienced fanciers on this subject. The worms are exceedingly plenty in pigeon-lofts, but an acquaintance tells me that where mice abound they devour the worms. In my opinion, the insects themselves have no effect upon the welfare of the feathered occupants of the loft; but, naturally, they are the most abundant in unclean, disorderly, unhealthful lofts.

The eggs of the beetle I have never seen. The beetles do not seem to thrive in confinement. I have found very small worms under lumps of manure upon the floor, which could not have

been hatched long. They prefer a small crack to a roomy one. Let two small boards be placed on the floor of a loft, one, with a brick or heavy weight upon it, or even nailed down, the other, unladen and loose, and more worms will secrete themselves under the former. They seem to prefer sour meal to sweet, and will appear in a shorter time under a board covering sour meal, than under one covering fresh. They are, to some extent, fond of dampness. A farmer tells me that he finds them in his horse-crib or trough. I should prevent that, were I the farmer, for the horse cannot be benefited by feeding upon meal-worms. A case is related of the larvae having passed from the human bowels, having been taken with the food; and an anecdote is related of a woman, who superstitiously drank clay from the grave of a priest, and who afterwards discharged beetles of the kindred genus *Blaps*. To return—the farmer says, that, by placing a little meal in his horse's trough, sprinkling it with water, and littering it with hay, he could produce a great many in a short time. A miller, whom I know, asserts that the meal-worm breeds in sour meal, that there are any quantity in the mill, but that they do no harm. A baker, who lives in my neighborhood, did not know of them; and the proprietors of a meal-store said they had but a few; another one, that the worms once bred in his store under the sink, in the dampness.

Fowls greedily devour the beetles, snapping them up ravenously and looking for more before the spectator realizes they are all gone. The would no doubt eat the larvæ, but the latter have a distinct use, and, in a small way, are an article of trade. I have sold about one thousand this year. They are used by the bird-dealers (and sold by them for the same purpose,) as food for mocking and other soft-billed birds. In England they are used for bait, with which to capture nightingales, and as food for these birds after capture. On page 430 of "The Dovecot and Aviary," the meal-worm is mentioned as bait for nightingales. One writer remarks, that it is curious that nightingales should be so fond of the meal worm, since, in a state of nature, this bird can seldom or never see them. The miller, previously spoken of, said he used to sell them for one cent apiece, to a bird-fancier; and, that he once counted out nine hundred to sell, but they unfortunately died before they were wanted. He also says he sold the beetles at the rate of two for one cent. I find the price to be about twenty-five cents per hundred, but I believe the bird store-keepers ask more than that. It is said that there are birds which will not live without such insect food as that furnished by the meal-worm. Chameleons in captivity are fed upon these worms.

I have never met with one of the pupæ of *T. molitor*. Dr. Packard says he has raised the pupa in early June from a larva found in May. A writer says: "The larva changes its skin several times, avoids the light, and at length assumes the pupa state without forming any cocoon, the imago appearing at the expiration of about six weeks, at first being a reddish color, but shortly afterwards assuming its black hue." There is another species, *Tenebrio obscurus*, which is liable to be confounded with this one. It may be distinguished by its color, which is a dull, pitchy black, and not shining, and by one or two more minute differences. The larva of *obscurus* is pale instead of cream-color. As to the geographical range of these two species, I quote the following from Riley's "Second Annual Report of the Noxious Insects of Missouri": "The imported meal-worm beetle (*T. molitor*) swarms throughout the whole United States, and is a great pest; while the native American species (*T. obscurus*) which has almost exactly the same habits, belongs to the same genus, and is of nearly the same shape, size, and color, is comparatively rare among us, and is scarcely known to our millers and flour-dealers;" and, "as to our American meal-worm (*T. obscurus*), Curtis states that it has been introduced into England, and that it is sometimes abundant in London and the provinces, but Kirby and Spence say not one word about it, and it seems to be confined to the English seaports and the places where American flour is stored, without spreading into the adjacent districts."

I have found among a lot of meal-worms of the ordinary yellowish-brown color, and possessing hard skins, white and soft individuals, apparently having just shed their skins, and the new one not having had time to harden. They reminded me of the soft-shelled crabs so highly prized by some people as an article of food. I suppose a mocking-bird or a nightingale, while eating these insects catches eagerly at such an one as a particularly choice and desirable tidbit. The sloughed-off skins may be found in considerable abundance where the worms are plenty. They are the cast-off overcoats which have been outgrown, and abandoned on that account.

I hope some one who reads these few remarks will have the inclination, time, and patience requisite for a thorough investigation of the habits of the meal worm.

PIGEONS.

Continued from page 513.

The front of the pigeon-room, or cote, should have a southwest aspect; and if a room be selected for the purpose, it is usual to break a hole in the roof of the building for the passage of the pigeons, which can be closed at convenience. A platform is laid by a carpenter at the entrance, for the pigeons to alight and perch upon, with some kind of defense against strange cats, which will so often depopulate a whole dove-house.

CATS are yet necessary for the defence of the pigeons against rats and mice, as they will both destroy the bird, and suck the eggs; thence cats of a known good breed should be trained up familiarly with the pigeons.

The platform should be painted white, and renewed as the paint wears off, white being a favorite color with pigeons, and also most conspicuous as a mark to enable them to find their home. The boxes also should be so colored and renewed as necessary, for which purpose lime and water will be sufficient. Cleanliness is one of the first and most important considerations; the want of it in a dove-cote will soon render the place a nuisance not to be approached, and the birds both old and young will be so covered with vermin, and besmeared with their own excrement, that they can enjoy no health or comfort, and mortality is often so induced. Ours were cleaned daily; thoroughly once a week, a tub standing at hand for the reception of the dung, the floor covered with sifted gravel, often renewed.

Pigeons are exceedingly fond of water, and, having a prescience of rain, will wait its coming until late in the evening, upon the house-top, spreading their wings to receive the refreshing shower. When they are confined in a room, they should be allowed a wide pan of water, to be often renewed as a bath, which cools, refreshes, and assists them to keep their bodies clear of vermin. In the attendance upon pigeons, caution is necessary with respect to their fighting, to which they are more prone than might be expected, often to the destruction of eggs or young, or driving the weakest away.

The common BARREL DOVE COTE needs no description, at the same time is adapted to every situation in which it is desirable to keep pigeons for ordinary use. To return to the room or loft; the shelves should be placed sufficiently high for security against vermin, a small ladder being a necessary appendage.

The usual breadth of the shelves is about twenty inches, with the allowance of eighteen between shelf and shelf, which will be sufficient not to incumber the tallest pigeons.

Partitions between the shelves may be fixed at the distance of about 3 feet, making a blind, by a board nailed against the front of each partition, whence there will be two nests in the compass of every three feet, so that the pigeons will sit in privacy, and not liable to be disturbed. Or a partition may be fixed between each nest—a good plan, which prevents the young from running to the hen, sitting over fresh eggs, and perhaps occasionally to addle them; for when the young are about a fortnight or three weeks old, a good hen will leave them to the care of the cock and lay again.

Some prefer breeding-holes entirely open in front, for the greater convenience in cleaning the nests; but it is from those that the squabs are likely to fall, hence a step of sufficient height is preferable. The tame pigeon seldom taking the trouble to make a nest, it is better to give her one of hay, which prevents the eggs from rolling; or a straw basket, or unglazed earthen pan, may be placed in every nest, apportioned to the size of the pigeons you breed.

A pan of three inches high, eight inches over the top, and sloping to the bottom like a basin, will be of sufficient size for a Tumbler, or a small pigeon, whilst one of double those dimensions will be required for a large Runt. A brick should always be placed in contiguity to the pan, to enable the cock and hen to alight with greater safety upon the eggs. The pigeon trap, on the house-top, is the well-known contrivance of those London rascals, who lie in wait as has been said, to entrap the property of others. A trap of another description, and for a very different purpose, is sometimes used; it is an area, on the outside of a building, for the purpose of confining in the air valuable breeds of pigeons which cannot be trusted to flight. Some are erected to the extent of twenty yards long and ten yards wide, with shelves on every side for the perching of the pigeons; thus they are constantly exercised in the air, retiring at their pleasure to the room or loft within.

(To be continued.)

EDITORIAL.

THE ZOO ON SUNDAY.

And why not on Sunday? What better way to rest from the six days' weariness or gain strength for the six to come, than to wander in Nature's Garden, to look on, wonder and admire the magnitude of her works, and the fitness of her ways? How many of us are not glad to spend Sunday with Young Breeder in that "back yard" in company with his almost human Light Brahmas? and yet he is not wicked. In a pilgrimage of some forty years we have not found his equal in pure Christianity. But what has this to do with the Zoo? We had either, like the thousands of others, to go on Sunday or not at all, and who could resist the temptation when our pleasant Huon was to be the guide? We met our friend in the center of the built-up portion of Philadelphia. To our invitation to ride, he suggested that he "always walked, needed the exercise, etc." It was only three miles, partly through the beautiful Fairmount Park, and over the famous Girard Avenue bridge. The Zoo we found too crowded to admit of our examining closely its denizens, a fact we regretted as Huon was familiar with every beast and bird, could have told us so much. It was amusing to note the absurd questions of the country people present, but Huon has promised us a chapter on the subject soon. I could not but wonder as we walked beneath the noble beeches that John Penn planted near the home he named "Solitude," because being so far away from the "busy haunts of men" to need to be visited specially if at all, what would he have said at the picture spread before our eyes then? The magnificent collection of animals, the immense Centennial buildings near by, and the 24,000 humans that on that Sunday morning were admiring, peopling, his "Solitude," but with not an angry, loud or disrespectful word. So orderly in fact that the five guards are rarely a necessity. Can it be that we have reached the height of achievement, or are there wonders to be shown the next Centennial that we as little dream of now? A most delightful day we spent with Huon at the Zoo, returning with him on foot to his beautiful home, where "a knife and fork" had for so many months awaited us. After a hearty dinner we adjourned to the library. Time sped fast and pleasantly. Reluctantly indeed, we bade our friend and his happy family good night, resolving as soon as the opportunity would permit, to take advantage of the invitations so heartily given, to "come again."

CENTRAL MAINE POULTRY ASSOCIATION.

In accordance with a call published in a paper in the central part of Maine, a meeting has been held at this place, and the "Central Maine Poultry Association" formed, with Dr. G. M. Twitchell, Fairfield, as President, F. E. McFadden, Esq., Fairfield, Sec'y, and F. H. Foss, Esq., Fairfield, Treas., and with a full board of officers.

The society has voted to hold its first exhibition Dec. 19th, 20th and 21st, at this place.

There are here fifteen or more breeders of twenty different varieties, all of fine stock.

The interest in this part of the state is steadily increasing, and it is hoped that the show will be a success, as liberal premiums are offered.

FAIRFIELD, ME.

PER ORDER.

We are advised by our old friend Mr. F. H. Schwartz, of his removal from Bernville, Pa., to Robisonia Furnace, Pa., Mr. Schwartz is a true fancier. Wherever is his home, his pets will be found; and having the faculty of creating an outside interest, in them wherever they are, we may expect to hear of an awakening interest in his new location.

W. F. BLACK SPANISH.

Having seen in FANCIERS' JOURNAL that I claimed the premium on W. F. Black Spanish, and that the premium belonged to Oliver D. Schock, I want to give you the correct statement.

The premiums were awarded on Thursday. On the Tuesday previous Mr. Schock entered the Spanish. On Wednesday at 10½ A. M., I bought them of him, with the proviso that he should receive the premium money they would win, while nothing was said as to who should take the honors. He gave the judges the authority to remove them, asserting that they were my property, and Mr. Ed. Shalter, one of the judges, put my name upon the coop. Now, you as judge, to whom does the honor belong? He said the premium money would just about pay him his price for the birds. I want no controversy, but do desire what is just and honest. I wrote you the premium list with honest purpose, and it seems as though the editorial beneath the errata gave my sending a dishonorable look. I hope you will correct the matter by saying it was a misunderstanding, caused by a sale during the fair. Mr. Schock and I are good friends, and do not wish to be otherwise.

DR. HECKMAN.

READING, PA.

We thought the error we attempted to right was like so many others that have occurred—a slip of the pen.—We know Dr. Heckman too well to doubt his integrity. We felt it only due to our time, and the space our readers pay for, to print only authenticated reports. Dr. Heckman certainly owns the premium birds, but the official list must decide the question as to whom the honor of receiving it shall be.

TOLLAND CO. SOCIETY.

At a meeting of the Tolland Co. Agricultural Society, held at Rockville, Conn., Oct. 23, 1876, Mr. P. W. Hudson, of North Manchester, was elected President. As Mr. Hudson is a thorough fancier, and his enterprise is directed to all varieties of live stock, we may look forward to the fair of the coming year as excelling any held since the days of Thos. Barrows, the founder of the society.

RULES AND PREMIUM LISTS.

We have received the Rules and Premium List for the Third Annual Exhibition of the Middlesex Poultry Association, to be held at Lowell, Mass., Dec. 5th to 7th, 1875.

E. T. ROWELL, Secretary.

CARDS, CATALOGUES, ETC., RECEIVED.

Descriptive circular of high class poultry, bred by George S. Joselyn, Fredonia, N. Y. See advertisement.

Descriptive catalogue—L. E. Sinsabaugh, Syracuse, Otsego Co., Nebraska.

Card of Gray & Shermam, Foxboro, Mass., Breeders of choice Brown Leghorns. See advertisement.

Card of W. H. Rathbone, Uncasville, Ct., Breeder of White Leghorns, and Black Hamburgs.

On Sunday, Oct. 29th, 800 of the Guide Books, of which our Huon is the author, were sold at the Zoological Garden, Fairmount Park, Philadelphia.

The cut upon the cover this week is of a pair of Red Pile Games, imported last year from Mr. Cooper, of Limerick, by their present owner, E. T. Bailey, Mt. Kisco, N. Y.

ERRATA.

No. 43, page 516, last line, 1st column read Pigmy Pouters for Pigeon Pouters, and for J. Van Winkle read Isaac Van Winkle.

CORRESPONDENCE.

EDITOR FANCIERS' JOURNAL:

I have in my possession a cock of the Light Brahma breed that is a real curiosity; he was hatched the last of May, 1874. He walks as erect as any person, and has ever since he was two and a half months old; he was not injured in any way to cause him to walk in this way. There have been a number to see him and they give in that they never have seen anything like him. I intend to show him at one or more poultry shows this winter.

J. H. MORRISON.

FAMILIAR SCIENCE.

Contributions to this department respectfully solicited from all.

—ONE DAY OUT OF SEVEN.—

Birds cannot always sing;
Silence at times they ask to nurse spent feeling;
To see some new, bright thing,
Ere a fresh burst of song, fresh joy revealing.

Flowers cannot always blow;
Some Sabbath-rest they need of silent winter;
Ere from its sheath below
Shoots up a small, green blade, brown earth to splinter.

Tongues cannot always speak;
O God! in this loud world of noise and clatter,
Save us this once a-week,
To let the sown seed grow, not always scatter.

LIST OF PLANTS IN FAIRMOUNT PARK, 18

Continued from page 517.

Clematis—virginiana, virgin's bower.
Cimicifuga—racemosa, black snake-root.
Caulophyllum—pappoose root.
Chelidonium—majus, celandine.
Corydalis—aurea, golden corydalis.
Cardamine—pratensis, field cardamine.
Cochlearia—amorica horse-radish.
Cerastium—vulgatum, mouse-ear chickweed; do. viscorum, sticky, chickweed.
Claytonia—Caroliniana, spring beauty.
Celastrus—scandens, staff-tree.
C. anothus—Americanus, Jersey tea, red root.
Crotalaria—sagittalis, rattle-box.
Cassia—marilandica, American senna; do. chamæchrista, sensitive pea, dwarf cassia; do. nictitans, wild sensitive plant.
Crataegus—oxyacantha, hawthorn, English thorn (May); do. crus-galli, cockspur.
Cuphea—viscosissima, wax bush.
Calycanthus—floridus, Carolina allspice, sweet-scented shrub.
Circea—lutea, larger enchanter's nightshade.
Chrysosplenium—Americanum, oppositifolium, golden saxifrage, water carpet.
Cicuta—hemlock, conium, maculatum, poison hemlock; do. lanatum, cow parsnip.
Cryptantha—canadensis, hone-wort.
Cherophyllum—procumbens.
Coronis—canadensis, horn cornel, or dogweed.
Conoclinium—coelestinum, (C. celestinum), golden.
Cirsium—arvense, Canada thistle; do. horridulum, yellow; do. pumilum, pasture.
Cynthia—virginica.
Campanula—Americana, American bell-flower.
Clethra—alnifolia, sweet-pepper bush.
Chimaphila—umbellata, pepsissawa; do. maculata, spotted winter-green.
Delphinium—consolida, branching larkspur, (blue and purple).
Dielytra—cucularia, Dutchman's breeches.
Draba—verna, whitlow grass.
Dentaria—laciniosa.
Dianthus—armeria, wild pink.
Desmodium—paniculatum.
Desizia—scabra, rough; do. gracilis, slender; do. crenata, double, pink flowered.

Daucus—carota, wild carrot.*Diercilla*—trifida, bush honeysuckle.*Dipsacus*—sylvestris, wild teasel.*Erysimum*—cheranthoides, false wall-flower, (scarce).*Elodea*—virginica or campanulata, hypericum.*Eunonymus*—Americanus, burning bush; do. atropurpureus, dark purple.*Epilobium*—coloretum, angle-stemmed willow-herb; do. lineare, linear leaved.*Eupatorium*—fistulosum; do. maculatum, spotted eupatorium; do. purpureum; do. album, white flowered; do. perfoliatum, thoroughwort, boneseed.*Erigeron*—helidifolium, robin's plantain; Philadelphicum, narrow leaved robin's plantain; do. heterophyllum, common fleabane; do. strigosum, fleabane, white-weed, daisy; do. Canadense, Canadian or common fleabane.*Epigaea*—repens, trailing arbutus.*Ephiphegus*—virginianus, beech drops.*Fumaria*—officinalis, fumitory.*Fragaria*—virginiana, wild strawberry.*Fedia*—fagopyrum, (radiata) corn-salad, Lamb's lettuce; do. olitoria, Pawnee lettuce.*Geranium*—maculatum, crane's-bill, spotted geranium; do. robertianum, herb robert.*Galactia*—glabella; mollis.*Geum*—virginianum, white avens.*Gellenia*—trifoliolata, indian physic.*Gaura*—biennis, biennial gaura, (rare).*Galium*—asprellum, rough cleavers or clivers; do. trifidum, dyers cleavers; do. aparine, common cleavers; triflorum, triflowering galium.*Gnaphalium*—polyccephalum, fragrant life-everlasting; do. uliginosum, mud, everlasting.*Gratiola*—virginica, hedge hyssop.*Gerardia*—purpurea, large-flowered, purple gerardia; do. pedicularia, lousewort; do. quercifolia, oak-leaved.

(To be Continued.)

—Magnets prepared by compressing iron filings in tubes have been exhibited to the French Academy by M. Jamin. If when soft iron filings are forcibly compressed by hydraulic pressure they acquire a cohesive power equal to that of steel.

—As the stream gradually wears the channel deeper in which it runs, and thus becomes more surely bound to its accustomed course, so the currents of the heart and mind grow more restricted to the course in which habit has taught them to flow. These intellectual and moral habits form many peculiarities of character, and chiefly distinguish one individual from another. They are, therefore, of the utmost importance.

—The seeds of some species of the genera *Collomia* and *Gilia* are enveloped in a peculiar mucilage, which develops spiracles and swells to considerable size when wet. Dr. Gray believes this to be for the purpose of anchoring, so to say, the seeds in the dry part of the world in which most of the species are found, and thus they possess in this peculiarity an advantage in the struggle. Granules of sand penetrate the mass of mucilage and hold the seed to the spot where it falls.

—The cause of the coloring of the autumn leaves is not well understood. It is said by some that the trees absorb oxygen during the night which owing to the coldness of the weather, they have not strength enough to throw out again in the day time, and this gives an acidity to the juices of the tree which changes the color of the leaves, otherwise they would be pushed down by the new buds in all their summer array. Others say that this may be true of leaves that are red, but will not account for the yellow and brown.

J. McCANN.

—The ship rat is very anxious that his supply of fresh water shall not fail; he will come on deck when it rains, and climb up to the wet sails to suck them. Sometimes he mistakes a spirit cask for a water cask, and he gets drunk. A captain of an American ship is credited (or discredited) with an ingenious bit of sharp practice as a means of clearing his ship from rats. Having discharged a cargo at a port in Holland, he found his ship in juxtaposition to another which had just taken in a cargo of Dutch cheese. He laid a plank at night from one vessel to the other; the rats, tempted by the odor, trooped along the plank and began the feast. He took care that the plank should not be there to serve them as a pathway back again, and so the cheese-laden ship had a cruel addition to its outward cargo.

—GOLD IN ANCIENT TIMES.—Whatever may have been the source whence the ancients obtained their gold, there is abundant evidence that this metal was admired and valued by them as much

as it is at the present day. Many of the accounts given by early writers dazzle us with the supposition that the stores of gold in those days were much larger than can be commanded at present. Thus, Semiramis is said to have erected statues of Jupiter, Juno, and Rhea, forty feet in height, and made of heated gold. Drinking-vessels made of gold, and weighing twelve hundred talents, are also spoken of. The sumptuous display of precious metals in the palaces of the great are frequently alluded to. But it has been aptly observed that the quantity diffused among the bulk of the English population of the present day, would make a sum-total far outbidding the golden wealth of those earlier days, though less obvious and glittering from being so much more diffused.

—**LAND AND WATER.**—Captain Mayne Reid suggests some new ideas in regard to the occurrence of the axolotl in the lakes of Mexico. This species resembles the larval or immature condition of many American salamanders, especially those occurring under logs in damp places. Much interest has attached to this animal from the fact that although on its native waters, at the altitude of the City of Mexico, it always remains in the larval condition, laying eggs and reproducing its kind, yet when individuals were taken to Paris, many years ago, they threw off their gills, and became transformed into true salamanders, living out of the water, and developed a totally different and much more brilliant series of coloration, with other changes in regard to the lungs, the teeth, and entire anatomy.

The special object of Captain Reid's letter was to express astonishment that descendants from the real axolotl were kept in fresh-water in the Brighton Aquarium, whereas they occupy the Lake Tezcucoc—a body of water so salt that even fish can not live in it.

—**THE CAT AND THE RAT AT PEACE.**—The *Sacramento* (Cal.) *Record Union* relates the following remarkable occurrence:—"Passing through the alley leading from Second to Third street yesterday the driver of a country wagon yelled to us, 'Here's something you never saw!' Ever on the alert for the new and strange we stepped over to where the grocer's Jehu had halted and looked upon a happy family outside a cage for once. A large tin can half full of water had been tilted over against a brick; on that brick sat a large rat drinking from the can, and right beside him with his head in the same can squatted a cat unconcernedly drinking from the same receptacle. Open-mouthed wonder kept us still. The cat, having deliberately quenched his thirst, licked his chops, stroked his ears, gave a whisk to his tail and trotted off. The rat continued to drink until a convenient brickbat came his way, when he jumped from his pedestal and scampered off, with a countenance expressive of pure contempt for the individual who would disturb him when even his natural enemy had permitted him to drink in peace."

—**MELIPONES—BEES WITHOUT STINGS.**—Ravert Wattel gives an account in a recent journal of the Acclimatization Society of Paris of a group of hymenopterous insects known as Melipones, and found in various parts of the world, resembling bees very closely, but being without any sting. Their honey-producing qualities are very decided, and it is thought that, possibly, they may hereafter constitute an important addition to the series of domesticated insects. They occur in the warmer regions of the New World and some of the islands of the Indian Archipelago. Resembling bees in their general character, they are smaller, with a more densely clothed body and the hind feet proportionally longer. They have, it is true, a rudiment of a sting, but this is not capable of producing any injury, nor is there any secretion of poison. As in the ordinary bees, there are three varieties of individuals, the males, females, and neuters. A large number of species are known to naturalists, and others probably still remain to be described. Some of them make their nests in hollow trees, while others suspend them from the branches. These are constructed of a series of cakes, and are arranged horizontally; they do not contain two series of opposing cells, but are much like those of wasps. The honey, too, is not stored away in the cells, but is placed in little cups by the side of the nest, which are ten times as large as in the former. These constitute a sort of amphora, more or less regular, which the workmen fill little by little. They then extend the walls so as to form a sort of cover, closing them exactly when they consider them sufficiently full. The honey of the insect is said to be of a very superior quality, and the wax capable of many important applications. Although deprived of a sting, the melipones are not, however, without the means of defense, but possess stout mandibles, and in biting the skin they leave upon it an acrid saliva, which produces, sometimes, an irritating wound. The spot is at first scarcely perceptible; but at the end of several hours or more a little vesicle makes its appearance, like that caused by cantharides,

with this difference, however, that an active inflammation sets in and sometimes causes great suffering. Many interesting facts in regard to this insect, as occurring in different parts of the world, will be found in the article referred to.

—**FEATHERED CENTENARIANS.**—It may not be generally known that the eagle, raven, swan and parrot, are each centenarians. An eagle kept in Vienna died after a confinement of a hundred and fourteen years, and in an ancient oak in Shelborne, still known as the "raven tree," the same pairs of ravens are believed to have fixed their residence for a series of more than ninety years. Swans upon the river Thames, about the age of which there can be no mistake, since they are annually marked by the Vintner's Company, under whose keeping they have been for five centuries, have been known to survive a hundred and fifty years and more. The melody of the dying swan is mythological. Upon approach of death the bird quits the water, sits down upon the bank, lays its head upon the ground, expands its wings a trifle, and expires, uttering no sound.

—**A NOVEL FISH.**—Our trap fishermen are continually capturing curious specimens of the finny tribe, and only yesterday one of the oddest and ugliest specimens we have ever seen was caught in the trap of William Weaver, off Taylor's Point, Canonicut Island. It is about three and a half feet in length, by about one and a half feet in breadth in its widest part, with skin like that of a shark, an ugly mouth, with four rows of teeth, and its shape is something like that of a belows fish. Its mouth is on the head extremity, and not at all underneath, while its side fins are more like the clipped wings of a fowl. It was very savage, and when an attempt was made to take it from the trap with a large iron-rimmed scoop net, it sprang forward like a snapping turtle and seized the rim of the net, and hung to it until it was placed in the boat. One of the fishermen afterward attempted to poke him with a short stick, and the fish seemingly contracted his body and sprang savagely forward, seizing the man's finger, lacerating it severely. The nondescript weighs over thirty pounds, and is now packed in ice, awaiting the arrival of Hon. Samuel Powell, who takes charge of all novelties from the waters of our part of Narragansett Bay. None of our fishermen have ever seen anything like it.—*Newport Letter to Providence Journal.*

—**THE TRADE IN WILD ANIMALS.**—A writer for the *Mittheilungen des Vereins für Erkunde*, of Leipzig, has just furnished an interesting article on the wild animal trade of Europe. He says that the whole business was formerly done by two men—one an Italian, named Casanova, and the other Charlef Hogenbeck, of Hamburg. In 1862 Casanova made a treaty with the wild tribes of Taka, Africa, engaging to take all they could capture, which resulted in the purchase from them of hundreds of beasts and reptiles. These were subsequently sent to the different zoological societies of Europe, and are now on exhibition. In 1874 one M. Von Reich, of Asfeld, went to Kassala and captured and brought from the African chiefs 26 giraffes, 22 elephants, 4 Caffre buffalo, 6 rare antelopes, 2 tapers, 2 gorillas, 5 hyenas and 3 leopards. Immediately afterward Hogenbeck imported 33 giraffes, 10 apes, 10 elephants, 13 antelopes, 4 lions, 5 leopards, 4 hyenas, 5 ostriches, 8 rhinoceros and a number of huge serpents. It takes from seventy to eighty days to bring the animals from Kassala to Hamburg. From the interior of Africa to the coast they have to drive the elephants, giraffes, antelopes, buffalo, &c., on foot, fastened together with ropes and chains. Often, through the negligence of the negro attendants, the lions and leopards get out of the cages during the transit and create a general stampede, causing loss of life and great loss of money.

—**NICE PETS.**—Thomas L. Bond, the celebrated alligator trapper, on Wednesday morning, says the *N. O. Bulletin*, boxed up about thirty of the largest-sized alligators ever seen and conveyed them to the city park, where a picture of the reptiles was taken by Mr. Anderson. Every one of the animals kept their large jaws open, and beside them stood the trapper. We learned the following facts about these reptiles from Mr. Bond: It goes into its hole about the 1st of November, with the first cold wind; stays until the first warm day in February. The female commences laying in the latter part of May; they hatch the latter part of July and August. They eat fish, young pigs, dogs—in fact any animal that comes within reach of them—negroes and grass when they can find nothing else; they commence to eat as soon as they come out, and eat until they go into their holes in the fall. The female lays from eighteen to ninety eggs, according to the size of the female. The male lies about the nest, and if he succeeds in driving the female off devours the young as soon as hatched. The nest is made in low swamp ground; the material used is dry grass or dried cane, and raised about three and a half or four feet

high. When it is of the required height she gets on top and with her claws makes a hole and deposits her eggs, then covers over with more of the same material, then a covering of mud to make it as near waterproof as possible. The first four years after hatching they grow about four inches per year; after that very slowly, not more than from one to two. Dr. Dick says, in his "Christian Philosophy," that man and the alligator are the only animals that kill their own species by wholesale.

—CHANGE OF COLOR IN ANIMALS.—It is well known that chameleons change color on different trees, and that many animals, and birds, and insects resemble closely the vegetation that surrounds them. It has been recently discovered that a species of crabs have the power of modifying their own color to resemble the surface about them.

M. Pouchet, a distinguished French naturalist, took crabs caught by fishermen, of a rose or dark lily color, and put them in porcelain dishes, having white or black bottoms. In twenty-four hours the crabs were entirely unlike each other. Those in the white dish were yellowish, almost colorless, as if they had just shed their skin; those in the dark dish were of a brown red color. He then transferred them from one dish to the other, and their colors changed to correspond. By the use of the microscope he detected the causes of change.

When the coloring cells are pressed close together, they are too minute to make any impression, and this happens on a white bottom. When the animal is placed on a dark ground, the coloring-cells begin to expand, send out little branches, and make themselves very perceptible. As the branches continue to distend they receive a cobalt color, and gradually settle into a brown. When the animals are transferred to a white bottom, the cells gradually contract again, till they seem colorless. This is a wise arrangement of Providence, to conceal them from their enemies.

—THE LAUGHING PLANT.—The London Garden copies, from Palgrave's work on central and eastern Arabia, an account of a plant whose seeds produce effects similar to those of laughing gas. It is a native of Arabia. A dwarf variety at Oman, which attains to a height of from three to four feet, with woody stems, wide-spreading branches and bright green foliage. Its flowers are produced in clusters, and are of a bright yellow color. The seed pods are soft and woolly in texture, and contain two or three black seeds of the size and shape of a French bean. Their flavor is a little like that of opium, and their taste is sweet; the odor from them produces a sickening sensation and is slightly offensive. These seeds contain the essential property of the extraordinary plant, and, when pulverized and taken in small doses, operate upon a person in a most peculiar manner. He begins to laugh loudly, boisterously; then he sings, dances, and cuts all manner of fantastic capers. Such extravagance of gesture and manners was never produced by any other kind of dosing. The effect continues about an hour, and the patient is uproariously comical. When the excitement ceases, the exhausted exhibitor falls into a deep sleep which continues for an hour or more, and when he awakens he is utterly unconscious that any such demonstrations have been enacted by him. We usually say that there is nothing new under the sun; but this peculiar plant, recently discovered, as it exercises the most extraordinary influence over the human brain, demands from men of science a careful investigation.

SMALL PETS.

ABYSSINIAN GUINEA-PIGS.

It cannot be otherwise than that differences of opinion will exist, and studious, honest writers make mistakes, but there is nothing to be gained by any one's getting angry and ventilating their disturbed minds through public journals, at the expense and to the injury of those who purchase and read for profit and pleasure.

I wish I could write you an early and reliable history of the Abyssinian Guinea-pigs, but cannot do so. Will write what I know from observation and letters that I have received in regard to them. You remember you told me some time ago of having seen in London, Guinea-pigs with hair like the Angora rabbits, but had never seen the like since, and I expressed a wish to obtain similar. In June 1875, I noticed in an English Journal an advertisement of a pair of Abyssinian Guinea-pigs for sale which were described as curly coated. Presuming they were what you

had described, I immediately wrote to the advertiser, ordering the pigs and requesting him to get another pair and send with them if he could.

In due time I received his reply, dated June 22, 1875, in which he informed me that he put the pair in a little enclosure on the lawn in front of his house without covering it, and something, probably a cat, stole the sow, and the pair being broken, he gave the boar away to a little lady. He then said he was anticipating more young, and if he had a pair, would send them to me if I desired; I engaged them, and on 17th of February, 1876, I received the whole litter, viz.: 1 boar and 3 sows. The boar and one sow were curly, or rough coated, and the other two nearly as smooth as the common Guinea-pigs.

In regard to their history, he wrote that his first notice of Abyssinian Guinea-pigs was an advertisement in the "*Bazaar Exchange and Mart*," by a lady in Durham Co., who said they were curly coated, and the parents came from Abyssinia. A few weeks before receiving the four pigs from England I heard of a pair of Angora Guinea-pigs in New York. Upon enquiring I found that they came from London, but the one who had them did not seem to know any more about the breed than I did. I ordered the pair, and received them Feb. 8th, and when the four arrived, nine days later, I found both lots were of the same variety. I have since heard of there being some in New York that came from Germany, but have not enquired for or about them, as I have now about thirty or forty, some of which are very fine specimens. In shape, size and habits they are the same as any common Guinea-pigs, but with the most of them the hair is what I call wavy. It is not long like Angora, neither does it curl like a negro's, but instead of lying down smooth it goes in all directions. Some have it in a ridge along the neck and back, others have it twisted, or turning in different directions in several places upon their bodies, like the curl on a Turbit's breast. Some have these twists, or cowlicks, or crowns, or whatever they may be called, all over them, and look queer enough. I have some of two or three colors like the common, and now and then get a white one with pink eyes. At one of the shows in England they offered a premium for Abyssinian Guinea-pigs, and some one won it.

W. H. BRACKETT.

—We would like to hear from Major Cryer and others upon these animals.

THE SKUNK—SOME OF ITS HABITS.

I was brought up in the State of Maine, where skunks are plenty, the winters are long and the snows lie deep. I will write of the skunk as I saw them there.

Skunks will not dig a hole in the ground to live in if they can find one already dug, such as an abandoned woodchuck's hole. They live mostly in the cliffs of ledges, under rocks, old logs or stumps, old buildings, stone walls, and particularly under barns where fowls are kept, that they may be handy to commit their depredations on chickens and eggs.

I lived "near a beautiful stream of water," but never knew a skunk to burrow near its banks, or no nearer than my barn, about twenty rods from the stream.

Skunks are not strictly nocturnal, as I have seen them many times in broad day, nor do they hibernate, as I have seen acres of snow three feet deep covered with their tracks in the middle of winter; the skunks coming out from the cliff of the ledges. I have also found them under my barn in midwinter and they would come out every night and travel round, as I could tell by their tracks in the snow. If a skunk gets under a barn he's bound to stay there until you kill him, which is not always a pleasant job.

N. VARNUM.

YOUNG FOLKS' CORNER.

IN THE CLOSET.

They've taken away the ball—
Oh, dear!—
And I'll never get it back
I fear.

And now they've gone away
And left me here to stay
All alone the livelong day
In here.

It was my ball, anyway—
Not his!
For he never had a ball
Like this.

Such a coward you'll not see—
E'en if you should like to be
Old as Deuteronomy—
As he is.

I'm sure I meant no harm—
None at all!

I just held out my hand
For the ball,
And somehow it hit his head,
Then his nose it went and bled;
And, as if I'd killed him dead,
He did bawl!

Nursey said I was a horrid
Little wretch;
And Aunt Jane said the police
She would fetch;
And cook, who's always glad
Of a chance to make me mad,
Said: "Indeed, she never had
Seen setch!"

No! I never, never will
Be good!

I'll go and be a babe
In the wood!
I'll run away to sea,
And a pirate I will be!
Then they'll never call me
Rough and rude.

How hungry I am getting!
Let me see:

I wonder what they're going to
Have for tea!
Of course there will be jam,
And that lovely, potted ham!
How unfortunate I am!
Dear me!

Oh! it's growing very dark
In here.

And the shadow in that corner
Looks so queer!
Won't they bring me any light?
Must I stay in here all night?
I shall surely die of fright!
Oh, dear!

Mother, darling! will you never
Come back?

I am sorry that I hit him
Such a crack.

Hark! Yes, 'tis her voice I hear!
Now, good-by to every fear!
For she's calling me her dear
Little Jack!

(For Fanciers' Journal.)

ZOO NOTES, NO. 31.

BY HUON.

WOMBATS AND KINGFISHERS.

The late Dr. James Rush of Philadelphia when planning his magnificent building for the reception of the Rush Library—which building has since his death been erected—forbade the

placing of any newspaper upon its shelves or tables forever, saying they were made up by "disjointed thinkers, and their contents therefore altogether unreliable." This sweeping assertion was brought most forcibly to my mind on reading in the leading paper of the country, Public Ledger, Oct. 31st and Nov. 1st, a report on Australia and its products, as represented in the Centennial Exhibition, in which the writer says, speaking of the Wombat, an Australian quadruped: "The Wombat is an animal very similar to a bat, but much larger, and has very large wings!" Now the fact is, the Wombat is not in the least similar to a bat, and is fitted to have a pair of wings about the same as a hog is. The Wombat is a herbivorous marsupial mammal, called a badger by the Australian Colonists, from its burrowing habits, and an ursine opossum from its resemblance to a small bear; so far from flying, it is the least active of all the Australian quadrupeds. It is found in *all* parts of Australia and is rather sought after for its flesh, which is very good though rather tough and has a slight taint of musk. The length of the Wombat is about three feet, the head measuring seven inches. It is remarkable for possessing fifteen pairs of ribs, only six pairs of which reach the breast bone.

In its wild state, the Wombat is nocturnal in its habits, living during the day in the depths of a capacious burrow, which it excavates in the earth to such a depth that even the persevering natives, as much as they desire the animal for food, will seldom attempt to dig one out of its home.

So much for the "Wombat with wings," but our "disjointed thinker" has not done with him yet, for he goes to South Australia, and there he finds the Wombat a "*vampire bat*;" and adds that "living specimens of them can be seen in the Philadelphia Zoological Garden!" Can they? The managers of that Institution would like to know where they are, and even the pair of Wombats once there are dead.

Once again I quote from this *intelligent* writer on natural history: He says the "Laughing Jackass, one of the native birds of Australia, is the largest variety of the woodpecker!" Indeed! The Laughing Jackass is a KINGFISHER, and is no more related to the woodpecker than it is to a robin or wild goose, as it belongs to an entirely different and distinct class of birds.

The Laughing Jackass, or Giant Kingfisher, is an inhabitant of Australia, but not found in Tasmania or Van Diemens Land. The cry of the bird is a singular, dissonant, abrupt laugh, more startling even than that of the hyæna, fairly frightening the novice in bush life, when first he hears it.

At the rising and the setting of the sun, the Laughing Jackass is a very lively bird. At the former time it welcomes, by its strange noise, the coming day, and at the latter it again pours forth its discordant notes as if in exultation of the coming darkness.

The home of the bird is usually in the hollow of the *Eucalyptus* tree. It makes no sort of nest, but simply lays its eggs—which are pearly white—upon the soft, decaying wood.

Several of these birds may be seen in the Aviary of the Zoological Garden. They are really handsome, though not possessing such brilliant colors as some other Kingfishers. The general tint of the back and upper surface is olive brown; the wings are brown and black, a few of the feathers being slightly touched with green. The breast and under parts are white, washed with pale brown, which forms a series of faint bars across the breast. The tail, which is long and rounded at the extremity, is of a fine chestnut color banded with deep black and tipped with white.

The scientific name of the bird which is *not* a woodpecker, is *Daceto gigas*, and the sub-family to which it belongs is the *Alcedinæ*. The woodpecker is a scansorial or climbing bird, and belongs to the family *Picidæ*.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange** only, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"To EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or Want column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

W. G. WENCK, McEwensville, Pa., has one pair Houdans, and one P. C. Cook, first-class birds, for exchange for offers in Fancy Pigeons. None but good birds wanted. Sealed letters preferred, but postals not objectionable.

T. H. HAYDEN, West Stafford, Conn., will exchange 1 trio Dominigue Leghorns, matched for breeding, 5 months old; also Books, Saunders' Domestic Poultry and American Poultry Guide, American Bird and Pigeon Fanciers Book, and Taxidermist Manual, for Fancy Pigeons. State colors of bird and markings.

S. S. REYNOLDS, Carlinville, Ill., has the American Farmers Horse Book, 600 pages, to exchange for Carrier Pigeons, or Maltese Kittens or Plymouth Rock Chickens.

W. W. THIBTS, Kuxnboro, Oneida Co., N. Y., will exchange an English Pointer Pups, 5 months old; Pigeons, (needs Blue Pouter Cock and Archangel Hen), choice Poultry, for Dry Goods or Clothing, or offers.

C. E. L. HAYWARD, Peterboro, N. H., will exchange Partridge Cochins, White Leghorns, and Single-comb Black Bantams, for Poultry or Pigeons. The above birds stock 1st premium at New Hampshire State Fair this year. None but strictly first-class birds wanted in exchange.

WILLIAM CALL, JR., Haverstraw, N. Y., has three full-blooded Setter Dog Pups, three months old, (than by Jennings' celebrated Dash), full pedigree given; which he will exchange for Fancy Pigeons, Breech-loading Shot Gun, or offers.

G. H. TWITCHELL, Fairfield, Me., offers for exchange P. Rocks, G. L. S. Bantams, W. Leghorns, P. Cochins Cockerels, for offers; and L. Brahmas, for White-faced Black Spanish. Stock extra, and the same wanted. A fair exchange is what I desire.

H. B. RATTERSON, Elmira, N. Y., will exchange a pair of Pekin Ducks, (Merrill's stock), for a pair of nice W. F. B. Spanish or Brown Leghorn Fowls.

THOMAS SMITH, Stony Brook, Long Island, offers a thoroughbred Setter Bitch, well broke, for a trio of first-class Light or Dark Brahmas, or Bantams.

P. WELCH, Linden, N. J., will exchange one or two P. C. Cockerels, early hatch, for Buff or Black C. Cockerels, or one year old Cocks. Must be good. Mine are premium stock.

F. D. BAILEY, St. Clairsville, Ohio, will exchange Light Brahmas, White Buff, and Part. Cochins, Todd's strain, good stock, for light single Harness, Lap-Robe, or Light Cuckoo. Must be good. Speak quick.

CHAS. SEISER, Doylestown, Pa., will exchange G. S. and Black Hamburgs, for trio of Houdans and S. S. Cockerel. Birds must be good.

R. M. GRIFFITH, Wilmington, Del., will exchange Fowls of 5 varieties, and Fancy Pigeons, 30 varieties, first-class, for Land in Delaware, Maryland, or Virginia; also first-class Hens in Philadelphia, for a Farm in Pennsylvania, Delaware, Maryland, or Virginia.

HOMER CHACE, 153 Clymer St., Brooklyn, E. D., N. Y., will exchange L. B. B. C., W. C. B. Poland Chicks, Aylesbury, Muscovy and Rouen Ducks, for Pigs, Pear and Quince Trees, Lumber, Potatoes, Apples, Harness, Cutlery, Paints, and Furniture. What offers?

JOHN W. SUTLIFF, JR., Box 20, Johnstown, Fulton Co., N. Y., has a Carbine Rifle and a Colt's Revolver, and Bird Cages that he will exchange for Gloves, Sheep Skins, or Buck Skins. What other offers.

FRED J. DAVIS, 16 Cypress St., Rochester, N. Y., will exchange, for Fancy Pigeons, 1 pair Red Carriers, 1 pair young Blue Pouters; 1 pair Pouters, Red Cock and Black Hen; 1 Blue Pouter Cock; 1 White Pouter Cock, good length; 1 Red Jacobin Hen; also Common Pigeons. What offers?

C. E. L. HAYWARD, Peterboro, N. H., will exchange Plymouth Rocks, Silver Spangled Hamburgs, Brown Leghorns, and Black Leghorns, for Poultry of other varieties, or Pigeons. None but strictly first-class birds wanted. Thoroughbred Pigs, and Fruit Trees wanted in exchange for Fowls.

SMITH & BRO., Stony Brook, N. Y., will exchange White, Golden and Silver Poland, White Sultans, G. P. and S. S. Hamburgs, Gray Borkings, Black and White Cochins, Rouen and Aylesbury Ducks, White China Geese, for Bantams, all kinds of Jewelry, or offers.

G. DILLENBERGER & SON, 69 Clifford St., Providence, R. I., will exchange Perrets and Lop-eared Rabbits, for good Leghorns, or first-class Fancy Pigeons, or extra fine Black-breasted Red Game Pullets, (Warren's stock), or good Singing Canary Cock.

CHAS. SEISER, Doylestown, Pa., will exchange small Engine and Boiler, Pat Lever Silver Watch, Sewing Machine, or Fowls, for Foot Lathe, 8-inch swing, Chuck, Tools, &c.

R. C. BORDWELL, M. D., Penn Yan, N. Y., will exchange Books, one Trotting Sulky, one Rabbit Hutch, made for six kinds of Rabbits, S. S. Poland, S. S. Hamburgs, L. Brahmas, and Bremen Geese, for one car load Hemlock Lumber, one good Rifle or Shot Gun, and Golden Sebright Bantams, B. B. E. Game Bantams, W. Cochins, and P. Cochins.

F. H. SCHWARTZ, Robisonia Furnace, Pa., will exchange some first-class Pouters, Carriers, Owls, Barbs, Archangels, Turbit, and White Fans. Send wants.

E. STUCKS, York, Pa., will exchange Bronze Turkeys, Fancy Pigeons, and Lt. Brahma Cockerels, for a new or good second-hand set of light harness for buggy use. Gum mounting preferred.

W. H. V., 10 4th Avenue, N. Y., wants to exchange 1 set light Harness, complete, silver mounted, hand made, but little used, cost \$40.00, (fine), for B. Leghorns, or P. Rocks. Who offers. Good stock given. Good stock expected.

JNO. F. HOUSER, Tamaqua, Pa., will exchange 1 Harp, Piano, 3 good Violins, 1 10-keyed Accordion, 1 Evan & Watson's Safe, 1 Pocket, and 1 large Case of Homeopathic Medicines, Elated and labelled in good condition, 1 Florence Sewing Machine, 1 bound vol. Wright's Illustrated Book of Poultry, 4 Fonts Type, assorted, 1 Single Silver-plated Buggy Harness, good as new, 1 Floebert Gun and Target, 1 Red Bird and Cane, 1 Rabbit Hutch, 1 Electric Battery, for Alderney or Jersey Cow, or Double Breech-loading Shot Gun, or offers.

JOHN F. BARDILL, Nazareth, Pa., will exchange 13 Black Barbs, 12 Tumblers, all colors, 5 Snells, yellow head and tail, 2 Carriers, all in one lump. These are good birds, for offers.

NIMROD, Traders Point, Marion Co., Ind., wants to exchange pair of White Leghorns, six months old, J. Boardman Smith strain, worth \$10.00, for Setter Pup. State bred, age, sex, and color. Must be good.

BOX 869, Rockville, Conn., will exchange a C. Cornet, cost \$60, for a first-class Central-fire Shot Gun. Must be in good order, as the Cornet is.

GEO. L. STILLMAN, Westerly, R. I., will give a pair of S. S. Hamburgs for a nice revolver; also a nice Light Brahma Cock, 1 year old from Fowls, and L. B. Cock from Plained's stock. A few Black Hamburgs for exchange. Make offers.

F. J. DAVIS, 16 Cypress St., will exchange 2 pairs Outside Tumblers, or 1 pair Outside Tumblers, and 1 Blue Pied Pouter Cock, or 1 Knapel Cuckoo, (very good), for 1 good Singing Canary or other Song Birds. My birds are good; want same.

J. S. GOODNOW, Millington, Mass., will exchange one trio P. Cochins, Buff Cockin Fowls or Pullets, or Dark Brahma Fowls or Chicks, for a Buffalo Robe. My fowls are good. Write.

J. O. THURSTON, 786 Broadway, N. Y., wishes a pair of first-class White African Owls, in exchange for Black or Dun Carriers.

W. W. DEWEES, Street Road, Chester Co., Pa., has a complete Key Check outfit, worth \$15, with some blank terms Silver Checks, People's Practical Poultry Book (Lewis), \$1.50; Herbert's Hints to Horsekeepers, \$1.50; several volumes (unbound) of Scribner's Monthly, Atlantic Monthly, and Biblioplist, all recent, to exchange for Plymouth Rocks, White Leghorns, or offers. Apply by letter.

MANSON HOUSE, Tamaqua, Pa., will exchange 1 trio P. Cochins Fowls, 1 trio S. S. Hamburg Fowls, 1 trio G. P. Hamburg Chicks, 1 trio White Leghorn Chicks, 3 pairs Aylesbury Ducks, 3 first-class B. B. E. Game Hens, 10 pair Common Pigeons, 2 pair White Calcutta Fans, 1 pair Brown Helms, 2 pair Black Short-laid Tumblers, 1 pair White English Carriers, 3 Parrot Cages, 5 Single Exhibition Pigeon Cocks; also 4 Coops of Six Apartments, a lot of Waton's Roup Pills and Tonic Paste, for Buffalo Robes, Harness, Sleigh Bells, or offers.

JOSIAH BARTON, Yardville, N. J., will exchange 2 pairs of beautiful Ring Doves, 1 pair White Fan Hens, 1 Silver Pouter Cock, and good Tumblers, for Blue Owls, Blue Wing Turbits, White Trumpeters and Priests. Want good birds; same given.

E. R. MAYO, Fairfield, Me., has one L. B. C. Cock, '75, Felch, and 6 Hens and Pullets, pedigree given. Don. Leghorn Cockerels to exchange for those of another strain, and P. Cochins. Will exchange for S. S. Hamburgs, B. B. C. Bantams, Buff Cochins, Pea-comb P. C., or any variety of Bantams. No grumbling at postals.

THO. S. WEIDENHAMER, Milton, Pa., has 1 pair of Bald-head Tumblers, 1 odd White Tumbler Cock, 1 good Seven-shooter Revolver, 1 good Hunting Case Watch, silver case, worth \$15. 1 will trade for 1 pair White Jacobins, or offers in Fancy Pigeons. White Jacobins preferred.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

F. H. SCHWARTZ, Robisonia Furnace, Pa., wants some first-class L. Brahmas, (Duke of York strain), D. Brahmas, Golden and S. S. Hamburgs. Send your offers quick.

RABBIT BOOK FOR THE MANY.

Containing the HISTORY OF THE RABBIT from the earliest times. Descriptions with illustrations of all the show and fancy varieties, and full directions for their selection, breeding, and management; the treatment of their diseases, and the construction of their dwellings. Sent post paid on receipt of 30 cents. Address

FANCIERS' JOURNAL, Hartford, Conn.

WANTED.

1. A Treatise on the Art of Breeding and Managing Tame, Domesticated, and Fancy Pigeons; by John Matthews Eaton, and published by the author, 7 Islington Green, London. 1852. Illustrated.
The Treatise of 1858 is not wanted.

2. A set of Six Matchless Engraved Colored Portraits, Life Size, by Wolstenholme, viz: The Almond, Black Mottle, Red Baldhead, Yellow-beard Tumblers, Black Carrier, and Blue Pied English Pouter.

3. A colored Diagram, or a Plan of Building or fitting up a Pigeonary, embellished with Tumblers, Pouters and Carriers.

We think there are several different diagrams, and would like all of them.

4. A set of six splendid Life Size engraved Portraits of The Fancy Toy Pigeons, colored, viz: The White Fantail, Yellow Jacobin, Silver Owl, Blue Turbit, Black-mottled Trumpeter, and the Black Barb.

All of above pictures published by J. M. Eaton.

A liberal offer would be made for any of the above in good order. Any information regarding John Matthew Eaton's life and works would be gratefully received.

EDITORIAL

MR. A. D. WARREN AND THE POULTRY WORLD.

After our editorial in reference to the above, we met Mr. Warren on the cars and prepared for an unpleasant controversy, but not so. Mr. Warren held out his hand and gave ours a hearty shake and called us friend in the warmest terms, saying that we had acted the part of a *man* towards him at all times, and regretted very much that Mr. Stoddard had not printed his article as he had written it, but the following letter from him will fully explain itself, although he draws it on the mild side. The fact is, Mr. Stoddard's love of money gets the better of him, not only in this case but in many other similar ones. We do not blame him, we simply pity him, and sincerely hope that before he "shuffles off this mortal coil," some method will be discovered whereby he can take his money with him. Yes, he would have printed Warren's letter as received, but,—but what? "Why some reader of the *World* might see it, and buy a copy of THE JOURNAL that would not otherwise hear of it." The great (?) and noble (?) heeded Stoddard!!! He is too good for this world.

FRIEND WADE:

I am not disposed to love controversy, and am so busy now that were I disposed, I should be obliged to refrain from taking any extended part. Yet I can not allow you to have anything against me in the face, and eyes of a mis-understanding, if I can set such right. You allude to me in the editorial contained in your JOURNAL, No. 40, in such a manner that I must, to clear myself, say that any private correspondence I may ever have received has always been held as *sacred*; and you mistake both the sentiment and intention if you lay that charge at my door. You desired to prevent any outbreak between Mr. Herron and myself, and held back for a time, opening the controversy, hoping I would arrange matters with Mr. H., so that there would be no need for the outbreak which you knew would ensue, for this I certainly thanked you, and believe you acted from principle, and that a good one, but I could not act differently. In my September letter to the *World*, I gave you praise for the manner you had treated this case. I said: "Let me say here that Mr. Joseph M. Wade, editor and proprietor of THE FANCIERS' JOURNAL felt sorry to publish this outburst of Herron's and only did it, I believe, because I advised him strongly so to do." This you will admit is true on my part so far as I believed it. The *World* has made some omissions from my letter, and I will give you my own words exactly: "It may be that all of the readers of the *World* do not take THE JOURNAL, even if they did, many might have passed Nos. 22 and 25, which contains the so-called Herron controversy," then I said: "I trust the fanciers generally who do

not take the F. J., will purchase Nos. 22 and 25, &c." If Mr. Stoddard did not care to advertise THE JOURNAL, I am not willing to have myself charged with any *typographical error*. My original letter is ready at any time and you will see you have no reason to blame me. Very truly yours,

A. D. WARREN.

WORCESTER, MASS., NOV. 9, 1876.

A POPULAR BOOK HOUSE.

Amid the general dullness in nearly every business it is gratifying to note that the book trade is in a flourishing condition, more new books being turned out by the large houses than usual at this time, whilst the sales show a corresponding increase. This is mainly due to the advent of the cool evenings, which are always a reading time. There can be no solitude among intelligent people whilst books of every imaginable description can be had, and at such reasonable prices as now. The publishing house of T. B. Peterson & Brothers, No. 306 Chestnut Street, Philadelphia, Pa., is one of the most extensive and reputable houses in the country, have made liberal preparations for this season's trade. A large number of new books have been issued within the past three months, whilst others have been reissued whose previous editions had been exhausted, and this house can now boast of having one of the largest and best selected stock of books from which readers can wish to select. They will send their catalogue to any address if written for, and it contains a list of the writings of such popular authors as Mrs. Southworth, Mrs. Stephens, Mrs. Hentz, Mrs. Warfield, Miss Dupuy, Mrs. Wood, Charles Dickens, Charles Lever, Alexander Dumas, Wilkie Collins, G. W. M. Reynolds, George Sand, and many others.

CARDS, CATALOGUES, ETC., RECEIVED.

Oliver D. Schock, Hamburg, Berks Co., Pa., breeder of fancy poultry, and high class pigeons.

West End Poultry Yard, Elmira, N. Y. Geo. W. Chidsey, breeder and shipper.

Geo. E. Peer, 23 N. Clinton St., Rochester, N. Y., breeder of Trumpeters and Jacobins.

J. Potter, Pacific Hotel, Springwells, Mich., breeder of White and Pile Games.

Card of H. C. Wickes, 71 W. Clifford St., Prov., R. I.

Price list from Brookville Poultry Yards. Leo A. Dosch, Brookville, Montgomery Co., Ohio.

To the very many that have written us for Centennial posters, we would say, we do not know where they are to be obtained. Like rare old engravings, but a limited number having been issued, they have doubtless passed out of print.

POULTRY AND PIGEONS.

(For Fanciers' Journal.)

FANCIERS' MEETING AT THE CENTENNIAL.

The call for a meeting to be held in Judges' Hall, 3 p. m., Thursday, Nov 2d, was quite promptly responded to. John E. Diehl called the meeting to order, when some gentleman proposed Col. David Taggart of Northumberland, Pa., for President. The Col. being duly elected, the following named gentlemen were then chosen, and elected Vice-Presidents:

Philander Williams, Taunton, Mass., John E. Diehl, Beverly, N. J., Judge Luse, of Iowa, Daniel Allen, Canada, and G. O. Brown, Maryland.

G. O. Brown, Secretary.

Mr. Diehl stated the object of the meeting was to advocate and discuss anything that might further the interests of "thorough-bred" poultry, etc. It has been the usual custom of exhibitors, in such special displays at their close to thus meet for discussion, &c.

Mr. Magrane (N. J.) remarked it would be proper to propose a list of subjects to be discussed, among which he concluded that "express charges" would answer for one, and the prices of pure bred poultry both from a market, and fancier's value. Judge Luse mentioned, that the express charges be now discussed. Mr. Magrane added "we are all sore-headed upon this point, and know the extortion imposed upon us fanciers, by the express companies. A concert of action is necessary to induce any material change."

Judge Luse (Iowa) remarked that many breeders in the East shipped twenty pounds of poultry with forty pounds of box. In some parts of the country if sixty pounds is shipped, it is rated as one hundred, and in other places is rated at its actual weight. Had studied the matter for years, but cannot discover any method to reach the Express Companies.

Mr. Magrane suggested that perhaps some of the large breeders might give information how to ship, what kind of boxes, &c.

Mr. D. D. Bishop (Conn.) called attention to the Canadian baskets or hampers, which he understood could be purchased at reasonable figures. These baskets are osier, lined with mu-lin, and could be shipped to be owned, by the receiver, &c.

J. B. Smith (Conn.) advocated making light boxes; he generally used a cheese box, in which he fixed standards sufficiently high, around which was fastened canvas, or stout muslin.

Mr. Todd (Ohio) used dry goods boxes, used them by sawing off to 3 or 4 inches of bottom, then placing corner posts, and covered with laths. In winter, covered with sacking. In this way was enabled to ship a trio of mature Asiatics for 35 pounds, and other breeds proportionately. With the American and U. S. companies could always be secured reductions, but not with the Adams.

Mr. A. M. Halsted (N. Y.) stated that Express Companies received poultry in good condition, but delivered it in bad, sometimes dead. On flour, dry goods, &c., they made good all losses or damages, why should they make this notable distinction?

Mr. — (gentleman unknown to the Sec'y,) called attention to

the fact that at one time he had been in the employ of an Express Co., and that it is not generally known that the size of space the box occupies is taken into account by the companies as well as weight.

Mr. Williams (Mass.). The right man must be sent, one that has influence, in order to secure a hearing, the only way to get at the matter was to send a committee to consult with the President of the Adams, and if successful, other companies would rapidly follow. He gave an experience in sending birds west, upon one occasion being charged two hundred dollars expressage, which was just double what it should have been. All efforts to have the matter corrected with the agent proved impossible. Some months later meeting an officer of the company he mentioned the case, and was requested to send him the number of boxes, and their exact size, which was done, and an order was subsequently forwarded for \$100. Weight in the case had nothing to do whatever with the shipment. Boxes should be sufficiently large for the comfort of the fowls.

Mr. Halsted, on one occasion desired a Newfoundland dog forwarded to him by express. Enquiries were made of the supposed cost of transportation. One company demanded \$25. Enquiry was made if this amount was not a mistake. It was not. Another company was then visited, and all they asked was \$4.50. Mr. Williams, had he an order to ship a trio by Adams, if he could, would prefer to pay two or more dollars out of his own pocket, and send them by another company.

Mr. Best (L. I.) gave his experience on the manner he was imposed upon by Adams' Express company in N. Y.

Mr. J. B. Smith motioned a committee of three be appointed to confer with Adams' Express Co., carried. The president, Col. Taggart, thereby appointed as such committee, Messrs. J. B. Smith, A. M. Halsted and Philander Williams.

Mr. Bishop moved that steps be taken to harmonize the difference in judging between the English and American Standard and ideas.

Mr. Williams.—In importing birds from England we get fearfully disappointed, in one respect, in the *vulture hock*. England goes for shape and leg-feathering, but does not seem to care much for comb. Our friends from Canada accept the English Standard. He knew from observation if he had an order from Canada, for L. B., that what he would ship to a customer in the States would not answer. He thought with the exception of vulture hocks, in ten years England and U. S. would be something alike in ideas.

Mr. Magrane.—All the material difference between English fanciers and us is on Brahmas only.

Mr. Allen (Canada). They ignored the vulture hock with quills entirely, and there was no use disguising the fact that we must go to England to get good birds. No breeder here of twenty-five years standing, that could furnish them at all. There was too much trying to get new things into the Standard, which prevented the standard from being a fixed fact, &c.

Judge Luse—"The American Standard remains," and related an incident where two men were in a precarious predicament, when one suggested to the other to pray, all he knew was that little prayer, "now I lay me down to sleep," &c., well, replied the other, "say that, it's the best we've got." The Standard is the best we've got, stick to it. If we can secure a man that is competent to judge several varieties, it is preferable, and one man gives the best satisfaction; if he makes a mistake, he cannot lay it to his associate.

Mr. Bishop coincided with the sentiments expressed by the honorable gentleman from Iowa, and remarked if birds were imported, it was heralded and seemed sufficient as an advertisement, &c., even after setting up an American Standard, they import birds which are bred to an entirely different Standard. The Standard (American) enforced on judges is arbitrary. Birds were also shipped to England, that are scaled by the American Standard.

Mr. Diehl notified the fanciers present, that Adams' Express Co. had issued an order to the agents that poultry to be returned from the Centennial, must be prepaid. He had instructed his clerks to receive deposits from the fanciers who would leave before the close of the display, and give receipts for the same, so that there would be no trouble or misunderstanding. Mr. Halsted said exhibitors rather than put up with such imposition, should ship their birds to N. Y. by freight, in order to get them to some other Express Company.

Mr. Magrane.—The only difference between us and English fanciers is on Asiatics. Open judging in England—and point judging is gaining in favor there. Perhaps we may soon have an international method of judging. Judging as now conducted is faulty, and open to improvement, and the Standard needs materially altering.

Mr. Mark Pitman, (Mass.).—American breeders of distinction, are too much ruled by young men who want to make a Cochins a Brahma, &c. He could remember the first Brahmas he had tails like the Dorking, but they could not be satisfied with them, and now they have them bob tailed, &c. The big breeders have allowed themselves to be hoodwinked. Impossible to make English and American fowls be judged by the Standard, unless it be known as a Cochins or Brahma by shape. He went on on shape. Make a big picture, a drawing of a Light Brahma cock, rub out, remodel, until we get proper shape, and then breed for that style and shape.

Mr. Bishop acknowledged he could not have had his ideas expressed any better than Mr. Pitman has given them, &c. Adjourned *sine die*.

Geo. O. Brown, Secretary.

THE SPANISH FOWL.

BY W. J. NICHOLS.

IV.—BREEDING AND PREPARING FOR EXHIBITION.

When any kind of domestic animal is kept in confinement, one of the most interesting and instructive occupations connected with them is in matching, breeding, and rearing of their young. How carefully are they fed and all their wants attended to! How anxiously are the little offsprings watched as they grow and develop the various points we have been striving to produce; and, if our efforts to bring forth a more perfect specimen than has been seen before only proves successful, with what self-pride and gratification do we admire the results! It is this which makes the fancier, and at the same time affords the over-worked man of business a brief but most essential relaxation from his daily pursuits.

It is my intention on this occasion to give a few hints on the breeding and exhibiting of Spanish, and I hope my remarks may be found useful to those who have recently commenced to keep these birds.

Many poultry fanciers think it is a very easy matter to breed Spanish, for there is nothing but the face, comb, and style to be considered. To those who are of this opinion, I would say try them, and then they will soon find it is no easy matter to produce a really first class bird. Face is, of course, the first point, but not a mere inconspicuous mass of white hanging in numerous creases and folds which, when opened, almost sickens one from the horrible stench it emits, but a nice smooth surface, and yet we must not altogether despise those coarse-faced birds, for they are often very useful to breed from, especially when in and-in breeding has been carried on too closely, but for show purposes they ought not to be encouraged. One of the most successful hits I ever made in breeding was in matching one of these heavy-faced birds with some small but beautifully smooth-faced pullets which had not been crossed for some years; by this means I obtained a greater

size of face without the coarseness, and in the following year they bred the winning pullet at the Crystal Palace.

In selecting birds for stock purposes, the hens should be round and smooth in face and the lobes free from tucks or folds. This is of more importance in the hens than in the cocks, for if you breed from hens with badly-shaped lobes, most of the cockerels will have very bad lobes too. The combs should be small, hanging gracefully over one side of the head. I prefer the comb always to hang on one side rather than to see them change from side to side with every motion of the head. When this is the case they are generally very large and thin at the base, and unsuitable for breeding cocks with good combs. Occasionally a hen is seen with an erect comb, but do not breed from such a bird, for the cockerels will have wretched combs. Some fanciers object to breed from pullets. My own experience is that there is very little difference whether pullets or hens are used. I rather prefer hens; but these generally commence to lay so late that they are useless for early chickens.

The cock should have a large face, the white reaching well towards the back of the head, for I have noticed that birds with a good breadth of face seldom have a pinched or a ribbon lobe. He should have a bold, upstanding carriage, with good length of leg; this latter point is of great importance, for however large the face may be, unless there is plenty of leg, with a long neck to give the body a commanding and a graceful appearance, the face is never seen to advantage, and the bird looks over-laden in head and dumpy in body, for he cannot move his head with that freedom and grace so characteristic of these birds. Small and pretty combs are most desirable, but big combs are often the result of trying to get large faces, as I shall presently show.

Wry tails, squirrel tails, and round backs are common in Spanish, probably owing to the close in and in breeding, which has been carried on for some years. However good the bird may be in other points, never breed from any with either of these malformations, as a large number of the chickens will inherit the same deformities; and here I would just mention, be very careful when purchasing birds out of a selling class to see that they are without any of these blemishes, for many otherwise very good birds are put into these classes, and the judges, being tired or too much hurried to look the class carefully full through, frequently give a prize to Spanish only because they have a nice face.

Then there are birds with white feathers in their bodies, and also a few totally white; but these are unsuitable for breeding, and even when a few white feathers are seen in a pullet after two or three moults, she will become almost white. White legs are invariably a sign of old age, and those with black legs mostly show a smutty or dark appearance in the white of the face.

To exhibit Spanish in the best possible condition requires some amount of practice and a very great deal of patience. Trimming, or more properly speaking, plucking out the small feathers and hairs on the face to make it look whiter and rounder, is a very tedious labor; one bird often takes hours to do thoroughly, and unless done it is useless exhibiting. Only last week, at Colchester, I saw a beautiful hen—the best in the class—exhibited by Mr. Wright, but it was unnoticed from not being either washed or trimmed.

To prepare these birds for exhibition, it is necessary to keep them from the cold winds and out of the heat of the sun, for if exposed to either of these, the white will be flushed or pinky. The face must be thoroughly washed at least three times a week for a couple of weeks before they have to be sent away, and if half an hour is devoted to extracting small feathers out of the face with a fine pair of tweezers, the trimming will not be so troublesome. In washing, plenty of soap and warm water are all that is required, using a soft piece of sponge, and if there are any sores, taking care not to knock off the scab. Milk is used by

some, but this is a mistake, for it clogs up the pores and dirt soon accumulates. With cocks, when the white hangs in folds, after washing and thoroughly drying the face, if a little violet powder is dusted between the creases it keeps them dry and sweet. I have heard of all sorts of cures for scabby faces, but nothing equals a liberal use of soap and water and an occasional table-spoonful of castor oil given to the bird.

Frequent washing the face and lobes keeps them clean and free from sores, and makes them soft and supple, and often adds much to the length of the lobe. In washing or trimming, an assistant is not required, for by tying the bird's legs together, and letting their bodies rest between your thighs, sitting on a chair, you can hold them perfectly well.

As I have already stated, to exhibit these birds successfully it is necessary to keep them in confinement, moderately warm during the winter, and cool in the summer; but directly we shut them up then their combs are sure to increase in size, and this is especially so with cocks, their combs growing so large that they are often quite unfitted for exhibition; to prevent this as much as possible, various plans have been invented, but I have found none answer so well as a stout piece of wire bent after the shape of the illustration, and fixed on the head. The two points A, which do not

come quite to the front of the comb, are tied together with fine string or cotton, B going round the back of the comb close to the head, and C keeps the comb erect. Whichever side the comb has a tendency to fall towards, of course, the C must be made long enough to reach nearly to the end of the comb. By this means a drooping comb can be made to stand erect for several days, and numbers have been kept from falling over when a bird has been unwell or out of condition. I have seen combs kept erect by using thin pieces of wood, but this is a far more troublesome and clumsy plan.

Another practice, which has been done only within the last two years, is to cut away a large piece off the back of the comb to prevent its lopping over, and a great many birds have received prizes, although mutilated in this way. Every Spanish breeder knows that to get a good comb, well set on the head, is quite as difficult to get as a good face, and more difficult to keep in proper order, and yet judges will give prizes to birds with cut combs. This I think a great mistake, and I do hope we shall see no more birds with cut combs carrying off prizes; but rather let judges encourage small and pretty combs than sacrifice everything for face alone; if they will only do this I am sure we shall get smoother faced birds, which will not require large pieces of white to be cut away from over the eye or between the beak and eye. At present, if we look carefully through a class of Spanish cocks there is hardly a bird to be found which has not had either its face or comb cut, and, of course, it is not the best birds that win, but those which have been most artistically "faked." At Portsmouth show the first and second prize cocks had been terribly cut both in face and comb, and, when I taxed one of the owners, he said, "I did not do it." What ought to have been done with these birds was to have disqualified them, or at least to have passed them, as was the case at Colchester with the winner at Ports-

mouth. But so long as prizes are awarded to birds with cut combs and faces, we shall only go on breeding birds with large, coarse combs and face.

As an old breeder and exhibitor of Spanish, I would much rather see a bird with a smaller face, a pretty comb, and a good carriage, win a prize than the cut and mutilated specimens with nothing to recommend them but their exuberance of face and lobe.—*The Country.*

FEEDING CHICKENS BY MACHINERY.

Some two years ago, in one of my frequent visits to Europe, while in Paris, my attention was attracted to a new machine for feeding chickens at the rate of 400 per hour, and fattening them to almost double their original weight in the short space of eighteen to twenty days.

I thought this was an ingenious invention, but, like many others, did not realize that it would ever be practicable. I did not believe that fowls could bear such treatment long, say nothing of their getting fat on it. In this, however, I was mistaken, for on my last visit the past summer, I found the "Martin" machine in general use, not only by men who make a special business of raising fowls for market, but also by farmers and gentlemen living in the country.

I thought a description of the machine would be interesting to that part of your readers who busy themselves at poultry raising, either for a special business, an accessory one, or for home consumption. I give it to you as witnessed by myself, in full operation for over one year in a farm house, with the best of results.

The machine I inspected in detail is built to accommodate 400 lodgers; it is located in a clean, well-finished barn, about twenty-five by forty feet, with ample sky-lights and windows to give it a cheerful, and almost out-door day-light appearance. It contains over 300 fowls of all descriptions, every one looking happy and contented, not to have to search for a living.

At an elevation of about three feet from the ground stands a cement circular bed of forty feet circumference, having a slope towards a hole in the centre to allow water to run out freely from a waste pipe connected with it. From the centre hole rises an iron shaft, well secured at the bottom, and at the same time revolving easily. From this shaft project numerous iron arms, holding out, what I shall call a large wooden drum, about forty feet circumference, the whole revolving at the least touch. This drum is the strange coop that I am to describe.

It is eight tiers high, each one fifteen inches in height, every tier divided into small cells, nine inches wide and eight inches deep. By this we see that the thickness of the drum is only eight inches. The rest of the circumference is all unobstructed, except by the iron arms supporting the drum. Each cell is open in front, in the shape of a heart, to give the fowls plenty of air and exercise, as far as thrusting their heads out is concerned, for it is all they can do. They are secured by one leg by a small chain, and the width of the cell is such that they cannot turn around. The back of the cells is completely open, and the depth being only eight inches, as I said before, there is no occasion for dirt of any kind to rest in it; it naturally falls inside of the open circumference and on the cement platform, already mentioned.

Twice a day the keeper will enter the drum by pulling out some cells arranged for that purpose, and using plenty of water keep the place as clean as possible, the waste in the centre carrying all dirt and water to a cistern where it is kept for gardening purposes.

Now that we see the drum all occupied by the feathered tribe, all anxious for the dinner hour to come, I will try to describe the feeding machine as well as I can.

Within a few inches of the drum, and between perpendicular beams, well secured and lined with iron sliding ways, is an iron tank, capable of containing, say forty gallons. In this is the food,

composed of skimmed milk and corn meal, the mixture having a semi-liquid consistency; no water is given. On the top of the tank stands the keeper, who, by a crank at his right, can elevate or lower himself and machine, as may be required, to reach or enter of cells after another. Every cell is numbered, and a place is reserved to write the date of entry. We will begin, say at cell No. 1, on the lower tier. The keeper takes hold of the head of the fowl with his left hand; with his thumb he opens the beak, and with the right thrusts an india rubber tube into the throat of the chicken, or whatever the fowl may be; then with his left hand he closes the beak and makes it as tight as possible, while his foot, pressing on a pedal, works a pump that forces into the fowl the necessary amount of food. Some require more than others, but the keeper knows his boarders, and he has in front of him a gauge in the shape of a dial, the hand of which shows exactly the quantity absorbed. This dial he watches carefully as he presses on the pedal, or else he might burst the crop of the fowl.

The instant this is done the keeper lets go of the fowl and the work is over, the fowl simply making the motion that we see in any animal that has eaten too fast. One undeniable proof that it does not hurt the fowl is that as their turn comes to be fed, you can see them projecting their necks out in hope to advance the time of their repast.

No. 1 being satisfied the keeper moves the drum and brings No. 2 in front of him, and so on until he has gone through one row of cells. Then he turns the crank just enough to bring himself and machine at a convenient height to work tier No. 2 easily; then tier No. 3, 4, 5, 6, &c. Fowls are fed three times a day—at day-light, noon and sun-down, and the place thoroughly cleaned twice per day. The fowls, chickens in particular, will fatten to almost an incredible size in a very short time, and when split open will show a very healthy condition.

The machine is kept in operation constantly, from the fact that in France chickens are hatched the year round by both natural and artificial means, and the result is that fat and tender chickens are to be found in the markets at all seasons.

Should any of your readers require more details, I will be able to furnish them in a few days.—*Alexis Godillot in American Grocer.*

CHESHIRE COUNTY ASSOCIATION.

The annual meeting of the Cheshire County Poultry and Pet Stock Association was held here Thursday. The following board of officers were chosen for the ensuing year:

President, Hon. Horatio Colony, Keene.

Vice-Presidents, Hon. Edward Farrar, Keene; Daniel W. Tenney, Marlboro'; Hon. James Burnap, Marlow; Dr. O. H. Bradley, Jaffrey; Jos. B. Abbott, Richmond; Noah W. Hardy, Nelson; Dr. Samuel Richardson, Marlboro'.

Secretary, John W. Sturtevant, Keene.

Assistant Secretary, Lucius C. Doolittle, Keene.

Treasurer, Geo. A. Litchfield, Keene.

Executive Committee, M. J. Russell, Harrisville; P. Frank Amidon, Hinsdale; Jas. H. Morrison, Marlow; Wm. Reed, Westmoreland; Edward A. Pickering, Ashuelot; Curtis G. Britton, Keene; C. E. L. Hayward, Peterboro'; J. Frank Emmons, Keene; E. R. Spaulding, Jaffrey; Geo. D. Wheelock, Keene; Edward Spaulding, Keene; Chas. H. Powers, East Jaffrey; Clark F. Rowell, Keene; Scott W. Bullard, Keene; Geo. D. Wheeler, New Ipswich; Fred K. Pratt, Keene; E. E. Lyman, Keene; Theron Hayward, Gilsum; Geo. W. Eastman, Swanzey; Geo. B. Holland, Walpole; Henry H. Tenney, Keene.

Auditing Committee, Wm. P. Chamberlain, Keene; S. A. Gerould, Jr., Keene; Jas. H. Fisher, Keene.

The Exhibition will be held at City Hall, Dec. 19, 20, 21. A liberal premium list will be ready for distribution soon. Everything indicates an unusually fine show is predicted. The Treasurer's report shows \$124.11 in the treasury.

"THAT CORN,"

Place, Wingshot, was not the only question to be answered to make "that corn acceptable to the beginner." There was another. "What breed do you keep?" Which question your "Johnny" answers. Yes, with *Games*, I should think you might find corn profitable to feed any where, in any quantity, and for all time.

As some one once said in *THE JOURNAL*, "The nervous breeds require more food, and that of a different character from those breeds whose characteristic is the making of fat and flesh." Feeding a nervous bird is like feeding a fire in a stove of good draught, and every draught open. There's a constant destruction of material. Take two persons, one fleshy, phlegmatic, the other thin, nervous. Which requires the greater amount of food? The one quiet, suffers but little waste, whereas with the other the waste, the expenditure, is constant. Though they sometimes say of themselves, they "eat so much it makes them poor to carry it around."

It won't do for you with your *Game* experience to advise Young Breeder with his Lt. Brahmas, unless it is with malevolent intent.

ELIPHALET STOWELL.

A NOVEL EXPERIMENT.

MR. EDITOR:

A gentleman, Lt. F. E. Pierce, 1st Infantry, Fort Randal, Dakota Ter., in writing me upon a business matter, gave me his method of experimenting with Leghorn Cocks' combs to prevent their freezing in that cold latitude. The idea seemed so novel to me that I will give it to you, as it may be of use to some of your readers who are fanciers of this fine fowl, and who live also in cold climates.

"It is so cold here that it is very difficult to keep fowls during winter without their being frozen. Especially do the combs of White Leghorns suffer; and this winter, the combs of my Light Brahmas were a little touched.

"As an experiment, I took two W. L. cockerels with very large combs, and made caps of flannel, which were made to fit nicely, and then slipped on from the rear of the comb, and fastened by passing a fine platinum wire through the cap, and the top of the front of the comb, and twisting the ends together. It has worked well. The caps have remained in their places, and on examination not a particle of the comb is frozen where the cap covers it, although they have run out all winter. The thermometer has stood on one occasion, 44° below zero, and frequently 39, 35, 28, 23, 19, &c. below. During one 24 hours it was not once above 19° below.

"I did not succeed so well with the wattles, as the sacks made for them would not stay in place, and could not be fastened so as to cover the whole. Where covered, however, they are perfectly preserved."

This is a simple device, and by its application many a Leghorn's comb might be saved, and, having the idea, a little ingenuity on the part of the experimenter may contrive a plan to succeed in shielding the wattles as well as the combs.

Yours truly,

A. M. DICKIE, M. D.

SECOND ANNUAL POULTRY SHOW.

The Second Annual Exhibition of the Genesee Poultry Association is announced to commence in Batavia on the 10th day of January next, and continue the six following days. There is every indication of a very large exhibition of Poultry, Pets, etc., and we would suggest to those intending to exhibit to select the best birds from their flocks now, and have them in proper condition for the Show. The premiums will this year be very liberal and the managers contemplate to get up an exhibition worthy the Genesee Country.

THE POULTRY CENTENNIAL.

The display of poultry and pigeons in the Pomological Building, on the Centennial grounds, hardly came up to the "great expectations" of the attending or visiting fanciers. It seems, or rather proved, that the "Lord Clyde" steamer story was a *hoax*. The arrangement of the coops was well enough, but the distribution of fowls in them was too scattered, and the varieties, also, *not* placed, as they should have been, together; consequently some of the rows had but few coops with fowls in. It must, however, in justice to Mr. Diehl, be added that, as he remarked, had not his hands been "*tied with red tape*," the arrangements would have been—*would have been, etc.* As the poultry was thus scattered, it was difficult to carry in memory the points of one pen of birds, to compare with another in a different part of the hall. As to scaling them, we made the attempt, but the *crowd* was too intense, too demonstratively inquisitive, etc. Light Brahmas were great est in numbers; some excellent specimens, and some *not*. Mr. A. B. Todd is said to have reported that he sold a pair for \$125. Darks, there were but few coops, and, with one or two exceptions, not remarkably choice birds. P. Cochins, as a class, were rather better. Those "under one year" being in several pens very excellent. In Buffs we were somewhat disappointed,—none, to our idea, being good and even in color. Symmetry, size, leg feathering, were in many instances all that could be desired. White Cochins, there were a dozen and a half coops; among them, many really extra specimens. For the number of coops, the Whites might be considered more for *quality* than quantity. Black Cochins, only a few specimens, but generally good, with the exception of legs, which were too *dark*. Games were a good class, showing many fine birds, and some *pit* bred birds also. Hamburgs, especially the S. S., we were disappointed in, hardly any of the nine coops exhibited (excepting one coop of Mr. Seavey's,) containing birds of as high standard as the Boston or Buffalo shows bring out. G. S. were more numerous in numbers, and, with a few exceptions, miscellaneous only. The S. P. variety contained some choice hens and pullets, uniformly and fine marked; much better than the males. G. P., only a few coops, to which can be applied the remarks on S. P. Blacks, over a dozen coops. Coop No. 1, "under one year," being, to our idea, the best in the class. Black Spanish, 15 coops, containing some really good, and some *really* bad specimens,—some very warty-wrinkly-faced-birds, that should not have been in a show-pen. White Leghorns, thirty-one coops, among them some very choice birds. In many cases, however, the cocks' tails approached too near the squirrel order. Browns, there were twenty-six coops, some notably good in combs, ear lobes, plumage, and style. Dom. Leghorns, three coops, of medium quality only. Some meritorious Dorkings, Warner taking the lead in numbers, if not in quality also. Houdans, generally good, though some deficient in crest,—more notable in the males—and the fifth toe in many instances not properly developed. Creves and La Fleche, three coops, two of first named and one of latter, all good birds. Polands, white, were only an average class. Silvers were better, and contained some fine specimens. P. Rocks, twenty seven coops, with several really choice pairs,—but few with perfect yellow legs. In many instances, the genuine P. R. shape was wanting. Dominiques, a baker's dozen of coops, and none of extraordinary merit. No doubt "our opinion" will not be relished by some of the exhibitors, and we can only offer in palliation to what we say *pen-sively*, that no doubt neither they nor their stock are to blame—but our *ideas* and *expectations* are perhaps a little *balloonish*. So let us add in advance, that, gentlemen who will *bless* us, we forgive you. Bantams, in nearly every class, were well represented, with many beauties. The finest specimens of Bronze Turkeys we ever saw were exhibited, and a grand pair of Wild, from Mr. James Storm, of Missouri. The

White Hollands were also good, both in plumage and size. The specimens of Geese were also good, as were likewise the several varieties of Ducks. The great attraction—the *greatest*, I should say, were the magnificent Silver, Golden, and Ring-necked Pheasants, exhibited by Messrs. Seavey, Rooke, and Waefelaer. The Canadian birds were allotted a space by themselves, and generally speaking, their birds were of a better average quality than the American bred. The Asiatics being noticeable for prodigious leg feathering, with marked presence of *hack* feathers. The Games were strongly represented by Mr. Allen, with some very high class birds. The Houdans were also good, but in many instances had scaly legs and bad feet. Polands, good, the W. C. P. the best we have ever seen. Bantams also fine. Ducks, few in numbers, but in nearly all instances of uniform good quality. Pigeons, there was a grand and extensive display of wonderful fine specimens. Among the largest exhibitors were Messrs. Cahill, Seavey, and Newell. I leave them for some of your pigeon fanciers to talk about.

One of the great "*episodes*" to be long remembered in connection with this "show" was the "*Fanciers' Centennial supper*," held at assembly rooms, Tenth and Chestnut streets, and was attended by the following fanciers:

Philander Williams,	Geo. W. Bradley,	S. H. Seamans,
E. D. Crownshield,	R. F. Shannon,	T. L. McKeen,
Alson B. Todd,	C. H. Hawkins,	F. F. Corson,
C. W. Chamberlain,	Mark Pitman,	C. Fitzgerald,
D. C. Waterhouse,	W. T. Rogers,	Z. C. Luse,
G. O. Brown,	A. M. Dickie,	W. H. Dool,
Jas. A. Storm,	W. T. Eisenhart,	G. W. Fredericks,
W. Sanderson,	M. H. Bardwell,	Philip Rogers,
H. Enos,	John Parker,	John D. White,
Geo. F. Seavey,	Daniel Allen,	A. C. Nellis,
F. W. Robertson,	P. F. Amidon,	J. C. Long, Jr.,
H. H. Black,	D. D. Bishop,	W. H. Hutlick,
D. H. Brown,	C. J. Ward,	G. A. Atkins,
A. P. Groves,	E. M. Deyo,	J. D. Nevins,
		J. E. Diehl.

Several gentlemen came in after we were seated at the supper table whose names I did not get. As it is, the list embraces a representation of fourteen States and the Canadas,—pretty good for an impromptu meeting. I believe the affair was originated by Messrs. Pitman and Diehl. Remarks were made by Mr. P. Williams, chairman, and vice-presidents of the evening as follows:—Judge Z. C. Luse, Iowa; C. J. Ward, Ill.; W. T. Rogers, Penn.; J. E. Diehl, Penn.; G. W. Fredericks, S. H. Seamans, Wis.; and D. Allen, Canada. Also by D. H. Brown, R. I.; P. F. Amidon, N. H.; D. D. Bishop, Conn.; G. O. Brown, Md.; Jas. A. Storm, Mo.; W. H. Todd, Ohio; and Mark Pitman, Mass.

Although it was a temperance supper, there was a full flow of spirits *à la* good humor; and the courteous and friendly greeting of fanciers was of such a nature as to cause all participants to be glad they were present, and no doubt the affair will be pleasantly remembered by us all. Such social intercourse is beneficial to the fraternity, and indulgencies of this kind should be more frequent.

Yours very truly,

CENTENNIALIST.

Some time ago on buying a fine rooster which did not show up good, the seller remarked that he would be all right in a day or two as he had been under cow (cowed). We thought no more of the matter until we overheard (a day or two afterwards), Jimmy, our Irishman, remarking to a friend of his. "Come Mike, till I show you the rooster that the cow laid on." The answer was "be jabers, it must have been a very small cow."

PIGEONS.

Very convenient baskets are now made of the cradle form, with partitions, or separate apartments. They serve for the carriage of pigeons for matching, or putting them up to fatten, or for any other of the usual purposes. I have seen them lately, in the basket shops on the Greenwich road, two or three miles from London. Food and water should be given in such a way as to be as little as possible contaminated with the excrement or any other impurity. Our pigeons having been constantly attended, we have never found the need of any other convenience than earthen pans; but there have been ingenious inventions for this purpose, of which the meat box, and water bottle following are specimens. The meat box is formed in the shape of a hopper, covered at the top to keep clean the grain which descends into a square, shallow box. Some fence this with rails or holes on each side, to keep the grains from being scattered over; others leave it quite open, that the young pigeons may the more easily find their food.

The water bottle is a large glass bottle, with a long neck, holding from one to five gallons, its belly shaped like an egg, that the pigeons may not light and dung upon it. It is placed upon a stand, or three-footed stool, made hollow above, to receive the belly of the bottle, and let the mouth into a small pan beneath. The water will, in such wise, gradually descend out of the mouth of the bottle as the pigeons drink, and be sweet and clear, and always stop when the surface reaches the mouth of the bottle.

To match or pair a cock and hen, it is necessary to shut them together, or near, or within reach of each other; and the connection is generally formed in a day or two. Various rules have been laid down by which to distinguish the cock from the hen pigeon; but the ma-culine forwardness and action of the cock is, for the most part, distinguishable.

INCUBATION.—The great increase of domestic pigeons does not proceed from the number of eggs laid by them, but from the frequency of their hatching. The hen lays but two eggs, and immediately proceeds to incubation.

Having laid her first egg, she rests one day, and, on the next, lays her second egg. They usually stand over the first egg, not sitting close until they have two, whence both the young are hatched about the same time: there are some exceptions, however, to this rule of nature, and the hen having sat close at first, one young bird may be hatched a day or two before the other. They often spoil their first eggs from inexperience.

The period of incubation is nineteen or twenty days from laying the first egg, and seventeen or eighteen from the last. The labor of sitting is equally divided between cock and hen, excepting that the hen always sits at night. She is relieved in the morning by the cock, which sits during the greater part of the day. The business of feeding the young is also divided between the parents; and the cock has often brought up the young, on the accidental loss of his mate. Should not the eggs be hatched in due time, from weakness, some small assistance may be necessary to extricate the bird from the shell; or should they be added, it is generally held necessary to provide the cock and hen with a borrowed pair of young, or at least one to feed off their soft meat, which else may stagnate in their crops, and make them sick; but as young ones for this purpose may not always be at hand, the exercise of flying, fresh gravel, and those saline compositions generally given to pigeons, are the proper remedy. Added or rotten eggs should be immediately removed.

Pigeons are extremely liable to be lost by accident, and that which is unaccountable, although they will find their way home from such great distances, they nevertheless often lose themselves in their own neighborhood. Should a cock or hen be lost during incubation, the eggs will be spoiled in twenty or thirty hours, and may then be taken from the nest; but if the accident happen after

hatching, the single parent left will feed the young. Should both parents be lost, the young are very easily accustomed to be fed by hand with small peas or tares, much preferable to barley. We did not find any necessity for recourse to the old housewife's instrument, a hollow reed.

THE POWDERED OWL, MAHOMET, AND DAMASCENE PIGEONS.

It is mentioned at page 301 of Mr. Fulton's "Book of Pigeons," that the late Mr. Matthew Wicking "was the first to invent, or produce, or introduce the color known as powdered blue." I believe Powdered Blue Owls were in existence last century, but Mr. Wicking may have produced them for himself. Mr. Moore in the "Columbarian" (1735) says of the Owl, "This Pigeon is in make and shape like the former (the Turbit), except that the upper chap of its beak is hooked over like the Owl's, from whence it has its name. Its plumage is always entirely white, blue, or black." He says nothing as to the blue being in any way different from other blue Pigeons, so that I would suppose Powdered Blues were not known to him. The colors of the Owl in his day are the colors of the African Owl now, except as to Pied Blues and Blacks, the result of breeding white and colored birds. Coming to the Mahomet, Moore says, "This Pigeon is no more in reality than a White Barb," and he then describes how it gets the name of the Mahomet. Thirty years later, in 1765, appeared the "Treatise on Pigeons," dedicated to John Moore. The author, after quoting Moore's description of the Mahomet, says, "So far Mr. Moore, and I think he has extremely well accounted for its being so called; but it is the opinion of many fanciers that the bird called a Mahomet is nearly of a cream color, with bars cross the wings as black as ebony; the feathers very particular, being of two colors, the upper part or surface of them appearing of a cream, and underneath a kind of sooty color, nearly approaching to black, as are likewise the blue feathers and even the skin, which I never observed in any other Pigeons but these; its size much like that of a Turbit, with a fine gullet, and in lieu of a frill the feathers rather appear like a seam; the head is short, and inclined to be thick; hath an orange eye and a small naked circle of black flesh round the same, and a beak something resembling that of a Bullfinch, with a small black wattle on it." Now, referring to Mr. Ludlow's portrait and Mr. Caridia's description of the Damascene in Mr. Fulton's new book, there is no doubt that the Mahomet of 1765 and Damascene of to-day are identical. The head, beak, gullet, and seam all tell of its relation to the Owl tribe, and no other Pigeon I know of would do so well to cross with the Owl; in fact, I think that between 1735 and 1765 the cross was made, for the author of the Treatise says of the Owl, "The blue ones should have black bars cross the wings, and the lighter they are in color, particularly in the hackle, the more they are valued." Is not this the description of a Powdered Owl? The Mahomet or Damascene is the powdered color to the highest degree. I lately mentioned this idea of the origin of the Powdered Owl to Mr. Caridia, and he agreed with me. He says, in his description of the Damascene, "This variety, in my opinion, is one of the most useful for experimental purposes."

Mr. Wicking may have discovered a remnant of the breed of Powdered Owls, being a very keen fancier, but what I think more likely is that he got hold of the Damascene or Mahomet, and made the cross himself. He may have had the very pair of birds mentioned by Mr. Brent. In Mr. Brent's book, page 26, he gives the description of the Mahomet from the Treatise of 1765, but says he does not remember having seen any such birds. Again, at page 109 he gives the points of the Mahomet as follows:—"Black wattle and cere; sooty skin and down; seam on

the breast; soft silver color [a more true description than cream]. No harm in offering a class, but I fear the bird is extinct." However, after he so wrote he appears to have seen a pair of these Pigeons, for I find in Mr. Tegetmeier's book of Pigeons, page 133, and in Eaton's treatise of 1858, page 102, the following:—(Brent). "This (the Mahomet) is one of the varieties of fancy Pigeons with which I have but a very slight acquaintance, having only once seen a pair at a London dealer's, and their appearance gave me the idea of a cross between an Owl and a Barb Pigeon; nevertheless, their seam and black wattle, cere, and skin I consider sufficient distinctive peculiarities to give them a place among fancy Pigeons as a separate variety. It is very probable that the present relations existing between this country and the Sublime Porte may cause the introduction of other varieties of Pigeons from the East." And has not Mr. Brent's idea come to pass in the introduction by that grand Pigeon-fancier, Mr. H. P. Caridia, of the beautiful gems the Turbeteens, Satinettes, Blondinettes, &c., from Asia Minor? Who so likely as Mr. Wicking to get hold of the pair of Mahomets seen by Mr. Brent at the London dealer's? He might have lost one of the pair before they were acclimated, and the most likely match for the survivor would be a Blue Owl. Mr. Fulton says, "Great was the surprise of many London fanciers when the new and startling beautiful color came upon the stage. The first we ourselves saw was about the year 1854. The color was produced—very likely partly by some lucky chance—by crossing Blues and Silvers, and it is most singular that, so far, crossing it with any of the small foreign specimens seems to overpower it, and it dies out." If my theory is correct the Powdered Owl is only after all half-bred as regards powdering, and therefore it is no wonder the color goes when crossed with the dusky Blue African. But if some experimental breeder would make the cross anew between the Damascene or Mahomet and the Blue African better results might follow, and certainly the produce would be better in head and beak than any Powdered Owls I have seen. Mr. Fulton says, "It was well put once in our own hearing by that old and much respected fancier Mr. Esquilant, who remarked that the only certain way of seeing a really true-bred English Owl now was to see a Powdered Blue." This is as much as to say that other English Owls than "Powdered" birds have been crossed with the African breed to improve them. No one after looking through Mr. Fulton's book will need to be told that Mr. Ludlow is not responsible for the coloring of the plate of English Owls. Some one has made a mess of it. The publishers would do well to publish a fresh plate, as it mars the whole book.—JAMES C. LYTLE, in *Journal of Horticulture*.

CORRESPONDENCE.

Will some Fancier inform me through THE JOURNAL the best disinfectant for pigeon-lofts, and oblige,
H. T. W.

[A free use of lime, both air-slacked, and in the shape of white-wash. Also cleanliness. Ed.]

FASCINATION—PHOGA IN ANSWER TO J. M. McCANN.

My article was written without consultation with any authority, and was the result of my own observations. I had never heard of Dr. Barton's Memoir (not being given to collating essays on Natural History from libraries) but have since made search for it, and found it in Bingley's Animal Biography (1805), and am sorry it is too extended for use here—but the following quotation from it may have escaped Mr. McCann's notice: "The result of not a little attention has taught him, that there is but one wonder in the business;—the wonder that the story should ever have been believed by any man of understanding and observation."

"I have yet to learn that there is any variety of bird or squirrel that would willingly sacrifice its life in defence of its young," says Mr. McCann. His observations of nature are very limited indeed if he does not know that birds and squirrels will make a vigorous defence of their young. It is an indisputable fact that they sometimes lose their lives in defence of their young, and are sometimes the victors. Birds and animals, like human beings, possess different degrees of courage, and so, the demonstrations are not always the same.

The following from the article on the Mocking-bird, from Cassell's Natural History, seems to have been taken from Wilson's Am. Ornithology, where it appears in substance, with but a little change in phraseology.

"During the period of incubation, neither man nor animal can approach the nest without being attacked, and cats are speedily made to fly. But the bird is especially enraged by the black-snake; no sooner is this reptile discovered, than the male darts on it with the rapidity of an arrow, and, dextrously eluding its bite, strikes it incessantly and violently on the head, where it is

very vulnerable. As the snake becomes sensible of its danger, it tries to escape, but the mocking-bird is thus encouraged to redouble its exertions, and unless its antagonist be very large, it often succeeds in destroying the foe. As the strength of the snake begins to flag, the bird seizes it and lifts it up partly from the ground, beating it with its wings; and when the work is completed, the bird returns to the nest and pours forth a song in token of victory."

The Ferruginous Mocking-Bird—Cassell's Nat. History.

"The admirer of woodland melody may well look on the engraving given on page 121 with the liveliest interest. A snake has attacked the inmates of the nest, while it is defended with a courageous spirit by the male bird, as he exerts all his powers to extricate his beloved mate from the coils of the reptile, which has almost deprived her of life. At the call of the mate, another bird of the same species has come with a rap flight, and with his bright eyes fixed with deadly hate, he is prepared to attack the snake; while a third is grappling with the reptile, and intent on tearing its skin from its body. Who will not wish the bird to be victorious, and their united assaults to be fatal to the invaders? The desire was happily realized, for Audubon, who relates the fact, says: "The snake was finally conquered, and a jubilee held over his carcase by a crowd of thrushes and other birds", until the woods resounded with their notes of exultation. I was happy in contributing my share to the general joy, for, on taking the almost expiring bird into my hand for a few minutes, she recovered in some degree, and I restored her to her anxious mate."

Mr. Bartram, in a note quoted by Wilson in his *Am. Ornithology*, says—"Yesterday I observed a conflict, or contest between a cat-bird and a snake. It took place in a gravel walk, in the garden, near a dry wall of stone. I was within a few yards of the combatants. The bird pounced or darted upon the snake, snapping its bill; the snake would then draw itself into a coil, ready for a blow; but the bird would cautiously circumvent it, at a little distance, now and then running up and snapping at it, but keeping at a sufficient distance to avoid a blow. After some minutes it became a running fight, the snake retreating; and at last it took shelter in the wall. The cat-bird had young ones, near the field of battle."

To be Continued.

TENEBRIS MOLITOR—A QUERY.

In the article "the meal worm," it is spoken of as the "dark loving miller," and "is one of the many species of beetles which love the darkness, and which when exposed to the light, do all they possibly can to get back into the darkness again." Can "P. P." or any one interested in these insects or in general natural investigations give a reason for this shunning—avoidance of the light? Does the light cause pain? If so what portion of the insect is so sensitive to its action? Can we not go still further and ask the special place the "lovers of the dark" fill in Nature's economy? What part have they to play that they are so compelled to it by this peculiar sensitiveness, a sensitiveness not individual, but so general as to characterize a species?

Q. C.

—The *Charleston Journal of Commerce*, of November 1, says: "The city was swarmed last night with several species of birds, some resembling very much the dove, but considerably smaller than that bird, and other small birds, about the size of the sparrow, resembling nonpareils. These little visitors made their appearance about nine o'clock in large numbers all over the city. They could be seen skimming the pavements, dodging into the corners of the doors and windows. One gentleman on Market street caught twenty-six in his store in a short time, and caged them in his show case. The *Journal of Commerce* office was attacked by them, and the windows of the composing room had to be shut down to keep them out. Scarcely

tains say they indicate that there has been a fearful storm in some locality, and that these birds have been driven from their abode by the storm. They are evidently a species of bird from far off, and not accustomed to our climate, as they appear to be very much at a loss here."

—WHAT CAME FROM THE WELL.—The Salisbury (Del.) *Sentinel* says:—"On Saturday morning, Mr. Samuel J. Turner drew up from his well, in the water bucket, a most curious reptile. The thing, which looks something like a huge lizard, is about twelve inches long, and is of a dark brown or leaden color, with dull yellow spots over his entire body. It has a head like a frog, is white under the throat, and its breathing-holes are situated on the top of its upper jaw, in the same manner as a porpoise's. It has four legs and a large flat tail, about the same length as the body. With this tail it can propel itself through the water at a very rapid rate. It is by some supposed to be a triton or water-newt, but Dick says that it is a spring-feeder, and that if he is removed from the well, the well will go dry, as his mission is to keep the springs open, and they generally go in pairs."

YOUNG FOLKS' CORNER.

For the *Fanciers' Journal*.

INDICATIONS OF WINTER.

The leaves are falling from the trees,
And coldly blows the Northern breeze;
The *Humming Bird* has taken flight
To Southern regions warm and bright,
The *Butterfly* no more is seen;
The *Frog* in coat of rus-set green
Is in some spring securely hid.
And silent is the *Katydid*;
The *Grasshopper* is heard no more;
The *Squirrel* hath laid in his store
Of nuts, in some old hollow tree,
And dormant lies the honey *Bee*,
The noisy *Locust* too is dead,
The *Cat-Bird* to the South has fled;
The croaking *Tree Frog's* voice is still,
We list in vain for *Whip-poor-Will*.
The *Fire Fly* with its sparkling light,
No more illumines the glade at night,
The *Dragon Fly*, with gauzy wings,
The *Hornet* with his pointed sting.
And many other insects gay,
Have with the Summer passed away:
The *Turtle* too has ceased to crawl;
The *Tumble Bugs* to roll their ball;
No more the *Lizard* sports around,
But hibernates beneath the ground;
Beneath some stone, or in some brake
Lies hid the deadly *Rattlesnake*.
The sprightly *Bat* no longer sails
Around, when evening shade prevails.
The *Crane*, the *Scaup*, *Rail*, and *Swan*,
Have to a warmer climate gone:
Wild Ducks and *Geese* from Northern lake
A Southerly direction take.
The *Beaver* has retired to dwell
Within his ice bound citadel;
Fair *Flora's* Summer reign is o'er,
Bright flowers bedeck the vale no more.
The woods and fields look quite forlorn,
The air feels chilly night and morn;
All vegetation at a stand,
Denoting winter near at hand;
Thus nature forcibly and clear,
Points out the seasons of the year,
And seems to say to great and small—
A Providence reigns over all,
No matter where the power may lie—
Beneath the earth—above the sky—
A voice through all Creation cries:
The *voice of Nature* never lies.

PEPPER CORN.

(For Fanciers' Journal.)

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending Nov. 9th, 1876.

RECENT ARRIVALS.

- 1 Quail (*Ortyx virginianus*). Presented by Mrs. M. R. Swee-ny, Phila.
- 3 Raccoons (*Procyon lotor*). 2 Great Horned Owls (*Bubo virginianus*). Presented by J. D. Towner, Blount Spring, Ala.
- 1 Red-vailed Hawk (*Buteo borealis*). Presented by James P. Massey, Phila.
- 2 Savens (*Corvus corax*). Presented by John L. Maistre, Phila.
- 1 Malayan Tapir (*Tupirus malayanus*) 2 Young Indian Elephant (*Elephas indicus*), 1 Black Leopard (*Felis pardus*), 1 Chacma Baboon (*Cynocephalus porcorius*) and 2 Eider Ducks (*Somateria mollissima*). Purchased.
- 2 Fournier's Capromys (*Capromys pilorides*). Born in the garden.
- 1 Snowy Owl (*Nyctea nivea*). Presented by Josiah Fitzgerald, Phila.

ARTHUR E. BROWN, Gen'l Supt.

TAMING THE TIMID TROUT.

FISH THAT BECAME FAMOUS BECAUSE THEY WERE EDUCATED—HOW THEY GRADUATED FROM THEIR NATIVE BROOK INTO THE MUSEUM.

I was much fonder when a little girl of taming animals than of playing with my dolls, and had domesticated raccoons, mink, squirrels, and even a hen-hawk which I kept chained to a tree near my bed-room window. I never was much interested in fish except when nicely browned and placed before me, until one day my father spoke of catching some trout and trying to keep them alive and tame them.

Springfield, Mass., as its name indicates, has many natural springs, and our grounds of three acres had five or six, from which the water flowed pure and cold during the hottest of summer days. We selected a spring at the foot of the green terraces back of the house, which, being hidden from the bright sun by the overshadowing locusts, we thought would be "just the spot" for some trout.

We had it dug out in square shape and sunk a wooden box 10 feet long, 8 feet wide, and three feet deep, and laid pipes to conduct the water in at one side and out at the other, as trout will live in none but running water. Around the box we built a kind of platform, and enclosed this with the daintiest of white fences. Grass plots in pretty designs and white gravelled walks completed the surroundings.

On the day appointed for our excursion we arose early and learned from father that the weather was propitious and trout would bite well.

We had decided to go to Cowslip Brook, four or five miles out from Springfield, where the variety of trout was larger, lighter colored, and more brilliantly spotted than in other streams near by. We had fine Limerick hooks (the best for trout fishing), from which we broke the barbs, so that the mouth of the fish should not be lacerated. My brother, sister, and myself baited the hooks with worms, but father, who was a skilled angler, used an artificial fly. He cast it in a dark nook under a rock—for trout are very shy and keep hidden away—and in a moment swayed his rod towards the bank and floundered a beautiful trout weighing about a quarter of a pound into the grass. We caught him in our hands and put him safely in the fish kettle we had made for the transportation of fish. It was made of tin, oblong in shape, and held about three gallons of water. There were two perforated covers that hinged across the center of the kettle and lifted up from each end. The covers were without moulding, and shut closely down into the top of the kettle two inches below the edge, so that the water would not spill out with the motion of

the carriage. We continued to fish for about four hours, and caught nine trout, weighing from one ounce to one quarter pound each, which we put in our spring.

We went out next morning to look for them, and not one could be seen. We thought they must have been stolen, but father suggested our poking under the platform with a stick; which we did, and they darted out into sight. We tried feeding them with raw beef finely chopped, and they seemed to let it drop to the bottom of the spring without eating; yet if we left them and returned again we found the meat had disappeared.

One day my brother Sam put a live pickerel among them "for company," he said, and a few hours afterwards I found him swimming about compositely with the tail end of a trout protruding from his mouth. It took him all day to swallow and digest this morsel, and before his appetite came on again I had him removed.

Little by little our trout gained confidence, and in a few weeks would eat the meat as soon as it was thrown into the water. After a while they would come to the surface of the water when any of the family appeared, and would dart back and forth significantly until fed. If hidden under the plank we would whistle or make a sharp sucking noise with the lips, and they would come to the surface. We taught them to feed from our fingers; we would hold out the meat just above the water and they would swim up and take it. But when feeding them thus they would bite our fingers dreadfully. On one occasion I had the first finger cut open the whole length. After this we put the meat on the end of a bluntly sharpened stick, and by swaying it as they came to the surface we taught them to leap out of the water a length of two feet.

Through the middle of the spring was a cross-beam which came to the top of the water, and we taught them to leap entirely over this.

One male fish darker colored than the rest was intensely greedy and never allowed the other fish a mouthful until he had taken his fill. They seemed to be afraid of him and kept out of the way until he was satisfied. When of four pounds weight he would eat two ounces of beef, and after he could not accommodate any more would continually take pieces into his mouth and spit them out. After such a dinner he would lie comfortably and lazily on the bottom of the spring for several hours.

They had young every year, but as is the case when not protected they were always devoured by the parents.

The tame trout became very popular after a while, and after several attempts were made to steal them we had them guarded by a large watchdog. Nearly all people who visited Springfield came to see the trout. There were persons from every State in the Union, and from Europe and Canada. During the summer we have had at many as 200 visitors on Sunday.

We kept the trout for seven years, and they weighed from three to five pounds. As they grew old they were less active—one became blind and two lost their teeth, but they were always attractive in form.

After a time the irrepressible Barnum, whom I had but just forgiven for suggesting to my mother the propriety of exhibiting my fat baby brother at his "Baby Show," came along and offered a high price for the trout. Feeling that we could not keep them comfortably during the fall and winter, as we were going to make improvements on the place, we consented, with many regrets, to let them go. When the bargain was closed we received with the rest a small measure or so of complimentary tickets to the museum and lecture-room, a pleasure Mr. Barnum always indulged in when he had made a good bargain. The trout were on exhibition at the old museum for the winters and returned to us summers, as they could not live in the Croton water. They died finally, I really believe, from old age.

I. B. ROBERTS, in *Graphic*.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged. "TO EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

J. REEMISTER, Box 163, Batavia, N. Y., will exchange 1 pair of White Leghorns, and a trio of Chicks, for a pair of Black Fews. None but first premium birds wanted.

E. G. MCINSTRY, Box 230, Chicopee, Mass., has for exchange a French Microscope, power 2,000, 6,000 and 10,000 times 29, 60 and 100 diameters, separates into 11 parts, frame polished brass, packed in a black walnut case, with accompanying instruments for works on Drawing, Painting, or Astronomy.

ROBERT HOWARD, North Adams, Mass., will exchange Standard White and Brown Leghorns, Partridge and White Cochins, Dark and Light Brahmas, Plymouth Rocks, and White-faced Black Spanish, for a first-class Black-pied Pouter Cock, or other Fancy Pigeons. None but A 1 birds wanted, as mine are.

C. W. GUIGNON, P. O. Box 479, Warren, Pa., has for exchange one trio P. Cochins, early hatch and fine exhibition birds; also 2 Brown-breasted Red Pits Hens, Dead Game, for S. Duckings, or B. B. Red Game.

ISAAC S. SCHADE, Tulpenhoecken, Berks Co., Pa., will exchange 21 pairs Partridge Cochins, value \$2.50 per pair; 3 pairs G. S. Hamburgs, value \$2.50 per pair; 35 Golden and 14 Silver Spangled Hamburg Cockerels, value \$1.25 each, for what offers. Anything that will not eat.

W. H. MOYER, Richersburg, Pa., will exchange one No. 1 Part. C. Cock (cost \$6.00), with 5 very fine Hens; 1 pair G. S. Hamburgs. Cocker too just from Easton; one pair Chick, early hatch; also Carrier and Fault Pigeons, for what offers.

H. J. EATON, Concord, N. H., has for exchange 4 Dark Brahma Hens, 5 White Leghorn Cockerels, 1 Partridge Cocker Hen, for a Standard Light Brahma Cock, or White Leghorn or Light Brahma Hens or Pullets. None but good stock sent; the same wanted.

EDWARD L. BROWN, Galt, Ont., will exchange one pair Bronze Turkeys, worth \$35.00, (Vanderwerf strain), for trio first-class Plymouth Rocks, or fliers. Write.

BOX 112, Turbotville, Northumberland Co., Pa., has a pair of young Singing Thrushes, for a Mocking Bird, or one of them for a Cardinal or Red Bird, a good whistler; or will exchange the pair for a No. 1 White-crested Black Poland Cockerel or Cock. Must have large crest.

T. J. McDANIEL, Hollis Centre, Me., has Brown Leghorn Pullets and Cockerels, exhibition birds, 55 and upwards, and Bronze Turkeys, to exchange for cloth or ready made clothing. P. C. communications invited always.

D. P. VAN HORNE, Bainbridge, N. Y., will exchange Plymouth Rock or Brown Leghorn Cockerels, for Silver Gray Dorking Cockerels; a Black Red Game Bantam Cock, for a Red-winged Jacobin Hen Pigeon.

HENRY C. WICKES, 71 West Clifford St., Providence, R. I., will exchange a white-blooded English Pointer Dog Pup, ten months old, marked liver and white, for an Equimaux, Scotch Terrier, Bull Dog, or offers. They must be good stock, or no trade, as mine is as good as there is in the State.

THOS. RIDGWAY, Haddonfield, W. Philadelphia, Pa., will exchange Pearl Guinea Fowl, Black Bantams, Antwerp Pigeons, &c., for W. C. Black Polands, Brown Leghorns, White Leghorns, White-faced Black Spanish, or offers Speak quick.

T. A. HIESKELL, Box 834, Bangor, Me., will exchange Brown Leghorn Cockerels or Pullets, for a good Setter or Pointer Pup. Must be good, as mine are.

G. G. FOWLER, Auburn, N. Y., has a cage of stuffed Birds, value at \$15, to exchange for White or Brown Leghorns, or Houdans. Make me an offer.

E. A. SAUCIUS, 125 Tremont St., Boston, will exchange Band and Orchestra Music for first-class Black Cochins to any amount; will also exchange for a thorough-bred Setter or Pointer Dog, if partly trained. Correspondence solicited. Catalogue mailed if desired.

GEO. W. DIXON, Box 188, Worcester, Mass., will exchange Black Cochins Fowls and Chicks, Black Red and Brown Red Game Bantams, Ginger Bantams, for Black Game Bantams, or Irish Gray Game Bantams, also Pure White Guinea Pigs and Colored Guinea Pigs, for Merchandise. My Bantams have always won 1st and 2d premium wherever shown.

S. P. STONE, Farms Village, Seneca Co., N. Y., will exchange one pair of D. Brahmas, four L. B. Hens, three B. B. R. Game Pullets, for B. B. R. Game Bantams, Red Pile G. Bantams. None but first-class stock wanted; will be the same.

DR. B. F. BEARDSLEY, Binghamton, N. Y., has some very fine L. B. Cockerels, exhibition birds, weight from 5 to 9½ lbs., Williams strain; P. R. Cockerels, Coddington strain, and B. B. R. G. Bantam Chickens, very fine, from Spaulding's best stock, to exchange for first-class L. B. Pullets, same strain as mine—large, fine, and fit to exhibit anywhere. None but first-class birds sent or received. Also Cinnamon and White Jacobins to exchange for L. B. Pullets.

BOX 869, Rockville, Conn., will exchange a nice Family Horse, seven years old, weight 1,000 lbs., sound and kind, for a registered Jersey Cow.

A. L. BANKS, Mount Kisco, N. Y., will exchange trio of India Silkies (imported), for a genuine Meerscham Pipe, with Amber stem. Must be sound, and A No. 1 in every respect.

JNO. F. HOUSER, Tamaqua, Pa., will exchange 1 Harp, Piano, 3 good Violins, 1 10-key Accordion, 1 Eran & Watson's Safe, 1 Pocket, and 1 large Case of Homeopathic Medicines, filled and labelled in good condition, 1 Florence Sewing Machine, 1 bound vol. Wright's Illustrated Book of Poultry, 4 Fonts Type, assorted, 1 Single Silver-plated Buggy Harness, good as new, 1 Flobert Gun and Target, 1 Red Bird and Cage, 1 Rabbit Hutch, 1 Electric Battery, for Alderney or Jersey Cow, or Double Breech-loading Shot Gun, or offers.

CHAS. SEISER, Doylestown, Pa., will exchange G. S. and Black Hamburgs, for trio of Houdans and S. S. Cockerel. Birds must be good.

JOHN W. SUTLIF, JR., Box 20, Johnstown, Fulton Co., N. Y., has a Carbine Rifle, and a Cottage Printing Press, and Bird Cage that he will exchange for Gloves, Sheep Skins, or Buck Skins. What other offers.

G. DILLINGER & SON, 69 Clifford St., Providence, R. I., will exchange Ferrets and Lop-eared Rabbits, for good Leghorns, or first-class Fancy Pigeons, or extra fine Black-breasted Red Game Pullets, (Warren's stock), or good Singing Canary Cock.

E. STUCK, York, Pa., will exchange Bronze Turkeys, Fancy Pigeons, and Lt. Brahma Cockerels, for a new or good second-hand set of light harness for buggy use. Gum mounting preferred.

MANSION HOUSE, Tamaqua, Pa., will exchange 1 trio P. Cochins Fowls, 1 trio S. P. Hamburg Fowls, 1 trio G. P. Hamburg Chicks, 1 trio White Leghorn Chicks, 3 pairs Aylesbury Ducks, 3 first-class B. B. R. Game Hens, 10 pair Common Pigeons, 2 pair White Salicenta Pairs, 1 pair Brown Helms, 2 pair Black Short-faced Tumblers, 1 pair White English Carriers, 3 Parrot Cages, 5 Single Exhibition Pigeon Coops; also 4 Coops of Six Apartments, a lot of Winton's Koup Pills and Tonic Paste, for Buffalo Robes, Harness, Sleigh Bells, or offers.

BOX 869, Rockville, Conn., will exchange a C. Cornet, cost \$60, for a first-class Central-fire Shot Gun. Must be in good order, at the Corist.

S. P. BULLAS, Providence, R. I., will exchange 1 full-blooded Scotch Terrier Dog, extra nice, color light brown, for Swallows. Yellow preferred.

G. E. PEER, 23 N. Clinton St., Rochester, N. Y., will exchange 1 W. Leghorn Cock, 1 Splashed Trumpeter Cock, 2 Yellow Jacobin Hens, 1 Black Jacobin cock, 2 Pouter Cocks, 1 pair of Blue Pouters, for two Red Trumpeter Hens, or offers in Jacobins, Trumpeters, or Bald-head Tumblers.

MATT HAFLE, Foxburg, Pa., will exchange one trio S. G. Dorkings, and 2 Cockerels, one Cock and 4 Hens G. Sp. H., one pair Cockerels and 8 Pullets G. Sp. H., one pair Rouen Ducks, all A No. 1 birds, for Canary Birds, Vinegar, Lard, Butter, Cigars, or offers.

BOX 31, Strasburg, Pa., wants Light Brahma Pullets of "standard" excellence for exhibition, in exchange for carefully bred Buzzell Pullets, slightly dark on back. Will exchange liberally.

CHAS. E. LONG, Lancaster, Pa., will exchange Archangels, Blue Owl, White Jacobins, Red Magpies, Pouters, Blue Antweps, and a fine lot of Black B. R. Bantams. See want column.

LOWE & COLONY, Fitchburg, Mass., have for exchange the following five trios of birds: L. B. S. P. C. S. S. White L., \$10; Brown L., \$8; Black L., \$5; B. B. R. Game Bantams, (1st and special at Athol), \$8; for B. R. Games.

JAMES DENISON, Findlay, Ohio, will exchange Aylesbury Ducks, White Guineas, Brown Leghorns, Black and Partridge Cockerels, Dark Brahmas, or Game Bantams, for Wire Netting, 3 or 5 feet wide, 2 inch meshes. Fowls all good stock; pure bred. Write on postals if you have them handy.

A. M. CAREY, Selma Grove, Pa., will exchange Dominique Leghorns, for Black Leghorn Pullets, Buff Cochins, or 10 other varieties of choice Fowls, for a nice Breech-loading Gun, or nice Double-barrel Gun, or for fine specimens Plymouth Rock Fowls.

DR. A. BOWEN, Greensborough, Md., has a nice Farm of 33 acres, close to town and R. R. Station, to exchange for good property in Village or City, just the place to raise early Chickens for market: only 86 miles from Philadelphia. Write, with stamp. No pro-fals.

J. G. HICKEN, So. Acworth, N. H., will exchange P. Cochins, G. S. and S. Hamburgs, B. R. Game Bantams, B. R. Game Stags, B. A. Bantam Cockerels, 1 Eb Corner, 1 thoroughbred Merino Ram Lamb, for a good Rifle, Cooper on the Game Fowls, or The Pigeon Book.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

NOTICE.—Anonymous communications not noticed. Rejected communications not returned. Manuscript not preserved.

VOL. III.

HARTFORD, NOVEMBER 27, 1876.

No. 46.

EDITORIAL.

THE JOURNAL A MONTHLY!

We are drawing Vol. 3 of THE FANCIERS' JOURNAL to a close. When started in the Fall of 1873, we were hopeful that the hard times then upon us would not be of long duration, that one season would mark its duration, but instead of one it has lengthened to three. The fanciers' world is one that has been specially affected. In many cases—in almost every case—the fancy has been the recreation, the luxury in the working life, and one of the places where, when retrenchment has been necessary, retrenchment has been made. Many too, that would have embarked in the fancy have been compelled to await a more propitious season. We could not have selected a worse time for our enterprise, and consequently we have sunk much money. We now propose to change the issue to a monthly. We are still however of the opinion that a weekly is a necessity to the fanciers of America—and when the fanciers so realize, we shall be ready at a week's notice to change once more to a weekly issue. Think of it fanciers—Is it worth your while? Is it for your benefit that the interest should be kept alive? Shall it be kept constant by frequent reports of the doings of the fancier's world, or is it enough that once a month the spirit should be revived?

Is it worth anything to you to have a chance to bring your stock before the public fifty-two times a year, or only twelve? If you have stock to sell, is it well to wait four weeks to make the fact known, or is it better to have the stock sold, and your money at interest before the monthly is issued? What shall we say to the fanciers abroad, that the fanciers in "the States" are unable to support a weekly, or have not the intelligence to appreciate one?

What effort is required to make the JOURNAL a success as a weekly?—one subscriber apiece for each one of those whose names are now upon our books. Having carried the paper through these three years of financial distress, we feel unwilling to relinquish it. We also feel it wrong to ourselves to attempt further if those most interested see no necessity. Think this matter over!

TO THOSE LONG OUR DEBTORS

We would say—We have made arrangements for putting their bills into the collector's hands on Dec. 1st. We hope the various amts. due will be ready when called for. To those who have paid up promptly both for subscription and advertising we return thanks. Looking over our books we find many small amounts—ridiculously small they may seem to those who receive the "Bal. due." But we would remind our patrons that five hundred bills of 50 cents each, amount to \$250.

Those wishing to keep their JOURNALS for binding, are hereby warned to be careful of Nos. 1 and 44, Vol. III, as we have none of either to spare. Parties having either, who do not care to bind them, will confer a favor by returning them, especially the latter, for which we will allow our regular sample price.

PLEASE NOTE

(Thereby saving time and trouble in the correspondence relating to the show,) that E. H. Hartshorne, P. O. box 2388, Boston, Mass., is Corresponding Secretary of the Massachusetts Poultry Association, not C. W. Chamberlain, who is Recording Secretary.

The Southern Tier Poultry Society will hold their next show in Elmira, N. Y., January 10th to 13th inclusive, 1877. Premium lists will be ready about Dec. 1st.

C. S. WHITE, Secretary.

ELMIRA, NOV. 15th.

The mail brings up the prize list and rules of the Central Maine Poultry Association.

F. E. McFADDEN, Secy.

With this we note the following slip:

"The Eastern Express Company will return FREE all poultry sent by this company to the Central Maine Poultry Exhibition, and the Maine Central Railroad will sell tickets, good for the round trip, at two thirds the regular rates."

Showing the enterprise of this new association and unusual liberality upon the part of Express Co., and R. R. managers.

Also of the Venango Co. Poultry Society.

W. T. BILL, Secy.

One of their rules is worthy of special reading:

"The entire proceeds of the Exhibition after paying the expenses thereof will be used to pay the prizes of the society as follows: Every first prize will be entitled to two parts and every second prize will be entitled to one part or share of said prize money, and all prizes will be paid promptly after the Exhibition. Certificates in lieu of money prizes will be given to exhibitors when desired."

The Premium List, and Rules of the Rhode Island Poultry and Columbarian Society, C. G. Sanford, Cor. Secy., is also received. The premium list is good, and their combination premiums a new departure. If the rules are carried out to the letter, fraud will be impossible. Their sixteenth rule reads:

"RULE 16th.—In order to receive a 1st premium, birds must score at least 170 points to the pair; a 2d premium, birds must score at least 160 points to the pair; a 3d premium, birds must score at least 150 points to the pair."

Also, MSS., from H. A. S.; Hans Schneider, Jesse G. Darlington, J. Y. Bicknell, T. G. G., Hoon, Jas. M. Lambing, Gay S. Cutus, Jas. McCann, Paul Logic, and others.

POULTRY AND PIGEONS.

CENTENNIAL PIGEON DISPLAY.

The grand international exhibition of poultry and pigeons, is now one of the things of the past—the display of pigeons was the grandest ever made on this continent. We sometimes hear of a *lusus naturee*, a play of nature, where something in the animal kingdom is produced which is not in accordance with the ordinary course. In looking at the exhibition of pigeons in Pomo-logical Hall, we could easily imagine that nature in sport had endeavored to show what a great variety of fantastic forms she could produce in these birds, in the different arrangement of feathers, some of which presented a most grotesque appearance, in the curious appendages to the heads and bills of some, and in the many shades of color. High class? yes, indeed, Pouters, 19½ inches long—Fantails, having 36 feathers—Carriers, worth five hundred dollars a pair, and this price refused for them by the gentleman who exhibited them—White Owls, bills so short that it was a difficult thing to find them—Yellow Fans, noble birds, the finest I ever saw—Barbs, one might wonder if they could be improved upon. The principal exhibitors were: Colell, (Brooklyn, N. Y.,) Thurston, (New York City,) Long, (Philadelphia,) Seavey, (Cambridgeport, Mass.,) Newell, (New York City,) Williams, (Taunton, Mass.,) Rommel, (Baltimore,) Erdman, (Philadelphia,) Morse, (Boston,) Scheld, (Brooklyn,) Grist, (Philadelphia,) White, (Chicopee, Mass.,) Parker, (Philadelphia,) Burpee, (Philadelphia,) McKeen and Hulick, (Easion, Pa.,) Long, (Lancaster, Pa.,) Van Opstal, (New York City,) Waefelcher, (Hoboken, N. J.,) Schuchman, (New York City,) Cryer, (England,) Cooper and Thomas, Canada. There were many others who exhibited small collections, many of them showing fine birds.

In regard to judging, I received my instructions from the United States Centennial Commission Director, and although I would have had the judging done the same way as in our local shows, yet you might as well fight an express company as to fight the Board of Centennial Commissioners; so that is the end of it. All exhibitors showing a meritorious pair of birds received a *grand medal of award*. I was informed by Gen. Walker, that no part of the exhibition attracted as great attention as did the show of pigeons.

I had the pleasure of gallanting the members of the Commission through the different passage ways, and pointing out to them some of the most valuable birds, and they were astonished beyond measure. The valuation of the pigeons exhibited was three times that of poultry,—this is a fact beyond dispute.

Gen. Johnson of Massachusetts, who visited the exhibition, was highly pleased with the colonialbarian part of it. The Fan- ciers' Centennial Supper took place on Wednesday evening, Nov. 1, 1876. There were many prominent pigeon men seated around the table. Mark Pitman of Massachusetts, the honorable chair- man of the board of judges, made us all happy by his remarks; P. Williams of Massachusetts, acted as chairman; and, well,—I

shall be tempted to take unto myself a wife before I meet him at Boston.

I was pleased to make the acquaintance of the Hon. Judge Luce of Iowa. I do wonder if I have that name right—if not, I will keep out of the way of the judge's cane. Now, friend Wade, you must indulge me—one or two stories, too good to be lost, must be handed down. One day during the show, Crosby of Connecticut came into the judge's room; "Ah!" said he, "Luce, the printers have made a fearful mistake in the special catalogue of the display of poultry—your name is printed Loose." "D— it," said the judge, raising himself up and shaking his cane, "the next catalogue will have it printed, the Hon. Judge Luce of Iowa." The judge's room was next to the room that contained the incubator. A lady opened the door one day—we were all within—looking at Gen. Walker, she said, "is this the room where they hatch?" "No," said Walker, "this is where we set." One word to those who will understand. Mark Pitman, stand up—do you feel Lusey or Loney? Oh, Mark! the judge got ahead of you on today. Well, like some pleasant dream, it is over. The next Centennial we will see—well, I hope, in heaven.

I cannot close this article without referring to the Superintendent, Mr. J. E. Diehl; he did all that he could to make the show a success, and could he have had his own way, things would have been different. The pigeon fanciers gave him a hearty vote of thanks for his kindness to them. The grand medal of award given by Mr. Burlingame of New York, was presented to Mr. Colell of Brooklyn, N. Y., and he well deserved it.

(From the Philadelphia Press.)

Yesterday the distribution of the special premiums offered by private individuals through the Centennial Commission, was made in one of the offices attached to Agricultural Hall, and was the occasion of some interesting formalities. The judges and a number of the exhibitors having assembled, Mr. Mark Pitman, of Massachusetts, chairman of the Group Jury, called the meeting to order, and introduced Mr. W. T. Rogers, of Doylestown, Pa., the judge on pigeons, and Mr. L. Burlingame, the expert, engaged to assist him. Mr. Rogers remarked that it had been his province to act in the capacity of a judge on similar occasions heretofore, but in all his experience he had never seen such a large and valuable collection of birds as that which had been gathered here, nor did he believe that any such display had ever before been made in the States. He announced that the first prize on the list, a fine gold medal, (valued at \$100,) presented by Mr. Burlingame, of New York, for the best collection of pigeons, had been won by Mr. H. Colell, of Brooklyn. In presenting the medal the speaker remarked that Mr. Colell had done much to improve the breed of fancy pigeons in this country, and that the valuable trophy had been fairly won. The second prize of a gold chain, (valued at \$75,) presented by Messrs. Wirth & Co., Brooklyn, for the best collection of Trumpeters and Tumblers, was also won by Mr. Colell. Prize third, a gold watch, also presented by Messrs. Wirth & Co., for the best variety of Pouters, of not less than six colors, was also awarded to Mr. Colell. The prize for the best collection of Carriers, a silver cup, (valued at \$50,) presented by Mr. Colell, was won by Mr. J. O. Thurston, of New York. Several other prizes of minor value were also presented.

DOYLESTOWN, Pa.

TENNENT.

COOKED FOOD.

If any reader of the *Journal* will mix four or five quarts of corn-meal with hot or cold water, mark its apparent quantity in the wet state, and its apparent satisfaction to his fowls, and how many it furnishes with a good square meal; and at another time stir up the same quantity with luke-warm water and yeast powder,

letting it stand over night to rise, or some hours near a warm stove, and I will warrant him the latter a better feed, better liked, and that will go at least one third farther. Mix this stiff enough to pour, and bake not quite enough for human digestion. If you have milk to sicken it with you will have reached the *ne plus ultra*. Bake slow, and as loafy as possible.

A neighbor of mine has lost 150 fowls this past summer with a disease he describes as manifesting a dark purple face and comb, springing suddenly up or forward several feet and dropping stone dead. He has seen a hen go on a nest, lay an egg, spring off and drop dead. What is it?

P. WELCH.

SOLID TURBITS.

Some ten or twelve years ago in buying some pigeons from a Mr. Stunz, of Baltimore, I found a Solid Blue Turbit, and though it was not a well bred bird, and had a common look, I then and there caught the Solid Turbit fever. I left orders with all the fanciers and dealers within reach of Philadelphia, for Solid Turbits, but none were to be found. After a time Mr. More sold me a small nearly solid cock. Soon after I found a hen in the loft of Mr. W. W. Clark, 1213 North 3d St., Phila., that had been bred by Caspar Heft, a bird good in color except the breast, which was a little red, like a robin's. I mated the pair, and purchased a very few imperfect birds. From this stock, by patience and perseverance, I built up a loft of thirteen birds, ten of which were extra fine specimens. Only those know how much I thought of this lot of birds that have been through the same experience. I was sorry to part with them, but when the Oak Lane yards were broken up, it became necessary. I offered them for sale, but strange to say a purchaser could not be found for this rare collection, until Messrs. McKeen & Hulick came forward and took them at \$10 each.

These gentlemen exhibited the birds at Springfield last winter, where two pairs were sold to S. C. Colt, of Hartford, for \$100. Messrs. McKeen & Hulick write me that they have been very successful in breeding these birds, and have a fine loft true to color. —Editor.

PIGEONS.

Continued from page 539.

Soft meat is a sort of milky fluid or pap secreted in the craw of pigeons, by the wise providence of Nature, against the time when it will be wanted for the nourishment of their young. In all probability, from instinct, the pigeons eat a great quantity at this time, and the grain goes through a certain process in their crops, which produces the pap or soft meat in question. This they have the power of throwing up at will, and, in feeding, they eject it from their own bills into those of the young ones, the bills of which are taken into their own. This kind of feeding continues six or seven days, when the old ones begin to mix some harder food with it, until at length they feed with whole grain. When the time approaches for the hen to lay, the cock is often seen driving her from place to place, not suffering her to rest anywhere but in her nest, apparently from an instinctive apprehension that she may drop her egg in an improper place.

Food.—Pigeons are entirely granivorous, and very delicate and cleanly in their diet; they will sometimes eat green vegetables, in particular, warm salads, and are extremely fond of seeds. Tares and the smallest kind of horse beans, commonly called pigeon beans, are both the best and cheapest food for pigeons, but the pulse should always be old, that is to say, of the previous year; as the new will scour pigeons, as well as any other kind of live stock. Seeds are occasionally given to pigeons, as a warming and stimulant diet; but according to my experience they greatly prefer rape and canary to hemp seed. It has been remarked, that

beans sodden in salt water scour pigeons equally with new beans, and, in a voyage, suffering them to drink sea-water will soon kill them although so generally benefited by salt, an excess of it is fatal as is also to vegetation, promoted as that is by a moderate quantity.

In most publications on the subject of pigeons, a dangerous mistake has been made in a term applied to beans. Small tick beans are recommended, instead of small horse beans. Now the tick or *kithwell* (in the western phrase), are the larger of the two common field varieties, and besides being inferior in quality, are too large for pigeons, which have been some times choked even with the common sized horse beans; on which account, the smallest possible should be procured, whence such are termed in the market accounts, "pigeon beans." Pease, wheat, and buckwheat, or bran, are eaten by pigeons; but should be given only in alternation, not as a constant diet. The same of seeds; they yet prefer wheat. The strong scent of cummin, and flavor of coriander seeds are said to have an alluring effect upon the olfactory nerves and palate of these birds; as also the scent of asafoetida, and other powerfully odoriferous drugs; and that the use of fumigations of such, in the dovecote, will not only attract the pigeons to their home, but allure strangers, which may be wandering in search of a habitation.

To be Continued.

SANGAMON COUNTY FAIR.

We are advised by the Secy. of the awarding of the following premiums to those of our subscribers exhibiting at the Sangamon County fair, held at Springfield, Ill., Sept., 1876.

PHIL. M. SPRINGER, SPRINGFIELD.—1st on each Lt. B. fowls and chicks; special for largest, and finest display; special for best 1 male and 3 females, each fowls and chicks.

W. H. LIGHTFOOT, SPRINGFIELD.—Buff C. chicks, 2d; 1st and 2nd, Dominique chicks, S. S. Hamburg chicks, B. R. Game chicks, Bl'k. C. chicks, Duckwing G. chicks; 2d, Buff C. chicks, Sebright Bantam chicks, and B. R. G. fowls, W. Guinea fowls, Pekin Ducks; 1st, Toulouse Ducks, and 1st, and 2d, White China Geese, with specials for largest and best display of each Bantams, Game Bantams, Geese, water-fowls; also for best 1 male and 3 female R. G. Bantams.

C. BECKER, SPRINGFIELD.—1st and 2d, Blk. Spanish; 1st for W. Leghorn chicks.

CHAS. BRESSMER.—2d, W. L. chicks; 1st, S. S. Hamburg chicks, with specials for best 1 male and 3 females S. S. H. and W. L. chicks; and best pair S. S. Hamburgs.

J. L. CONNELLY, Harristown.—1st, Sebright Bantam chicks; 1st and 2d, Cayuga Ducks; 2d, Toulouse Geese.

GOODRICH LIGHTFOOT, SPRINGFIELD.—1st Embden Geese.

WHY FARMERS KEEP POOR.

A recent writer says: After long observation I have come to the conclusion that a great majority of the farmers that are poor might have made money. If you inquire into their business habits, you will find that they always sold the best and kept the poorest. For instance, if they have too many sheep on hand, they pick out the best to be sold. If you ask them why they do so they will say, "Because they bring twice as much as the others, and I am hard up, just now, for money." I know that it is not a good plan, and I do not intend to follow it always. I think the habit of selling the best is a very poor plan for any man, I don't care what his circumstances may be. I have a man in my mind now, who always sells his poorest sheep for more than twice as much as the average farmer gets for his best. I have seen farmers in the fall pick out their best pigs to fatten, because they would make a few more pounds of pork than the others. This I call very poor economy.

GAME BANTAMS.

I believe that every true poultry fancier, after going the rounds and testing the qualities, pro and con, of every variety of fowls, almost invariably settles down upon one of them, which to his mind embodies the qualities most essential to his requirements. This, at least, is my own experience. After years of experience with Cochins, Brahmas, Spanish, Hamburg and Mongrel, I have come to the conclusion that for the best return in eggs and meat for the cost of production, our little Game Bantams will carry off the palm. Some may think them too small, and their eggs too diminutive for use or profit, but for broilers they cannot be surpassed, and there is no poultry flesh of better quality or flavor,

FANCIERS' JOURNAL.

H. NICHOLS

and what has been said of their eggs by the English fancier, "Wiltshire Rector," that "the first half of a boiled egg is the best, and in the Bantam egg we have the first half," is as good and sound as when it was penned. But setting aside all questions of profit and loss, there are none of the many varieties of the poultry family which embody within a given compass, so much social quality, so much independence of character, or so much intelligence as these diminutive specimens. Look with me for a moment at the little group beneath my window, just starting out for their morning walk. Unconfin'd by fence or lattice, they range at will, and as they stop at my call, show me if you can a more perfect group, in all the essentials of poultry beauty. As they gaze at me with their upturned faces, I read the intelligence of more than brute nature in their sympathetic eyes, for I am aware of a sympathy existing between myself and them, and they also know of that sympathy, and express their knowledge to me in all their acts and motions. See that proud and gallant cock as he struts about with an almost human vanity. Do you not suppose him conscious that he is the center of attraction? or again look at that favorite pullet, carrying herself so modestly, a perfect beauty in form, color, and grace, and yet apparently unconscious of her charms.

From its earliest infancy the Game Bantam presents the strongest claims to the attention of the fancier. During the first week of its existence its seeming helplessness draws largely upon our sympathy, and as it approaches its maturity, the exquisite symmetry of its form, the brilliancy of its plumage, and the exceeding gracefulness of all its movements render it an object of unrivalled beauty.

With regard to judging Game Bantams, I must, at the risk of seeming impertinent, take some exceptions to the methods

now in vogue. I think too much stress has been placed upon certain points, and too little upon others. We seem to have forgotten that the days of cockfighting have passed away and that our birds, both Game and Bantam are not reared for the pit, and should no longer be judged from the cocker's standpoint. Beauty of form and color has been too often made secondary to fighting qualities. This, to my mind, is all wrong. The first point in importance, in my judgment, in the Game Bantam is style; second, color; and third, size, and so on. Consult any breeder of note or experience, and he will tell you how much more easily he can produce birds of good color and size, than he can birds of good stylish carriage, and how much easier it is to produce birds of small size, than those of good plumage, therefore I give preference to those points which are most difficult of attainment. I have seen one of the best, if not the best Bantam I ever saw, entirely overlooked by the judges, at one of our most prominent shows, and left without a commendation. In form he was simply perfect, in style he surpassed every other bird in his class, and in color he rivalled the hues of a sunset sky, and yet he was passed by for no ostensible reason, unless it was that he was not sufficiently gamey to meet the requirements of a false taste, which must sacrifice beauty, and brilliancy of color and form, to mere fighting qualities; such blunders on the part of our judges naturally give credence at times to the charge that our shows are managed for the benefit of the ring, and not for the purpose of bringing out the best types of the various classes of our birds.

W.

THE SPANISH FOWL.

BY W. J. NICHOLS.

VI.—TRIMMING.

The disqualification of some Spanish chickens at Oundle for being over trimmed, and also of two cocks for having had their combs cut, clearly shows that even exhibitors and breeders of these birds are in some doubt as to how far these practices are allowed; and as I have only alluded to these matters very briefly in my previous articles, I now propose giving my views on trimming, so that, if possible, there may be a more definite settlement of these questions. I do not wish to be thought egotistical, or desire to dictate to gentlemen who were breeding and exhibiting before I was born; but I wish simply to express my opinions, and if any of my readers differ with me, I hope they will freely express their views.

The extraction of the small feathers and hairs from the face of Spanish has now been allowed by all judges for many years, and it undoubtedly adds vastly to the appearance of the birds, as every exhibitor is fully aware; he also knows that it is useless for him to exhibit a bird in its natural state, for it would most certainly be unnoticed. Such being the case, there is nothing dishonest or fraudulent in trimming these birds within certain limits. The question which naturally suggests itself is, to what extent may trimming be done without running the risk and disgrace of being disqualified. I have seen birds trimmed to such a degree that not a single hair could be seen between the comb and the bottom of the face, and the skin above the white was quite discernible, and yet these birds have been awarded prizes. Occasionally birds are seen with the white reaching to the base of the comb, but never "a quarter of an inch up the comb itself" (the italics are not mine), as was recently stated in an article on trimming in a contemporary. The white is sometimes seen in very small patches on the comb, but these are very rare cases indeed, and no one at all acquainted with the subject would think of calling this "genuine white face." White it is, but certainly no part of the face. In speaking of the face is meant the white between the base of the comb and the bottom of the jaw bone; and when this is properly trimmed for exhibition there should be a narrow mar-

gin of black feathers running between the base of the comb and the white. This should commence well in front of the eye, close to where the white starts from the beak. At first, there should be a single feather, the number of the feathers and the width of the black gradually increasing as it approaches the back of the head, until the outline finally terminates in the lobe. The great thing to do in trimming Spanish is to cause the face to have the appearance of being larger than it really is, and this can only be done by giving the white a well-defined outline, and a good arch over the eyes, and the removal of every hair or feather out of the face; always remembering that on no account should the trimming go beyond the white, for if this be done, then the birds ought to be disqualified.

With regard to cut combs, I think hardly a moment's consideration of the subject is required to see how bad the principle is in awarding prizes to birds mutilated in this way. If Spanish fanciers are allowed to exhibit cocks with combs cut to prevent them falling over while at a show, why should trimming, and dyeing, and all the many other swindling tricks be objected to in other classes? I cannot see any difference in the act or object between cutting the comb of a Spanish cock, and in plucking the hocks of a Brahma or Cochin. Both are "fraudulent practices," and yet of late we have seen the plucked bird disqualified, while those with cut combs have been awarded prizes. I think the matter only wants to be brought to the notice of the judges for them at once to see how unfairly they have been acting to exhibitors who show their birds in a natural state; and I do hope we shall not again see Spanish cocks with their combs cut, winning prizes, even if we have to give up something in the quantity of the face and lobe, for this can be well afforded. This brings me to cutting the face. I do not object to this so strongly, because in many cases it is absolutely necessary that pieces of the white should be removed to enable the bird to see to eat; but I have no liking, as I have already stated, for these heavy-faced birds, and much prefer one with a moderate quantity of white of a fine quality, with a neat comb, good carriage, and full activity.

—The Country.

ANIMAL LIFE.

Few men engaged in the practical walks of life are so intimately associated with nature as the farmer. He has to deal every day with a great variety of domestic animals, while at the same time he is constantly favored with opportunities to study the habits and peculiarities of animals in a wild state, in the fields and the forests. An intelligent, observing farmer is a practical zoologist. He has a wider range of knowledge, and greater mass of facts about animals, birds, reptiles, fishes, and insects, than most other men, and this knowledge is technically called zoology. Almost every kind of knowledge, when it is classified, seems to end in some *ology*. Zoology treats of animal life, and is a science of the utmost interest, but of vast extent and difficulty. The general system of classification in this great kingdom of nature, and the natural history of the more common animals, with some knowledge of their comparative structure, should be familiar to every well educated person. The zoologist, in applying his knowledge to agriculture, would, as an entomologist, discourse of useful insects, like the silk-worm and the honey-bee, their habits, diseases, and proper treatment under the varying circumstances of their existence; or he would point out the injurious insects, the borers, caterpillars, and beetles, and inform us what to do for protection against their depredation. As an ichthyologist, he would reveal the mysteries of the new branch of farming, the breeding of fish; and as an ornithologist, he would give us an insight into the structure and habits of domestic and other birds. He should also teach the history and peculiarities of the different breeds of mammals, which have resulted from domestication, and the principles by which varieties are to be produced or preserved.—*Ploughman*.

TO HUON.

I, for one, wish to say that I have often seen and shot skunks in broad day light, when they were traveling about in the woods, and also have killed ten times as many skunks in the winter as I ever did in the summer, and I have repeatedly seen them out after very heavy snow storms, when the snow was a foot deep, hunting for rabbits and quail.

Their holes are always crooked, and at all angles.

I say their scent is used as a mode of defense, and offense, as I will now relate.

One day a friend and I were sitting on a fence near some brush, resting; we had been hunting, and had our guns in our hands. While there a very large old skunk walked out of the brush, came directly towards us, and when about sixteen feet from us wheeled around and fired his artillery. The charge did not reach us, but we could smell it, and it smelled so strong it made us sick. A good charge of No. six shot soon ended that skunk's short but ugly life. Would also say that this happened about noon.

If Huon will come out here I will be pleased to show him a skunk running at large, and he can undertake to catch it alive, and see if it is a ducky or turtle-dove.

One more ax to grind, and I am done through. The great Audubon says that the muskrat is a hibernating animal, and that its habits are strictly nocturnal. That is not so in this part of the U. S., as I have shot them at all times, in the winter, in broad day light, and expect to kill lots of those very identical varmints this coming winter.

WING SHOT.

VAT I KNOW ABOUT SKUNKS.

Vell, you like do hear me apoud dot skunkds, doud it. In dis bart mit der United States, he vos of *infernal* habits, and *ranks* high as a sheheral in der army, vos so sdrong as a elephants. Ycu can dote any time ven he around vos come, id makes no madder of you *doud see* 'em, his fragrance is wasted mit der midnight airs efry time. Ven you look of him, "distance lends enshantment mit der views." As bouldry fanciers dey vos *suckses*, eggs like-vice. My brother-by-law, he come oud do see me from Bosdon, ond ve gou out mit a gunning, ond apoud den mit dee clock we find a *peaudiful* liddle skunks; he told me "vat you call dot small liddle fellers, how dame he vas." I dote him shooid id kwick as der dayfel. He shod im. I doid him pedder he dook him mit us. He dook mit him along. Dot poor brother-by-law had do bury his clothes for dree weeks afore Richard vas himselfs again. Of you cot a bad cold der skunk don't seem so pat, put if you sutenly come on do von "dersweed by and by" for some dime vill dell der company you vos peen in. Der animals vos liddle, "bud oh gosh." Dot vos all I know about em. Berhaps some gendlemens vat has had something do do mit em gan doud in *de tail* more as I Gould myself.

Yours, mit fragrances,

HANS SCHNEIDER.

SWITZERKASSETOWN, PA.

A TRAP FOR SKUNKS.—A barrel balanced on the bilge over a pole, about seven inches high, with open end brought down to the ground, and bait put in bottom. The skunk will walk into the open end, and when he gets past the middle the barrel will right upon the bottom, leaving the skunk a prisoner. This has often been tried successfully.—*Canada Farmer*.

There is one thing about a hen that looks like wisdom—they don't cackle much until they have laid their eggs. Some folks are always bragging and cackling what they are going to do beforehand.

The Home.

For the Fanciers' Journal.

WHAT THE SPARROWS SAID.

BY GUY S. CUTES.

We had some bright, pleasant days in November, yes in November, and on one of them, a day when the sky was beautifully bright, and as tender as the memory of an old love story, a day in fact which seemed so un-Novemberish, that some thought it must have dropped out of the calendar and fell in the wrong place. On such a day I was tucking in their cosy winter beds, my usual number of hyacinths, tulips, polyanthus, jonquils, narcissus, lilies, and other Dutch bulbs (I don't mean German, as it is so much the habit of the unthinking to call everything German "Dutch," but regular Hollanders); not forgetting that dear Swiss patriot, the crocus, which in February is said to be "a flower."

[A word, if it is not too late, dear friends, about planting your bulbs. The reason that so many of them never come to flower, (as I have heard you say), may be two-fold. Firstly, your ground is not properly prepared; secondly, you, perhaps, plant them too deeply. Nothing produces better flowers than three parts good leaf mould, taken from some old woods where the leaves have been rotting for ages, and a fourth part a mixture of unwashed sand and soil taken from under good rich sod. As for the planting, I know the books say, four inches deep for hyacinths, and three inches for tulips, jonquils, and other bulbs, but I have been a practical grower of them for years, and have had much success, and I have never planted them quite three inches deep, but have rather trusted to plenty of bed clothing, which can be taken off whenever the warm sun of spring falls upon them.]

While I was spading up and pulverizing the ground, a pair of sparrows lit upon the fence near me and began twittering, and chirping in the most earnest manner, which I soon found was a regular *parlez vous* which seemed to run in this wise:

Mrs. Sparrow—"Wonder what he is doing?"

Mr. Sparrow—"He's going to plant flowers, and next spring we will have a fine time feeding on the young buds, leaves, and petals."

[True, you little pirates, you do that same in the spring and make sad work of our young tulips and hyacinths. But I know how to prevent you, I shall cover my beauties over with a fine wire screen, the interstices of which shall be too small for you to get your sparrow bodies through, and too far above the flowers for your sparrow bills to reach them, and thus will I save my pets from your depredations.]

As my work went on, more and more sparrows came, until there was quite an assemblage of the little brownies, and great now was the chirping and twittering from all sides of the garden. At last my bulbs were all in bed, well tucked in, the last pat of the spade given, and then I commenced to pull down the old vines,—morning-glories, black-eyed-Susans, cypress, Mexican and Colorado vines, balloon plants, and divers other creeping things, which had, during the long summer, made a verdant and flowering wall on three sides of the garden.

[Those who have not tried know not how beautiful the garden may be made by thus planting the trailing, creeping, and climbing plants so close together, that the result will be a green wall dotted with red, white, blue, and yellow flowers, and which will seem to grow right up, perpendicularly from your flower beds or grass plat. Try it friends, next summer!]

At the first rip of the vines, there was a general exclamation among the sparrows.

Mrs. Sparrow—"What is he doing now, pray?"

Mr. Sparrow—"Why, I declare, he is pulling down all those vines which yet contain so many seeds, from which we have had so many good meals, and expected to get more!"

Rip, rip at the vines—I wanted them you see for bed-quilts for my bulb-beds. "Dear! dear!" twittered the sparrows, "what shall we do? the cruel winter is coming, the snow will lie deep on the ground, covering all our food up—no one will think of us, and we shall surely starve!"—said all the sparrows in chorus.

Rip, rip went more vines—"See," said the sparrows, "he's even going to pull down those which have run up on our houses, which made them beautiful all summer, and which are yet so full of nice seed!—Please good man! listen to us—please do!"

"Well!" said I,—you see I began to understand sparrow language—"Well!"

"Please don't pull all down. Leave us at least the covering on our houses, or we may leave you, and not come back in the spring, when you so much want us to rid you of the measuring worms and ugly caterpillars—please don't pull all down!"

"Beloved sparrows," said I, "so be it. The dead vines on your houses with their ripe seeds shall remain, until you have feasted on all the seeds or the chill winds of winter shall blow them away."

And then such a chirping, such a twittering as there was in that sparrow throng, you never heard, as they all in one voice returned thanks. There now the vines remain, and there they may remain until the last seed has been utilized, and I hope that the sparrows in reminding me of their wants, will remind others of the cold and scanty days, now coming, for the feathered tribes who live in large cities.

This is what the sparrows said to me on that bright November day.

HINTS ON HOME ADORNMENT.

In preparing autumn leaves, I have found that when varnished or oiled they seem more liable to catch the floating particles of dust; ironing them in any quantity is laborious, and I think gives them a less natural look; while if laid in books (books not wanted for every day's reading or reference), and left in press undisturbed a few weeks, the result will be entirely satisfactory. A special word as to Ferns. These should be placed very carefully in press as soon as possible after gathering, and allowed to remain there until wanted for use. These always require delicate handling, as they are very brittle and easily spoiled. Do not omit the little things you find about home in your walks or rides; gather bunches of green Oats and Rye, the feathery Grasses, the late bronzed leaves of the Blackberry and perpetual Rose, and even the despised weeds, and to these add some green leaves of Ivy, Maple, or any convenient sort by way of contrast, and you will find yourself amply repaid for your trouble by the additional airiness and grace given to your bouquets. When the dark and stormy days of winter come, get together your treasures, and with a bottle of mucilage, pasteboard cut into various shapes for backgrounds, a strong needle and thread, by the exercise of your artistic taste in arranging and making-up of your adornments, you will find a pleasant occupation, and be enabled to brighten up your rooms to the admiration and enjoyment of all your household.

I do not know that I can give you any better ideas for the arrangement of your leaves than by describing my parlors. On entering the front room the first thing that strikes the eye is a group composed of two crescent-shaped pieces running into each other, formed of the deeply indented brown Oak leaves, mingled with various colored leaves and Ferns, and dried Oats and Grasses fastened in here and there by a drop of mucilage, the ends terminating with long Ferns or sprays of Sumach. Between the front windows is a differently shaped cluster with

plenty of large Ferns forming the outline and filled up with a diversity of leaves. In my rambles in autumn I secured some long branches of the Briar-wood Vine bearing full bunches of dark purple, almost black berries; these draped in tangled masses thickly intermingled with the berries of the Bitter-sweet Vine, and Star-oak burrs are trained along the cords over a picture in the opposite end of the room, and also over a favorite little chromo which hangs in a recess above a stand of Tradescantia, that most satisfactory plant which grows so luxuriantly in spite of stove heat and illuminating gas. Around the cords of another picture is trained a long spray of wild Clematis, with its feathery seed pods, looking as if a breath would blow them away, while in reality they make a permanent decoration.

Over a crimson bracket supporting one of Rogers' statues is a large half wreath composed entirely of Ferns in variety, as green and fresh as when in their native haunts, and on a dark carved corner bracket stands a slender white vase of Ferns and Sumach, while from the base of the bracket floats the grey Florida moss, so soft and filmy, interspersed with our crimson northern berries. For the mantel I have a small vase of Ferns with a delicate butterfly hovering on it, and a pair of panel pictures. 'Ah! but those are painted,' is the exclamation of visitors. No, they are not painted, they are nature itself. Not having the gift of painting, and determining not to be outdone, I again drew upon leafy treasures. I procured two thoroughly-dried boards of the desired size, and had them painted black, sandstoned, and varnished. I then selected the tiniest, brightest, and most perfect leaves and Ferns, and arranged them in groups upon my panels, attaching them carefully with mucilage, then covered them with glass the exact size of the boards; the edges were bound together with narrow strips of black paper, such as is used by bookbinders.

My crowning attraction is our window, the admiration of all beholders. It opens into a small library with a glass roof, which admits light sufficient to make it as lovely by day as by night with a strong gaslight behind it. I procured from the stationers a piece of oiled tracing muslin the exact size of the individual panes, and filling the lower half of the window, which consists of two large panes of plate glass, the muslin giving the appearance of ground glass. In one pane I have a border of Ferns, in the center a bunch of Ferns with a few colored leaves and delicate sprays of Grass. In the other is a large bouquet of exquisite leaves of every shade intermixed with Ferns, Grasses, and Oats, surrounded by a half wreath of Ferns and green leaves, terminating on each end half way down the picture with a leaf of the long pointed walking Fern, and the whole is a marvel of beauty. This window is not only a picture to all but it is a memory and a token of friendship. I have a dozen varieties of Ferns, and some of these are joyous reminders of pleasant friends found among the mountains. Some are a tribute of affection gathered by a friend, while those curiously-spotted Maple leaves and other brilliant beauties came from the granite hills of New Hampshire, and the remainder from different portions of New Jersey."

—N. Y. Tribune.

Thus well to walk with a cheerful heart,

Wherever our fortunes call,

With a friendly glance and an open hand,

And a gentle word for all.

Since life is a thorny and difficult path,

Where toil is the portion of man,

We all should endeavor, while passing along,

To make it as smooth as we can.

An accomplished Indiana girl calls hay "grass a la mowed."

THE GLORY OF THE AUTUMN WOODS.

J. M. MCCANN.

"Tears, idle tears, I know not what they mean,
Tears from the depths of some divine dream
Rise in the heart, and gather to the eyes,
In looking on the happy Autumn fields,
And thinking of the days that are no more."

Beautiful the spring when all things are awakening from the sleep and dreams of winter—the red buds are swelling—the early flowers unfolding their many-colored petals—the snow drifts white on the northern hills, but melting slowly into crystal streams, and silver water-falls as the golden chariot of the sun is driven higher and higher through the fields of the sky—when the birds are glittering in scarlet and blue and gold, and their melody goes up from every tree and flowering shrub—many tuned hymns of praise to the Giver of Life.

"In the spring a fuller crimson comes upon the robin's breast;

In the spring the wanton lapping gets himself another crest."

Beautiful the summer—the noon of the year—when spring has grown into manhood, the grass lands are green and the wheat fields are gold, and the flowers are everywhere—exhaling the odors of paradise and preaching the poetry of God.

There is a glory in the autumn woods when the leaves are turned to flowers—gold and crimson, emerald, brown and scarlet, and the garlands hang everywhere under the arching branches—beautiful as pictures by "the grand old masters."

The sugar maple is a blaze of crimson glory, and the tulip tree is covered over with cloth of gold—the beech is still green as in the happy summer time, and the oak is clothed in sober brown. Far off upon the mountain tops cedar and pine look gloomy and black—forming a black ground dark and beautiful for the glory of color that lies before them. The squirrels are merry in the wood, and the quail form happy families in the stubble fields. The early frosts have given to the hares again the strength the summer's sun had stolen from them, the music of the hunter's horn is heard among the hills and they bound away before the hounds mad with the love of life. We call them timid, yet the lion would be no bolder. The painted leaves come down in showers, spreading carpets over all the wood land, and the wild ferns peep up through them—beautiful as marine plants upon a shell-paved shore. Scarlet berries gleam among the dying foliage, and hang on slender vines over the laughing waters. The cardinal darts among the gloomy pines like a red meteor, "trailing light," over the storm clouds, and the blue bird sings in mournful notes—"winter is coming." "Little mosses, golden mosses," cover the rocks with beauty, and spread over the sunny banks like fairy gardens.

The grapes hang in purple clusters from the vines, and the hickory trees are crowned with nuts. The dove sits silently upon the withered tree, free from all danger of the hunter's gun—to the Persians they were sacred birds—the wild Indians would not harm them for they thought that the souls of the departed rested like jewels in their breasts. The robin loves the orchard best, and flies from field to wood—a happy bird, for the old legends tell us that he covered his breast with blood in tearing a thorn from the crown of Christ; and you know that he covered the little children over with leaves when they were left to die in the wood. The breeze goes by and tosses out the golden acorns from their beautiful carved cups. The earth is laying up a store of seed, and the summer's sun will kiss them into leaf and flower.

A melancholy haze is over every thing, and the Indian summer fills all the land with a dreamy beauty—the old year is dying—fading, fading into the pitiless winter. The frozen dew drops are scattered over every wood and meadow. The glory has faded from the painted leaves and all are brown. The summer birds with their plumage stained with the hues of the rainbow, and the

sunset, have left the northern woodlands and gone to climes where winter never comes. Over the mountains—over the sea the feathered armies fly by myriads—away, away to—

“That land where the lemon trees bloom—
Where the gold orange glows in the deep thicket’s gloom,
Where a wind ever soft from the blue heaven blows,
And the groves are of myrtle, and laurel, and rose—
Knowest thou it?”

FAMILIAR SCIENCE.

Contributions to this department respectfully solicited from all.

—We copy the following from the fly-leaf of an old book on ornithology formerly owned by our contributor, Peter Peppercorn. “The study of Natural History is pleasing in youth, delightful in manhood, and a solace in old age. As, when we are no longer able to traverse the woods and fields, we may sit and recall the scenes of the past, and ponder over the wonderful works of Nature.”

FASCINATION—PHOCA IN ANSWER TO J. M. McCANN.

Continued from page 541.

From “Goods’ Anamalia.”—“Some years since Mr. Rittenhouse, an accurate observer, was induced to suppose from the peculiar melancholy cry of a red-winged maize-thief, that a snake was at no great distance from it, and that the bird was in distress. He threw a stone at the place from which the cry proceeded, which had the effect of driving the bird away. The poor animal however immediately returned to the same spot. Mr. Rittenhouse now went to the place where the bird alighted, and, to his great astonishment he found it perched upon the back of a large black snake, which it was pecking with its beak.

At this time the snake was in the act of swallowing a young bird, and from the enlarged size of the reptile’s belly, it was evident that it had already swallowed two or three other young birds. After the snake was killed the old bird flew away. Mr. Rittenhouse says that the cry and actions of the bird had been precisely similar to those of a bird, which is said to be under the influence of a serpent.”

I myself, have repeatedly seen Black snakes driven from trees by both blue-jays and red-squirrels.

As to the evidences in support of the theory of fascination, we have the same stereotyped list of authorities and incidents, recorded in all Natural Histories. In the examination of many works I find in support of the theory, nothing newer, and but little in addition to the evidences quoted by Mr. McCann. Does it not seem a coincidence, that with the decline of credulity and superstition and the dawn of rigid scientific investigation and scrutiny, that there should be no new evidence adduced in support of this fascinating theory, although the facilities for observation are so much improved?

Let us have a little fresh evidence if possible.

Here is a little negative evidence. The common rattlesnake. (*Crotalus durissus*) Tenney’s Natural History (1865). “This snake feeds upon young hares, squirrels, and birds which it secures by lying in wait for them. Its reported charming powers is probably a mere notion which has no foundation in fact.”

“The food of the rattlesnake consists of rats, mice and reptiles and small birds, the latter of which creatures, it is said to obtain by the exercise of a mysterious power termed fascination, the victim being held as it were, by the gaze of its destroyer, and compelled to remain in the same spot, until the serpent can approach sufficiently near to seize. It is even said that the rattlesnake can coil itself at the foot of a tree, and by the mere power of its gaze, force a bird or squirrel to descend and fling itself into the open mouth waiting to receive it.” The chapter from which this is copied is devoted to a review of the evidence on both sides,

with a leaning in favor of the theory of fascination, with however this modification: “Every squirrel or bird may not succumb to the same influence, just as every human being does not yield to the insane desire of jumping from heights, and it is probable that a rattlesnake may coil itself under a tree, and look all day at the squirrels sporting in the branches or the birds flitting among the boughs without inducing one of them to become an involuntary victim. Yet it is possible that out of the many hundreds that could see the serpent, one would be weak-minded enough to yield to the subtle influence and instead of running away, find itself forced to approach nearer and nearer the fearful reptile. Thus far there is no difficulty in accepting the theory of fascination, but the idea of a *moral compulsion* on the part of the snake and a perforced obedience on the part of its victim, is so strange that it has met with very great incredulity. Still, although strange it is not quite incredible. There are many persons who cannot stand on any elevated spot, without feeling so irresistible a desire of flinging themselves into the depths below that they dare not even stand near an open window or walk near the edge of a cliff.” Wood’s Natural History.—Here occurs a brilliant opportunity for Mr. McCann to distinguish himself by a metaphysical demonstration of the value of the *idea of a moral compulsion*, on the part of the earth beneath an open window or a cliff.”

To be Continued.

NIGHT AND DAY WITH PLANTS.

It is the law of nature that all plants should sleep at night, but they may be artificially disturbed, the law set aside and yet the plants thrive. A French chemist tried the experiment on the *mi-mosa*, keeping it in a bright light at night, and a dark room during the day. The plant did not at first, take kindly to such unnatural treatment, but soon got used to the change, and at last turned day into night, and night into day, as easy as a daily newspaper editor.

A year or two ago as was my custom, I planted in my garden beds quite a number of hyacinths. When the spring opened, all of the bulbs but one came up. Thinking that it was a late one, and would yet appear, I waited patiently, but it came not. Wanting to fill the vacant spot with something else, I turned up the earth with my trowel, and lo, there was the hyacinth in full bloom, with *flower-stem growing downward!* It had by some chance, in covering up I suppose, got turned up side down, but nature was not to be cheated of her rights. Nor was the flower devoid of color, as one would suppose would be the case, considering that the flower was blooming in the dark, but was a finely tinted blue, only a few shades lighter than it bloomed in the natural way. It was such a strange freak of nature, and so contrary to the general idea that plants can have no color without light, that I called several witnesses to the fact, all of whom are ready to testify to the truth of the statement.

HUON.

POTASSIUM.

It is well known that water is composed of two invisible, inodorous gases, oxygen, and hydrogen. Oxygen is a supporter of combustion, but will not burn. Hydrogen, on the contrary, is a combustible, but will not support combustion. Potassium is a metal which is lighter than water, and having a great affinity for oxygen. A very pretty experiment, which may seem wonderful to those who have never seen or heard of it, may be shown with these substances. Telling them that you are going to set fire to water, take a basin of water, and drop a small piece of potassium in it. Immediately upon touching the water, it will apparently burst into a bluish flame, and skip about on the surface of the water, and finally disappear with a slight “*psk*.” The explanation is very simple. Potassium has a greater affinity for oxygen than hydrogen has, and immediately upon touching the water, it decomposes that substance, separating the oxygen from the hydrogen. It unites with the oxygen which forms with it potassa, and is

dissolved in the rest of the water. During this chemical action, there is sufficient heat produced to ignite the hydrogen, which, in the endeavors to escape, moves the potassium from place to place, upon the surface, and causes the skipping motion.

H. A. S.

—**IMPORTANT MEDICAL DISCOVERY.**—The details of the following cases we find in a late number of the *New York Medical Journal*:

"An American doctor of medicine having heard of the discovery made in France, that pain could be relieved by hypodermic injections of cold water, resolved to try the experiment. His first case was a woman who, during three years, had suffered so much from lumbago that she cried out with pain on the slightest movement of the muscles of the back. The doctor injected ten drops of cold water under the skin in the lumbar region, on each side of the spinal column, and in less than a minute the patient felt relief. 'She stood up without pain, sat down without assistance, and in less than five minutes after the injection, picked up a pin from the floor with ease.' Some time afterwards the pain returned, but was mitigated the next day by a puncture without injection, and the woman who had been so long crippled was able to work at a sewing-machine. Another case was rheumatism of the ankle joint, cured by injection of ten drops of cold water; and a third was nodular rheumatism, involving the shoulder, elbow, wrist, and knee-joint of the right side. Here again the injection of cold water gave relief within five minutes. 'I repeated these injections,' says Dr. Dessau, 'two days after, when the left knee was attacked, with a like favorable result. In all these cases, slight complaint was made at the moment of injecting the water, of a burning sensation; but not more, I imagine, than when any other fluid is used for a like purpose. In this last case, I injected ten syringefuls of water at one visit, so there is no danger from the quantity employed.' It certainly is a most valuable and ready means of relieving pain, particularly in rheumatic cases."

—**MILITARY SERVICE AMONG ANTS.**—A gentleman of this city, one morning recently, while walking in his garden, observed two columns of ants crossing the path in opposite directions. Upon noticing the curious movements closely, he saw that those going in one direction carried the bodies of ants which he supposed to be dead, while those going the other way seemed to have deposited their burdens, and were returning to get new loads. It was his first impression that the ants were engaged in stocking a new cemetery with their illustrious dead. In order to note what effect a disturbance of their line would create, he dropped a little sand upon the column. Instantly the apparently innominate ants sprang to the ground and became vigorously alive, while the carriers retreated in a pusillanimous fashion. As more grains were dropped the ants became very pugnacious, rearing up and attacking each grain furiously. From this singular conduct the gentleman concluded that the ants were the fighting members of the tribe, a sort of mounted infantry that was being transported across the country to guard some new frontier settlement, and that, as soon as the grains began to fall upon the column, the ants, thinking enemies had opened a fire from their catapults, allowed the warriors to dismount and pitch into action, while the carriers beat a retreat out of danger. In view of the circumstances, such a conclusion seems warranted. At any rate, antkind has been regarded since Solomon's time as exceedingly clever in all matters of domestic and social economy, and there is no telling to what degree of intelligence it has attained in the progressive age. Who knows but what we daily tread under our feet ant republics and insect empires, among which civil wars are progressing that necessitate the maintenance of standing armies at the public expense.—*Louisville Courier Journal*.

—**HOW THE OYSTER GROWS.**—The body of an oyster is a poor, weak thing, apparently incapable of doing anything at all. Yet what a marvelous house an oyster builds around his delicate frame. When an oyster is first born he is a very simple, delicate dot, as it were, and yet he is born with his two shells upon him.

For some unknown reason, he always fixes himself on his round shell, never by his flat shell, and being once fixed he begins to grow; but he only grows in summer. Inspect an oyster shell closely, and it will be seen that it is marked with distinct lines. As the rings we observe in the section of the trunk of a tree denote years of growth, so do the markings on an oyster tell us how many years has passed in his "bed" at the bottom of the sea.

Suppose the oyster under inspection was born June 15th, 1870, he would go on growing up to the first line we see well marked; he would then stop for the winter. In summer, 1871, he would more than double his size. In 1873 and 1874 he would again go on building till he was dredged up in the middle of his work in

1875; so that he is plainly five and a half years old. The way in which an oyster grows his shell is a pretty sight. I have watched it frequently. The beard of an oyster is not only his breathing organ—i. e., his lungs—but also his feeding organ, by which he conveys the food to his complicated mouth with its four lips.

When the calm warm days of June come, the oyster opens his shell and by means of his beard begins building an additional story to his house. This he does by depositing very, very fine particles of carbonate of lime till at last they form a substance as thin as silver paper and exceedingly fragile. Then he adds more and more till at last the new shell is hard as the old shell. When oysters are growing their shells, they must be handled very carefully, as the new growth of shell will cut like broken glass, and a wound on the finger from an oyster shell is often very dangerous.—*Frank Buckland*.

—The bulletin of the Torrey Botanical Club contains a suggestive paragraph in reference to the influence of trees upon rain and atmospheric moisture, as shown by the experience of the island of Santa Cruz, in the West Indies. This island is said to have been a garden of freshness, beauty, and fertility twenty years ago; it was covered with woods, trees were everywhere abundant, and rains were profuse and frequent. The recent visit of a gentleman who had known the island in its palmier days revealed a lamentable change, one-fourth of the island having become an utter desert. The forests and trees had been cut away, rain-falls had ceased, and the process of desiccation, beginning at one end of the island, had advanced gradually and irresistibly upon the land, until for seven miles it had become as dry and barren as the seashore. Houses and plantations had been abandoned, and the advance of desolation was watched by the people, wholly unable to prevent it, but knowing almost to a certainty the time when their own habitations, their gardens, and fresh fields would be a part of the waste. Indeed, the whole island seemed doomed to become a desert. This sad result is owing entirely, according to the belief of the inhabitants, to the destruction of the trees upon the island some years ago.

—**A QUEER BIRD—EAGLE OR HAWK?**—Mr. Jacob Kepler, says the *Pottstown Ledger*, living about half a mile from Limerick Square, this county, captured a rare old bird on Friday in a wooden trapbox. This bird has annoyed Mr. Kepler for the past two years by depredating on his poultry. It is a question among those pretty well versed in ornithology as to whether it is a hawk or an eagle, as it has the peculiarities of both birds. It measures about five feet between the tips of its wings. It is quite large enough for an eagle, and it has the yellow beak of that bird. On the other hand it has no white feathers on the head and tail, and the beak though curved, is short like a hawk's. It is very strong, and when removed from the trap it buried its claws up to their roots in a pine board, and could only be made to loose its hold by prying them off with a lever.

—**M. Emile Collnot**, the French manufacturer of earthenware has lately discovered a new mode of decorating buildings. Instead of applying a decorated faience to the wall, he proposes enameling the wall itself, by putting up a light scaffolding and using a blowpipe instead of an oven. The advantages of the scheme are cheapness and durability. Experiment has proved that the process is less expensive than separate plates and the decoration is calculated to last as long as the stone itself.

—**YIELD OF ORANGE SEEDS.**—Can any of our orange growing readers affirm or deny the following: F. B. Hudson writes to *Our Home Journal*: "I have recently made a discovery that an orange seed will produce more than one tree. I have found as many as five from one seed, all distinct, with no connection except in the seed. I separated and transplanted 20 from six seeds. I have shown to a good many of my neighbors, none of whom knew of it before."

A very heavy loss has befallen the Essex Hunt, in England, in the enforced and total destruction of the bitch pack. Two or three months ago a few cases of that dread malady known as "dumb madness" occurred, and as soon as the symptoms manifested themselves each hound was taken from the kennel and destroyed. Up to the 1st of August no further outbreak occurred, but during that period the disease spread so much that it was thought best by the master, Mr. Loftus W. Arkwright, after hearing the opinion of his veterinary surgeon, and that of his huntsman, to destroy the remainder of the pack. Accordingly these, numbering eighteen and a half couples, were shot by the head keeper and were afterwards buried in lime. The whole of the bitch pack, which was considered to be one of the finest bred and best hunting packs in the kingdom, had thus to be sacrificed.

SMALL PET DEPARTMENT

(For FanCIers' Journal.)

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending Nov. 16th, 1876.

- 1 Snowy Owl (*Nyctea nivea*). Presented by W. Carpenter, Jr., Salem, N. J.
- 1 Alligator (*A. mississippiensis*). Presented by Dr. E. J. Elbridge, Americus, Ga.
- 1 White-throated Capuchin (*Cebus hypoleucus*). 1 Black-handed Spider Monkey (*Atles melanochleris*). 4 Parakeets, 1 Red-billed Tree-Duck (*Dendrocygna autumnalis*?). 1 Vervet Monkey (*Cercopithecus talandii*). 12 Macaque Monkeys (*macacus cynomolgus*). 2 Pig-tailed Monkeys (*M. nemestrinus*). 1 Rhesus Monkey (*M. Cerythraeus*). 1 Mandrill (*yocephalus mormon*). Purchased.

ARTHUR E. BROWN, Gen'l Supt.

CATS.

While the majority of people have kindly feelings towards dogs, comparatively few are attached to cats; and yet the ancients made these animals special objects of attention and kindness. On many of the old monuments of Egypt representations of cats are to be seen, while quantities of bronze figures and mummies of them have been exhumed in and around Thebes and other cities. Some of these mummies, all swaddled in long strips of perfumed linen, and with their heads curiously painted, were discovered in an excellent state of preservation, and lying in wooden coffins. The Egyptians seem to have trained some of their cats to hunt and carry game, for in pictures of hunting scenes in the valley of the Nile, cats are represented pouncing upon marsh-birds, or bringing them to their masters. This variety of the feline tribe differs, however, from our common cat, being rather more of a tiger or leopard. When the sultan of El-Daher-Beylars—who reigned over Egypt and Syria toward 1260 A. D.—died, he bequeathed a garden called "the cats' orchard," which was to be kept as a refuge for all stray and hungry cats. This garden is still devoted to its original purpose, though greatly reduced in size. The cat, being by virtue of his office and functions a trustee of all pious and charitable bequests, superintends a daily distribution, between noon and sunset, of butchers' refuse meat and scraps, which are dealt out in proportionate quantities to each and every cat that comes or is brought into the large court yard known as the Mehkemeh. And there are regular *habitudes* of the place that never fail to come at the appointed hour, whatever the weather. They throng in on all sides and the roofs of the neighboring houses literally swarm with them. As a natural consequence, the uproar is something terrific. In certain parts of Italy and Switzerland this same custom is observed. In Florence there is an old cloister which is used as a house of refuge for cats. This establishment is much patronized by those people who wish to select good mousers, as the animals are well trained and cared for. In Geneva the cats wander through the streets like the dogs in Constantinople, and are never molested. On the contrary, the people are generally very willing to feed them. In Rome, at certain hours, butchers and hucksters go through the city with meat for the cats, and as soon as the latter hear the peculiar cry or whistle of these dealers they rush out of the houses and get their respective shares of the daily meal, for which their owners pay a monthly contribution. The veneration felt by Arabs for cats arises from superstition. They believe that spirits assume their shape to visit their departed friends. The Mahometans have also prized the cat, on account of the prophet's liking for the animal. Many eminent men of ancient and modern times have valued cats as pets: for example,

Cardinal de Richelieu, Cardinal Wolsey, Dick Whittington, Lord Chesterfield, &c.; but for all that many of our readers will agree with that witty French writer who said, "The Lord made the cat to allow us the pleasure of fondling a tiger."

The following story about "Colonel," a dog owned by Chas. Kestler, of Denver, Col., by the *Denver Tribune*: "The animal is about five years of age, and has been with his present master from his (the dog's) birth. One of Colonel's amusements is the play of 'ball.' From some cause or other no one of the reasoning human family saw fit to pay any attention to Colonel's wishes and feelings in regard to the ball business during all of yesterday forenoon, and the ball itself was laid away in a drawer that occupies the center of a writing desk in the main office of the hotel. The Colonel stood this with canine dignity for several hours, but finally concluded on making an attempt to secure his ball, without regard to the human race. He spent the better portion of an hour in trying to open the drawer by pressing his feet against it. As this only made matters worse, he next endeavored to secure the 'open sesame' by pulling the knob in the center. This knob, however, was both small and round, and the Colonel could secure no grip with his teeth. His next effort was a 'rear' attack, and was perfectly successful. Going under the desk he manifestly observed the location of the back of the drawer, and also saw (and reasoned) that by standing on his hind legs he could insert his front paws between the back of the drawer and the back of the desk, and so press the former forward, and thus secure his much coveted treasure, the ball. To think, with such a dog as Colonel, was to act, and almost sooner than it can be told, and in the presence of a number of parties interested in the matter, the drawer of the desk was pressed out. Colonel at once appeared in front, from under the desk, and leaping upon it he saw and eagerly clutched his plaything. The efforts made by Colonel, his temporary confusion and distrust, his perseverance and final triumph were all witnessed by a number of gentlemen."

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

For "TO EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the **Exchange** or **Want** column.

No **Exchange** or **Want** will be inserted unless accompanied with 25 cents.

W. H. RATHBONE, Unscaville, Conn., will exchange a trio of choice White Leghorn Chicks, (Smith strain,) for a copy, in good order, of Cooper's *Work on the Game Fowl*.

J. B. TUCKERMAN, Eaton, Madison Co., N. Y., will exchange Chromes and Frames, a quantity of Pop Corn, 1 trio Golden Poland Chicks, and 1 pair White Pouters, for offers. Write quick. All correspondence answered.

H. H. TSHUDY, Litz, Pa., will exchange ten pairs of Tumbler Pigeons, and four Brown Leghorn Cockerels, for P. Rock or B. Leghorn Pullets, or offers.

H. S. CHAPMAN, Saybrook, Conn., has some fine Plymouth Rock Pullets to exchange for Golden or Silver Sebright Bantams, or Dutch Rabbits. Postal or any other card answered.

W. J. B., Box 489, Middletown, Conn., has five Buff Cochins Pullets to exchange for same of Plymouth Rocks, (pure bred).

W. B. SHERRY, Stony Brook, L. I., will exchange 10 varieties of Pigeons, two of Poultry, for Wild Deer, or a Shot Gun. Want good stock; mine is the same. Speak quick.

G. R. HAY, West Laurens, N. Y., will exchange one thoroughbred Jersey Bull, 2 years old, solid color, for anything worth \$50; B. Leghorns, E. B. E. Game, or Bull Dog, for a Violin, Watch, Harness, Gun, or others.

S. D. R. SMITH, Williamsport, Pa., will exchange one Success Washing Machine, cost \$25; one Checker and Backgammon Board, with set of Checkers (new), two Dice Boxes, with Dice (new); one set Solid Bone Dominoes; one Gribbage Board; one small spy Glass; one small Pocket Powder and Cap Flask; one Book Slate, \$1.10; one Double (hinged) Slate, 10x18; one case Surveying Instruments, complete; and a large number of useful Books, for Leghorns and Bantams, or offers.

W. C. EATON, Newark, N. J., will exchange a Magic Lantern, coat \$200; a Graves' Incubator, \$100; or German (anaries, good singers, for Black or White Cochins, or B. Leghorns. Must be first-class.

A. B. HOLCOMBE, JR., Lambertville, N. J., will exchange 1 pair Japan Silkies, 3 pair Silver L. Bantams, and 3 Silver D. G. Bantam Cockerels, for Plymouth Rock and Brown Leghorn Pullets, early hatched birds, or Japan Silkies Cock.

F. A. PERKINGTON, Delaware City, Del., has Fancy Pigeons to exchange for White Leghorn Hens.

DR. H. ENOS, Milwaukee, Wis., will exchange White Cochins (large birds), and White Leghorn Cockerels, for Fancy Pigeons, or others.

J. JEWETT PARKS, Blairsville, Pa., wants a Scroll Saw and Foot Lathe in exchange for Fancy Pigeons, consisting of Jacobins, red and yellow,outers, Tumblers, Duchesse, B. B. Red Game Bantam Cockerels, King Doves, Lop-eared Rabbits, Goat, Coach Dog.

P. H. SELOVER, Morris, N. Y., will exchange four Dark Brahmas Hens, extra fine, for four Silver Pencilled Hamburg Hens or Pullets, or two Silver Pencilled Cockerels for two Silver Pencilled Pullets. Must be good.

MRS. M. A. STEPHENSON, Chagrin Falls, O., will exchange a first premium White Leghorn Cockerel, for a standard Black Leghorn Cockerel, and a trio of standard Brown Leghorns, Todd's stock, for a pair of Pekin or Aylesbury Ducks.

MANSION HOUSE, Tamaqua, Pa., will exchange 1 trio P. Cochins Fowls, 1 trio S. P. Hamburg Fowls, 1 trio G. P. Hamburg Chickens, 1 trio White Leghorn Cockerels, 3 trios Aylesbury Ducks, 3 first-class B. B. R. Game Hens, 1 pair Common Pigeons, 2 pair White Cuckoos, Fan, 1 pair Brown Heimer, 2 pair Black Short-faced Tumblers, 1 pair White English Carriers, 3 Parrot Cages, 5 Single Exhibition Pigeon Coops; also 4 Coops of Six Apartments, a lot of Watson's Roup Pills and Tonic Paste, for Buffalo Robes, Harness, Sleigh Bells, or others.

J. A. ROBERTS, Paoli, Pa., wants a trio Light Brahmas, Plained's stock, No. 1; will give 1 Brahms Pullets, cross of Williams, Kern and Felch others, for 1 Brahms pure, or Nursery Stock. No postals, or other offers in trade wanted.

F. J. DAVIS, 16 Cypress St. Rochester, N. Y., will exchange 2 pairs Outside Tumblers, or 1 pair Outside Tumblers, and 1 Blue Pied Pouter Cock, or 1 Rumpless Cock, (very good), for 1 Singing Canary, or other song birds. My birds are good; want same.

W. H. RATHBONE, Uncaesville, Conn., has Black Hamburg and White Leghorn Chickens, very fine, to exchange for Dark Brahms Pullets of some well-known strain. Must be nice. Send along your offers.

OLIVER D. SCHOCK, Hamburg, Berks Co., Pa., wants 1 White Carrier Cock, 2 Blue Swallow Coops (barred), 4 Yellow Jacobin Cocks with pearl eyes. The above birds must all be first-class; for which I will give Pigeons of many varieties. Postal cards accepted.

JAS. L. VOSE, Russell Hill, Wyoming Co., Pa., has a trio of Dark Brahmas, a trio of Pair Cochins, and a trio of White Leghorns, and will exchange either trio for a trio of Aylesbury Ducks, or others.

L. R. SPONG, West Fairview, Cumberland Co., Pa., will exchange 1 White-faced Black Spanish Cockerel, lot of Deunjohns, all sizes, 1 Tobacco Knife, lot of Connecticut-made Baskets, lot of 3 bushel Burlap Bags, 4 lbs. Pepper, 1 lb. Cloves, 1 lb. Allspice, lot of grape and Strawberry Boxes, for 1 year's subscription of Faniers' Journal, Brown and White Leghorn Hens, &c. Make offers. Postal cards answered.

C. B. ELBEY, Pittsburgh, Pa., has one Flute, value \$12; one Piccolo, value \$6.75, both new; Black African Bantam Cockerels, to exchange for good Cigars, or Silver Ware.

MRS. DR. MARTIN, Mercersburg, Pa., offers Apple, Peach, and Pear Trees, all good grafted fruit, and 1000 Graft Grape Vines, for anything in Poultry line, or fancy stock of any kind. Desire B. Spanish, Aylesbury and Pekin Ducks, Turkeys, Rabbits, Guinea Pigs, or anything in the fancy stock line alive, or electrolysis.

S. D. R. SMITH, Williamsport, Pa., will exchange one Fancy Pigeon and Bantam Show Cage, 39 in. long, 33 in. high, 31 in. wide, galvanized 3 1/2 in. wire, two floors, eight apartments, door with brass patent lock, and key to each, fancy tin Mansard roof, nice turned wood posts, partitions galvanized wire, only used at last Fall's show, took 1st premium, cost \$45, for Leghorns and Bantams, or others.

ROBERT HOWARD, North Adams, Mass., will exchange Standard White and Brown Leghorns, Partridge and White Cochins, Dark and Light Brahmas, Plymouth Rocks, and White-faced Black Spanish, for a first class Black-pied Pouter Cock, or other Fancy Pigeons. None but A 1 birds wanted, as mine are.

S. D. R. SMITH, Williamsport, Pa., will exchange one pair of choice English and Irish Gig Bull Terrier Pup, three months old, full-blooded stock, best of pedigree given on application, for Leghorns and Bantams, or others.

S. D. R. SMITH, Williamsport, Pa., will exchange one trio each, Fowls, Buff Partridge Cochins, Light Brahms; Chickens, three trios Buff, one trio Black, one trio White Cochins, one trio Light Brahms; Hens, five Black, one White, two Buff Cochins, four Dark, two Light Brahms, three White Sultans; Pullets, three Dark Brahms; one pair White Frizzle Fowls, one Japanese Silkies Cock, one Partridge Cochins Cockerel, one White Leghorn Cockerel, for Leghorns and Bantams, or others.

E. C. NEWTON, Batavia, Ill., will exchange Electrotype Cuts of Poultry, for Books on Architecture, Tame Squirrels, or any thing of value. State what you have to exchange; also for what breeds you want cuts, and I will send proofs of cuts.

D. N. HULSHOUSER, Box No. 123, Milton, Pa., will exchange one trio of B. B. R. Game, hatched in May '76, for Plymouth Rocks.

JNO. F. HOUSER, Tamaqua, Pa., will exchange 1 Harp, Piano, 3 good Violins, 1 10-keyed Accordion, 1 Evans & Watson's Safe, 1 Pocket, and 1 large Case of Homeopathic Medicines, filled and labelled in good condition, 1 Florence Sewing Machine, 1 bound vol. Wright's Illustrated Book of Poultry, 4 Potts Type, assorted, 1 Single Silver-plated Buggy Harness, good as new, 1 Floebert Gun and Target, 1 Red Bird and Cage, 1 Rabbit Hutch, 1 Electric Battery, for Alderney or Jersey Cow, or Double Breech-loading Shot Gun, or others.

E. A. SAMUELS, 125 Tremont St., Boston, will exchange Band and Orchestra Music for first class Black Cochins to any amount; will also exchange for a thorough-bred Setter or Pointer Dog, if partly trained. Correspondence solicited. Catalogue mailed if desired.

BOX 869, Rockville, Conn., will exchange a nice Family Horse, seven years old, weight 1,000 lbs., sound and kind, for a registered Jersey Cow.

A. H. CAREY, Selma Groves, Pa., will exchange Dominique Leghorns, Black Leghorn Pullets, Buff Cochins, or 10 other varieties of choice Fowls for a nice Breech-loading Gun, or nice Double-barrel Gun, or for fine specimens Plymouth Rock Fowls.

BOOK EXCHANGE.

Advertisements under this head, of 4 lines or 48 words, describing and offering one Book for Sale, Exchange, or Wanted, will be allowed at 10 cents for each and every insertion.

A GOOD WORK ON ARCHITECTURE.—E. C. Newton, Batavia, Ill., wants the above in exchange for Electrotype Cuts of Poultry, Swine, &c. Describe book and give author's name, and price; also for what breeds you want cuts for, and I will send proofs.

GEORGE F. SEAVEY,

CAMBRIDGEPORT, MASS.,

Importer and Breeder of High Class Pigeons and Poultry, viz.:

Carriers, Smooth-head and Crested Fantails, Jacobins, Turbits, (winged, tailed and solid colors), Inside Tumblers, Short-face Tumblers, and Berlin Button-heads, Silver and Golden Spangled Hamburgs, Scbrignt Bantams, and Pheasants.

I offer the following pairs Pigeons for sale at prices annexed, and can furnish single birds of many of the varieties.

Also a few choice Silver and Golden S. Hamburgs, at \$5 to \$10 each, or will sell my entire stock of Golden.

CARRIERS.

White,	\$10.00, 12.00 and 25.00	Red,	\$10.00 and 20.00
Black,	10.00 and 25.00	Yellow,	15.00 and 30.00
Blue,	12.00 and 20.00	Dun,	10.00, 15.00 and 40.00

SMOOTH-HEAD FANTAILS.

White,	\$4.00, 6.00, 8.00, 10.00 to 15.00	Red Cocks,	\$5.00 to 6.00
Black,	10.00 and 15.00	Yellow,	13.00, 20.00 and 30.00
Blue,	4.00, 7.00, 10.00 and 15.00	Dun,	10.00 and 15.00

TURBITS.

Agates,	6.00 and 10.00	Mottled,	6.00

JERSEY, ALDERNEY, and GUERNSEY COW.

HOW TO

Choose, Manage and Breed to the Most Profit.

Illustrated. Price, \$1.50.

Address FANCIERS' JOURNAL, Hartford, Conn.

WANTED.

1. A Treatise on the Art of Breeding and Managing Fanc, Domesticated, and Fancy Pigeons; by John Matthews Eaton, and published by the author, 7, Islington Green, London. 1852. Illustrated.
The Treatise of 1858 is not wanted.

2. A set of Six Matchless Engraved Colored Portraits, Life Size, by Wolstenholme, viz: The Almond, Black Mottle, Red Baldhead, Yellow-beard Tumblers, Black Carrier, and Blue Pied English Pouter.

3. A colored Diagram, or a Plan of Building or fitting up a Pigeonary, embellished with Tumblers, Pouters and Carriers.

We think there are several different diagrams, and would like all of them.

4. A set of six splendid Life Size engraved Portraits of The Fancy Toy Pigeons, colored, viz: The White Fantail, Yellow Jacobin, Silver Owl, Blue Turbit, Black-mottled Trumpeter, and the Black Barb.

All of above pictures published by J. M. Eaton.

A liberal offer would be made for any of the above in good order.

Any information regarding John Matthews Eaton's life and works would be gratefully received.

EDITORIAL

THE BALTIMORE SHOW.

The following extract will explain itself. "We are going to have a grand show. I've just received a letter from the St. Louis Kennel Club and they will be with us in full force. At the lowest estimate we may count on 400 dogs.

The show of pigeons will exceed that of last year; and last year we had the credit of having the best display of pigeons yet held on this side of the water; but this year will beat it. Mr. John Yeudall has promised to be here with his magnificent birds, and will himself offer a special premium of \$50.

Philander Williams will be here during the entire show, with his noted stock. Indeed our prospects are very flattering, and I trust you will drop in and see us. I'm here, chuck full of biz.

Hastily,

BALTIMORE, MD.

GEO. O. BROWN.

All who desire to see really good bred birds should make their plans to visit the Baltimore Show. There is no doubt but as far as the pigeon fancy is concerned, it will be the "Battle of the Giants."

Ed.

WESTERN PENNSYLVANIA POULTRY SOCIETY, PITTSBURGH, PA., Will hold their Annual Exhibition of Poultry, Dogs, and Pet Animals, January 10th to 17th, 1877. They expect to offer premiums to the amount of from \$2,000 to \$3,000. The premium list will be out early in December, and will be mailed to applicants.

EDWARD GREGG, President.

A. H. LANE, Secretary.

Western Pennsylvania is noted for the enterprise of its fanciers, and the good birds owned. With the Maryland show just closed, its prize winners transferred to Pittsburgh—with the local beauties kept fresh for competition there—what may we not expect? So much that we shall try to be at both shows.

DEAR SIR:

Will you or some fancier inform me through your Journal, the simplest and easiest way to tell a cock from a hen pigeon, and oblige, yours, &c.,

YOUNG FANCIER.

Moore says in his Columbarium—"I shall next give you some instructions how to form a tolerable judgment whether a pigeon be a cock or h-n, for in this point the best and oldest fanciers have been sometimes deceived; for this purpose, therefore, take the following rules:

The hen has generally a shorter breastbone than the cock.

Her vent and the os sacrum, or bone near the vent, is more open than in the cock.

Her head and cheeks are thinner, and she does not look so bold as the cock's.

Her coo is shorter, and nothing near so loud and masculine as the cock's; besides, the cock frequently makes a half round in his playing, which the hen does not, though a merry rank hen will sometimes show and play almost like a cock, and, if very salacious, will sometimes tread another pigeon.

And lastly, in young pigeons, that which squeaks longest in the nest is generally reputed a hen."

RULES AND PREMIUM LISTS, CIRCULARS, CARDS, ETC., RECEIVED.

Premium List of Western New Hampshire Poultry Society.—I. W. Sturtevant, Secretary.

This society has also made liberal terms with the express and railroad companies, as this notice sent with the premium list would show:

"The U. S. & Canada Express will transport coops at reduced rates, and the American Merchants' Union Express will return coops free. Passengers attending the Exhibition will be carried for half fare from all stations on the Cheshire and Ashuelot Railroads. A special train will leave for all stations on the Ashuelot Railroad at the close of the Exhibition Thursday evening."

Special Premium List offered by the Illinois Poultry Association, from which we quote:

"W. H. Todd of Ohio, has been chosen by the Executive Committee to do the judging. All know him too well for any comment. Suffice to say that he is one of the best judges of poultry in America.

Judge Z. C. Luse of Iowa City, has kindly consented to attend our exhibition, and to deliver an address on poultry, some evening during the Exhibition. All know the Judge to be one of best breeders in all Iowa, not only of poultry alone, but also Jersey Cattle."

By the premium list of the Central Poultry Association of Pennsylvania, we learn that the birds are to be exhibited in pairs. 1st premium birds must score at least 170. 2d premium, 160 to the pair.

They offer also \$100, as special association premiums. \$20 for best collection of poultry; \$10, best display of fancy pigeons; the rest to be given to best birds shown singly.

Card of E. S. Ellwanger, breeder of fancy pigeons, 140 Mt. Hope Avenue, Rochester, N. Y.

Card of G. R. Wheeler, manager of Farmers' Union Warehouse, Shedd, Linn Co., Oregon.

Selling out card of Express Poultry Yard, Stony Brook L. I., W. B. Sherry, Prop.

Card of B. Blampied, breeder of G. and S. S. Hamburgs, W. Leghorns and Pea Fowls, at Mt. Zoar Poultry Yards, Elmira, N. Y.

POULTRY AND PIGEONS.

CENTENNIAL AWARDS.

At the distribution of special premiums by the Centennial Commissioners, Mr. Herman Colell, of Brooklyn received the 1st prize, the fine gold medal valued at \$100, presented by Mr. Burlingame, of New York, for the best collection of fancy pigeons. In presenting the medal, the speaker remarked that Mr. Colell had done much to improve the breed of fancy pigeons in this country, and the valuable trophy had been fairly won. The 2d prize, of a gold chain valued at \$75, presented by Messrs. Wirth Brothers, 92 Broadway, Brooklyn, E. D., for the best collection of Trumpeters and Berlin Tumblers, was also won by Mr. Colell. Prize No. 3, a gold watch, stem-winder, also presented by Wirth Brothers, for the best variety of Pouters, was also awarded to Mr. Colell.

Very remarkable was the pair of Red-pied Pouters, which carried the prize, the male bird measuring 19½, and the hen 19 inches. Special premiums for the best collection of Owls, Swallows and Priests were also awarded to Mr. Colell.

The silver cup, valued at \$50, was awarded to Mr. J. O. Thurston, of New York, for the best collection of Carriers. Very fine pigeons were also exhibited by Mr. C. Spiess, and Mr. A. Scheld, of Brooklyn.

NEW YORK, Nov. 25, 1876.

MR. JOS. M. WADE:

DEAR SIR:—Having read the letters written by "Centennialist," on the Pigeon and Poultry show at the Centennial, I must say in the interest of the New York Exhibitors of Pigeons, that their show of fine birds was never excelled in any exhibition by any other State, and if the exhibition generally was a failure, it was due to the apathy of Fanciers in other States.

Philadelphia and Baltimore being the representative cities of their respective States in the fancy, should blush at being beaten by New York; those cities being the headquarters of so many fanciers, we expected to see them come out with a fine display, but, though the fanciers themselves were present, they left their birds at home; had they done as well as New York, the show would have been the grandest one ever held in this country. I think it a shame that such a fine exhibit of birds should pass unnoticed by the literary talent connected with THE FANCIERS' JOURNAL and having waited a sufficient time for some report of the exhibition, and not being gratified, I will attempt to write what I saw there exhibited by New York and vicinity.

In Carriers, J. O. Thurston, of New York was ahead with his magnificent collection of ten pairs, P. C. Biegel, followed with two very fine pairs, next in order came D. E. Newell, and P. Schuchman, with several pairs, making in all, the finest collection of Carriers ever exhibited in this country.

In Pouters, A. Scheld and H. Colell of Brooklyn, and P. Schuchman, of New York showed a splendid collection.

Tumblers were shown by H. Colell and A. Scheld of Brooklyn.

In Barbs, D. E. Newell, exhibited his large and exceedingly fine collection of twenty pairs, many of them prize-winners at former shows.

In Russian Trumpeters, C. Spiess and H. Colell came to the front with magnificent birds.

Very fine African Owls were exhibited by H. Colell.

In Toys, H. Colell, A. Scheld, and C. Spiess showed birds as finely marked as the plates in "Fulton's Book of Pigeons."

To enter minutely into the merits of each exhibit would consume too much space, but I will say that almost every known variety of Fancy Pigeons were exhibited by New York alone.

BARB.

HAMBURGs AT THE CENTENNIAL.

SUNDAY.—Rain pouring down. My mind wanders back to the departed Centennial Poultry Show, and in particular to the display of Hamburg fowls and chickens. The principal exhibitors of Hamburgs were of Silver Penciled, Messrs. Rogers, Hurst, Taylor, and Schofield, of Pennsylvania, White of New Jersey, McMillan and Kay of Canada. Pennsylvania is without doubt ahead. The firm of Hurst & Taylor exhibited some very fine fowls and chickens. Some of the fowls would score 90 points. The chicks were not in as good exhibition trim as they will be in December. Mr. Hurst understands how to breed Silver Penciled.

The Schofield breeders, John, James, Thomas, and Mark, exhibited some very choice Silvers, and some of the chicks showed some very good points, but did not score over 90.

Mr. White, I was informed, paid \$1,000 for a pair of imported Silvers! Some of the gentlemen named above would have sold him a pair, as good in all respects for \$30, but, however, the birds were very good, and would point up well, and I have no doubt but that some of the birds exhibited in his flock will make their mark at some of our winter exhibitions.

One fact is evident, Pennsylvania has furnished some as handsome Silver Penciled Hamburgs as any one would wish to see on exhibition, fine silvery white head, light red eyes, deep red, large, square fitting, and good spike comb; opaque fitting close to the face, flat, round and even ear-lobe; neck and hackle fine tapering, carried well over the back; clear silvery-white back; breast in cock silvery-white, full and prominent, in hen, penciled evenly across with black bars. Tail in cock, black, full, and well expanded; in hen penciled across with black bars; shanks blue, and carriage upright and graceful.

We have birds like those described, and are proud of them. Canada, I will admit, is not far behind the States in good Silvers. Messrs. McMillan and Kay exhibited some noble birds, and yet I think we are even with them, and well, a little ahead. I think of all the Hamburg family, the Silver Penciled looked the best. However in Silver Spangled, Mr. Scavey, of Mass., exhibited some very fine birds. In Golden Spangled, the Schofield family, made a fine exhibit. Mr. Eisenhart, Penna., showed one pair, and they were worthy of special mention.

I noticed in the Canada exhibit, one pair of Golden Penciled, the penciling commenced at the top of the head. Why they were placed on exhibition, I cannot understand. In Golden Penciled, Messrs. Hunt, Taylor and Long, of Pennsylvania, each exhibited birds handsome, and well up to the standard.

In Black Hamburgs, Canada is ahead. Mr. McMillan showed birds that would be hard to beat.

The Penningtons of N. J., and Mr. Adams of N. Y., had some very good birds. I have always loved the white-faced Black Spanish, and have bred them for a number of years.

I must speak of the exhibition of Spanish, made by Canada. I never examined finer birds. America has no Spanish birds

that can compare with them. Fine, large, noble fellows, good faced, fine comb, splendid tail, and perfect legs, but the largeness of the birds struck me more forcibly, that all other points. The trouble with American birds of the Spanish class, is, they are too small. We have sacrificed everything for the white face. We have gained the face, but have lost the body.

Taken all together, the Hamburg family showed careful breeding, and I, as well as many other fanciers, were highly pleased with the display.

DOYLESTOWN, PA.

TENNENT.

THE FANTAIL.

In commenting upon this singular variety of pigeon it is almost necessary that we should preface our remarks by a few observations relative to the present varied opinions held by Fantail breeders, with regard to its characteristics considered of most importance. The conflicting opinions of fanciers have too often been manifested to need more than a passing reference to show the importance of establishing a standard in order to tone down, or settle, if possible, these differences, so that those young fanciers who seek enlightenment as to the real merits may not be discouraged by such contrary opinions as are at present promulgated, and which certainly must be quite as annoying to the fancier as embarrassing to the experienced judge. We do not suppose that all fanciers will follow our standard and depart from their own peculiar views, but we will endeavor to make clear our opinions, and lay them before the fancier to draw his own conclusions.

There appears to us to have been raised a local model in most districts where the culture of the Fantail has been at all cared for, and, as a consequence, we too often find that what one judge has denounced to-day as unworthy even of a commendation, a brother fancier and judge to-morrow pronounces perfect, and signifies such by the award of a prize. Thus our exhibitions are frequently looked upon, from the fancier's point of view, as mere lotteries—scrambles for honor, or gain, or both with a result far more gratifying to the wondering visitor than it is to those more intimately concerned. And it is to this reasonable cause, we think, may be attributed the fact that many staunch fanciers fall out of the ranks of exhibitors; and that others less skilled or educated in Pigeonology are deterred from taking part in so hazardous a speculation, and therefore either ride their little hobby in obscurity, or content themselves with such many-colored spangled mongrels as may be seen upon our English farmsteads or at the poultry shops in our busy towns, rather than submit to change of fashion or the various flights of fancy to which, as exhibitors, they are so often subjected.

We must not be supposed to be taking to task as referring to any of our qualified judges individually or collectively, for to all persons so engaged we would give our hearty support, and would strive to obtain for them the utmost freedom for their candid views, and also the greatest forbearance for their mistakes, for to such errors the most zealous fanciers or experienced judges are liable. In no variety is there greater allowance necessary than in the judging of a number of pens of Fantails, for in their carriage and deportment it may be truly said they are as changeable as the shade, and in consequence due allowance should be made. It is simply our desire to settle *great* points and merge *little* differences, in order to bring about a better understanding among fanciers and judges with regard to this general favorite.

The following description, then, is the result of our careful study.

Fantails, as all fanciers are aware, and as most of your readers will guess, take their names from the peculiar fan-like shape of their tails, and which is, of course, one of the most important points in the bird, and to which the fancier should direct special attention. But it must also be borne in mind that the Fantail

possesses other peculiarities besides its conspicuous tail. It has an eccentric shaking motion of the neck, which has been thought much of by some fanciers—so much, indeed, that this characteristic was once sought for as an estimable point, and in preference to a large and expansive fan. By such admirers they were called "Broad-tailed Shakers."

There have been many strange tales told about this kind of bird which we pass over without notice, but two of the most remarkable we think it well to refer to, as they proceed from eminent naturalists, and may mislead those who seek instruction from such writers. From one of the abovenamed sources we learn that "The Fantail is capable of expanding and closing its tail like," says one "the Turkey," and another "the Peacock." But this notion must

be imaginary; it is contrary to fact, for the Fantail does not even possess the same power over its tail, as do the other varieties, for the Fantail cannot close its tail, but can only control the membrane upon which the feathers grow, in an upward, downward, and sideway motion, which does not influence the spread of the fan in any way.

Another peculiarity noticeable in this variety is, that in its shaking motion it stands upon its toes, and by its backward jerking also a person unaccustomed to them might suppose it would topple over backward; but as a rule, notwithstanding the extent to which the birds throw back their heads, they should be able to maintain their equilibrium gracefully, and carry erect and at ease the expansive fans with which they are adorned, and by which they are partially overshadowed.

Fantails, are generally speaking, of a strong and vigorous constitution, requiring but little care in their management beyond providing a suitable pen for keeping them dry and clean, and then with ordinary attention, they will thrive and prove prolific birds, and good also to rear their young. Plenty of space should always be given, and all nooks and corners avoided, lest they should crush, break, fringe, or wholly destroy their tails. Brick nests on the floor have been found most suitable for these birds. They seldom fly much and cannot fly long; and whatever may have been said about their aerial rudder, powers of locomotion, or high flying under exceptional circumstances, we know well from experience that good Fantails cannot and will not fly much, but that they are the tamest and perhaps the most tractable of all pigeons.

At present the recognized varieties of Fantails are *White, Blue, Silver, Black, Red and Yellow, Splashed and Saddlebacked* ones

are numerous, but are only looked upon as mongrels. It is a rare occurrence to find two of these latter kinds alike. There are also *Frizzled* and *Silky* Fantails. White Fantails are by far the most numerous, and amongst them are unquestionably to be found the best specimens.

The *general properties* or qualities of the Fantail are briefly summed up as follows, which, with the aid of our engraving, we hope will be sufficiently clear to elucidate our views. The *head* of the Fantail should be plain—capped ones were once numerous, but are now almost disregarded. The head partakes somewhat of the ordinary elongated shape of the common Dove Pigeon, but with a sudden rise from its small wart or nostril covers to the top of its head, and then as sudden a recedence to its neck, which should be slender and of a nice symmetrical curve. The *breast* must be prominent; the *shoulders* or wing-butts generally hidden from view; the *wings* should suddenly slope from their sockets, and just meet at their tips behind the bird, and trailing, or nearly so, upon the ground; the *back* is very short, as a result of the neck and base of the tail coming in contact; the *tail* should be large and widespread, in form three-fourths of a circle, and possessed of three rows of broad feathers, about forty-two in number. The bird must not throw backward its head so as to protrude behind, and thus divide its tail. To fanciers more accustomed to other varieties forty-two feathers for the tail may seem a great many, and so, indeed, they are; but we have known a Fantail to have forty-eight tail feathers, but we prefer a bird possessing qualifications even in a less degree, but in all its integral parts, rather than having solely a preponderating number of tail feathers at the sure sacrifice of an erect carriage, without which many essential and minor points are entirely lost. Our engraving shows the desired combination.

The tail should not only be of a three-fourths circular form, but should slightly incline over the back, but not be aside, nor should it too much overhang, otherwise by its weight the bird's wings are uplifted, the body hanging forward, and the general appearance spoilt.

The *eye* of the White Fantail is dark hazel; the *legs* rather short; the *beak* and *nails* pinkish white; *legs* and *feet* coral red.

To admirers of the expansive, many, and broad-feathered "fan" at any cost, we would again observe that such a point is very desirable, but in our admiration of such a good point we must not forget the proud tip-toe strut, the graceful carriage, and nervous shake so characteristic of a good Fantail, and without which the largest "fan" cannot be effectively displayed. We have had under our notice too many distorted specimens—toppling forward, and crouching beneath the weight of their bulky tails, their breasts in close proximity to the ground, their pinions crossed and pointing skyward—to adopt such point only as our standard. We should endeavor, as far as possible, to obtain the embodiment of all the essential qualities, of which good carriage plays so important a part; it is the means by which other good qualities are exhibited to advantage.

Blue Fantails are far less numerous than the White, and, as a rule, cannot be procured of such quality. The majority of Blues are of a dingy hue, but there are now many excellent Blue Fans of a good clear color. Blue Fantails should be of a good, bright, uniform color, the head and neck feathers of a little darker tint. Across the upper coverts (as in Blue Pigeons generally) there are two black bars; a rim of black is also upon the tail near to its extremity. The *eye* of the Blues must be pearl, the *beak* and *nails* dark.

Black Fantails should be as near as possible jet black; but as yet this desirable object is only occasionally attained. They are much too frequently produced of a bluish black, with oftentimes a faint indication of a bar, which is objectionable, and conclusively shows a cross with a colored specimen, and however desirable

such cross may be to perfect other points, color must assuredly suffer.

The *general properties* of Blues, Silvers, Blacks, Yellows, Reds, Frizzled, and Laced Fantails are much alike; indeed, they should all answer the one general description. Color of *eye* and *feathering* in each of the five first named constitute the differences, and denote the variety to which the birds belong. Red and Yellow Fantails are very scarce. They should be of one even color, or "self colored," and must be free from the slaty gray too frequently visible upon most varieties termed self colored. They are held of little value unless they are pure and uniform in color throughout their feathering. The Reds and Yellows, also, seldom have such expansive tails or such broad feathers as the other kinds; their tails are more frequently of the tundish or shuttlecock shape, and in consequence are not so attractive as the Whites and Blues, but still they command attention from their novel appearance. Silvers are much like the Blues, presenting the appearance of a nearly washed-out blue, save the bar and lower portion of hackle, which is dark—nearly black.

The *eye* of the Blues, Silvers, Blacks, Yellows, and Reds should be of a pearl-like color. Good yellow-eyed birds are numerous in each variety (save Whites), but pearl eyes for Blues, Blacks, and Silvers should always be preferred. Of Yellows and Reds we are not so particular, but would prefer pearl.

Frizzled Fantails are scarce. They may be described as White Fans with their feathers turned upside down. *Silky* Fantails also present a singular appearance. They much resemble an ordinary specimen partially dried after a bath, but yet have, as their name denotes, a nice silky appearance. Good specimens are of a darkish tint on the eye, wattle, and nostril.

These two last named varieties are extraordinary-looking birds, command a high price, and attract great attention at our public exhibitions from their very singular and rare appearance.

—*Journal of Horticulture.*

POULTRY AT GREAT BARRINGTON.

The thirty-fifth annual exhibition of the Housatonic Agricultural Society, holden at Great Barrington, Sept. 27th, 28th and 29th, with the finest display of live stock and farm produce ever made in western Massachusetts.

There were nearly a thousand head of cattle on ground, and all the leading breeds were well represented. Pigs were out in full force, and of all kinds and all colors, from the plump and sleek little Essex, to those domesticated Rhinoceroses, the Chester White. Sheep by the score, and last, but not the least, the Chickens. The officers of the society deserve great credit for the prominence they give to this department of the exhibition, and also for being the first in this vicinity to adopt the Standard as a guide for the judges. They have, the past season, erected a neat and convenient poultry-house, 14x60 ft., with ninety-four coops of the regulation size, and judging from the crowd that thronged the building during the three days of the fair, there was no lack of interest.

The building is well planned, and is an ornament to the grounds. The thanks of the exhibitors, and poultry breeders generally are due to Mr. A. L. Hubbell, the gentlemanly Vice-President of the society, for his exertions in carrying out the arrangements, and had the judging been honestly and fairly performed by the Standard, as the rules required, the show of poultry would have been a complete success. The writer is well aware that the position of judge at a show is an unpleasant, and generally a thankless task, and that mistakes are quite likely to occur; but if the committee go so far in pleasing their friends as to give prizes to fowls that are utterly disqualified they must expect to have their decisions pretty severely criticised.

There were 115 coops on exhibition, although only 81 entries

were made, owing to some misunderstanding of the regulations. This was unfortunate, as some of the very finest fowls were debarred from competition.

The display was a good one, most of the birds being really good specimens, with but few scrubs or mongrels to be seen, and showing a marked improvement over previous exhibits at this place.

The Leghorns took the lead both in numbers and quality, being the best as a class generally; the first premium birds being very fine. The 2d premium Whites, were the worst in the class. The cockerel having an enormous comb folded and twisted in front, and lopped at the back, making him absolutely disqualified as a show bird, and unfit for a breeder. The 2d pen of Brown contained the best cockerel in the class, and had the pullets been older they would have sharply contested for first honors.

The next in numbers was the Cochins; three coops of Buff, and nine of Partridge being entered; no Black or White being shown. The Buffs were all disqualified, and received no premiums. The 2d premium trio of Partridge were very fine, and were good enough to compete for the highest honors at any show. The trio that received first were utterly and hopelessly disqualified, and I can account for this award, only on the "tickle me, tickle you" principle. The cockerel was a gaunt, ill-shaped, wicked-looking villain, and the pullets had clay-colored breasts, with scarcely a sign of penciling, and one of them had the nicest webbed feet that I ever saw on anything except a water fowl. Dark Brahmas, two coops, both deserving their awards. Light Brahmas, five entries, and excepting the first premium trio, were a bad lot. Plymouth Rocks were fair, Mr. Brewer's premium birds were remarkably fine, and I hope we may see them at some of the leading shows this winter.

Games were a good class, although the awards were misplaced. The first on Black Reds was given to a pen containing wheat-colored hens, and one had had a top-knot trimmed out, but it was so clumsily done that it was plainly to be seen by the most careless observer. The 2d went to a fine trio of Warren's strain, exhibited by F. C. Backus, of Pittsfield. This gentleman also showed the most promising trio of Red Piles that I have seen for a long time, but for some reason they were unnoticed by the judges. Mr. Dearing exhibited a magnificent Gray Duckwing, said to have been bred by Dr. Cooper. He was a tall, well stationed, powerfully built cock, showing plenty of bone and muscle, and would weigh I should judge, nearly 7½ lbs. There were several other coops of Game competing, but were mostly too young to show to advantage.

Polish, Hamburg, Houdan, and Dominiques, several coops of each, were fair birds; the first on Houdans going to the largest and finest trio of chicks that I ever saw at any show.

Three coops of Turkeys, four of Geese, and three of Ducks made out the list. The first pen of Geese were beauties, rivaling the newly fallen snow in whiteness, and were all the time surrounded by an admiring crowd of ladies. Rouen Ducks were fine, as were the Aylesburies, although the latter were rather below the average in size.

There were one or two coops of several other breeds, of which I did not make note, as time was limited.

I will add that in making this report, I have given the plain facts of the case, as they appeared to an outsider, and have endeavored to be fair and impartial, and "nothing extenuate, nor ought set down in malice."

WASHENING.

LIST OF AWARDS:

Turkeys.—1st, F. K. Hinkley; 2d, Wm. Ford.

Geese.—1st, Hiram Dings; 2d, Mrs. L. Van Deusen; 3d, Geo. Kellogg.

Ducks.—1st, Rouen, Geo. Kellogg. Aylesbury, 1st, Geo. Kellogg.

Brahmas.—L., 1st, H. Dings; 2d, C. S. Joyner. Dark, 1st, F. C. Backus; 2d, S. B. Sardam.

Leghorns.—White, 1st, Geo. Kellogg; 2d, Albert Winchell. Brown, 1st, Geo. Kellogg; 2d, A. L. Branning.

Dominique.—1st, Chas. Scudder.

P. Cochins.—1st, J. R. Baldwin; 2d, S. B. Sardam.

Game.—Black Red, 1st, J. H. Race; 2d, F. C. Backus. Red Pile, 2d, J. H. Race. Blue, 2d, J. H. Race.

Polish.—Black, 1st, W. Clark. Golden, 1st and 2d, J. C. Wheeler.

Dominiques.—1st, R. A. Holmes.

Houdans.—1st, Jas. H. Beckwith; 2d, E. L. Gorham.

Bolton Grey.—1st, H. Hollenbeck; C. Brusie.

INSTINCT vs. SIGHT.

A Plain Blue Antwerp Homing Pigeon, from Van Opstal's stock, that I raised this year in Providence, R. I., was taken to Canton, Mass., distant 30 miles, to be flown, preparatory to flying a race from Boston to Providence.

This bird was tossed in a raging northeast storm, and where it could not have seen the earth if above it to distance of 300 yards, and consequently could not see 500 yards in any direction, still this bird found the way home in a comparatively short time.

It is needless to add that the person to whom the bird was sent ought not to have tossed it in such weather.

I have, with one of my friends here, who takes great interest in Homing Pigeons, flown a great many birds, but this is the most remarkable case that has yet come under our observation. I would add that this bird had flown from a point 18 miles from Providence, in the direction of Canton, two days previous to his flight in rain and fog.

PROVIDENCE, R. I., Nov. 19th, 1876.

G. W. A.

TO PRESERVE EGGS.

I have experimented with many nests of eggs this year, and find that butter or grease of any kind with me will certainly keep the eggs clear, but incubation will not begin. I have tried a solution composed of glycerine and olive oil with the same result. If you wish to keep eggs fresh for six months, take four ounces of the best glycerine and two ounces of the best olive oil, shake well up together and rub on the eggs. I had some eggs at breakfast that were put down last January in a cool cellar, that were treated with a coat of this egg preserver, and packed the large end down, in fine sand or salt, and you could not tell them from freshly laid eggs. Out of twenty-four dozen that we have used this month, that were put down in that way in January and February, only five bad ones (and they only had a strong musty smell not rotten, my wife said,) have been found among them.

DR. W. C. MUNROE.

WESTERN MASS. POULTRY ASSOCIATION.

ED. OF FANCIERS' JOURNAL:

At a meeting of the Executive Committee of our society held Nov. 23d, it was voted to judge and award society premiums to single specimens, each bird to be considered a unit, and stand or fall by its own merits. Also voted that a bird to receive 1st premium shall score 90 points, 2d premium 85 points, and 3d premium 80 points. These figures to be strictly adhered to by all judges. Awards will be made before the public are admitted to the hall.

Show will be held at Northampton from Jan. 24th to 26th inclusive, 1877.

Please give the above a place in your valuable paper at an early day, and oblige, yours very respectfully,

M. L. KIDDER, Assistant Secretary.

SPORTSMAN'S DEPARTMENT.

(For *Fanciers' Journal*.)

RAIL-SHOOTING IN SOUTH JERSEY.

It is a curious fact that the Tuckahoe river which winds its crooked course between Atlantic and Cape May counties, and pours its muddy waters into Great Egg Harbor bay, contains not a single spear of wild rice from its source to its mouth, while all the numerous creeks that help swell the volume of its waters, above where the flood tides are salt, are filled with this reed. Rail birds, as every gunner knows, delight in the seeds and tender shoots of the wild rice, and where it is plentiful congregate in vast numbers and grow enormously fat. The marshes on the margins of the tributary streams of the Tuckahoe, as I said before, abound in wild rice and consequently are favorite feeding grounds of the rail.

The first of September, '76, found me staying at a farm house a stone's throw from the brackish waters of the Tuckahoe, impatiently awaiting one of the easterly gales and high tides which accompany this month of the equinox. On the fifth the wind "hailed round to the eastward," and a retired old sea-captain prophesied a high tide next day. Sure enough the sea-captain's prediction came true, and a very high tide, indeed, came in. Early in the morning I put on my overdress of white "duck," and shouldering my breech-loading gun, went down to the rail skiff which lay secured to a wharf at which coasting schooners were loaded with wood. The negro whom I had engaged to "push" for me, was already in the boat, smoking a short, black, clay pipe, which he removed from his mouth every few minutes to whistle:

"De gospel train am comin' by."

A slight rain was falling and the tide, which was yet only about half flood, had covered the marsh which I had selected as the scene of the "murder of the rail," to a sufficient depth for pushing our light boat over every part of it.

The strong arm of the negro at the oars sent the light skiff swiftly through the turbulent waters, and we soon entered the mouth of the selected creek.

"Sah, if you'll git ready, I think I can raise a bird or two out of dat patch," said Jake, my negro pusher, dropping the oars and seizing a long cedar pole with three "paws" at one end, to prevent it from sinking deeply into the mud. The boat was sweeping along a narrow bunch of wild rice. So I buckled my cartridge belt around me and drawing back the hammers of my gun, awaited the "flush" of a rail. But the negro gave the skiff a sudden shove through the reeds, causing me to lose my balance. I lay on my back in the bottom of the boat with the muzzle of the cocked gun staring Jake directly in the face. The negro's face assumed an ashy hue, and he ducked his head quickly to one side and said in a chattering voice, "Sah, I'd like to push for you, deed I would, but if you do sich a foolish trick as dat, agin, I'll jump over board and swim ashore, deed I will, sah!" It was a

miracle that in falling I had not pulled the triggers and had a murder on my conscience.

Promising Jake that I would try to be less awkward, I regained an upright position and bracing myself firmly with my knees against the sides of the skiff, once more awaited a shot. Whack! went the push-pole on the surface of the water, *queet! queet!* went the rail from a hundred directions. "We've struck a mine of dem," said Jake. I had no time to reply, for even as he spoke bang! bang! went both barrels at two rail that had jumped up on either side of the boat. I missed them both. "Yah! yah!" roared the black, "O, golly! de patent gun!" But his laugh soon ceased and his countenance changed to a look of wonder, for while he was laughing I had put in new cartridges and cut down a rail that rose some thirty yards ahead. Another rose on the report, and I killed it, and while Jake was picking them up I had reloaded. "Anyhow sah, dem patent guns loads right smart," he said, greatly astonished at the rapidity with which a breech-loading gun may be loaded.

During this day's sport I had an opportunity of observing a brutal method used by some of the South Jersey men for slaughtering rail. Two farmers' sons in a "garrey" were practicing this pot-hunterish manner. They were on the marsh opposite, so I had a fine view of their proceedings. When a rail was flushed they would not attempt to shoot it, but allowing it to alight would push noiselessly up to it and poking their pot-metal gun within a few yards of the unwary bird, as it sat on the water, blow it nearly to pieces with 2 oz. of number five shot. The birds being very fat and adverse to flying far, these railthirsty Jersey men secured some fifty terribly mangled rail, which birds together cannot contain less than six pounds of shot, making them enjoyable eating for people with false teeth.

Jake pushed up the creek until the tide turned, and then we came down with it, gunning the marsh on opposite side. In about three hours' shooting, I secured one hundred and thirty-four birds—an excellent bag, Jake said, but which he attributed not to my excellent shooting but to the rapidity with which a breech-loading gun can be shot.

PAUL LOGIC.

BIRDS AND LIGHTHOUSES.—The brightness of the lamps in the lighthouses of our coasts says the *Jacksonville Union*, frequently produces great destruction among birds. As they fly along the beach in the gloom of the evening, or seek the shelter of the land when the ocean breezes blow too strong for their comfort or pleasure, they are dazzled by the brilliancy of the lights in the towers, and frequently fly blindly against the glass of the building, crushing and breaking their bones, and often killing them instantly. On Wednesday evening vast numbers flew against the tower at Maryport, and were killed, or so badly bruised that they crawled away to die. It is said one of the light-keepers swept off in the morning six hundred dead birds from the top of the tower, and that many others were scattered on the ground at its foot.

A GOOD JOKE was perpetrated by a Chemung county farmer, a member of the Elmira Farmer's Club. He had been greatly bothered by hunters from the city who had entered his woods with a perfect abandon and slaughtered the squirrels in great numbers. One day he procured two or three squirrels, took them to a taxidermist and had them stuffed. He then took them to his woods and nailed them fast to the limbs of as many trees, in such a way that they could be easily seen by the hunters. How much powder and lead has been wasted on those squirrels it is impossible to tell, but many a good marksman has wondered why he could not bag the game. The old farmer has doubtless many a hearty laugh at the discomfiture of the hunters. We are not sure that we ought to have let the secret out, but the joke is a little too good to keep.

(For Fanciers' Journal.)

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending Nov. 22d, 1876.

- 1 Robin (*Turdus migratorius*). Presented by Mrs. Lewis W. Moxey, Phila.
- 1 Barn Owl (*Strix flammea*). One Badger (*Taxidea americana*). Purchased.
- 1 Barred Owl (*Syrnium nebulosum*). Presented by John Krieger, Phila.
- 1 Red Owl (*Scops asio*). Presented by Mrs. Stewart, Phila.
- 1 Snowy Owl (*Nyctea nivea*). Presented by David Landreth & Sons, Phila.
- 1 Green Monkey (*Cercopithecus callitrichus*). Presented by Alex Cattell, Jr., Phila.
- 1 Spanish Cock and Hen. Presented by A. B. Goodyear, Phila.

ARTHUR E. BROWN, Gen'l Supt.

FAMILIAR SCIENCE.

Contributions to this department respectfully solicited from all.

—We copy the following from the fly-leaf of an old book on ornithology formerly owned by our contributor, Peter Peppercorn. "The study of Natural History is pleasing in youth, delightful in manhood, and a solace in old age. As, when we are no longer able to traverse the woods and fields, we may sit and recall the scenes of the past, and ponder over the wonderful works of Nature."

FASCINATION—PHOCA IN ANSWER TO J. M. M'CANN.

Continued from page 552.

Mr. Gosse in Romance of Natural History, after reviewing the whole subject concludes as follows: "We shall not perhaps err if we conclude that the peculiarity exists not in the object but in the subject; that it is a mental emotion capable of being excited by objects having little in common, except the death terror which they excite. I have no doubt that it is a phase of extreme terror: the singularity of the phenomenon consists in the reversal of ordinary instinctive laws which it induces."

"The power said to be possessed by the rattlesnake of fascinating its prey has been the theme of many an astonishing tale, and the possession of this faculty is still believed by many. There is no doubt that the smaller animals on which the reptile subsists are alarmed in the presence of their known enemy, and that fear may cause them to lose their self-possession, and thus they are more readily seized by their cunning opponent."—Goldsmith's Animated Nature.

"Their glance has been said to have the power of fascinating their prey so as to make it drop into their mouths; but there can be little doubt that, if this power exists, it has been greatly exaggerated. That a suddenly surprised animal should be arrested by terror and easily fall a victim to the serpent is highly probable, but that it should descend to its destruction from the tops of the tallest trees is almost incredible."—Dic. of Nat. His.—Breton.

"Though it does not climb trees it nevertheless makes its principal food of birds, squirrels, &c. It was for a long time believed, that it had the power of torfying them with its breath, and even of fascinating, that is, of forcing them by its glance alone to precipitate themselves into its mouth. It appears, however, that it is enabled to seize them, only during those irregular movements, which the fear of its aspect causes them to make."—Cuvier's Animal Kingdom.

"It is believed by some naturalists to have the power of fascinating its prey, by going at it so as to render it incapable of flight, but others are doubtful as to this being the fact. The probability seems to be that the victim is prevented from escaping merely by the extreme terror which its formidable enemy inspires."—Buffon's Nat. His.

"It has been supposed that the rattlesnake employs its rattle to startle the squirrels and other small animals upon which it feeds, from their repose, and that these being deprived of the power of making their escape, from the terror inspired by the unexpected proximity of their enemy, fall easy victims to its voracity, but this, like the accounts of the fascinating power exercised by the rattlesnake on their prey, is scarcely borne out by facts."—Orr's Circle of the Sciences.

"Numerous experiments prove that the rattlesnake eats indifferently all kinds of dead birds he meets with; and that he employs no supernatural means, as asserted, to seize his victims."—Cassell's Nat. His.

Carpenter's Zoology does not refer to it.

To be Continued.

—Mr. Turner Evans, of Paris, Iowa, has in his possession a mad-stone which he affirms and has the documents to prove, has effected 680 cures of persons and animals bitten by rabid dogs, in some cases where hydrophobic convulsions had set in. The stone is no larger than a man's thumb, and weighs but a quarter of an ounce.

—Queen Victoria has received from the empress of Brazil a present of a dress woven of the webs of the large South American spider.

—A petrified honeycomb is the latest Sacramento novelty. The combs are full of honey—and wax and honey are turned into solid stone.

For the Fanciers' Journal.

THE EDELWEISS (GUAPHALUM LONTOPODIUM).

We may hope at some future day to see this interesting flower growing upon the northern crags and mountain-side of our own beautiful land. Here is what has been done with it in Germany.

It has been hitherto supposed that the Edelweiss could not be grown anywhere but among the Alpine mountains, neither, it was thought, would it bear transplanting. Such however seems not to be the facts as a gardener in Cassel, Germany, has succeeded in raising a little plant of it to a blooming flower! It was brought from one of the most inaccessible mountains of the Tyrol in the autumn of 1874, enveloped in a ball of moss, and was not disturbed until the next spring, when it was properly planted, and in June ten little blossoms appeared clad in the well-known hue of silver-grey, which developed into the snow-white tuft known in the language of flowers as "noble purity," which is the meaning of the name Edelweiss. With the success of the Cassel gardener in view, it is now proposed to try the transplanting of the Edelweiss to the Hartz and Thuringian Mountains in the hope that if it should grow there the tendency of Alpine tourists to seek it in the dangerous spots where it is as yet only to be found flourishing, will die out. Not only has the tourist met with death or broken limbs in the endeavor to obtain the valued flower, but often has the young and hardy jäger been found cold in death, at the foot of the crag, on the top of which had grown the Edelweiss—the choicest gift an Alpine lover can bestow on the maiden of his love—with the snow-white tuft, for which he had ventured and lost his life, clasped in his hand!

The Austrian Alpine Club last year, alarmed at the number of accidents to seekers after Edelweiss, resolved to prohibit the wearing of it by the members of their club.

Be this our holy, high ambition,
What'er our fallings past and gone,
To rise above our sad condition
Seek "noble purity" alone,
And boldly mounting 'ward the skies
Gain e'en in death our Edelweiss.

GUY S. CURTIS.

THE HOME.

(For Fanciers' Journal.)

DINING AT THE RESTAURANT, vs. DINING AT HOME.

AN EXPERIENCE OF A SINGLE WEEK.

[SCENE.—DINING ROOM IN MR. DYMPLÉ'S HOUSE—TIME, DINNER HOUR—MONDAY. SEATED AT TABLE, MR. AND MRS. DYMPLÉ—MISS JENNIE, AND MASTERS PHIL AND CHARLIE DYMPLÉ.]

Mr. D. Well Dolly dear! How glad I am that I have arranged my business so that in future I shall be able to dine with you and the children at home. You have a splendid piece of beef here; how will you have your slice, rare, or well done? Indeed you are such a rare woman yourself it would not be "well done" on my part to give you an outsider—"Second cut," eh? Well, there you are—Now Jennie, how will you have yours—rare, eh? well done for you—and Phil—rare too, and Charlie—"Rare papa;"—Well, here you are, why, what a rare set you are—Now Dolly dear serve out the coffee and you, Jenchen, the vegetables, and what a cozy, pleasant dinner we will have! I am quite provoked to think how much pleasant chat I have lost away from you and the children, Dolly, by being obliged through business, to dine at those confounded restaurants. And how any man who can go home to dine, does not go is a mystery to me; especially when I realize, as I do now what freedom there is from care, and what comfort and happiness there is in sitting down with one's wife and children to the principal meal of the day.

Mrs. D. Yes Ducky, it is very nice to have you home with us; the dinner never seemed right without you at the head of the table, and I hope after this there is where we shall see you every day. I am sure Jenchen and the boys, as well as myself, will do all we can to make your dinner hour a pleasant one. By the way, now that you are here, I wish you would measure the hall before you go, as we must have a new carpet put down, and I wish to know exactly how many yards to purchase.

Jennie. And Pop—Mrs. Marabout is to send home my new bonnet some time to-day—will you please leave me about \$20, for indeed my pocketbook is quite empty—do now, that's a dear Pop!

Phil. And father, I wish you would see that gas-man again; there's a leak somewhere in my room, and it ought to be attended to—last night I was almost suffocated.

Charlie. Papa, I want a new strap for my school-books. You know you promised me one more than—

Mr. D. Yes, yes, now let me see; Dolly, you want the hall measured; Jenchen, there's your \$20—what an extravagant puss you are—And Phil, just go over to Mr. Oxygen and tell him to come over here and attend to that leak—and Charlie, I'll get you a strap as I come home. Time's up now—should be at the store this moment! Good bye. *(Exit in haste.)*

SCENE 2d.—SAME AS BEFORE. (TIME—TUESDAY—FAMILY SEATED AT TABLE.)

Mrs. D. Now father, there's a nice pair of chickens for you to carve—at least they should be nice—but that range bothers me more than a little—I think we will have to have a new range put up, and I should just like to have one the same as Sally Bender has had put in her house—

Jennie. Yes Pop, that's just an elegant range. I was there to tea last Wednesday you know, and Tilly Bender did bake some cakes for tea which were just lovely! and if we had such a range as that you would see how I would "play dough," as you call it—and what cakes I would bake for you—do have a new range—and by the way, Pop, don't you think Mrs. Marabout sent a bill for \$30 instead of \$20, for my bonnet?—It's a love though—

She says I made a mistake in the price, and that you would be angry at me for even thinking of wearing a \$20 bonnet.

Mr. D. Indeed! my dear child, I thought you were very extravagant in giving \$20 even, and I don't—

Phil. But father, the bonnet and the bill have both come home, and I hope you are not going to make us all look so mean as to haggle over it, for then I should be afraid you would do the same with my tailor when my "knickerbocker" suit comes home—and it's a "stunner," I tell you.

Charlie. Papa, you did not get me the right kind of a strap, I told you I wanted one just like Bill Swivell's, and papa, I want a "knickerbocker" too—all the fellers in our class wears 'em.

Mr. D. Well, you must have it, I suppose—and Jenchen, here's another "X." I always called you a dear girl you know. There! there! don't pout,—and now I must go.

Mrs. D. But Ducky! what about the range? Will you see to it?

Mr. D. Yes, yes, I will think of it.

Mrs. D. "Think of it!" that's just the way with the men!

Mr. D. Well, well; I must go now.—*(Exit somewhat worried.)*

[SCENE 3d.—WEDNESDAY—TIME AND PLACE AS BEFORE. ALL SEATED AT TABLE WITH THE EXCEPTION OF MR. DYMPLÉ.]

Mrs. D. I wonder where your father can be! Here's Phil in a hurry waiting to go to the boat-race—the dinner will be overdone if it is not soon served up; or it will be all cold when he comes if it is. I declare the men don't care how us poor women work and slave to please them. *[Enter Mr. Dymplé.]* Well, you have come at last! I expect the dinner is all spoiled, and I had such a nice leg of lamb with mint sauce.

Mr. D. Why, Dolly dear, I could not come before, I had a customer in hand and by whom I made several dollars.

Mrs. D. There it is. All you men think of is getting dollars, and my nice dinner, after all my pains, getting spoiled.

Mr. D. And, I might say, Mrs. D. that all you women think of is spending dollars. Look at Jenchen's new bonnet—

Jennie. Now father I do not think I am extravagant at all. You ought to see Carrie Vanbeil's bonnet. Mine is nowhere, and her father didn't say a word! I declare father, I never saw such a man as you in my life. One has no comfort with you—*(cries.)*

Phil. I hope there will be no fuss like this when my "knick" comes home.

Charlie. Papa—Bill Swivell's got a new pair of shoes, and I want a pair just like 'em. They're patent leathers.

Mr. D. *(excited.)* I don't care if he has; nor—

Mrs. D. Husband! don't snub the dear child that way. If all the boys wear them, why he must have them too. And, now I think of it, you will have to send a plumber here to see about the water; we can't get a drop in the bath-room and Mrs. Bozer, our next door neighbor says they get a full supply all over the house. How do you like that lamb? It would have been better had you come sooner, though that range does work terribly; still I think you could get no such dinner at a restaurant. How did you like it?

Mr. D. Very well, but it would have been better if I could have had the same freedom from business as one can get at a restaurant. I hardly know among you all what I have had for dinner; but my time is up—I will think of all your wants, if I can, as I go back to the store. It will help digest whatever it was I have had for dinner.—*(Exit—As he hurries out of the door Mrs. D. calls out, Hubby! Don't you think our front door and windows should be oiled? and the gate have a new coat of green?)*

[SCENE 4th.—THURSDAY—SAME TIME AND PLACE. ALL SEATED AT TABLE.]

Mrs. D. Now this is nice; all to sit down together and have a quiet dinner. So different I am sure, from your hotel or restaur-

rant dinners, where all is noise and confusion. To be free from care, vexation, and annoyance, there is surely no place like home.

Jennie. Pop! Last summer you promised me a set of *croquet*; will you never get it for me? now the first clear day Carrie Dubosq, Alice Warwick, Susie Wilson, and their young men are all going out to the park to play, and I have promised to go with them, and Reading says that he will send my *croquet* out for me, so I wish you would get it to-day—stop as you go from dinner and tell Mr. Perry to send it home before night, then I will be sure to have it all ready.

Mrs. D. And Ducky, speaking of *croquet*, our kindling-wood is nearly out, Bridget says; I wish you would stop at the saw-mill and order a load. It is considerable out of your way I know, but then they send us such good wood that it pays for the trouble, and I know if you get to the store once, you are then so busy that you will never think to send for it, so I wish you to stop yourself, for we may be out in a day or two.

Charlie. Papa, I want a rousing flag to fling out of my window on the "4th July." Bill Swivell and Gus Mylertz are going to have one and I want one just like theirs. It will only cost ten dollars—pole and all—that's all I want for the "4th" besides a thunderin' lot of fire works! Now do get me the flag before they are all gone—Flags are going up like fun—they'll be awful dear, and scarce too, next week.

Phil. Father, I wish you would give me another slice of beef—rare, if you please. You ought to bring home a new carving knife, that one's played out, and I like my beef out "diaphanous"—that's the word now. If you will give me the money I will get you a carver to-day, and at the same time you may as well give me the money for my "knickerbocker;" it will be home to night, and my tailor says he's "one price," and "cash down" now.

Mr. D. Yes, yes; I declare you are all handing up your plates for a second supply, and as yet I have scarcely tasted a mouthful. Let me—

Mrs. D. Children! do let your father get his dinner. You should not bother him so at meal times. I declare! he has no peace with your wants—coffee? why I declare I had quite forgotten you, Ducky, but be sure you do not do that way about the kindling wood, dear.

Charlie. Nor about that flag, papa.

Phil. Or the money for my "knick." I declare I would not have the boy take them back for want of pay, for one million dollars.

Jennie. And, father dear, the *croquet*—whatever you forget, don't forget that.

Mr. D. (rising). Well, well, I will try and think of all, but—

Mrs. D. Stop Ducky, you have not had your dessert.

Mr. D. Have n't I?—Well really I don't know what I've had, for hearing of what you all have not! I must go without the dessert to-day as I have no time, but I will take an apple in my pocket. Good bye!

(As *Mr. D.* goes, *Mrs. D.* cries:—Ducky, don't forget the kindling-wood. *Exit D.*, closing the door with a bang.)

[SCENE 5th.—DINING ROOM AS BEFORE.—TIME, FRIDAY.]

Enter Mr. D. "No one here!" (goes to kitchen door.) Bridget! where's Mrs. D., and why is not the dinner ready?"

Bridget. Well Sur, the dinner ain't ready!—Mrs Dymple's up stairs,—the range wouldn't cook to day, Sur, and the kindling-wood is all gone, Sur! (*Enters Mrs. D.*)

Mr. D. How's this Dolly, it's quite late, and hardly a sign of dinner?

Mrs. D. Well, I told you that range was out of order days ago, but you did nothing about it, but say you would see to it, and then there is no wood, and I told you yesterday to order a load!

Mr. D. Well I did order it, but you did not say you were quite

out, and so I did not hurry it up—and now tell Bridget to serve up dinner, as I must hurry back to the store.

Mrs. D. That store! You are always in a hurry to get to that store—one never has any good of your company; I declare Dymple, I wish—

Mr. D.—Don't wish anything, my dear, but have the dinner placed on the table, and ring the bell for Jenchen and the boys.

(*Bridget serves up, rings the bell—Enter Jennie and the boys. All sit.*)

Mr. D. Why Dolly, this steak would make excellent sole-leather! besides, it is much too rare—it is hardly warmed through!

Mrs. D. Well! I told you, that range would not cook!

Phil. Yes! there, and a dull knife makes tough beef; you wouldn't let me get a carver yesterday, and now "you see how it is yourself!"

Jennie. I don't want any beef, or anything else!—(pouts.)

Mr. D. Why, what's the matter Jenchen? you seem in a hurry about something! Didn't your *croquet* come home?

Jennie. No it didn't, and at two o'clock, Reading will be here to take it out in his carriage. I don't suppose you ordered it at all?

Mr. D. Yes I did; and it was to come up early this morning.

Charlie. Papa, I want an eagle on my flag-pole. I don't like an old ball. A flag's no good that ain't got an eagle on the pole! What's a ball got to do with Liberty? And I want an eagle, "Liberty or Death," on the "4th of July!"

Phil. Father, I don't like that knickerbocker. The coat ain't nobly enough; and the vest must be too short, for all the fellers keep tellin' me to "pull it down!" The trousers are only twenty-five inches wide in the leg, and I ordered them twenty-five and a half. I want you to stop there and tell him to make me another; he won't do it for me, but he will for you!

Mr. D. Very well!—Now my dear, give me a cup of coffee, and with a taste of your rice pudding I must be off.

Mrs. D. Well it is too bad that you must go so soon after all a body's care! Oh, I liked to have forgotten. That hall carpet! It is half a yard too short! how came you to make such a mistake in the measurement?

Mr. D. I don't know that I did make a mistake, and I have no time now,—confound the carpet!

Mr. D. There now, fly into a passion! This is what I get for trying to make home look nice and comfortable, and you fall to swearing about it! (cries. *Exit Dymple with hat rammed down over his eyes, and hands in pockets, leaving the door wide open, which Mrs. D. shuts with considerable slam.*)

[SCENE LAST.—SATURDAY.—SAME TIME AND PLACE.—ALL SEATED AT TABLE.]

Mrs. D. How glad I am Ducky, that you come home so regular to dinner. 'Tis so much nicer that I declare it is quite a different house; and you will spend no more money or time in those abominable restaurants, will you?

Phil. Say father, that suit of mine?

Charlie. Papa! my flag hasn't come home, and the "4th" is only three weeks off!

Mrs. D. Ducky, what am I to do about that entry carpet? I can't put it down. Why don't you speak? I am sure we have none of us been unreasonable; have we children?

Phil. I am sure I have hardly said a word the whole week—some fellows are knagging their governors for something all the time!

Jennie. I only said a word about *croquet*, and I ain't got my set yet either.

Charlie. Well, all I wanted was a flag, a pair of shoes like Bill Swivell's, a knickerbocker, some fire-crackers, and an eagle on—

Mr. D. Wife! give me my coffee and dessert, please,

Mrs. D. Yes; Ducky. There you are, and now tell me—?

Mr. D. Yes, now I tell you! I have dined at home for one week, and not a dinner have I had in peace!

Mrs. D. Oh! Ducky!

Children. Oh! father!

Mr. D. One moment! I can hardly tell what I have dined upon during the last six days, for I have had carpets, gas-fixtures, knickerbockers, kindling-wood, water-pipes, patent leather shoes, bonnets, carving-knives, kitchen-ranges, flags, fireworks and spread eagles, each and every one in turn, and sometimes altogether; with a parting shot regularly fired at me every day as I shut the front door! Now I can dine at a restaurant without any of these articles served up, and where the only demand upon me is the value of the check the waiter brings me; where too I have a chance to know what I am eating, and time and opportunity to read my paper, in the bargain!

Mrs. D. But, Ducky!

Mr. D. One moment! It would seem as though you had all entered into a conspiracy, only that I know man, as well as woman, is a grumbling animal, and if the grumbling was done at the right time and place much might be borne with, but, allow me to say, Dolly and children, the dinner hour and table is not the right time and place to bring up the sum total of your wants. I shall attend to all unfinished demands on Monday; but henceforth, as pleasant as you think home, I shall dine at the restaurant. (*Exit Dymple while all stand amazed, and wonder "what on earth can be the matter with father"?*)

MORAL.

Wives, daughters and sons, the pleasantest home, and the best of dinners may be spoiled by two much mixing of bonnets, gas-pipes, fireworks, patent-leathers, and "sich." If you want husband and father to dine at home, transact your business at the proper time, and let him dine in peace, for truly may he say "better is a dinner of herbs where peace is, than a stalled ox, and business there-with!"

GUY S. CUTUS.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"TO EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the *Exchange* or *Want* column.

EDITORIAL.

WEEKLY VS. MONTHLY.

To the many inquiries, we would say,—No. 50 we will make a double number—a sample of the monthly issue we design for 1877. The next number, therefore, being for January 1st, we propose to apply the price of the unissued numbers—Nos. 51 and 52—to the monthly subscription for 1877, and to credit subscriptions already made for the weekly for 1877, to the monthly account, or to refund the balance due at the close of the present year, to those who desire it.

Those whose subscriptions close with the year, we would be pleased to have renew with us, promising as soon as the times will warrant, to resume the weekly issue.

MISSING NUMBERS.

W. H. Jeffries, Irwin Station, Pa., says: Journal No. 45 failed to come to hand this week; please mail me one.

I know it has been published on time, as I have already got a hat full of answers to my "ad."

G. O. Rudin, Evergreen, says: Please send me No. 43 of Nov. 6th, 1876, of your "Dear Journal," it has as yet not come to hand. No. 44 received to-day. I can't do without a single number, so please forward the No. 43. I suppose it got lost, if so, charge me for the number, as I don't want you to be out any thing.

N. S. Cornwall, Northampton, Pa., says: Either you forgot me, or Uncle Sam's mail is at fault, as I have not received the last number of THE FANCIERS' JOURNAL, (Nov. 27th); if I do not receive the JOURNAL to read every Monday eve. things go wrong the whole week, so be careful that I have it in future, and much oblige.

The numbers were sent from the FANCIERS' JOURNAL office, and were doubtless "lost in the mail." Any subscribers not receiving the JOURNAL regularly will confer a favor by so informing us, when missing numbers will be at once forwarded.

GLEANINGS FROM THE MAIL.

S. Lott, Bellona, N. Y.—Wishing you success, and that you may be able to keep it as a weekly, I remain, yours, &c.

W. G. Wenck, McEwensville, Pa.—Never change THE JOURNAL to a monthly; rather than change, raise the subscription price.

A. G. Day, Ithaca, N. Y.—I am sorry to hear you talk of turning THE JOURNAL into a monthly, and hope you may still continue it as a weekly. It is a weekly messenger of news, regard-

ing the fanciers' interest, and I hope you may meet with such success as will keep it running. I for one shall heartily know how to do without it. I wish you success in the future.

C. H. Stone, 615 Dunham Av., Cleveland, O.—I sincerely hope you will never merge the weekly into a monthly; weekly is bad enough.

J. M. Smyser, York, Pa.—Continue my subscription to the "FANCIERS' JOURNAL," for which, enclosed, find amount of subscription. I would not be without it, and consider it worth more than its price for the sake of the exchange column alone. With my best wishes for your success, I am respectfully yours.

W. G. Nichols, Springfield, Ohio. Don't give up THE WEEKLY JOURNAL!

H. S. Chapman, Old Saybrook, Conn.—I am sorry to hear that the FANCIERS' JOURNAL is likely to turn summersault backwards, yet we cannot expect you to publish it weekly for our benefit at your expense. I am ready for one, to guarantee another subscriber. If you change to a monthly would it not be well to have the publishing day about the 15th of the month, rather than the first? Many of your subscribers take monthlies, nearly all making their appearance the first of the month. Put yours at the 15th, it will help bridge over the gap from one month to another and gain you many subscribers.

OBITUARY.

We regret to have to record the death of Mr. James L. Pierce, at Worcester, Mass. We learn that at the Springfield show last February, Mr. Pierce contracted the long and severe illness, which baffling the physicians, finally terminated his existence.

FRIEND WADE OF FANCIERS' JOURNAL:

I hailed with pleasure the column of household affairs in FANCIERS' JOURNAL, and regret to see that it has not been kept up. Now the way I would propose to remedy this is, let any one who wishes information on any subject send you the questions he or she may want answered, to be published in Journal with answer, if you are prepared to give it, if not, give some of your many readers a chance to answer; for they may know just what to say. What if the questions asked do not concern household matters? the ones seeking information will regulate that to suit themselves; they will ask the questions they want answered, and what will make a paper more interesting than the fact that one can get just the information he wants by simply asking for it?

With an earnest wish for continued prosperity of the Journal I commend this suggestion to your consideration.

J. S. EDWARDS.

Our pages are always open to the fanciers. Any information we can, we will give gladly. But unless questions require immediate attention we would invite our readers, that may have had an experience to warrant, to make the replies—thus increasing the interest.

I won first on Blk. African Bantams at Centennial, which makes me proud.
Yours, C. B. ELBEN.

POULTRY AND PIGEONS.

EGGS DURING WINTER.

It is by no means the cold weather that prevents hens from laying, as it is frequently stated or fancied. Many pullets—of many varieties—will begin to lay their first litters in December, or January, and very frequently the Asiatics will "lay all winter long," more or less, after the month of November, as we have reason to know. But these "winter layers," of any breed, are those that have been hatched early in the season, and who have successfully gone through their moult, in the fall or late summer. After they recover fairly from the critical indisposition referred to, they begin rapidly to make egg-meat, and soon begin to lay.

We sometimes read, of late, about the "remarkable breed of fowls" that some enthusiastic young fancier has become possessed of, "which begins to lay invariably early in the fall, and continues right on regularly, cold or warm, through the winter and spring, and succeeding summer." This must be a wonderful variety, indeed! We have never yet met with any such fowls, and we never expect to. It is entirely against Nature's laws that any such unusual occurrence should take place with domestic poultry, of any description.

That some varieties lay more eggs, and some less, we all know. But the process of egg-growing in the bird, and the natural laying of that product, are governed by fixed laws; and there is no deviation from those laws. Hens do not lay when they are moulting. Feathers fall out, and new plumage forms during this term, but no eggs are created then. If you get your birds out early enough in the year to allow them time to pass their moult in mid-summer, such pullets will be likely to lay early in the following winter.

If those fowls, when a year old, pass safely through the second moulting in the summer, they will again lay early in the second winter, and so on. But never expect your late moulting hens, of any variety, to lay you eggs in winter time. It is simply impossible. The secret of these "winter-laying fowls" will be found to be limited to those hens or pullets which are very early hatched, and which first pass healthily through the moulting, in good season.

G. P. B.

DOMINIQUEES.

I notice in THE JOURNAL that a Mr. Raub gives his experience in raising Dominiquees, and asks for others to do the same. As his birds were not satisfactory to him, I feel as though I must say something in their favor. I have never before written in the praise of my fowls, so his reference to unprincipled dealers cannot refer to me. Dominiquees were the first birds I ever fancied, and that was before the Brahmas or Cochins were known here. They have always given me entire satisfaction. The principal objection of Mr. Raub was their not breeding true rose combs. I have never been troubled in that way; mine have bred as true to color and comb as any other variety I have ever known. I find them maturing early, excellent as table fowls, and as layers

they do not stand second to Hamburgs or Leghorns. I consider them the best fowl a farmer can raise, as they are ready for market sooner than the Asiatics, commence laying when from four to five months old, and continue to lay through the winter, when eggs are scarce and high. Their eggs are not as large as the eggs of either Cochins or Brahmas, but more of them are laid in a year.

Dominiquees cannot be kept in as close quarters as the Asiatics. They must have a large grass run, to do well. I hope to hear from others their experience with their birds.

JESSE G. DARLINGTON.

HESTONVILLE, PA.

APOUD MANISH DINGS.

MINE FRIEND MISHDER VADE:

How you vas again—long dhimes before I see me you dot oudher dhimes again py grashus. ED. FANCIERS' JOURNAL.

DEAR SIR:—The Western N. H. Poultry Society has received 197 entries from Mr. C. E. L. Hayward, of Peterboro. I think it the largest number of entries and embraces the greatest variety of poultry and pigeons ever exhibited by one man. The entries embrace the following: 53 varieties of fowls; 7 varieties of turkeys; 9 varieties of geese; 13 varieties of ducks, and 68 varieties of pigeons.

Yours truly,

JOHN W. STURTEVANT, Sec'y.

KEENE, N. H., Nov. 27, 1876.

THE SPANISH FOWL—CONCLUDED

By W. J. NICHOLS.

CUTTING THE FACE AND MANAGEMENT OF CHICKENS.

In my last I mentioned about cutting the faces of Spanish. One of my readers has since reminded me that I do not explain how best to perform this operation. I therefore take the opportunity of doing so. To cut the face properly a pair of curved surgical scissors are required. They should be sharp and strong, for the white is unusually tough and difficult to cut. In removing any of the ugly folds, either over the eyes or between the beak and eyes, cut well underneath the flesh, bringing the top pieces over and pressing the edges together. Should the wound bleed, freely sponge it with cold water, and endeavor to knit the edges together, and the bleeding will soon cease. The operation should be carefully done, without scarring the face, or to such a trifling extent as hardly to be distinguishable to many people. When finished, shut up the bird in a totally dark place for some eighteen or twenty hours. If allowed to run he would be pretty certain to commence shaking his head, which would start the bleeding of the wounds, but when confined in a dark place he is quiet, and on the following day very little can be seen except the dry blood round the cut, and in about a week or ten days it will thoroughly have healed.

It is very pleasing to find that several new fanciers have recently commenced to keep these birds, all of them residing in large towns, and perhaps I may just state that they will meet with many disappointments; but the pleasure and amusement of breeding, and the excitement of exhibiting, will far exceed all the little annoyances. I have received several letters from gentlemen asking various questions, and I need hardly say I shall at all times be very pleased indeed to answer any inquiries. Fanciers, as a rule, are only too glad to be able to advise or assist the beginner.

I have not mentioned anything about the management of the chickens, and, as some amateurs have asked for information on the subject, I propose answering their inquiries now. For the first week or ten days after the chicks are hatched nothing is so good to feed them on as crumbs of bread and hard-boiled eggs chopped up very small; they will require during this time to be fed nearly every hour, the first meal as early in the morning as possible; as they get older, barley meal mixed to a consistency so that it will break and crumble when thrown on the ground; if too soft, the little chickens cannot get it down their throats, it also sticks to the outside as well as the inside of their beaks. A small quantity of cooked meat, cut up very small, may be given, and it is very amusing to see how eagerly they hunt one another for these little dainty morsels. They must not be indulged with too much meat, however much they may like it. Corn may now be given to them. I prefer good sound wheat, which they are very fond of; and if the weather is cold a little hempseed will be found beneficial; as they get older whole barley may be used, and occasionally maize. They should always have plenty of green food each day. If there is no grass run, then they must have cabbage or lettuce leaves, or grass cut up small, for unless they have green food of some kind it is impossible to keep them in proper health. Clean pure water should be easy of access.

The chickens are often infested with insects, especially when kept in small places. These worry and irritate the poor little creatures so much as often to cause their death. A short time ago I went to look at a friend's birds, and soon heard a most piteous and melancholy chirrup, and saw that the chickens were drooping their wings, and their bones were beginning to show through their skin. Sure signs, these, that they have vermin, and on examination such proved to be the case in this instance. They should be well sprinkled all over the body, especially under

the wings and round the vent, with fine sulphur, not forgetting the hen. Two or three applications will always prove sufficient to rid the chickens of their tormentors.

Plenty of fresh air and exercise is absolutely necessary for all young animals. If the chickens are confined, various plans must be devised to provide them with amusement and occupation. Little mounds of road dust, sand, fine gravel, dry earth, fine chaff, or small boxes placed about the yard, all help to give them something to do; and to watch their little antics as they chase one another round and over these little mounds is certainly most amusing.

Another plan, which will engage their attention for hours, is to get some brewers' grains, put them in a shady corner where flies can get at them, and when there are plenty of maggots, give a shovelful to the chickens to scratch over, and this they will do so effectually that when they have finished it will be impossible to find a single maggot.

Spanish are very much given to feather eating. I have seen birds entirely denuded of their feathers, except those in the tail and wings, and one would imagine they had been plucked. This habit is generally acquired when the chickens are first getting their feathers; it is, therefore, of the greatest importance that they should be well occupied then, and if one is seen picking out the soft feathers, which at this time are full of sap and blood, remove the delinquent at once, or it will very soon teach the others the same abominable habit, and when once learnt, a pullet or hen is sure to recommence plucking. Again, when about to lay, I have tried everything to prevent them from disfiguring one another, but all to no purpose, and the only plan with old birds given to feather eating is to keep them separate; and the house, of which a drawing appeared in *THE JOURNAL* No. 43, is well adapted for this, as it provides several small compartments suitable for single birds. With chickens, I have found if they once get well feathered without having learnt to pluck one another, they seldom do so afterwards. It will, therefore, be easily seen how important it is to keep the chickens occupied, not only to make them strong and healthy, but to prevent that plague to a Spanish breeder, feather eating.

One of our correspondents asks, "At what age should the white face begin to show?" This will generally begin to appear when the chickens are a month or six weeks old; at three months the lobe in the cockerels should begin to drop; and the pullets' lobes ought at that age also to show themselves very clearly; but their faces will be blue, and the more of this seen the larger will be the face. While the cockerels' wattles are firmly fixed to the underneath part of the face, so long will the lobes continue to drop; but when these are loose and the lobes and wattles become detached or hang loosely from the jawbone, very little increase either in the size of the face or in the length of lobes may be expected.—*The Country*.

MR. J. M. WADE:

Allow a novice in poultry, to make the following enquiries, viz: what among the domestic fowls stands ahead for beauty of plumage?

Is the bird of Paradise a domesticated fowl, or a bird to be kept caged, where to be had and about what do they cost? What in their color and size?

My friend describes a fowl he saw at the Centennial Poultry Exhibition, as very beautiful in plumage, called Pluming Pheasant. May not be correct in the name, I trust your great familiarity with the like, will enable you to understand what I refer to. If so, have the goodness to state whether it is domesticated or otherwise, and where to be obtained.

My object is to get a few fancy, showy birds or fowls for grounds limited in extent.

WM. POST.

CAN A POULTRY FARM PAY?—NO. 2.

In my former article (page 476) I gave my reasons why I thought a poultry farm should pay in Great Britain. In the present sketch I purpose explaining how my friend and myself intend managing our poultry farm.

1st. We are seeking for thirty acres of land at a moderate rental to commence operations. We have two good markets easy of access, besides a good chance of local sales.

2d. We intend to take up both branches—viz., egg-producing and meat-producing, our breeding stock consisting of two hundred hens, all hardy good layers and good table birds, supplemented by fifty sitting hens, divided as under—sixty Houdans, sixty Brahmas, eighty Redcaps (and fifty Cochins hens for mothers). All these are good layers—the Cochins are the best of mothers and sitters, the Houdans are nearly equal to Dorkings, and the Brahma cross with Houdans give fine birds for table. The Redcaps, again (not generally known), are considered in Yorkshire among the best layers, as well as plump good table birds, very hardy, and easily reared.

3d. The system to be adopted is in the main the Bellair (French) one—namely, houses 16 feet by 15 feet, only instead of putting 330 hens into one house (which we shall do in the case of our young birds waiting for market), in our two producing-houses we shall put one hundred hens a-piece, divided as follows:—House 1, Twenty Brahma hens, twenty Houdans, and sixty Redcaps, with Brahma cocks. House 2, Twenty Redcap hens, forty Houdans, and forty Brahmas, with Houdan cocks. The fifty Cochins hens (mated when required with Houdans), will be kept in a spare shed, their duty being hatching young broods; still at other times they could be doing ordinary duty.

In this department, the hatching, the Brahmas could do good service also, leaving the egg-laying chiefly to the Houdans and Redcaps. It will be seen from this that we shall save complication of breeds and general arrangements, requiring only two large runs besides the breeding one for young chickens.

Next to a cottage opening from the kitchen is the breeding house, arranged much as the Bellair one, 16 feet by 15 feet. Houses 1, 2, stock houses, and same size. House 4 same size, with a supplementary house No. 5, 14 feet by 15, for young stock waiting for market. The supplementary house could hold 250 birds; say 580 in the two. On the other side of the yard will be a second breeding house, a house for Geese, one for Ducks, each as above, 15 by 16 feet, and a larger spare house 24 feet by 15; to this must be added store-room and packing-room, each 16 feet by 15.

Between the chickens and the waterfowl is a courtyard 45 feet by 28, open, if required, to both departments. The whole area, exclusive of cottage and store-rooms, is 60 feet square. We purpose keeping twenty Ducks—viz., ten Rouen and ten Aylesbury, as well as six Geese (Toulouse). Such, then, is our proposed stock, buildings, arrangements, and general plan of work; now for some of the minutiae.

First, I would call your attention to a proposed improvement of my own in the arrangements of nests, &c., in the fowl houses. According to the Bellair system the nests are placed in tiers one above another at each end of the houses, with roosting perches covering the center area. According to my plan all the nests are on the ground, with board and perches as recommended by *The Canada Farmer*. These nests go all round the several houses; but as this would not give sufficient nests I multiply two double rows up the center of each house, with boards and perches all the same height from the ground. These center rows of nests are portable.

We do not expect to do all this producing power at once; we may begin with a half or a quarter of the stock as may hereafter

be determined on. Again, we do not intend to keep our young stock on hand longer than to fit them for the market. We hope to arrange to send to the markets weekly or fortnightly all birds fit for table, and so to keep down the stock, thus having about five hundred birds fitting for market, a sufficient supply of young chicks in the breeding ground, and the breeding stock as above enumerated, thus having at most a thousand birds at one time throughout the year. By the arrangement of our two producing-houses that while we get the double cross of Houdans and Brahmas, we have in each Brahma hens mated with Brahma cocks, and Houdan hens with Houdan cocks, so that the several breeds can with care and attention be kept pure, and enable us for some few years to renew the stock of pure-bred ones of each class.

In the house arrangement and accommodation simplicity and economy have been duly cared for: the same may be said of the outside arrangement. We only require three divisions of runs—viz., one for breeding young chicks, one for the Houdan cross, and one for the Brahma cross. The outside bounds of these runs to be constantly changed to suit rotation of crops; in fact, the several flocks, if I may so call them, would have to be regularly herded out and in from their houses to their runs, thus giving extent and change.

Twelve acres out of the thirty round the yard are to be used for the poultry and their runs, leaving eighteen acres for cultivation. We could thus be nearly self-supporting, producing the crops required for our use—namely, barley and oats for our grain crop and straw; cabbages, lettuces—green crop; potatoes, turnips—root crop; and grass for hay and pasturage, giving a proper succession in rotation of crops in batches of six acres, roots and green crop forming one batch.

Finally, seeing what a limited amount of space and accommodation under this system is really required, and that every small holding we might take would necessarily have some sort of out-buildings and sheds, the building capital required need not be over £200, as adequate workmanship in shed-building is not required.

In time, of course, as the breeds become too much crossed we should have to erect a few pens for rearing an annual supply of pure-bred birds to work with. As good eggs and good table birds can only be had by breeding from good stocks, our aim must be ever to keep good breeds to work upon. —G. R. HARRIOTT, in *Journal of Horticulture*.

The Westchester Co. Association send out a good premium list. Their show coming among the first, when the birds exhibited will be fresh and in good plumage, should be a success. We know of birds owned in that neighborhood, well worth the admission to see.

Having to deal with the National Express Company, they did the best they could for their exhibitors:

"Arrangements have been made with the National Express Company, whereby all articles for exhibition sent here by them at regular rates, will be returned free of charge."

They may be considered as having done a great deal, when from the following, also taken from their circular, we learn that the National Express Co. was a monopoly:

"All Goods, either from the North or South, must be shipped by the Harlem Railroad as freight, or by the National Express Company."

MR. JOS. M. WADE:

I think this Express business ought to be attended to, as their charges are out of all reason. Now last week I sent a box away containing a pigeon, and paid the charge which was sixty cents. The same box was returned with one pigeon in from the same place and the charge was \$1.05. It was the Adams Express Company. A. B. HOSKINS.

DOMINIQUE.

Our friend Raub is sound in his ideas regarding Poultry literature. Would that we had more such breeders who are willing to state plain facts, including the faults common to different varieties, as well as their merits. Writers often show too much of a disposition to laud the fowls they breed, showing only their good qualities, with an apparent view to measurably deceive the public for the sake of making a sale. My candid opinion is that all such communications have a decided tendency to injure the cause, and result in final disadvantage to the writers, as well as the fraternity generally. I can sympathize with breeders of Dominiques, as well as many other varieties of fowls, in their disappointment, having bred them for several years, and often been disgusted with the result. In 1870, Col. Howland, of Chicago,—not O. Howland, the huckster,—showed some splendid specimens, winning first on old and young, at Chicago. These

Of course I apologized and explained, and made an offer which was accepted, the result of which was mutually satisfactory. I had determined to correct these faults in my Dominiques, and, although I have bred them ever since, all my experience and labor has not yet eradicated all of them. Since the first year no black ones have appeared, and for two years past about one half of the chicks are splendid specimens, while the other half will show either white ear-lobes, ill shaped combs, black beaks, cloudy legs, and red or straw colored feathers. These defects I believe to be common to every strain of Dominiques in the land. In view of the above facts, I sometimes fail to restrain a smile of contempt, that steals over me when I read the arguments brought forth to prove that "*my Dominiques*," "*my Brown Leghorns*," "*my Brahmas*," or *my ANYTHING* are faultless, and the only ones adapted to the wants of everybody. No variety of fowls are without their faults, some are more faulty than others, and when

two trios I purchased. The accompanying cut was drawn from one of them and is a good representation of them. As a matter of course I was proud of my birds, and anticipated grand results. But "how are the mighty—ideas—fallen!" I counted my prize chickens before they were hatched. About one in ten *only* came up to my expectations. Customers were furnished with eggs, and as a specimen of returns, I quote from one of them: "The Dominique eggs hatched well, but, sir, I want you to understand that I am a man of influence, and do not propose to rest quietly when I have been swindled. Some of the chickens have white ear lobes, some have cloudy legs and black bills, and two are coal black. Two are splendid birds in every respect, but the finest cockerel, otherwise, has red feathers in his hackle. The other eggs you sent me have produced splendid birds, and are worth more than double what all the eggs cost, but the idea of being swindled by one whose reputation is as good as yours, cannot be tolerated." The above named faults I found in my own yards. I was aiming, at that time, to hold what little reputation I had gained, and permanently establish myself on a firmer basis. My disgust may be imagined, but my feelings cannot be described.

we all decide to show up the faults, as well as the merits, we will start on the sure foundation. There is no better way to improve than to study our faults. In the above picture I have shown the dark side of Dominiques, and now propose to show the other side. My experience teaches me, that, notwithstanding their faults, they are truly a valuable breed, possessing beauty, hardiness and utility. As egg producers and as table fowls they are surpassed by very few. They are good sitters and mothers, but not so persistent in "hugging the delusive phantom" of hatching chickens in a barren nest, as the Asiatics. They bear confinement well, and with moderately warm quarters are as good winter layers as Brahmas, and are well adapted to the wants of the farmer, or any one who has but a small yard.

But for a beginner, who desires something that will breed true, I would advise him to choose some other variety.

P. S. I have no Dominiques to sell.

J. Y. BICKNELL.

Several large White Arctic Owls, a bird rarely seen south of the St. Lawrence river, have been recently shot near Brunswick, Maine.

VALLEY POINT POULTRY SHOW.

The following is the list of awards of the above show at their 9th annual exhibition, held at Cuba, N. Y., Sept. 26th to 29th.

Light Brahmas.—1st, Ormiston Bros., Cuba; 2d, Irwin Thomas, Franklinville.

Dark Brahmas.—1st, E. A. Newton, Cuba; 2d, S. C. Drew, Cuba.

Partridge Cochins.—1st, F. F. Latta, Friendship; 2d, S. C. Drew.

Buff Cochins.—1st, E. Ricker, Cuba; 2d, John S. Howan.

Creve Cœur.—1st and 2d, Geo. Conners, Seymour.

Houdans.—1st, Geo. Conners; 2d, H. J. Smith, Friendship.

Plymouth Rocks.—1st and 2d, F. F. Latta.

White Leghorns.—1st, W. F. Fisher, Cuba; 2d, Nelson Alexander, Black Creek.

Brown Leghorns.—1st and 2d, F. F. Latta.

W. P. Black Spanish.—1st and 2d, S. C. Drew.

Golden Spangled Hamburgs.—1st, H. J. Smith; 2d, W. G. Kidder.

Silver Spangled Hamburgs.—1st, E. A. Newton; 2d, S. C. Drew.

Golden Penciled Hamburgs.—1st, E. A. Newton; 2d, W. G. Kidder.

Silver Penciled Hamburgs.—1st, F. F. Latta; 2d, W. G. Kidder.

W. C. Black Polish.—1st and 2d, H. J. Smith.

W. C. White Polish.—1st and 2d, H. J. Smith.

Golden Polish.—1st and 2d, H. J. Smith.

Silver Polish.—1st, H. J. Smith; 2d J. M. Thomas, Cuba, N. Y.

B. Red Game.—1st and 2d, Ormiston Bros.

Derby Game B.—1st and 2d, D. Shay, Cuba.

White Game.—1st and 2d, D. Shay.

B. B. R. Game Bantams.—1st, F. F. Latta; 2d, E. Ricker.

Bronze Turkeys.—1st, S. C. Drew; 2d, Wm. Simpson, Jr, New Hudson.

Slate Turkeys.—1st and 2d, S. C. Drew.

Black Turkeys.—1st, S. C. Drew; 2d, ———

White Turkeys.—1st, S. C. Drew; 2d, G. F. Gallup.

MR. EDITOR:

I desire to make a few comments upon the articles written by P. Card, and B. G., Nos. 34 and 35, of Sept. Nos. I am glad to see that P. Card has so fearlessly sounded the key note of this Postal Card campaign, and that so many P. Cards are rising in his defence. P. Card's articles are logical, reasonable, and good sound sense combined. He has given the 3 cent stamp required by fine-haired gentry, a just and deserving rebuke, for advertising "no postal cards answered." Has B. G. or Young Breeder ever seen an advertisement of a business man offering his goods for sale, concluding with "no postal cards answered?" B. G. thinks if everybody had been pestered with postal cards as he has been, all would get tired of them. For my part I have had my share of them. I never considered them pestering, but am glad to receive them, and perfectly willing to answer any and all questions relating to my fowls, free of charge. Several years ago I sent postal cards to five or six of the leading poultry papers then published, as

them to please send me specimen copies as I wished to become a subscriber; four of the six responded and sent specimen copies, free of charge, and since that time I have been a constant subscriber to those papers, and have at times patronized their advertising pages. So much for answering postal cards.

I agree with P. Card, and disagree with B. G. and his friend Young Breeder, that poultry men who really have a large correspondence to respond to, call postal cards a curse and nuisance that should be abated.

The government had better retire these postal cards, if they hurt these fine haired dealers. If I want to buy a sewing machine, wagon, chickens, ducks, geese, or bull pup, I will write a postal card, providing I can get all the questions on that I want a reply to, if the postal will not contain what I wish to write, why then of course we will get a 3 cent stamp. If the correspondent will not answer my postal card, why then we will address another to the man that has the good sense to reply to all inquiries concerning his stock. Good for you, P. Card. Long may you prosper.

LEO. A. DOSCH.

BROOKVILLE, OHIO, Oct. 16.

"SETTING."

In Tennet's description of the pigeon exhibit, at the Centennial, and the remark of General Walker to the lady's enquiry, "if this is the room where they hatch?" Walker's reply was, "No, this is where we set." This reminds us that but a few squares from where this exhibit was made, at the hotel on Lancaster Av., Hestonville, there is, or was, not many years ago, a tin plate on the door of the room to the right of the entrance, on which was painted, "*Ladies Setting-room*." Although this appears to have been a "setting" room, we doubt if anything more than gossip was ever hatched there.

RED BARB COCK.

We understand that Mr. D. E. Newell of New York city, offered \$60 for the Red Barb cock illustrated a short time since in THE JOURNAL, hoping to add it to his already valuable collection. But its owner, Mr. Erdman, refuses the tempting offer.

ERRATA.

In Centennial pigeon display, line 22, page 546, for Morse read Moore. The gentleman referred to is Mr. E. H. Moore of Melrose, Mass.

I have bred Dark Brahmas several years, both in England and this country, and I can freely say that for utility and general purposes, both for the farmer and townsman, they stand at the head of the list, and if you desire beauty, where can you find it stand out with more perfection, than in the finely penciled Dark Brahma Pullet?—Circular of E. G. Bayley.

CARRIER PIGEONS.—A proposition is on foot for establishing a regular-pigeon communication throughout the country of Suffolk, for police purposes, the head quarters to be at Ipswich.—Live Stock Journal.

The beak of the Carrier is (or should be) light, that of the Dragoon black; this forms a distinctive feature between the two varieties, so the beginner can always by this means distinguish between the two.

I have now been a constant reader of your paper for two years, and I am constrained to say, it fills the bill. As long as I breed fancy poultry I must have it. Sooner curtail expenses elsewhere than do without it. I take several Monthlies, they are too long coming, compared with your weekly.

DOMESTIC DEPARTMENT.

HOUSEHOLD RECIPES.

Oatmeal.—We find it a good rule and a change to have oatmeal mush one breakfast and oats cakes the next. Our rule for the latter is:—Take two cups of cold oatmeal mush—mix one egg thoroughly through it, add one tablespoon of sugar, and flour enough to make into cakes. Dip each into pounded cracker and fry brown in hot, sweet, clean, lard or drippings. Oatmeal mush needs to be thoroughly cooked—or if time will not permit in the morning, soak the meal over night.

Things not generally known.—Cotton and linen cambrics are washed with soap much better in soft water; but then it is much better to rinse them afterwards in hard water, as it shrinks and hardens the fibres, and gives the cloth more firmness and elasticity, while the soft water would leave the fabric more lax and limp— and less brilliant.

Potash and soda are both alkalies, and have some like properties, still, they are very different in some respects. Potash is made by boiling down into a solid mass, like maple sugar, the lye of wood and vegetable ashes in a pot; while soda is procured by burning a sea weed or grass known by the name of *Salsoda*.

Both potash and soda, when boiled with grease or oily matters will make soap, but of a different character—soda and oil form hard soap, while potash and oil form soft soap.

This is the reason why alkalies applied to grease spots on cloth will remove and clean it—the grease combines with the alkali, forms a soap, which then is easily washed off with water.

For much the same reason, rubbing pure clay on grease spots will cleanse them, as the grease has a strong affinity for the clay, and when combined, water will readily wash out the whole; this is the principle of cleaning cloth with Fuller's clay.—*Maryland Farmer*.

SALT PORK cut into slices and soaked over night in milk is an improvement upon even fresh pork.

Nun's Puffs.—(Contributed.)—Take two ounces of butter and rub it into a pint of flour; boil a pint of milk and pour over it, and stir very well, then put in four eggs and beat the whole well together: pour the batter by the tablespoonful into boiling lard or butter.

Burns and Scalds.—The common whiting of commerce (found in nearly every kitchen), reduced by cold water to the consistence of thick cream, is to be spread on a light linen rag, and the whole burnt surface instantly covered, and thus excluded from the action of the air. The ease it affords is instantaneous, and it only requires to be kept moist by subsequent occasional sprinklings of cold water.—*Scientific American*.

Weeds growing in water purifies it.

PERIOD OF GESTATION AND INCUBATION.

Bread crumbs and German paste, with meal worms, is a good standard food for Blackbirds, etc. A little ripe fruit may be given occasionally, by way of a treat. H.

FAMILIAR SCIENCE.

Contributions to this department respectfully solicited from all.

LIST OF PLANTS IN FAIRMOUNT PARK.

Continued from page 527.

- Hepatica*—triloba, liverleaf.
Hydrastis—canadensis, turmeric root, (very scarce.)
Helianthum—canadense, frost-plant, rock rose.
Hypericum—perforatum, common St. John's-wort; do. corymbosum, spotted; do. mutilum, small.
Hibiscus—syriacus, (althæa) Syrian Hibiscus.
Heuchera—Americana, alum-root.
Hydrangea—arborescens, common Hydrangea.
Hamelis—virginiana, witch hazel.
Hydrocotyle—americana, pennywort; do. umbellata, pennywort.
Heracleum—lanatum, cow parsnip.
Hedera—helix, English ivy.
Houstonia—coerulea, dwarf pink, innocence.
Helianthus—loewis, (Helianthus) ox-eye.
Hieracium—venosum, veiny-leaved hawkweed; do. paniculatum, slender.
Halesia—tetraptera, four-winged snowdrop tree.
Impatiens—pallida, touch-me-not; do. fulva, jewel-weed, touch-me-not.
Inula—helenium, elecampane.
Keria—japonica, (Corechorus japonica,) Japan globe-flower.
Krigia—virginica, dwarf dandelion.
Kalmia—latifolia, mountain laurel; do. angustifolia, narrow laurel, sheep poison.
Lepidium—virginicum, wild pepper-grass.
Lychnis—githago, corn cockle.
Lechea—major, larger pinweed; do. minor, smaller pinweed.
Lespedeza—violacea, violet-flowered lespezea; do. repens, trailing lespezea; do. capitata.
Lythrum—salicaria, loose strife.
Ludwigia—alternifolia, seed-box, bastard loose-strife.
Lonicera—tartarica, tartarian honeysuckle; do. alba, white honeysuckle; sempervirens, trumpet honeysuckle; do. xylosteum, English fly honeysuckle.
Leucanthemum—vulgare, white-weed, ox-eye daisy.
Lappa—major, burdock.
Lactuca—elongata, trumpet milkweed.
Lobelia—inflata, indian tobacco; do. syphilitica, blue cardinal flower; do. spicata.
Lysimachia—ciliata; do. quadrifolia, four-leaved loosestrife; do. nummularia.
Linaria—vulgaris, (Anterhinnum linaria), toad flax; do. elatine, small toad flax.

To be continued.

FASCINATION—PHOCA IN ANSWER TO J. M. M'CANN.

Continued from page 563.

Compte's Herptology.—Same as Cuvier's Animal Kingdom:—"The cat-bird is one of those unfortunate victims, and indeed the principal, against which credulity and ignorance have so often directed the fascinating quality of the black snake. A multitude of marvelous stories have been told me by people who have themselves seen the poor cat birds drawn, or sucked, as they sometimes express it, from the tops of the trees (which by the by the cat-bird scarcely visits) one by one into the yawning mouth of the immovable snake. It has so happened with me, that in all the adventures that I have personally witnessed the cat-bird was actually the assailant and always the successful one. These encounters never take place but during the breeding time of birds, for whose eggs and young the snake has a particular partiality. It is no wonder that those species whose nests are usually built near the ground should be the greater sufferers, and the most solicitous for their safety: hence the cause why the cat-bird makes such a distinguished figure in most of these marvellous narrations. That a poisonous snake will strike a bird, and allow it to remain till nearly expiring before he begins to devour it, our observations on the living rattlesnake, at present (1811) kept by Mr. Peale, satisfy us is a fact; but that the same snake, with eyes, breath, or any other known quality he possesses, should be

capable of drawing a bird, reluctantly from the tree tops to its mouth, is an absurdity too great for me to swallow."—Wilson's Am. Ornith.

Let me suggest to Mr. McCann that "*the flaming eyes and fiery tongue of the living serpent*," although very impressive language, is rather an extravagant expression for a *student of nature*."

He says: "Here we have the testimony of eminent men of science and of unimpeachable veracity. They have seen in various parts of the world, the fascinating power of the serpent over its victim. What right have we to question their statements?" Such talk in this day and age of the world when the musty relics of tradition and superstition are being overturned in every direction, is simply ridiculous. As to the value of the evidence in support of any theory which taxes our credulity, the following extract from a lecture by Prof. Czermak in the private physiological laboratory of the University of Leipsic is to the point.

"The physiological facts which I shall demonstrate and discuss as they occur in various animals, are remarkably surprising. They will afford us opportunities for making deductions which are interesting in their historical relations, and they will also serve to demonstrate to us how man, uneducated in natural science, is deficient in judgment when he comes to view unfamiliar incidents of nature. They will show us that such a man examines natural phenomena in a way which is certain to deceive him, by convincing him that he has observed events which in reality never occurred. The obstinacy and lack of discernment which he thus brings to bear on his investigations are truly astonishing; and it is not surprising therefore, that the intelligent inquirer into the operations of nature should place little reliance on the testimony of highly honorable persons whose minds are untrained to the work they have undertaken. Even when such persons are possessed of great culture—even perhaps in natural science—but are not infused with that spirit of exact investigation so necessary to the discovery of truth in nature, we are justified in regarding their statements with hesitation and suspicion. Often, very often, we are obliged to listen to relations of unusual or dubious natural events, and cannot avoid feeling irritated at the assertions—which the speaker regards as putting an end to all argument—"I was there. I saw it all with my own eyes, and heard it all with my own ears. What I report is actually true!" The relator has really been present; he has seen and heard everything of which he speaks; he is in real earnest, and he tells the truth; and yet what he reports has never taken place, and the real investigator of nature is perfectly right in disregarding his testimony, while at the same time his truthfulness is not questioned. This may strike you as paradoxical. It is so, however, only in appearance, for the discrepancy disappears when we come to make the discovery that it is the perception of the observer which is at fault, and that the eyes and ears have been correct so far as their functions were concerned. The circumstance is what I call an *event viewed unequally*. In the want of discernment in which such an observer is placed when investigating nature, he regards the temporary coincidences and consequences of certain real events as in themselves real. He accepts these circumstances at once, and without thorough investigations, as having an intimate and direct relation with real events. He therefore forms a conception of something which is not real and he reports as an actual occurrence that which, in the way he means, never in fact took place. Such a circumstance constitutes an event not thoroughly tested, or an incident *unequally investigated*, and, I believe we are not merely logically justified, but morally forced, to distinguish among events in the perception of nature, a new and especial category, that of events *viewed unequally*." * * *

"Nothing strengthens the mind like a habit of investigating natural events with thoroughness and strictness. Without this habit credulity and superstition can neither be broken nor restrained."

NOTES FROM A PRIVATE CORRESPONDENCE.

Its so queer about the lichen growth on these trees. Upon some it will be only on the northern exposure of the bark, from root to the very highest twig, and that the shield lichen. Then may be the very next tree will be perfectly free from extraneous growth of every kind. The next may be draped in the garlands of the lace lichen, while another will be a mass of mistletoe. Why the difference in parasitical growth in such close quarters? As I said before, it's queer! I was thinking to-day about the mistletoe. Did you read in the *American Garden*, I believe it was, of 1875, about the English mistletoe. I saved the scrap at the time, and hunted it up for you as soon as I got home.

MISTLETOE IN ENGLAND.

"The mistletoe is rarely, or almost never at present found growing upon the oak. Indeed I have read in some recent authority that only three oak trees are known in all Great Britain with mistletoe upon them. Being in England on Christmas day, and observing the mistletoe everywhere conspicuous—in company with the holly, ivy and laurel—I made inquiry, wherever I could get a chance, as to whence the supply was obtained. Some knew only that just before Christmas day, at the markets, one could get a bunch of mistletoe, holly and ivy to hang in the window, for "tuppence" or more, according to quantity or quality. I saw few people who had seen it growing; and those had only seen it upon crab-trees or old apple-trees, never upon an oak; and hardly any would believe that it could grow on an oak. Nor had they ever seen it except in the west of England. Generally, they thought that it grew only in England. At a wholesale stand in a market in Liverpool, the day after Christmas, I saw a very large bunch on a piece of an apple-tree limb, the branches of mistletoe being as much as four feet long, and the thickest part of some branches an inch and a half or two inches in diameter. The price of that bunch, then, the day after Christmas, was five shillings sterling. The market-man said he believed it came from Kidderminster; and that the market supply came from the west of England.

I had, however, several opportunities to inquire of well-informed business men, familiar with the imports and exports and shipping of England, and they uniformly gave me quite another account, which, in the words of one of them, as nearly as I can remember, is the following:—"O yes, I know all about the mistletoe; it is a fungus; a thing that grows on the branches of trees. I never saw much of it in England; it always grows on knotty old apple-trees; never on an oak. They tell some rubbish about oaks and Druids and the sacred plant; and, particularly among the lower classes, that it is good to kiss the ladies under at Christmas—a sort of harmless bounce, a deceit, that does very well. But I've seen no end of it in Belgium, on old orchards; apple trees that are lumpy and don't bear much fruit; and at Christmas time they import immense crates of it from Belgium into England; crates of immense size—most surprising numbers of them—and supply the whole English market. It's just as good, for there's not much more mistletoe than Druids in England now." I learned also, that, according to general report, the mistletoe was propagated by boring holes in the bark of trees, deep enough to get at the sap, and inserting the broken berry, or the seed with its viscous covering.—*Isaac H. Hall in Torrey Bot. Club Bulletin.*

That was a surprise to me at the time of reading it. The idea of the mistletoe growing upon apple-trees—about equal to the "figs upon thistles." Why, of course, they were a growth upon the oak!

Did the Druids have apple-trees? Maybe they did—but in some way my impression was they didn't. But it's queer again the mistletoe does not grow upon oaks in England, or on the continent, but grows upon nothing else in California, that I ever saw, and the growth is so rank! Another error, the mistletoe is not a fungus. The fungi never show green herbage—think of a mush-

room with leaves, or a mistletoe in mushroom form. The fungi belong to the cryptogami, whereas the mistletoe is of the order *Diorcea*, class *Tritandrea*. The mistletoe is a true parasite, its root penetrates the soft white substance between the inner bark and the wood, and absorbs the juices that should have gone on further for the support of the tree. Annie thinks they are found only upon dying, decaying trees. Granted, but the death, decay, is because of their presence. There is another difference; a fungus is not a true parasite, it simply clings to the surface, receiving its nourishment from the air—and yet the rule won't hold good—because lately the Academy of Sciences have had presented to them a new fungus growth found in Nevada country, that is destructive to the growth of pines up there.

By the way, writing of fungus—a new one has lately been presented to the Microscopical Society, of which fungus I was favored with a photo, which I forward to you. At the presentation was read a paper descriptive, which I also send you.

AGARICUS TRIDENS.

to give the end a stellate appearance. The gills are distant, decurrent, notched and sinuate, and of a pale straw color. It is most assuredly one of the Hymenomyces, and an Agaric. The spores are ovate or round, exceedingly minute and borne on true basidia.

The peculiarity of this fungus is its being found only in the abandoned drifts of mines, where it has received the name of the Lily of the Mines.

This particular specimen was found attached to the timbers of a drift long closed in the Yellow Jacket Mine, Virginia City, Nevada, where the still moist air was most favorable to fungoid growth. [To be continued.]

PACIFIC.

SMALL PET DEPARTMENT

(For Fanciers' Journal.)

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending Dec. 2d, 1876.

- 1 Alligator (*A. mississippiensis*). Presented by Saml. F. Keely, Roxborough, Pa.
- 1 Horned Toad (*Phrynosoma cornuta*). Presented by Wm. N. Farnous, Phila.
- 1 Black Spider-Monkey (*Ateles ater*). Presented by Robert Kevin, Phila.
- 1 Bald Eagle (*Haliaeetus Caecephalus*), and 1 Snowy Owl (*Nyctea niuea*). Purchased.
- 1 Loon (*Colymbus torquatus*). Presented.
- 1 Common Gannet (*Sula bassana*). Presented by W. H. Zern, Atlantic City, N. J.

ARTHUR E. BROWN, Gen'l Supt.

(For Fanciers' Journal.)

ZOO NOTES, NO. 4.

BY HUON.

PRAIRIE DOGS.

If you have enough rabbits, squirrels, and guinea-pigs, and want still other pets, try the prairie dogs. They are very amusing, their antics and gambols being quite as funny as those of little kittens. If you have ground for a prairie-dog village you will find as an amusement it will pay. At the Philadelphia "Zoo" the "village" gets a large share of attention where, though they have lost in some measure their fear of strangers, they still go through the form of setting a watch, and always seem to have out a picket to warn of the approach of any foe; which picket, or guard, though it changes, is always made up of the old dogs, sitting solemnly upright, the dog on watch duty remains, while the others feed, and sounds his note of alarm by rapid barks or rather squeaks, when down sink the whole tribe in their holes, disappearing as suddenly as Roderick Dhu's men did in the Highland heather!

Make yourself at home with the prairie dog, and he will become quite familiar; he will come at your call, take food from your hand, and even from your pocket. He will climb up to your shoulders, gnaw your buttons, and poke his inquisitive little nose into your pockets if he but smell a cake or a cracker there. In short, there is not a funnier little pet out than the prairie dog.

THE WHITE ELEPHANT.

The largest White Elephant to be seen in Europe belongs to the Emperor of Russia, and is located in the Grand Park, at St. Petersburg. It was a present from a former Shah of Persia to a former Emperor of all the Russias, and is said to be at least one hundred and fifty years old! Certain it is that the animal was in the same park in the time of the infamous Empress Catharine, who was crowned Empress at Moscow, in 1762, and died in 1769, and could he talk, what a story he could tell of the high jinks of that extremely dissolute Empress and generally bad woman, who inhabited the very palace, to which the park then, as now, belonged.

When this white elephant was a "new arrival" in Russia, he was decked out in very fine trappings, with richly ornamented riding-turret, etc., but for a couple of generations past, he has steadily refused to be saddled and mounted. In his old age he has grown cross and unmanageable, as though he had outlived his love of the world, and has become disgusted with things in general.

In the Philadelphia "Zoo" have been lately introduced two baby elephants, "Baby-Boo," male, three years old, and "Wolly-po-tump," female, four. They are healthy, playful little animals

of the Indian species, and we may reasonably hope from their good condition, and the great care taken of them by their keeper, that when the next Centennial comes around, they may be able (we shall improve now, since our Centennial, so much that elephants may talk by that time) to tell the people of the wonders of 1876.

ALBINOS.

From the *Chicago Field* of Nov. 25th, we learn that Dr. A. F. McKinney recently shot a female Albino quail, *Oryz Virginia*, on his plantation at Germantown, Tenn. It was a beautiful specimen and was presented to Mr. D. Bryson of Memphis, Tenn. About a week ago the "*Forest and Stream*" received at their office in New York, a partial Albino quail, shot by Mr. H. Fassett of Philadelphia.

This reminds us to say a word for

"BILLY JONES,"

A pure white squirrel, the last of three we received over a year ago, from Mr. Edward Bassett of Berlin, Wisconsin. One, a female, died a few months after it came to us. She had many indications of having received a charge of shot, which charge doubtless caused the convulsions which finally carried her off. She was very tame, and a great pet. Being unable to jump to any distance, she was often allowed her liberty. The second, a male, was sent to Lewis Ruhe, (importer of rare animals) 98 Chatham street, N. Y. But "Billy Jones" was too smart—too nearly perfect, for us to part with, consequently, in one of Osborn's

Incomparable Cages, "Billy accompanied us to the "land of steady habits," where he has been much admired. During the winter "Billy" is kept in the kitchen, and carefully attended by a lady who is very fond of pets, therefore he is in the best of health all the time, and as he is constantly talked to (ladies must talk to something) he has got so he always replies, in his way, which is very amusing. He does not often get his liberty, because there is too much "squirrel" in him. He is too lively. The first time he was let out he landed on our shoulder, then on our writing table, when inkstand, paper, and other materials were thrown around very lively. From the table he sprang to the plants in the window, where he was soon half buried in the dirt. At another time he got out on the lawn. He made no attempt to run away, but got in the loose dirt under an arbor vitæ, where he almost buried himself, eating and rolling in the dirt like a playful kitten, proving to our satisfaction, that squirrels in cages are sadly neglected. They need and must have loam occasionally in some form, or they will not keep in that condition so pleasing to lovers of squirrel pets. Their diet should be varied, and consist of nuts, clover heads, grass, bread, &c. In fact, "Billy" does not seem to have the best of manners, for he will ask for apples, or anything he needs, if any one is eating in sight the article he wants. He knows no fear, as when let out he will run between

the legs of any dog however large or strange, the same with cats. It is amusing to see him examine our cat's tail, as she sits watching him placidly until he finally tests it with his teeth, when pussy jumps up as though she was wanted elsewhere. Having just shed his coat he is pure white, with bright pink eyes. He is perfect in form, larger than the gray squirrel, and has a very large bushy tail. Will some of our naturalists tell us, why with his new coat his actions have changed? He has become apparently more savage. Is this the pairing season for squirrels, or why is he more savage at this time?

During the winter of 1875 and 1876, we had 3 white squirrels, 1 black, 1 gray, and 2 striped ones. In the evenings we often let several of them loose in our dining room. The striped ones were always timid and would shun us. The larger squirrels seemed untamable until their teeth gave out, when they became tame and would take food from the hand. The black or gray would always make room for the white ones, which among themselves would have terrible encounters, and always had to be separated. It was a very pleasant sight to turn all loose at once when they were hungry, and watch them feed until satisfied. The white female had a particularly winning way of half sealing, half coaxing nuts from the others; when all were satisfied they would hide the remaining nuts. Never putting two nuts in one place so long as they could find two places—we purposely made as many places as possible, by providing slippers, boots, &c., &c., and never in our experience were two nuts put in one place until all the places had been utilized, then, and then only, would they begin to put two in a place, and finally three, &c., &c. To us this rather hurt the theory that they lay in large stores of food in one place for winter. As George P. Burnham would say, "why is this thus? Will McCann, Huon, or Phoca please explain?"

WADE.

EXCHANGES.

Advertisements under this head, of four lines, or forty-eight words describing and offering for **Exchange only**, will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

"To EXCHANGE FOR CASH" or "GREENBACKS," "WANTED A PURCHASER," or "WANTED AN OFFER," etc., etc., cannot under any circumstances be admitted to the **Exchange** or **Want** column.

No Exchange or Want will be inserted unless accompanied with 25 cents.

F. F. GROW, Glenwood, Pa., will exchange a pair of P. C. Fowls, very fine, weight 20 lbs.; also fine Rouen Ducks, for White-crested Black Poland. A chance for a good trade for some enterprising person. None but good birds wanted.

H. H. TSHUDY, Lititz, Pa., will exchange one trio B. Leghorn Chicks, and one trio Buff Cochins Chicks, for Plymouth Rock Pullets.

S. C. SMITH, Lock Box 132, Warren, Pa., wishes to exchange a Violin, cost \$16, for a Cocker Spaniel, broken on Grouse, or a good Pointer Pup Dog.

ABM. V. N. DEFOREST, Metuchen, N. J., will exchange an Adams Casket Printing Press, 9x13, warranted to be in perfect order, for Brown Leghorn, or others.

J. HORACE FASSITT, 1630 Locust St., Philadelphia, Pa., will exchange a pair of Yellow Mottled Trumpeters, for a pair of Flying Antwerp.

BOX 2946, New York, wishes to exchange White Barbs, Black and Dun Carriers, and Antweps, for a Double-barrel Breech-loading Shot Gun, which must be by good maker, and in fair condition, or offers.

H. E. SPENCER, Centerville, Broome Co., N. Y., will exchange either a trio of White Cochins, Todd's stock; White Leghorns, J. B. Smith's strain; or Brown Leghorns, F. J. Kinney's strain, for Plymouth Rock Pullets, or Pekin Ducks. Must be good stock. Answer at once.

JOHN K. CAMP, Winsted, Conn., will exchange Scribner's Monthly, bound in cloth, new, years 1871 and 1872; and a book entitled, Events at the National in 1873; also two fine Light Brahma Pullets, and one yearling Hen; also S. S. Hamberg, for fine Colored Dorkings, yearling Hens or Pullets, or B. B. Red Game Bantam Pullets.

W. J. EYENDEN, Williamsport, Pa., will exchange 2 Irish Setter Pups, lemon and white, 8 months old; 3 E. B. K. Game Bantam and 3 Silver Duckwing Game Bantam Cockerels, 1 pair Red Carriers, breeders, 1 Red Jacobin Cock, 1 Violin and Bow, valued at \$25, and a Watch, valued at \$15, for Breech-loading Shot Gun, Rifle, Cigars, Berkshire Sow, or offers.

WINFIELD, Box 110, McKeesville, Northumberland Co., Pa., has Houdans, one Single-barrel Shot Gun, with Game Bag and Shot Pouch, one copy Graham's Standard Phonography (new), several Cans, all sizes, Homoeopathic Medicines, never been opened; one copy Winner's Guitar Instructor, &c., for offers in Pigeons, Game Bantams, or other Fowls. Postals received.

G. E. BACON, Riverside Station, Conn., will exchange 1 Brown Leghorn Cockerel, and 3 Pullets, for 1 pair of Bronze Turkeys.

J. HORACE FASSITT, 1630 Locust St., Philadelphia, Pa., will exchange 2 pairs of Antwerps, for two pairs of Jacobins, White, Black, or Blue.

E. F. ERLAND, Plymouth, Mass., will exchange first-class Pekin and White Call Ducks, for German Canaries, good singers, and Wild Geese, first-class.

E. M. PEASE, 35 Grand St., Hartford, Conn., wishes to exchange a set of Key Check Dies, Letters and Figures, (steel); also good assortment of German Silver Key Checks and Rings, for Leghorns, or a Fleetwood S. roll Set.

C. M. GRAY, Trenton Falls, N. Y., wants to exchange Printing Press, Violin, Pointer Dog, Partridge Cocks, Rouen Ducks, Pile Game Chickens, Derbys and Bantams, for a Rifle, Shot Gun, Revolver, Watch, Set of Harness, Berry Plants, Fruit Trees, &c.

HENRY CLAYTON, Mount Pleasant, Del., will exchange Buff Cochins (bred from choice birds of Williams and Churchman's strains), for one pair of good Turbit Pigeons, and one trio of choice Black Red Game Bantams. Correspondence solicited.

DR. J. THOS. BUSSEY, Fennettsburg, Md., will give 2 Brown Leghorn Cockerels for a good Brown Leghorn Cock, and 2 P. Rock (cockers), or 1 P. R. and 1 American Dominique Cockerel, for Houdan Cock. Must be good.

EZRA B. DIBBLE, New Haven, Conn., will exchange 6 Hens and 1 Cock, Light Brahmas. Hens weigh from eight to eleven lbs. each; all hatch of 1875, for any thing (but live stock) that I can realize \$20 cash for.

C. B. ELLEN, Pittsburgh, Pa., has one Flute, white \$12; one Piccolo, value \$6.75, both new; Black African Bantam Cockerels, to exchange for good Clairs, or Silver Wares.

ORLANDO SEELY, Box 129, Ithaca, Tompkins Co., N. Y., will exchange Silver Spangled Hamburgs, B. B. R. Game Bantams, and White Fantail and Flying Antwerps, bred from imported stock, for small Printing Press, or offers.

THE WOODBERRY NEWS, published at Woodberry, Md., will exchange Advertising, for Chickens, Ducks, Geese, &c., of fancy breeds, or for the eggs of either.

F. FRIES, Sherrills Mount, Iowa, will exchange first premium and pedigree Essex Eggs, for other breed, or good Newfoundland and Shetland Pups; also D. and L. Brahmas, premium birds, for Eggs. Will warrant all my stock to give satisfaction. Answer quick.

BOX 368, No. Attleboro, Mass., has for exchange one "Jaques" in incubator, in perfect order, and but little used, for others. Singing Canaries preferred. Postal cards accepted.

G. E. BACON, Riverside Station, Conn., will exchange one second-hand Weed Sewing Machine, in good order, for one Brown Leghorn Cock and seven Pullets. Must be good ones.

C. P. BOLLES, Rockville, Conn., will exchange one pair of B. B. R. Game Bantams, and one pair of Wild Geese, also a Blue Dutchess Cock, and a Yellow Hen, for Inside Tumblers, (any color except black), Fantails and Trumpeters. What offers?

CHARLES A. ANDREW, West Boxford, Mass., will exchange Lop-eared Rabbits, of any age, or White Fantail Pigeons, for young Ferrets, or P. Rock Pullets, or offers.

BENJ. BLAMPIED, 307 Mount Zion St., Elmira, N. Y., will exchange one beautiful Black Walnut Mocking Bird Cage, highly ornamented, and fit for any parlor. Is 4 feet long, 2 feet wide, 2 feet deep; arched door frame; double doors in front, French plate glass in doors and headlight. Large back door, with looking glass, and fine Chromo of Deer and Rabbit cased in same. Beautiful Steeple in center, also one at each end. Draw tray for cleaning cage, in three sections, and covered with rich oil cloth. Door and bell knobs silver mounted. Was once offered sixty dollars for cage and refused it. Will exchange the same for five (5) trios of thoroughbred Poultry, following varieties: W. C. B. Polish, W. C. W. Polish, G. Sebright Bantams, W. Leghorns, Brown or Black Leghorns. None but pure stock wanted. Exhibition birds. Write.

T. D. ADAMS, Franklin, Pa., will exchange 4 trios of G. S. Hamburgs, No. 1 and 2; Corn Shellers; Fowls; 30 Chromos, neatly framed; FanCIers' Journal, complete to '77; Parsons' Laws of Business; Wells' Every Man his own Lawyer; Water Fountains, (Wade's) 1 gallon; a White Pointer Cock, and Beagle Dog, for a small size Printing Press, complete, or offers on postal cards.

R. W. SNYDER, Owego, N. Y., wants to exchange pedigree Buff Cochins for a good Setter Dog, or offer.

W. G. EATON, Newark, N. J., will exchange a Magpie Lantier, cost \$200, Brown Incubator, \$100; or German Canaries, good singers, for Black or White Cochins, or B. Leghorns. Must be first-class.

BOX 869, Rockville, Conn., will exchange a nice Family Horse, seven years old, weight 1,000 lbs., sound and kind, for a registered Jersey Cow.

J. T. BELL, Franklin, Pa., has 7 trios Black Red Games, '76 hatch, \$10 per trio; Loug Silver Watch Guard, \$15; 7-shot Cartridge Revolver, \$8; good heavy Single-barrel Shot Gun, \$15; Single-barrel Cartridge Pistol, \$4; three years Fowls World, in patent bind, \$5.50; 75 lb. collection Minerals, \$10; Home Corn Sheller, new, \$2.50, to exchange for Breeding Machine, Breeding-lood Shot Gun, Printing Press and outfit, Foot Lathes and Tools, large Cartridge Revolver, Music Box, or offers.

JNO. F. HOUSER, Tamaqua, Pa., will exchange 1 Harp, Piano, 3 good Violins, 1 10-keyed Accordeon, 1 Eran & Watson's Safe, 1 Pocket, and 1 large Case of Homeopathic Medicines, filled and labelled in good condition, 1 Florence Sewing Machine, 1 bound vol. Wright's Illustrated Book of Poultry, 4 Points Type, assorted, 1 Single Silver-plated Buggy Harness, good as new, 1 Hoebert Gun and Target, 1 Red Bird and Cage, 1 Rabbit Hutch, 1 Electric Battery, for Alderney or Jersey Cow, or Double Breach-loading Shot Gun, or offers.

JOSHUA BOWERS, Morrow St., between 5th and 6th, Wilmington, Del., has a pair of splendid Newfoundland Pups, 6 weeks old. They are thoroughbred, I know, for I have their mother. I would like to exchange them for first-class Carrier Pigeons. I have also about 15 pair of Outside Tumblers, mostly black. I would exchange for other varieties of Pigeons.

WANTED.

READ INSTRUCTIONS AT THE HEAD OF EXCHANGES.

The name and address of any person acting dishonestly through the Exchange and Want columns, will be placed at the head of Exchange column.

DR. O. W. BROWNBACK, Pendleton, Ind., wants a trio of Partridge Cochins. Please describe fully, and give lowest cash price.

R. M. GRIFFITH, Wilmington, Del., wants purchasers for his stock of Pigeons and Chickens, at down prices. Send your orders at once.

R. M. GRIFFITH, Wilmington, Del., wants to rent to a Breeder, for one or more years, House and Lawn, 10 acres of Land, Poultry Yards, Pigeon Lotte, all complete. Parties can have possession immediately if required.

WANTED.

1. A Treatise on the Art of Breeding and Managing Game, Domesticated, and Fancy Pigeons; by John Matthews Esq., and published by the author, 7 Islington Green, London. 1852. Illustrated.

The Treatise of 1858 is not wanted.

2. A set of Six Matchless Engraved Colored Portraits, Life Size, by Wolsstenholme, viz: The Almond, Black Mottle, Red Baldhead, Yellow-beard Tumblers, Black Carrier, and Blue Pied English Pouter.

3. A colored Diagram, or a Plan of Building or fitting up a Pigeonary, embellished with Tumblers, Pouters and Carriers.

We think there are several different diagrams, and would like all of them.

4. A set of six splendid Life Size engraved Portraits of The Fancy Toy Pigeons, colored, viz: The White Fantail, Yellow Jacobin, Silver Owl, Blue Turbit, Black mottled Trumpeter, and the Black Barb.

All of above pictures published by J. M. Eaton.

A liberal offer would be made for any of the above in good order.

Any information regarding John Mathew Eaton's life and works would be gratefully received.

Correspondence solicited on the subject of Pigeon Books, old and curious books, and Autographs of men of note, living or dead.

WM. GARDNER BARTON, Salem, Mass.

RABBIT BOOK FOR THE MANY.

Containing the HISTORY OF THE RABBIT from the earliest times. Descriptions with illustrations of all the show and fancy varieties, and full directions for their selection, breeding, and management; the treatment of their diseases, and the construction of their dwellings. HARTFORD, DECEMBER 18, 1876.

No. 49.

EDITORIAL.

OUR WEEKLY SUPPLEMENT.

From all quarters the word has come, "Don't give up the weekly." Letters have fairly poured in upon us, assuring us of the satisfaction the JOURNAL has given as a periodical, and of its usefulness as an advertising medium. We dislike to deprive our paper of its characteristic, but find it impossible to bear the expense of maintaining it. We have given the matter much thought. Have seriously asked the question, "How can we afford to keep up the weekly issue?" One plan has suggested itself, and we have hastened to carry it out in the Supplement which we shall present you the coming week. It is our plan for 1877 to issue monthly, a paper similar to the No. 50 of Vol. 3, and in the interim, to issue three numbers of the Supplement, thus giving the alive men of the fancy a chance to advertise freely. This Supplement will be sent to all subscribers to the monthly, free. It will also be sent without the monthly to any address, for 50 cents per annum, 40 numbers being issued during the year. Special terms to agents. Agents wanted everywhere. Exchange rates the same as in the present weekly. Advertisements ten cents per line of about eight words. Advertise! Send us your advertisements, and help us to support a weekly advertising medium for the fanciers.

COMPLIMENTARY TICKETS.

We return thanks for the complimentary tickets to the Fair-fie'd (Maine) Poultry Show, and to the Western New Hampshire Poultry and Pet Stock Exhibition.

INFORMATION WANTED.

How did Mr. John Bishop ever succeed in hatching those chickens in the Jaques Incubator? (See JOURNAL No. 16, May 1st, 1876, page 195.) He said he would let us know some future day. I would be very much pleased to read it in the FANCIERS' JOURNAL; it would benefit me and many other readers of the precious paper.

Yours truly,

E. E. H.

HOLD ON TO THE WEEKLY.

FRIEND WADE:

I sincerely hope you will change your mind in regard to making the JOURNAL a monthly; if you make the subscription price \$3.00 per annum, I have confidence to believe all the old subscribers would gladly pay it. Hold on to the Weekly, and place my name on the subscription list at \$3.00. I can only say—shame, shem

on the Poultry Breeders and Fanciers of America, if they do not at once respond and help hold up your hands. W. T. ROGERS.
DOYLESTOWN, PA.

PREMIUM LISTS, CARDS, CATALOGUES, ETC., RECEIVED.

Rules and premium list of the Leavenworth Poultry and Pet Stock Association. The regular premiums are liberal, but there are also 178 specials offered.

Their rules seem to have been made with care, and with the good of the exhibitor in view.

Reductions from the regular fare are announced as having been promised by the railroads centering at Leavenworth, while the Express Cos. collect full rate to the show but return specimens free.

This new society has our best wishes for success in this their second exhibition.

Special prize list of the Maryland Poultry and Fanciers' Association, enumerating thirty-one very liberal premiums for dogs, and nineteen for poultry.

Their railroad arrangements are as follows:

"The Baltimore and Ohio Railroad will carry Dogs free, to and from the exhibition, from all stations on their lines.

"The Pennsylvania Central will also carry Dogs free on their road, East of Pittsburg, to the show.

"The Philadelphia, Wilmington and Baltimore Railroad, will also carry Dogs free."

Entries close 20th December.

Constitution and By-Laws of the Saginaw Valley Poultry Association.

Show to be held at East Saginaw, Mich., Jan. 30th to Feb. 4th, 1877.

J. H. COWELL, M. D., Secretary.

In spite of the dull times the forming of new societies in Michigan and Maine proves the interest alive.

Illustrated catalogue and price list of Asiatic fowls, as bred by Halsey and Cosgrove, Le Sueur, Minn.

Card of Chas. W. Gunn, dealer in birds' eggs, nests, and skins, rabbits, pigeons, etc., 10 Jeff. Ave., Grand Rapids, Mich.

Circular of E. G. Bayley, Breeder of Dark Brahmas, exclusively. Yards at 20 West Maryland St., Indianapolis.

Card—Harmon Bowers, Fanciers' store, cor. Hudson Ave., and Green St., Albany.

Circular of Key-Stone Poultry Yards, C. U. Johnson, North East Pa. "Lt. Brahm as a specialty."

Card of Birch Lawn Poultry Yards, M. T. Kelley, Bloomingdale, Park Co., Ind.

S. P. Stone, Farmer Village, N. Y., breeder and shipper of pure bred fowls.

John A. Lord, Kennebunk, Maine, breeder of high class W. Cochins, and Lt. Brahmas.

POULTRY AND PIGEONS.

SEASONABLE HINTS.

Be careful of the new plumage of the birds intended for the show room. Give such birds clean sand for their dust baths.

A bird *can* be washed if the feathers are soiled, but wash and blue them ever so well, the plumage has lost the luster, that, like the bloom on the peach, is only once given.

Give exhibition birds plenty of room, otherwise they may get quarreling, and be ruined for the show-room. Guard carefully against feather-eating. Watch closely for the first signs of it, and punish the offender.

Guard against sickness not only from exposure, but from lack of exercise, also. Be careful, if cold weather sets in, to prevent frozen combs.

If any portion of excreta clings to the fluff, give the birds a bundle or so of straw to pick over and work among, and the soiling will soon be worn off.

Feed liberally and regularly. Do not cram your birds to get great weight. If you do, it will be at the expense of some other point or points.

Be an honest exhibitor. If nature has disqualified your birds, accept the fiat. Don't resort to plucking, cutting or painting. If your Black Cochins have red hackles, don't paint them, hoping to deceive the judges. If you have influence, don't use it to put them in a poor light, else you'll be apt to hear that keen-eyed Scotchman that breeds Buffs, say, "put 'em out, mon, put 'em out, they're a disgrace to the show." "Be honest, though the heavens fall."

THE AMERICAN STANDARD OF EXCELLENCE.

The American Standard of Excellence is the subject of considerable discussion at this time, and promises to continue to be till after the meeting of the A. P. A. at Boston, in January next. And, as an interchange of the sentiments of the fanciers of the country is the only way to learn just what is wanted, I presume the real or imaginary errors, omissions, &c., will all be made right in due season. I cannot lay claim to the title of "old breeder," either in years or experience; yet I trust I have enough of both to entitle me to give my opinions in this important matter, for it is an important matter. Breeders have been now several years conforming to its teachings in mating and breeding their stock, and now have probably got themselves properly fixed to produce standard birds. And this being the case the members of the A. P. A. and those conducting the present criticisms of the Standard, should be very guarded in what they do lest they destroy the work which has already been done, and also destroy the confidence of American fanciers in the possibility of ever being able to form a perfectly reliable Standard. Do not do as children with a box of building blocks—knock down what you have constructed to build some more elaborate and fantastic appearing structure. I notice several critics make very strange assertions in relation to it. One says, "Give us Wright's Poultry

Book for a Standard, and that is good enough for America, England, &c." Now with all due respect for the writer, and Mr. Wright, I would like to enquire if Mr. Wright is better authority than the combined talent and experience of the united fanciers of America. I am too thoroughly American and Yankee to believe that American fanciers cannot frame a Standard better suited to America than Wright, Tommy Dod—or any other man. The English may be older as poultry fanciers, but does any one claim they are better in all things pertaining thereto?

No, gentlemen, we have now a Standard. If it is erroneous in some points, cut them out and replace them with better. If it omits anything necessary add that to it, but leave the structure as it is. Do not let petty jealousy or pecuniary interest destroy that harmony which is so necessary to prosperity in any undertaking. One learned gentleman does not know how to mate up a pen of Lt. Brahmans, as he does not know whether a hen with a single comb is a good Brahma or not. Now with all due respect to the gentleman's standing as a breeder and writer, I would like to suggest that a little common sense—very common sense too—should help a six year old boy out of that difficulty. I have a boy four years old who would quickly tell you that kind of bird was not a Brahma at all. Again, the same gentleman says "not a Corporal's guard of the best fanciers of the country ever refer to it in mating up their breeding pens." I submit that the "old fanciers" know just how to mate their birds to produce Standard birds, as required by said Standard. Also that common sense and scientific experiments, pedigree, &c., have helped intelligent old and young breeders to mate their breeding pens. If the Standard of Excellence does not suit you, please tell us *why*, and give us better reasons for changing it or for substituting the fruit of your fertile brain for it, and none will be faster to follow you than the subscriber. But we have a Standard now, and let us *improve* it if it is found incomplete; but do not destroy it. You cannot all have a Standard to suit your "strains" or peculiar fancies—ah! there's the rub—it *does* not suit every strain in the country, and it will not do till it suits Mr STRAIN; so I will throw cold water on it, and on its ruins I may rear an edifice like unto my strain. Another finds that "it is not full and explicit enough, and fails to meet all the requirements of all cases, according to his idea. I will admit that in a few cases more might be said to the Amateur or "Young Fanciers," but to judges, such as associations should employ, it is full enough in its teachings. A fancier qualified to judge birds at a show should have judgment as well as knowledge and experience, and that judgment will point out to him the course to take in any case that may come up. In the cases mentioned by this last critic, the gentleman himself is not in the dark as to how to act or how he would act if such a case came before him. For if, as he says, he cannot sufficiently condemn the fault by the number of points credited to that particular part, should he cut them off entirely he has still one or two more ways to reach and punish the defect.

Again you can never expect to form a Standard that will enable every one that sees it to judge and score a bird properly. For every one is not capable of applying the most simple rules to judging poultry or any thing else. Some people are entirely incapable of doing or learning anything correctly. Or they may learn some things and are incapable of learning others. For instance, I was acquainted with an officer in the army during the late war, who could never learn a bugle call. Even calls that his horse (he was a cavalry officer) learned, he could not learn, such was his want of an ear for music. Another case was that of a school-mate of mine who was so deficient in comparison of colors that he had to leave his situation as clerk and seek other employment because he could not tell blue from green, nor purple from black. Now both these gentlemen were smart, reliable business men, but were deficient in these particu-

lars. Now take a man who is deficient in "comparison," and what kind of a poultry judge would he make, if even you put into his hands a Standard guide as large as a family Bible? Take one deficient in color, and put him to judging Games, P. Cochins, or Hamburgs, and what kind of a verdict do you suppose he would render?

Now do not charge the American Standard of Excellence with your own failings. It is not to blame if you cannot tell a bird of fine symmetry from a long legged, staggering cockerel, homely in shape, and uncouth in gait and appearance. Do not hastily condemn the work of the best fanciers of America, because you cannot find a good bird, or tell one when you see it.

ELIPHALET STOWELL.

EGGS, FOWLS, AND GAME IN CALIFORNIA.

WHY IMMENSE SUPPLIES ARE BROUGHT TO CALIFORNIA FROM THE EAST.

Within the past fortnight half a dozen ear-loads of eggs have arrived in this city from Iowa and adjacent States. One importer alone received 30,000 dozen, and the price fell from twenty-four cents to twenty-two cents. It is not surprising that so large a quantity of Eastern eggs has thus suddenly been brought into our market, because a demand in almost any spot on earth in these days of railway facilities will find a supply. But it is somewhat surprising that our own people, knowing the demand to exist, have not taken more efficient means to supply it nearer home. Perhaps no better market can be found than San Francisco for eggs, fowls, and game. The stall-men are constant rivals in their bids for an increased supply. This is not the season for game, but small birds, hare and rabbits are taken in any quantity, while chickens fit for broilers are in great demand at from five to seven and a half dollars a dozen, and roosters and hens readily bring nine and ten dollars at wholesale, and ducks ditto. Hitherto

RAISING FOWLS

Has not been considered a profitable speculation in California, because the long Summer drouth and dust are said to breed vermin and disease; and when the owner of a fine flock wakes up some fair morning he is likely to find that one or two hundred have suddenly died during the night. This is very discouraging, and detracts largely from the profits. To meet such emergencies or avoid such calamities, chicken growers must closely study the peculiarities of our climate and the habits and requirements of the poultry. Fowls need fresh meat as well as a farinaceous diet. Old bones and oyster shells pounded up are not sufficient, though useful during the laying season. But every chicken raiser ought to understand that if drouth and dust are the cause of disease, verdure and water are in a great measure the remedy. Therefore one who would be successful in raising fowls for the market should first of all select some spare piece of land, and, if barren, plant it with eucalyptus trees for shade, irrigate and sow it with grass, and keep it green the year round. Chickens

NEED BOTH SHADE AND GRASS,

And will not do well without these advantages. But with a good shady grove and green grass to keep the fowls fresh and healthy, and movable henneries kept well whitewashed, and moved frequently to keep the fowls clean, there is no good reason why anyone should fail in this enterprise who knows anything about the business and science of poultry raising. One gentleman in Texas has an annual income of ten thousand dollars from his poultry ranch. And there is a fortune in this business for anyone competent to conduct it on this coast. The constant demand, which can only increase with the increase of our population, assures the profit. And if our people will give more attention to this matter they will not only be paid for their pains, but we shall not need to look to the East for aged eggs or a supply of poultry.

—San Francisco Call.

THE NEXT SEASON'S WORK.

It is none too soon to begin the work for next year's breeding. Those who have kept their young birds of both sexes together, should make haste to separate them, and the stock should be looked over, to see the material on hand for the season's work. Where the work of the year past was a success, it may now be noted, and thought be taken how the success may be continued; where it was a failure will also be shown now, and the true fancier will consider where the fault lies, and will study to rectify it. The live fancier is already seeking through the press, his patrons for the future. He makes the reading world familiar with his name and wares, before the mass of the breeders have realized that one season is past, and another upon us. "Delays are dangerous" to the advertiser.

GOUT OR RHEUMATISM IN FOWLS.

These two names are applied indifferently to an inflammation of the feet or the joints of the legs. The affected parts will be reddened and swollen, and the bird will probably show signs of pain. The disease is probably caused by some fault in the digestive apparatus, but the trouble may be increased by exposing the fowl to cold and wet. There are several forms of these diseases, besides the one described. In one, the only symptom may be a slight lameness, or with this, the joints may be stiff and the toes bent up, or twisted to one side. The trouble called "cramp" is perhaps of a partly different nature, but this is not certain.

When the inflammation is very great, the bowels should be well opened with jalap or calomel. Twice a day may be given a pill containing a half-grain of extract of colchicum. The bicarbonate of potash might prove a valuable remedy. Opium may also be administered in the same doses, or more if necessary to soothe the pain. The local treatment consists in washing the affected parts with warm water in which is dissolved potash, or in case there is only a stiffness, and no great amount of inflammation, some mustard may be added to the water. Oil of mustard is said to be useful internally in this last case. Sweet oil also has a favorable influence in cases where there is much inflammation. The fowls should be removed to a warm, dry place and be fed well.—*Rural Home*.

SHOW AT EASTON.

The grand consolidated Poultry and Columbarian Show of Eastern Pennsylvania will be held at Easton, from January 5th to 8th, inclusive, and under the able management of Messrs. McKen and Hulick, will undoubtedly be a grand success. The exhibition hall is situated in the central part of the city, and is far preferable in every way to the building that was used for the same purpose last year. The first premium will remain the same as last year, namely \$5.00, and there will also be a splendid list of specials. For fanciers, no better show will be held during the winter of 1877 for the display of stock owned by them, than at Easton. The judging will be done by men thoroughly competent to act in that capacity. The number of points to the pair, required for first premium will be 175, second 165, third 155. The first premium on pigeons will be \$2.00, and they must be of a high degree of excellence to obtain the award.

As there will be no exhibition at either Doylestown, Philadelphia, or Allentown during the present winter, of course the city of Easton will be the grand center of attraction, and as it is the first grand consolidated show of poultry and pigeons ever held in that part of the country, a large turnout of people and stock is predicted. The preparations now being made are all on a grand scale.

TENNENT.

SPANISH AT THE CENTENNIAL.

EDITOR JOURNAL:—

"Every man thinks his own geese swans;" and this saying was more than ordinarily well exemplified in "Tennent's" article pertaining to "Hamburgs."

The display of W. F. B. Spanish, in both the Canada and American departments comprised *good and bad birds*, as did also the display of *Hamburgs*, for which Mr. "Tennent" shows such dotting "literary" inclinations. He says:—"We have sacrificed everything for the white face;" and apropos we will add, that the W. F. B. Spanish show equally as "careful breeding" as the Hamburgs, and to quote additional words of "Tennent," "I, as well as many other fanciers, were highly pleased with the display." The American display of Black Spanish was fine beyond a doubt, as were nearly all the different classes, and in justice to exhibitors, honors should be given to those entitled, and "slurs" omitted.

America, we are pleased to state, has some *very fine* Spanish fowls, and as far as the *face* is concerned, must in many cases be accorded equal, if not superior to foreign exhibits. American Spanish fowls have *not* deteriorated as much as "Tennent" would have us believe, and in our opinion, this class is being continually improved by its many enthusiastic admirers, and we predict that eventually America can boast of W. F. B. Spanish equal to *any*, both as regards *face* and *size*.

PERO NIXON.

PREPARING POULTRY FOR MARKET.

Poultry should not only be fat when killed, but should be properly dressed and put up for the market. Poor goods may not sell because they are presented in an attractive form, but the best will not bring good prices unless they attract by their appearance. After the fowls are killed comes the most exacting part of the work of preparation. The skin must not be broken; it must not be parboiled; pin-feathers must not be left in, nor the down stand out like the first virile furze on a boy's face. To prevent these unsightly and repulsive appearances follow a few simple and natural directions. Pluck the fowl while the animal heat still remains; do not kill at a time more than you have facilities for immediately dressing. The use of hot water is certainly essential, but do not have it hotter than is absolutely necessary in order to start the feathers. Pick out all the pin-feathers, using tweezers if necessary, but do not tear the skin. Singe the plucked fowl over a gas jet or the flame of a kerosene lamp; in the latter case it is sufficient to hold the fowl over the glass chimney of an ordinary kerosene lamp, turning the fowl rapidly. The work may be done in a few seconds. Some prefer a handful of feathers or a few scraps of paper kindled to a quick blaze in the fire-place or stove, the lids of the latter being removed.

In some markets poultry is sent with crop and intestines undisturbed, probably as much because it is thought the fowls look fairer and plumper, as for any hope of gain from extra weight. It is preferable on some accounts to draw the fowls. The French market-women draw their poultry, carefully wipe out the cavities and stuff with a bunch of clean unused paper—ordinary straw or manila paper—and their poultry is delightfully sweet and attractive.

Poultry should not be packed for transportation until entirely cold. Then it should be laid in clean straw, breast down, keeping wings and legs close to body. See that there is no discoloration of blood on the skin. If the heads are removed pull up the skin of the neck and tie it over the severed portion with a bit of strong thread or twine. Never cut off the spurs of old hens or cocks with the idea of passing them off for young chickens; purchasers are generally older than the most ancient specimens of your poultry yard, or if perchance the customer is green, that is no excuse for dishonesty.—*Canadian Poultry Journal*.

A MIDSUMMER RAMBLE.

I enjoyed my midsummer ramble so thoroughly that I cannot keep it a secret. Leaving Baltimore one bright, beautiful Tuesday morning, I was rapidly "whisked" along by the fast mail, via the N. C. R. R. The grand and picturesque scenery seemed like a vast panorama, to unroll before me, displaying all the glorious fullness of a bountiful season. Well tilted, nearly kept farms, followed one another or rather were passed on one side, while on the other, the beautiful Susquehanna was slowly ebbing its way to the Chesapeake Bay. The river was exceedingly low, looking as if it might be easily forded any place between Harrisburg and Williamsport. Considerable tobacco is raised along the river flats. What a grand sight it was to suddenly "round a curve," and have in a twinkling, as if by magic, spread out before us, green, velvety green fields, skirted with forests whose foliage, had already, in anticipation of Autumn's kisses, commenced to blush; fields of snow-white buckwheat blossoms, whose fragrance filled the air; orchards weighed down with red cheeked fruit, and cattle standing knee-deep in the water, while in the distance amid the hazy atmosphere—such as only that season affords—towered in uneven sublimity, the mountains, whose sides and tops are always covered with the evergreen of hemlock and pine. Five p. m. found me in Elmira, where it was unpleasantly warm, and exceedingly dusty. I thought how different the weather, from the last time the Editor of the *Journal* was there—when he was "snowed in for a week." Another hour, and I was at Watkins, where we were met by Dr. J. W. Lyon of Burdett, whose hospitality we enjoyed for several days, as well as numerous rides after his fancy stock. The Doctor is an enthusiastic fancier of horses, and what he does not know of them is not worth knowing.

After doing this place with its Glen, Eldridge, Seneca Lake, Hector Falls, and other attractions, with a party of ladies and gentlemen I visited little Cayuga lake, on a fishing excursion—but knowing how incredulous "some" of the readers of the *Journal* are, about fish stories, I refrain from "telling" the quantity of fish caught. On our return, we halted at a substantial, cosy farm-house, (apples were ripe there) and I was shown a pair of "*new California*" (?) fowls. They came all the way "from the gold regions," and were a pair of *very poor* Partridge Cochins.

Binghamton was my next halt. Time was so limited here, that I was unable to visit Mr. Martin, and some other fanciers. Next up the charming Chenango Valley to Oxford, where I spent several days substantially enjoying myself with an uncle—who, to my surprise, I found a chicken fancier, having W. C. B. Polands. All theories to the contrary, his Polands are good incubators and mothers. We saw one set of early chicks, nearly full grown, and his best hen clucking around, (with a nice brood of young) as motherly as a Brahma. They are allowed full range all weathers, and have proved as hardy as any fowls.

With Mr. Geo. T. Brown, I visited the pretty village of Norwich, (Chenango Co.) In riding through the place, we saw several yards of nice pure bred poultry. The only fancier we found was the Hon. A. G. Prindle, county judge, but only discovered that he was a fancier by having his fine pigeon loft pointed out, as we were riding past. Having had an invitation to visit a dairy—for which both Chenango, Orange, and Herkimer counties are noted—our next stop was at the farm of Mr. Gilbert J. Brown, Smithville Flats. Forty cows were here milked, among which were some fine specimens of Jerseys. Mr. B. was kind enough to also show us through a cheese factory, with a capacity for the milk of four hundred cows. We also spent a day in fishing on Cincinnati pond, noted for its fine "pickercel." Reluctantly I left this land of milk and golden butter, and started again for Watkins.

On the route when near Owego, I saw grazing on the hillside a

fine herd of pure Holstein (or Dutch) cattle, which, with their very distinct characteristic marking—known as the “belt,”—together with the bright green pastures as a background, afforded a most attractive, and animated picture. I saw some choice cattle, yet must admit that before I left Baltimore I saw at the farm of Mr. T. A. Cochran, Ayrsbires, and Jerseys, that were the bosses of all I had yet seen. Next, a steamer from Watkins via the beautiful Seneca Lake, to Geneva—just in time to catch on the rear platform of the last car, and we were on the rail, bound for Utica.

The first glance after platforming, showed us the honest countenance of our friend J. Y. Bicknell, a fancier's hand shake, and “Mr. Brown, Mr. Adams.” Ah! I thought this is Newton Adams—and I said “Mr. Adams I am very glad to meet you.” Mr. Adams was there, with a horse and carriage, and kindly volunteered to show us around the city. I was pleasantly surprised to find such elegant and substantial mansions, and artistically designed grounds. Fort Hill Cemetery was visited, which we found very attractive, and commanding a fine view of Utica and surrounding country. It contains a splendid conservatory, in which, are many very rare, and choice tropical productions. Mr. Bicknell called my attention, by means of a microscope he carried with him, to beauties I never dreamed of. The uninitiated can hardly imagine what hidden beauty, in plant life, the microscope renders visible, in even the most common flower. Like Mr. B., hereafter our constant companion shall be the microscope. At the monument of a Mr. Barnard, we noticed a bust figure of a beautiful woman—by Hiram Powers. It seems Mr. Barnard, when in Rome, it saw, admired, and purchased. It is a masterpiece of art. We came very near—(our trio of fowl fanciers, Bicknell, Adams, and Brown,) getting into the Lunatic Asylum, as visitors, of course (?) However we were on the grounds, where we saw several of the inmates, outside enjoying themselves in a rational manner. A drive along the very extensive grounds exhibited to us large and most excellently cultivated fields of vegetables, thrifty and prolific as a Peter Henderson market garden. Last but not least, we drove up to the residence of Mr. Adams, and had the gratification of inspecting some grand specimens of Golden and Silver Spangled, and Black Hamburgs, White Leghorns, and Plymouth Rocks. No wonder he walks away with the premiums, when he shows, for he has the stock that is bound to win, if there is anything in points, at a Standard, Mr. Adams is an enthusiastic fancier, quality in preference to quantity his idea. I have a habit, when I am about to meet a stranger—of whom I have heard about, of drawing, so to speak, a mental photograph of what I expect to find him like. But in about all cases, my mental photo's are not very good likenesses. Now I intended to see Mr. Adams, and imagined in him, I should find one of that style of men who would point out to us his Leghorns, and remark, in a bigoted manner: “There's some leghorns I'd like to see anyone beat.” Don't know why I got this idea. In Mr. A. I found a polished gentleman, a judge of fowls, who was aware his birds would exhibit their qualities, and gave his visitors credit enough to consider they were capable of appreciating the same. “Train time” was drawing-near, and I departed from Mr. Adams, and with Mr. Bicknell was soon on my way to his well known yards. A night's good rest, a hearty breakfast with mine host Bicknell, and his estimable family, and I am in excellent spirits to inspect his stock. The first great attraction I saw was some remarkably fine Aylesbury ducks. I pick one of them up, and discover in this weight, he does not deceive his looks. Then I notice a pile game cock, and three hens, that are unusually excellent. No wonder; they were imported! Then I saw for the first time a yard of real Cayuga ducks. Then, as Mr. B. feeds, I follow him around, coming to Spanish, (grand ones) Creves, Lafleche, Cochins, Hamburgs, Houdans, Bantams, &c. But as

he has separate farms, where some of his stock is reared, I enjoy the following day in visiting them. But why dwell in praising his stock when all that is necessary to show their qualities is to remark they were: “Bicknell's Stock.” I have always had a strong belief that a fancier could successfully manage a number of breeds, and care for them just as well as with one breed as a specialty. If for no other reason, than with one breed, the study of the characteristics are soon noted—no contrast to note any difference, &c., while with several breeds, the observant fancier may always discover something characteristic in each variety, thereby enabling him in discovering merits and demerits, besides allowing no opportunity for monotony. Keeping several varieties is not merely a pastime, but a business. At least such has been my experience, and I discovered J. Y. B. took better care of his flocks than did any “specialist” I have ever known. Of another thing I am satisfied, to be a successful breeder of “good” fowls, one must be a true fancier, a lover of his birds. As I silently contemplated Mr. B. I remarked, the labor (?) of caring for his feathered beauties, was no task, but a pleasure. But I digress. Among his pigeons I noticed some fine White Trumpeters, and grand outside Tumblers. I must admit—not that I would willingly rob J. Y. B. of any of his merited laurels—that I had covetous thoughts, and as I stood surrounded on all sides with featheredesters, I mentally wished “I were in his boots.” Don't be astonished reader, when I say my wish came to pass that very night. But let it be a warning to us all, not to make such avaricious wishes. Yes that night I was in his boots, and down the stream with him fishing. Also the next day, those same rubber boots were again brought into requisition, for a similar excursion. A terrible windy day, yet our success was excellent, and among the day's incidents was J. Y. B.'s wrestling with a huge turtle, for which I kindly loaned him his boots to “land him.” I caught a number of fine young salmon, but to their element again returned them, as Mr. B. had only a year previous, placed several thousand in the stream. An afternoon was devoted to riding around viewing the splendid country, in his immediate vicinity, where hops are very extensively cultured. It was a novel sight to me—the tall straight poles, in their long systematic rows, not unlike an immense vineyard; the pretty contrast of the hops, against the dark green foliage affording a most pleasing picture. The strange looking, seven bushel boxes (I mean to say boxes holding seven bushels each) the pickers deposited the hops in, reminding me of the old fashion square well curbs, in the days of the “old oaken bucket.” The peculiar looking houses for drying were also objects of wonder. A merry lot of young people generally do the picking. The vines are cut near the ground, the poles pulled up, brought to the boxes and the hops removed. The young folks performing this duty, chatting, and sometimes gayly singing some familiar air, all joining in the chorus, gave evidence that enjoyment was also prevalent. A brief conversation we held with one of the young ladies who was highly intellectual, pretty, and stylish, and a daughter of a most estimable family, induced us to conclude that hop-picking in such company has its romantic attractions also. No wonder worthy young men and women do here congregate. Passing by several houses after night fall, we heard their merry voices in song, and once, the tones of a violin rang out on the clear night air, and we saw pantomimic shadows flit across the window curtain, in the “all promenade.” At one time, we sat in the carriage in sight of twelve hop yards, some of them embracing a good many acres. Mr. Bicknell anticipates soon changing his present business, which necessitates the reduction of his stock. I sincerely hope that the fraternity will not entirely loose him as a fancier, for such gentlemen are needed in the fancy, to neutralize the effect of unprincipled dealers.

To be continued.

ANNUAL MEETING OF N. H. POULTRY SOCIETY.

At the annual meeting of the N. H. Poultry Society, held in Manchester, Dec. 4, 1876, the following officers were elected for the ensuing year:

President.—Hon. Virgil C. Gilman, of Nashua.
 Vice-Presidents.—Gen. Natt Head, Hooksett; Albert Beard, Nashua; J. O. Adams, Manchester; Lowell Eastman, Concord; Warren F. Daniell, Franklin; Horatio Crowley, Keene; J. G. McKeen, So. Acworth; Warren Brown, Hampton Falls; G. W. Dolloff, Lake Village; C. E. L. Hayward, Peterboro.

Secretary.—Andrew J. Tuck, Nashua.
 Treasurer.—Wm. G. Garmon, Manchester.
 Attorneys.—Sulloway & Topliff.
 Auditors.—Aaron Young, Portsmouth; H. M. Putney, Andover.

Executive Committee.—Col. Geo. W. Riddle, Wm. T. Evans, A. W. Quint, C. H. Bradford, Manchester; O. A. Hamblett, Milford; C. C. Russell, W. H. Knowles, Nashua; C. M. Boynton, Concord; D. F. Silloway, Fisherville; J. H. Morrison, Marlow.

MR. JOS. M. WADE:

DEAR SIR,—I would like to inquire through the columns of your JOURNAL, (if you will permit) the best, safest, and cheapest way to pack eggs for hatching, in quantities of from one to three dozen, so that they may arrive in good order to the person with whom you may be dealing.

I am very sorry to hear you speak of changing your paper from a weekly to a monthly, and for one, I will try to help to make it pay as a weekly, by getting one or two subscribers for you. Brother fanciers, let us all try, by putting forth a little extra effort among our neighbors and see if we cannot make THE FANCIERS' JOURNAL a paying journal, and have it remain as it is, a weekly visitor, instead of receiving it only twelve times during a whole year.

B. M. CROSBY.

Our method has been, to pack in dinner baskets, costing from 40 to 50 cents each, with which we were as successful as we could expect. We first wrapped each egg in paper, then packed in bran, or cut hay. Pressing the cover down tight and fastening with wooden pins. Almost the last dozen eggs sent out by us were packed in this way, the basket then rapidly rolled over a floor some 20 feet, and shipped to West Va., from Phila. Eleven healthy chicks were hatched from them.

EDITOR FANCIERS' JOURNAL:

The secretary of the Berks County Poultry and Pet Stock Association informs your representative, that the coming show, commencing on Dec. 25, has prospects of a very fine and large collection of stock. One of the principal buildings, Keystone Hall, at Reading, the county seat, has been engaged. Part of the exhibit made by the Netherland Agricultural Society at the Centennial, will also be on exhibition, and the florists will show a large collection of plants, etc., from their green-houses. The hall will be exquisitely and elaborately decorated. With such a scene and such a collection of birds as may there be seen, the exchequer of the society will be amply filled. Amongst those prominently connected are the judges of the courts, iron masters, the legal fraternity and state officials, together with the prominent fanciers of the county and state. We will give your readers full particulars in the future. Fraternally,

ALEXANDRINA.

The origin of Easter eggs—a hen.

PIGEONS.

(Continued from page 547.)

The last dietetic, or rather, perhaps, medicinal article, necessary to be described, is the SALT CAT, so called from some old fancy of baking a real cat with spices, for the use of pigeons, which, however, I never observed to eat animal food. In compliance with this custom, I caused to be placed in the middle of the pigeon loft, a dish of the following composition: loam, sand, old mortar, fresh lime, bay-salt, cummin, coriander, carraway seed, and all-spice, moistened into a consistency with urine. The pigeons were constantly pecking at this, and were in a constant state of good health; how much of this may be attributed to the use of the cat, I cannot determine; but, certainly, they are extremely fond of it, and if it had no other merit, it prevents them from pecking the mortar from the roof of the house, to which otherwise they are much inclined. The cat was mixed and heaped up in a dish, a piece of board being placed upon the summit, to prevent the birds from dunging upon it; when it became too hard, it was occasionally broken for them.

The regular OLD FORMULA for this cat is as follows:—gravel or drift sand, unctuous loam, the rubbish of an old wall, or lime, a gallon of each—should lime be substituted for rubbish, a less quantity of the former will suffice—one pound of cummin seed, one handful of bay-salt; mixed with stale urine. Inclose this in jars, corked or stopped, holes being punched in the sides to admit the beaks of the pigeons. These may be placed abroad.

Many fanciful and groundless tales may be found in old books, relative to the medicinal and remedial properties of almost every part of the pigeon; thus much, however, may be relied on, their flesh, when young and in good condition, is a nourishing and stimulant diet; that of the full-aged pigeon more substantial, but harder of digestion, and, in a considerable degree, heating. The general rule of color affecting quality in the flesh, holds good in tame pigeons. The black and dark feathered are proportionally dark or brown fleshed, of high flavor, inclining to the game bitter of the wild pigeon. The light color in the feathers denotes light and delicate flesh. Their dung is of an extremely heating and drying quality, whether as a manure, or for medicinal purposes. It was in former days, a principal ingredient in nitre-beds, when that article was almost entirely manufactured at home.

CARRIERS, HORSEMEN and DRAGONS are travelers or messengers, and I have occasionally seen TUMBLERS turned off, at the distance of forty miles from home. The Carrier, it is said, has performed a journey of forty miles in an hour and a half, and of over ninety miles in three hours. A Dragoon has flown seventy-six miles in two hours and a half; this ancient fancy of flying pigeons had declined, but has, it seems, revived within a few years. The admired qualities in the TUMBLER are excessive high flight, so as to be almost imperceptible to the keenest eye, in fine and clear weather; perseverance in their flight for many hours together, and tumbling over and over repeatedly during their ascent and descent.

Whatever benefit or utility may have been derived, in ancient days, from these winged messengers, it is probable the moderns reap no other benefit from them than that of amusement and the gratification of curiosity, by flying them for prizes and betting. Scarcely, however, is there a great race or great fistic contest at a distance from the metropolis, but a profitable use is said to be made by pigeon-flyers, in sending instant intelligence of the result to their confederates in town. But after all, this appears with perhaps a few exceptions, to have been from the beginning, a regularly repeated hoax; and such is the opinion of a late writer in the sporting magazine. The practice, nevertheless, of flying pigeons between this country (England) and the continent, has revived within the three or four last years, and has been frequently repeated. It is pretended that speedy intelligence is thus kept up between London and Rotterdam, on the course of exchanges.—To be Continued.

HOMING ANTWERPS.

It seems to me, Mr. Editor, to be rather remarkable that there are, among the pigeon fanciers, so few who keep the Antwerp Homing bird. When I reflect upon the subject of pigeon-keeping as a fancy, study, or hobby, and bear in mind the care that must be taken of Toy Pigeons, the difficulty of raising them, with their delicate constitutions from constant confinement, it really looks to me as though the producing of a spreading tail in one variety, a protruding crop in another, a ruffle on the breast, or a frill about the neck of another, cannot be as satisfactory or as interesting as is the raising of the keen-sighted, swift-flying, and home loving Antwerp. Nothing gives me greater pleasure than to watch my birds, when, in their morning flight, they circle upwards and upwards until they are mere specks in the sky, knowing full well that nothing but death from a hawk, who, by the way, is not likely to be hovering over a city, will prevent my finding them in their cote when they have tired of exercising. The simple fact of their loving "home" so, is, in itself, a very pleasing feature, and when, with a little training, you are able to send a dozen of them away, thirty, fifty, or one hundred miles, and knowing the time they are to be tossed, what can be more delightful than, with your friends on the lookout with you, to see them far in the distance, coming straight for home like grape from the mouth of a cannon, and mighty near, as just then the shout "here they come," bursts from your lips, and you want to take each and every one of them close to your breast and endeavor to tell them how much they have contributed to your pleasure.

The keeping of Antwerp Homing pigeons has given me a great deal of enjoyment, and if I had children it would please me very much to find that they exhibited an interest in the raising and tending of these birds. Next year my friends and myself propose to have quite regular communication between Block Island and this city, with these birds; the Island is fifty miles away, one half the distance being straight "out to sea" from the main land.

G. W. A.

PROVIDENCE, R. I.

We sincerely hope the Antwerps of "G. W. A." will escape the unmerciful grip of the hawk, but we will assure him that very many pigeons are annually taken by hawks, over the city of brotherly love, (not between hawk and pigeon) and carried into the wilds of Jersey. T. Grist, of Philadelphia, has often witnessed this thing with his favorite birds.

A PRELIMINARY.

BY V. M. F.

It is nearly two years since I had the pleasure of contributing to the FANCIERS' JOURNAL, and in the mean time it has spread its wings and flown northward. But what a change! It was good and valuable before, but now it is what I have been looking for all my life. A journal uncured by an exhausted subject, and one launched upon the great sea of Nature, in which the useful and the beautiful both have a place. But the greatest field for discovery still lies in the forest. I do not expect in this short article to come down to the work which I have laid out for future contributions, if acceptable to you and your readers, but simply to view the field, and premise for after-thoughts. Consistent with former subjects, I still cling to the old theme—domestication and acclimation.

I do not accord with some naturalists who believe in Mr. Darwin's theory of creation. If I did, all my advocacy would be misconceived.

Sacred history asserts that all the living creatures were made for man. Taking that for true, the Creator fashioned them for man's use, making a complete agreement and harmony between man's wants, and the lower animals' adaptation to supply that

established need, which man has for the living creatures under him.

This presupposes a duty in man to ascertain through his judgment, what the creatures are adapted to supply. Remote ancestors have found out the use of the horse, cow, hog, sheep, and some other animals. But brute creation did not stop with those. If they had been sufficient for man's use, creation would have stopped with them. But it is assumed that the balance were made for food for man, and for one another, in an unsubdued or wild state. If any are unsuceptible of any other use, then, that problem is solved. But if other uses can be discovered then it is not. And to that, I will invite attention in subsequent contributions.

DOMESTIC DEPARTMENT.

HOUSEHOLD RECIPES.

OAT MEAL BREAD.—No more wholesome bread can be eaten than that made of good, clean, sound oats. They are a fine substitute for wheaten grits, and by many preferred to cracked wheat. Oat meal makes nicer, whiter, and more light or puffy griddle cakes than buckwheat. Weight for weight, oat flour has more nutriment, and is more digestible than wheat flour; and it makes nice mush.

The heaviest and soundest grain should be selected; then run through a hulling or smut machine; then coarsely ground and the thickest bran bolted out.

When we were farming we always selected a few bushels of our best oats, and had them nicely ground for our family use.

REMEDY FOR WARTS.—Ten cents' worth of cedar oil, applied a little at a time every few days for a couple of weeks, will cause the warts to slough off and disappear. This remedy is so unfailing that it should be generally known.

BROILING MEATS.—When meats are broiling on a gridiron over hot coals, the sudden heat applied sears the outside, which shuts in the juices, and the rapid application of heat soon cooks the meat through, if in moderately thin pieces. It is then tender, juicy and palatable. Those who never broil their fresh meat, fish or poultry do not know the excellence of a properly-cooked dish of animal food.—*Jackson Sentinel*.

TO BOIL A HAM.—It should be put into cold water and the water changed two or three times, according to the saltiness of it. Allow one hour to every three pounds, to boil it tender. If desired very nice, a pint of champagne may be added when the ham is about half boiled. When well done, peel off the skin, roll two soda crackers, fine, add to them pepper to taste and cover the fat of the ham. Set the ham in the oven until the "cracker meal" is slightly browned, then lay it on the dish for serving. Cover the bone with a paper ornament, made by cutting a feather edge on a long strip of stiff white or fancy-colored paper, and winding it around the bone in the shape of a feather. The ham is then ready for the table.

—KEEPING CIDER SWEET.—This fall, cider is ridiculously cheap, and those who have plenty may be interested in knowing how to keep it sweet. We find the following process recommended as efficacious:—Allow the cider to work until it has reached the state most desirable to the taste; then add grated horse radish in the proportion of a tumbler and a half to the barrel of cider, and shake up well. This arrests further fermentation, and after remaining a few weeks it may be racked off in clean casks, and the air excluded by closing the bung. Cider preserved in this way has a very pleasant flavor.

ERRATA.—For the sentence, "the larger seemed," etc., in 2d column, p. 578, read, "they (the striped squirrels) seemed untamable," etc.

On page 577, 3d line, read "class *Dioecia*, order *Tetrandria*," for "order *Diorcea*, class *Tetrandria*."

FAMILIAR SCIENCE.

Contributions to this department respectfully solicited from all.

CARRIGEEN.

The *Chondrus crispus*, or Carrageen, which grows in such vast quantities on the coasts of the British Isles, belongs to the rhodospERMES, though when growing, as it frequently does, in shallow tide-pools, exposed to full sunlight, its dark purple color fades into green or even yellowish white. When boiled, it almost entirely dissolves in the water, and forms on cooling, a colorless and almost tasteless jelly, which of late years has been largely used in medicine as a substitute for Iceland moss. Similar nutritious gelatines, which also serve for the manufacture of strong glues, are yielded by other species of rhodospERMES, among others by the *Gracillaria spinosa* of the Indian Ocean, which the Salangala (*Hirundo esculenta*), a bird allied to the swallow, is said principally to use for the construction of her edible nest.

The steep sea-walls along the south coast of Java are clothed to the very brink with luxuriant woods, and screw-pines strike every where their roots into their precipitous sides, or look down by thousands from the margin of the rock upon the unruly sea below. The surf of incalculable years has worn deep caves into the chalk cliffs, and here the Salangala builds her nest. Where the sea is most agitated whole swarms are observed flying about and purposely seeking the thickest wave-foam. From a projecting cape, on looking down upon the play of waters, may be seen the mouth of the cave of Gua Rougkop, sometimes completely hidden under the waves, and then again opening its black recesses, into which the swallows vanish, or from which they dart forth with the rapidity of lightning. While at some distance from the coast the blue ocean sleeps in undisturbed repose, it never ceases to fret and foam against the foot of the mural rocks, where the most beautiful rain-bows glisten in the eternally rising vapors.

Who can explain the instinct which prompts the birds to glue their nests to the high dark vaults of those deep, and apparently so inaccessible, caverns? Did they expect to find them a safe retreat from the persecutions of man? Then surely their hopes were vain, for where is the refuge to which his insatiable avidity cannot find the way? At the cavern of Gua-gede, the brink of the precipitous coast lies eighty feet above the level of the sea at ebb-tide; the wall first bends inwards, and then, at a height of twenty-five feet from the sea, throws out a projecting ledge which is of great use to the nest-gatherers, serving as a support for a rotang let down from the cliff. The roof of the cavern's mouth lies only ten feet above the level of the sea, which, even at ebb-tide, completely covers the floor of the cave, while at flood-tide the opening of the vast marine grotto is entirely closed by every wave that rolls against it. To penetrate into the interior is thus only possible at low water, and during very tranquil weather; and even then it could not be done, if the rugged roof were not perforated and jagged in every direction. The boldest and strongest of the nest-gatherers wedges himself firmly in the hollows, or clings to the projecting stones, while he fastens rotang ropes to them, which then depend four or five feet from the roof. To the lower ends of these ropes long rotang cables are attached, so that the whole forms a kind of suspension bridge throughout the entire length of the cavern, alternately rising and falling with its inequalities. The cave is 100 feet broad and 150 feet long as far as its deepest recesses. If we justly admire the intrepidity of the St. Kildans, who let down by a rope from the high level of their rocky birthplace, remain suspended over a boisterous sea, we must needs also pay a tribute of praise to the boldness of the Javanese nest-gatherers. Before preparing their ladders for the plucking of the bird's nests, they first offer solemn prayers to the goddess of the south coast, and sometimes deposit gifts on the tomb where the first discoverer

of the caverns and their treasures is said to repose. Thus in all zones, and in every stage of civilization, man is directed by an inward voice to seek the protection of invisible powers when about to engage in a great and perilous undertaking.

As I have already mentioned the Salangala builds her nest of sea-weeds, which she softens in her stomach and then disgorges. During its construction, new layers, which soon grow hard in the air, are continually deposited on the margin, until it has attained the proper size. When gathering time approaches, some of the pluckers daily visit the cavern to examine the state of the brood. As soon as they find that most of the young are beginning to be provided with feathers, their operations commence. These nests form the first quality; those in which the young are still completely naked, the second; while those which only contain eggs, and are consequently not yet ripe, rank third. The nests with young whose feathers are completely developed are over-ripe, black and good for nothing. All the young and eggs are thrown into the sea. The gathering takes place three times a year; the birds breed four times a year. In spite of these wholesale devastations their numbers do not diminish, as many of the young have no doubt flown away before the day of execution, or other swallows from other unexplored caverns may fill up the void. In this manner about 50 piculs are annually collected, which the Chinese pay for at the rate of 4,000 or 5,000 guilders the picul. Each picul contains on an average 10,000 nests. Dividing these 500,000 nests among three gatherings, and reckoning two birds to each nest, we find that more than 333,000 swallows inhabit at the same time the Javanese coast caverns.

In the interior of the island, in the chalk-stone grottos of Bandong, the Salangala also breeds, but in far inferior numbers, as here the annual collection amounts on an average to no more than 14,000 nests. In these inland caves, swallows and bats reside together, but without disturbing each other, as the former when not breeding leave their caverns at sunrise, disappear in the distance, and only return late in the evening, when the bats are already enjoying their vespertine or nocturnal flight.

In Sumatra and some other islands of the Indian Archipelago bird's nests are likewise collected, but nowhere in such numbers as in Java. They are brought to the Chinese market, where they are carefully cleaned before being offered for sale to the consumer. The addition of costly spices renders them one of the greatest delicacies of Chinese cookery, but as for themselves they are nothing better than a fine sort of gelatine.

The Japanese have long been aware that the costly bird's nests are in fact merely softened algæ. They consequently pulverize the proper species of sea-weeds, which are abundantly found on their own coasts, boil them to a thick jelly, and bring them to market under the name of *Dschin-schan*, as artificial bird's nests. The Dutch call it Agar-agar, and make great use of it; simply boiling sufficient to convert the dried substance into a thick uniform jelly, which is both nourishing and easy of digestion. Thus we see that the algæ, which the Romans considered so perfectly worthless, that, when they wished to express their utter contempt of an object, they declared it to be still viler than the vile sea-weed, "*projectæ vilior algæ*," are by no means deserving of so hard a sentence.

Man himself might be much more justly reproached for neglecting the abundant stores of nourishment, which nature has gratuitously provided for him on all flat and rocky coasts. For not only the species I have mentioned are eatable, but also some of the commonest fuci of our seas (*Fucus nodosus*, *F. vesiculosus*, *Laminaria saccharina*), as well as the gigantic alarinas and durvilleas of the colder ocean regions. And yet how rare is their use, notwithstanding the increasing wants of a rapidly growing population.

"THE SEA"—HARTWIG.

Mr. J. J. Wier, says a foreign paper, exhibited some larvæ at a meeting of the Entomological society, which he believed to be only the common meal-worm (*Tenebrio*), but which had been found in the corks of port wine bottles. Considerable damage had been done, since they ate quite through the cork, and allowed the wine to escape. He suggested the use of bran instead of sawdust, as the probable cause of their incursion into the cellar. Mr. W. W. Saunders related an instance of a number of larvæ of *Dermestes lardarius*, which were brought into the docks with a cargo of skins, effecting an entry into an adjoining ware-house, where they perforated and rendered entirely useless a quantity of manufactured corks.

—QUEER FISH.—There has just been placed in the New York Aquarium a rare species of fish recently brought from Japan by Mr. Gill, of the firm of Martin Gillet & Co., of Baltimore city. Mr. Gill has had several of these fish at his residence in Baltimore for some time past. These fish are said to be the first of the kind seen in America, and since being placed on exhibition in New York the specimen forwarded by Mr. Gill has attracted much attention from prominent naturalists. The peculiarities of the fish are the brilliant colors of their scales and three separate and perfectly developed tails, which the Japanese claim are the result of many years of the most careful breeding. Numerous attempts have been made to bring this fish to America, but this is the only instance in which success has been attained. A swinging tank, nicely balanced on axles, was suspended on board the ship, so that the effect of the ship's motion was scarcely perceptible, but even after this care had been taken, only seven fish out of twenty-eight survived the journey. Mr. Gill has taken great care providing for the remaining six, which he kept in his house in Eutaw Place. They have spawned fifty young, exhibiting all the peculiarities of the originals. The fact that this fish has never been seen outside its native waters in Japan, together with the peculiar interest attaching to it from the careful manner of breeding necessary to produce the triple tail-like tails, renders it of much importance to all fish culturists. The full grown ones are about eight inches in length, their tails being nearly four inches long. When placed along side of our gold fishes their brilliant colors show in striking contrast.

SMALL PET DEPARTMENT

(For FanCIers' Journal.)

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending Dec. 6, 1876.

- 1 Bittern (*Botaurus minor*). Presented by H. B. Case, Londonville, Ohio.
- 3 Bantams. Presented by Spencer Trotter, Phila.
- 1 Opossum (*Didelphys virginiana*). Presented by Ellwood Johnson, Germantown, Pa.
- 5 Ruffed Grouse (*Onosca umellus*), 2 Moose (*Alce americanus*), and 2 Polar Bears (*Ursus maritimus*). Purchased.

ARTHUR E. BROWN, Gen'l Supt.

ZOO NOTES, NO. 33.

BY HUON.

WHY THE GANNET WOULD NOT FEED.

Some weeks ago the Zoo Garden came into possession of a Gannet, sometimes called the "solan goose," but whose scientific name is *Sula bassana*. Now *Sula* is something of a bird, being near three feet in length, and broad in proportion. His color when full grown is white generally; the head and neck buff, and the primaries black. The yearling bird is nearly quite black, and all through life it bears marks around the eyes which look like a pair of "specs," hence Gannet has been given another name—"Spectacled Goose."

A dear lover of fish is your Gannet, and it has been supposed by some that he was quite indifferent as to kind, so that they were fish-es, but such we shall directly see is not quite the case. In his own waters along the coast of the Atlantic, Gannet is a mighty

fish-er, no fish of common size being too large for him to attack or capable of evading his terrible beak. Poised high in air he sights a fin in the blue waters beneath him, and down he comes like a thunderbolt, sending his sharp bill through and through his unsuspecting victim.

This habit of his causes him sooner or later to be caught himself when he is wanted, as the Gannet hunter nails a herring to a flat board and sets it afloat as a trap. Spying the herring, down swoops Gannet sending his bill clear through the board from which it cannot extricate itself, and thus becomes an easy prey to the Fowler.

Sometimes Gannet interferes with the fishermen, seizing upon the center of the net as it is being drawn in, and getting entangled in the meshes is captured along with the fish.

So much for the bird—now as to why he did not feed. Upon his first appearance he was handed over to keeper Pavonareus and by him placed in the basin of the fountain which forms the center ornament of the Aviary.

When feed time came Gannet would not eat, but the keeper thinking it was because the bird was tired after its journey, or that it was a stranger, gave it no further thought for that day. But the next day it was the same thing—in vain did he try his choicest fish upon him—then a piece of his freshest meat—all in vain, Gannet was not to be tempted. Keeper now began to fear for his bird, and wondering what was its particular tap, he wended his way to the sea-lion pond to consult with keeper Sheppard as to what he should do.

"Try some of my nice fish," said sea-lion keeper, and armed with a blue fish, a gar, and two or three white perch, back to the Aviary went its keeper, and one after another he laid them before his fasting bird. All in vain! That wonderfully abstemious or terribly obstinate biped, statue-like, stood on the rim of his fountain, refusing even to look at a single fish.

"I have some 'high meat,'" said sea-lion keeper, when on the third day bird-keeper imparted to that worthy his troubles, and some of the "high meat" as an experiment was carried away and placed before Gannet, but still in vain. Gannet was neither tempted, or offended, he would simply like Falstaff with honor, "have none on't."

Then said Pavonarius, "the bird must die."

"Yes," said sea-lion keeper, "the bird must die."

"Yes," said superintendent Brown when called in to the consultation round the fountain, "the bird must die."

"Never say die if the court knows itself," said the Gannet, out of the one eye it had placed upon the consultants, just as though it had heard every word of their consultation. Nor did Gannet die, though the fifth day had now passed since he had been declared off his feed.

The morning of the sixth day of Gannet's advent was the proper time for cleansing the fountain, drawing off the water and filling it afresh. Vessels had been provided for the reception of the various kinds of fish which sported therein, and which now must have a temporary removal. On the fountain rim sat Gannet watching the proceedings as though he knew all about it, and what a row there would be directly. Divers fish were transferred to the basins, the water all drawn off, when keeper Pavonarius exclaimed "What's become of all my gold fish? A week ago I had more than two dozen of them here; all the other fish of various kinds I find, but not one of my beautiful goldies."

"I could tell you what became of them," said the eye of the Gannet as he sat there on the rim of the fountain, looking as innocent as a new-born lamb—and just then it dawned upon the mind of the bird-keeper, why the Gannet did not feed, and since that discovery there being no more gold fish, three fresh, blue mackerel per day is that bird's allowance, and his appetite is good to this day.

THE SQUIRREL AND THE BURGLAR.

A German story thus illustrates the fact that no creature is too small to be of use, sooner or later:

"An apothecary had a tame squirrel, which he used to keep in his own private room adjoining his shop. The little fellow was allowed plenty of liberty, for the door of his cage was frequently left open, and he used to climb up doors and windows and spring thence upon his master's hand.

As the winter came on, he was in the habit of building himself a nest of any tow he might find about, and used to choose for residence the pocket of his master's coat. When, in the evening, the coat was taken off and hung upon a nail, the little squirrel would climb up the door on which the nail stood, run down the coat, and take up his quarters in the pocket, carrying always in his mouth a good supply of tow, which he had prepared and rolled together beforehand, and with which he contrived to make in the pocket the cosiest night's lodging in the world.

"A housebreaker, watching his opportunity, selected an especially dark night for getting in through the window of the apothecary's little back room behind the shop. He knew that the apothecary kept no dog; he could easily guess where his coat would be likely to be hanging up. He soon found the pocket, and was just about to lighten it of purse, pocket-book and keys, when a misfortune totally unexpected befell him.

In rummaging for keys and purse, he had struck the squirrel, of whose strange habits with regard to his bed-room he had not been aware. Not liking to be thus suddenly disturbed, the little animal gave the thief so sharp a bite on his thumb that he could not forbear yelling with pain, and the master of the house, alarmed at the unusual sound, came into the room armed with the poker just as the thief was escaping through the window.

The watchman happening to be passing, the unwelcome guest was given into custody; and as the geese at Rome had saved the capital by their cackling, so the little squirrel had saved his master's property by lodging in his coat pocket.

MISSEL THRUSH versus SQUIRREL.

I was spectator—says Rev. R. Blight of England—of an encounter between the above pugilists.

Having found a missel-thrush's nest about the middle of March, I was anxious to find out when the young ones would be hatched. I therefore went daily to look at the nest. On Thursday morning a squirrel, feeling I suppose, a deeper interest than even I did, paid it a visit. He met, however, with a very different reception, for while I was permitted to climb up the tree so as to overlook the old bird in the nest without disturbing her, his kind attentions (whatever his intentions may have been) met with a most cruel and decided repulse. I was just in time to see the squirrel knocked, not only off his legs, but also off the branch on which the nest was built, down to the ground—a distance of ten feet. His bewildered look at such unladylike conduct was a study for an artist. The old bird did not allow him time to recover but alighted on his back and furiously pecked away at his poor head, so that I began to fear that I should have a dead squirrel to pick up.

What with the shrieking of the Missel-thrush in not very melodious tones, and that peculiar noise of the squirrel when irritated, and the scuffle among the dead leaves, there was a pretty hubbub. The squirrel after a few seconds managed to get away and ran up a tree. The bird flew at him again, and again compelled him to come to the ground. He then got into an angle in the roots of a tree, and sat on his hind legs, boxing away with his fore legs, in what, I suppose, is the "most approved" squirrel "style," reminding one forcibly of a certain Scottish hero of whom it is sung,

"His back against a rock he bore,
And firmly pinched his feet before."

But the missel-thrush had the best of it, for she flew down at him from above; and no one can be surprised that, with those wings flapping just in front of his eyes, and those terrible shrieks sounding in his ears, the squirrel at once decided that "discretion is the better part of valor," and made another bold effort to escape. He ran about twenty yards along the ground, and in that distance was three times pulled up to defend himself with his fists. At length he reached another tree, and by cork screwing round the trunk contrived to reach the upper branches. As the tree was one of an avenue there was a good course for him; and now began a veritable "race for life," for the missel-thrush darted with such violence at him that, had she struck him, he must have fallen at least thirty feet. The race continued for nearly three hundred yards, when the missel-thrush gave up the chase and returned to her nest, where she sat for some time muttering in a very significant manner, and adjusting her ruffled feathers. During all this time, until the race began, I was never more than two yards distant from the combatants, but neither appeared to notice me in the least degree. I saw nothing of the male bird the whole of the time. Had he joined in, I fear that Mr. Squirrel would not have got off as easily. It was a fair fight, and I have now an immense admiration for the "pluck" of the missel-thrush, while I have become more inclined than ever, should I be put on the grand jury, to find a true bill against the family of this squirrel, on the charge of feloniously entering dwelling house, with intent to murder.

GEORGE F. SEAVEY,

CAMBRIDGEPORT, MASS.,

Importer and Breeder of High Class Pigeons and Poultry, viz.:

Carriers, Smooth-head and Crested Fantails, Jacobins, Turbits, (winged, tailed and solid colors,) Indian Tumblers, Short-face Tumblers, and Berlin Button-heads, Silver and Golden Spangled Hamburgs, Sebright Bantams, and Pheasants.

I offer the following pairs Pigeons for sale at prices annexed, and can furnish single birds of many of the varieties.
Also a few choice Silver and Golden S. Hamburgs, at \$5 to \$10 each, or will sell my entire stock of Golden.

CARRIERS.

White,	\$10.00,	12.00 and 25.00	Red,	\$10.00 and 20.00
Black,	10.00 and 25.00	Yellow,	15.00 and 30.00	
Blue,	12.00 and 20.00	Dun,	10.00, 15.00 and 40.00	

SMOOTH-HEAD FANTAILS.

White,	\$4.00, 6.00, 8.00, 10.00 to 15.00	Red Cocks,	\$3.00 to 6.00
Black,	10.00 and 15.00	Yellow,	18.00, 20.00 and 30.00
Blue,	4.00, 7.00, 10.00 and 15.00	Dun,	10.00 and 18.00

TURBITS.

Silver Wing,	\$10.00	Dun Wing Hen,	\$4.00
Black "	7.00 and 10.00	Solid White,	10.00
Blue "	7.00 and 12.00	Solid Black,	10.00
Red "	6.00, 8.00 and 10.00	Black tail,	10.00
Yellow "	15.00	Silver tail,	8.00

BERLIN BUTTON-HEADS.

White Cocks,	\$5.00	Blue Cocks,	\$5.00
--------------	--------	-------------	--------

JACOBIANS.

White,	\$8.00, 10.00, 12.00 and 15.00	Red,	\$5.00, 7.00 and 10.00
Black,	4.00, 6.00, 8.00 and 12.00	Yellow,	12.00 and 15.00
Blue,	4.00, 8.00 and 15.00	Dun,	8.00

CRESTED FANTAILS.

White,	\$10.00 and 15.00	Blue Hen,	\$7.50
Black,	6.00, 12.00 and 18.00	Red Mottled Hen,	5.00

INSIDE TUMBLERS.

Black,	\$12.00	Red Splash,	\$8.00
Red,	12.00	Black Mottled,	8.00 and 18.00
White Splash,	8.00 and 10.00		

SHORT-FACE TUMBLERS.

Almond,	\$10.00 and 25.00	Kites,	\$7. and 10.00
Tortoise Shell,	5.00 and 8.00	Black,	4.0 and 8.00
Agates,	6.00 and 10.00	Mottled,	6.00

HOMING PIGEON.

EXCHANGES.

Advertisements under this head of 5 lines or 40 words, describing and offering "for exchange only," will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

["To Exchange for Cash," or "Greenbacks," "Wanted, a Purchaser," or "Wanted, an Offer," etc., cannot under any circumstance be admitted to the Exchange. Want column.

["Enclose stamp for reply" will not be allowed. Each and every advertisement must be written on a separate slip of paper, and on one side only.

["No Exchange will be inserted unless accompanied with 25 cents.

E. KRAUSE, Zanesville, Ohio, will exchange one pair of fine Maltese Kittens, one Gray Squirrel, one California Quail, young Angora Rabbits, out of imported stock, same Lop-eared Dove, for a good full-blooded Lop-eared Buck, or a young pair of Silver Gray, Patagonian, or Belgian Rabbits, or offers.

CHARLES W. HOITT, P. O. Box 425, Nashua, N. H., will give 1 pair Black Jacobins, 1 pair Splashed Tumblers, 1 Black Short-faced Tumbler Cock, and 1 Archerbel, for 1 pair Belgian Canaries (long breed), or 1 pair of Blue or Red Fans. Must be fine birds. Will give one pair of Trumpeters, (Cock yellow, Hen black,) for 1 pair of Blue or Red Fans.

JOHN R. GLENN, West Chester, Pa., wants to exchange 1 pair of Blue Pouters, and 1 pair of Gray Squirrels and Cage, for White Crested White Polish Chickens, or Brown Leghorns; also two Fan-tailed Hens for 1 Cock Bird.

JOHN E. SCHUM, 150 South Water St., Lancaster City, Pa., will exchange a fine Pointer Bitch, 1 year old, out of imported stock; also one Setter Pup Dog, 4 months old, both very fine built, and cannot find any prettier Bitches or Dogs than the above named; also some very nice Fancy Pigeons, for offers. Speak quick. All letters, &c., answered at once.

F. A. CLOCK, Bay Shore, L. I., will exchange 6 standard Brown Leghorn Pullets, for 6 standard Light Brahma Pullets, either Felch or Williams strain.

JOS. A. RATZER, 307 N. Eden, above John St., Baltimore, Md., will exchange one pair of Canaries, male and female, with Fancy Cage, male a good singer, for one pair of Pouters, White, or Red Pied. Must be large birds, and heavily bodied.

JNO. H. WAITE, Baldwinville, Mass., will exchange one Black Cochins Chick, price \$10 per trio, for Brown Leghorns, Dark Brahmas, or offers. Want nothing but good stock.

JOHN F. HOUSER, Tamaqua, Pa., will exchange 5 beautiful Grey Squirrels, with Fancy House, 1 pure White Female Squirrel, with French hood Cottage, wheel attached; 3 good Violins, 3 Parrot Cages; 1 Rabbit Hutch, 4 apartments; 15 pair of Ayshire Bantams, 1 trio P. Cochins, 3 pair Black English Carriers, and 2 pair White, extra birds; 7 pair White Calcutta Fans, 1 Red Helms, 3 pair Black Short faced Tumblers, 1 Pouter Cock, 1 Red-winged Turbit Hen, 1 pair Mottled Tumblers, 2 old style Family Clocks, stand about 8 or 9 feet high, first-class time-keepers; 1 show case, with four drawers, for Cigars or Tobacco, 1 Orn. Potatoes, Buffalo or Lap Rabbits, or offers, but no live stock.

JOHN THORRETT, Meriden, Conn., has for exchange one Setter Dog, young and partly broke; also one Setter Dog Pup, 4 months old; also 1 Brown Leghorn Cock, took second premium at Bristol last winter. Mine are good stock, and want the same.

J. H. HEKENANER, Williamsport, Pa., has for exchange one pair of Black Snells, one pair of Turbits, silver-wing Cock, with red bars on wing, Hen solid black wing; one solid White Barb Cock, for a trio of Silver Lace Bantams. My birds are all first-class; same expected. Postal cards accepted.

E. P. DATENHAM, West Milton, Pa., has for exchange 1 trio Buff Cochins, good; 1 trio S. S. Hamburgs; Chicks, 1 pair S. S. H.; Fowls, 3 P. Cochins Hens, 2 P. C. Pullets, 2 Cocks of P. C., 2 Leghorn Cockerels, 1 trio D. Brahmas, 1 Houdan Cockerel, for L. Brahmas, Brown Leghorn Pullets, Pekin Ducks, Fancy Pigeons, or offers.

THOS. S. WEIDENHAMER, Milton, Pa., has 1 pair Mottled Carriers, 2 pair White Fans, 1 pair B-d-head Tumblers, 1 pair Yellow Tumblers, 1 pair Mottled Tumblers, 2 pair Brown Tumblers, 1 pair Moorpans, 1 odd Quaker, 1 odd Fan, 1 pair Rabbits 1 Trained Dog, 1 Accordeon, 1 Violin, 1 Banjo, to exchange for offers.

CHAS. O. MEINALL, Box 256, Milton, Pa., will exchange 3 pair Pouters, 3 pair W. C. Fans, 1 pair Smooth-head Fans, 1 pair Mottled Fans, 1 odd M. Fan, 1 pair Yellow, 1 pair Black, 2 pair Shells, 1 pair, on Red and one Black Tumblers, 1 pair Brown Subians, 1 pair German High-flyers, 2 pair Carriers, 1 pair Dutchess, 1 pair Barbs, one black one red. (The above stock are mostly old mated birds, and No. 1 breeders and good birds, and nothing but the same wanted) in exchange for Brown and W. Leghorns, Game Fowls. Any one not having good stock need not answer this. The Game to be "Dead Game," and warranted to be such, or offers. Or will exchange for a Breech-loading Shot-gun, or Rifle, or all kinds of Hamburgs, Polish, or all kinds of Fancy Fowls.

J. B. JR., 719 Elliott St., Buffalo, N. Y., will exchange Yellow, Black, and White-crested Fancys, for Yellow, Black, and White Smooth-head Fans, Smooth head Red Fan Hen, Crested Red Fantail Cock. See wants.

J. B. JR., 719 Elliott St., Buffalo, N. Y., has to exchange 4 Red-Pied Pouter Cocks, 1 pair White Pouters, 1 Blue, 1 Black Pied Cocks, and 1 Mealy Pouter Cock, for Pouter Hens, or Blue Fantail Hens, Red, Black, and White Barbs, for Seawallows. See wants.

A. HOMER, Lawrence, Mass., will exchange a trio Buff Cochins, and White Leghorn Cockerels, for Plymouth Rocks, Black Cochins Cockerels, or G. S. Bantam Pullets. Must be good.

ABM. V. N. DEFOREST, Metuchen N. J., has for exchange a large Male Goat (castrated), two years old, perfectly broken to harness, very gentle; value of Goat and Harness, \$10.00. This is a rare offer. Brown Leghorns preferred.

G. A. STOCKWELL, Worcester, Mass., will exchange White Turkey Cock, pair Black Bantams, Pitman's Photography, Whittier's Poems, Geo. Eliot's Works, Vanity Fair, by Thackeray, Eugene Aram, and Last Days of Pompeii, by Bulwer, Lie of Gen. Scott, Gates Ajar, and Haged In, by Phelps, Old Town Funks, by Stowe, Zuppers Philosophy, (indispensable), for Poultry and Pigeon Books, Birds, Pigeons, Cooops, Cages, Lumber, Grain, Rouen Drake, Mastiff Dog Pup, pure bred laying Pullets, or offers.

W. F. MUCHMORE, Basking Ridge, N. J., will exchange a new Sewing Machine, price \$275, warranted for Brown Leghorns, Partridge Cochins, Light or Dark Brahmas, and \$75 in cash. Make some off-r.

POST OFFICE BOX 248, Racine, Wis., will exchange a new Sewing Machine, "Independent," cost \$60, for Breech-loading Shot Gun, or offers.

F. A. PENNINGTON, Delaware City, Del., will exchange G. S. Hamburgs, No. 1 birds: 1 Flute, cost \$10; 1 Walnut Mocking Bird Cage, cost \$12, for White Barbs, Red or Blue Fans. Must be No. 1 birds.

S. NEWTON, Oakdale, Allegheny Co., Pa., will exchange a few Paintings and Engravings, without Frames, Small's Manual Homeopathic Practice, and How to Make the Farm Pay, for Greenhouse Plants, Roots or Seeds. Send list of Plants.

JOHN HOGAN, Newton, N. J., will exchange a pair of Dorkings or Games, for a large PlymOUTH Rock Cock, a pair of Rouen Ducks, Cooper's Game Fowls, or offers in Game Bantams.

E. F. ERLAND, Plymouth, Mass., will exchange first-class Pekin and White Cull Ducks, for German Canaries, good singers, and Wild Geese, first-class.

E. M. PEASE, 35 Grand St., Hartford, Conn., wishes to exchange a set of Key Check Dies, Letters and Figures, (steel); also good assortment of German Silver Key Chains and kingly, for Leghorns, or a Fleet-wood Scroll Saw.

ABM. V. N. DEFOREST, Metuchen, N. J., will exchange an Adams Cottage Printing Press, 9x13, warranted to be in perfect order, for Brown Leghorns, or offers.

ORLANDO SEELY, Box 129, Ithaca, Tompkins Co., N. Y., will exchange Silver Spangled Ham-burgs, B. B. R. Game Bantams, and White Fantail and Flying Antwerp, bred from imported stock, for small Printing Press, or offers.

THE WOODBERRY NEWS, published at Woodbury, Md., will exchange Advertising, for Chickens, Ducks, Geese, &c., of fancy breeds, or for the Eggs of either.

F. FRIES, Sherrills Mount, Iowa, will exchange first premium and pedigree Essex Pigs, for other breed, or good Newfoundland and Shetland Pup; also D. and L. Brahmas, premium birds, for Eggs. Will warrant all my stock to give satisfaction. Answer quick.

WANTED.

Advertisements under this head of 5 lines or 40 words, describing what is wanted, will be allowed at twenty-five cents for each and every insertion. For every line extra 10 cents will be charged.

ROWLEY & MORGAN, 16 Genesee St., Utica, N. Y., want Fans, Black, Yellow, and Mottled. Speak quick.

A. A. WYLLIE, Bowmanville, Ont., wants purchasers for Pigeons, either for single birds, or by the lot: wants also a White Fantail Hen. State price.

MINNIE DACHSHUND, Box 92, Basking Ridge, N. J., wants the address of a pure bred or imported German Darchshund Dog.

J. B. JR., 719 Elliott St., Buffalo, N. Y., wants Pouter Hens, Smooth-head Blue Fan-tail Hen, Crested Blue Fantail Hen, Smooth-head Red Fantail Hen, Crested Red Fantail Cock, Blue Barless Swallows, Red and Yellow Swallow Hens, Blue Bar Hen, pair of good Black Swallows.

GEO. IRWIN, Mayville, Chautauque County, N. Y., wants a pair of pure bred White Turkeys, Give price, and pedigree, as far as known. None but pure bred wild wanted.

FANCIERS' JOURNAL

AN ILLUSTRATED WEEKLY PAPER,

DEVOTED TO

THE FEATHERED WORLD, THE STUDENT OF NATURE, AND THE INTERESTS AT HOME.

"NOT FOR ITSELF—BUT FOR ALL."

ESTABLISHED 1873.

JOSEPH M. WADE, Editor and Proprietor.

Twelve months, . \$2.50. Six months, . \$1.25. Three months, or less, per copy, 5 cents. Single copies, 6 cents.

POSTAGE PREPAID.

NOTICE.—Anonymous communications not noticed. Rejected communications not returned. Manuscript not preserved.

VOL. III.

HARTFORD, DECEMBER 25, 1876.

No. 50

EDITORIAL

OUR CLOSING NUMBER.

The present number will close the year, complete the third volume of the FANCIERS' JOURNAL, and its present issue as a weekly.

The letters that have come to us from all quarters give us the assurance that our efforts have been appreciated, and we feel the proof conclusive when we note the fact of the greater part of our patrons already renewing their subscriptions for 1877, and their promises of unsparing efforts to add to our list. And too, very many new subscribers have also come to us. Altogether the future looks bright, and we are hopeful that with another year we may take up the weekly issue, and by having our paper self-sustaining, be able to add from our private resources the best talent, both of pen and pencil to be found in either England or America. Of those who have delayed their renewal for 1877, we respectfully ask their continued patronage, promising if the past has been good, the future shall be better; as we shall improve upon our successes, and profit by our mistakes.

Remember, our JOURNAL is the *fancier's* journal; protective of the fancier's interests, and promotive of the fancier's good. Devoted to no ring, influenced by no clique, each fancier is but serving his own cause in building it up. Not only do we ask for your aid as subscribers, but, as practice is twice better than theory, we ask your contributions to its pages. We ask for your comments, your criticisms, your experiences, experiments, successes and failures, that the new comers may learn from you. Consider the JOURNAL as belonging to the each one of you. Consider its usefulness, its standing, as conducive to your success as fanciers; for as its sphere is enlarged, so also will the measure of the good it may afford be added to.

For our little paper, "The Exchange and Mart"—our effort to furnish a weekly advertising medium for the poultryman—we also ask your attention, your patronage. At all events give it a trial. Advertise in it if but once. See what a circulation of 5,000 will bring to you. If you are willing to circulate it in your neighborhood, among your friends, send to us for copies, and they will be forwarded to you at once, free of charge. The "Exchange and Mart" will be issued the 1st, 8th, and 24th of each month; the monthly being sent out upon the 15th. We hope thereby to bridge the gulf made by the monthlies whose publication day is the 1st, and by so doing afford satisfaction to those for whom we labor.

Subscribers not receiving the FANCIERS' JOURNAL, or the "Exchange and Mart," will please notify us immediately.

BUFFALO INTERNATIONAL POULTRY ASSOCIATION.

Mr. Geo. W. White, secretary of B. I. P. A., writes us:—

"We expect to have the grandest show we have ever had, and shall not be cramped for room as we generally have been."

We expected as much. The Buffalo fanciers do nothing by halves.

CONTENTS OF VOL. 3.

Those who receiving the FANCIERS' JOURNAL for the first time, would know the material used in the make-up of a year, may do so by looking over the index sent out with the present number. Back numbers can be supplied—bound or unbound. Vols. 1, 2 and 3—desirable additions to any library—we will supply bound in cloth, at \$3.75 each. Covers also furnished at 65 cents each. Sent by mail prepaid.

ACCEPTED MANUSCRIPT.

Acclimation and Domestication, (V. M. F.); Domestication of Quail, (B. White); "How will it wash," (Guy S. Cutus); A Rainy Day at the Zoo, (Huon); Jeannie Englehardt, (Huon); Crumbs of Knowledge, (Ad. sum); Our American Standard, (E. S.); Notes, (Pacific); Madeira Vine, (E. H.); The Mistletoe vs. Pacific, (E. H.).

Those desiring to advertise in the "Exchange and Mart" will please send their advertisements at once. We would call attention to the column of "sales," also added to the JOURNAL's columns, where articles of a single kind may be offered for sale at 25 cents each insertion.

CARDS, CATALOGUES, ETC., RECEIVED.

Card of Ozro C. Barrows, prop. of Bristol Poultry Yards, Bristol, R. I.

Centennial Card of C. B. Elben, breeder of Blk. African Bantams, Pittsburgh, Pa.

E. A. Lyman, Keene, N. H., White Crested Polish a specialty.

H. B. Batterson, Prop. of Sunnyside Poultry Yard, Elmira, N. Y.

GENESEE POULTRY ASSOCIATION.

Premium list received, for the second annual exhibition of the Genesee Poultry Association, to be held at Batavia, N. Y., commencing Jan., 10th, and continuing until the 18th.

Entries close Wednesday, Jan. 10th.

HENRY TODD, Sec'y.

NEW SOCIETY.

The fanciers of Orleans Co. have organized an association, and propose holding an exhibition at Albion, commencing Jan. 22d, and continuing 5 days.

CORRESPONDENCE.

DEAR SIR:

I am disappointed that you are to make the *Journal* a monthly. I will pay \$5 a year for it as a weekly. Enclosed find \$3, one copy to be sent to my own address, as heretofore; the other to be sent to ——— Yours, &c.,

BINGHAMTON, N. Y.,

B. F. BEARDSLEY.

DEAR SIR:

"If our exertions at the last poultry show were of any benefit to the *Journal*, our services will be at your disposal at the next exhibition. Please answer, but do not give up the ship. The wind has been contrary to us all this year, but surely will change after new year." With best respects, yours,

G. DILLENBERGER & SON.

FRIEND WADE:—I am very sorry to hear you intend taking off our welcome visitor, the weekly, but hope you find in the monthly a source of pecuniary gratification.

Yours, &c.,

W. L. LUNDY.

NEW YORK, Dec. 15th, 1876.

FRIEND WADE:

With others I must express my regrets at the idea of having the *JOURNAL* changed to a monthly. In case there is encouragement enough to warrant a continuance of a weekly, I will guarantee to send you five subscriptions at \$2.50 each, and will remit the amount whenever notified of said continuance. Will not other subscribers and friends of the *JOURNAL* make efforts to furnish proper support?

Yours truly,

J. G. BICKNELL.

BUFFALO, Dec. 20, 1876.

When a fancier with the world-wide reputation of J. Y. Bicknell, acknowledges the need of a weekly, what must the necessity be for the dealer whose name is not known in scarcely his own street? There are two secrets in successful business of any kind; the first, let your stock be first-class; 2d, let the world know you own it and have it for sale, by the advertising of it.

MR. JOS. M. WADE:

MY DEAR SIR:—I see you intend to make a monthly of the *JOURNAL*. If not too late take my advice, and do not make a monthly, for the field is already occupied. We need a weekly. Keep it going as a weekly. Have only 4 pp. reading matter, and as much advertising as possible, for which you can add pages. If not too late, give the matter a thought. I am sorry you ever took it away from Philadelphia. REV. G. W. FREDERICK.

DEAR SIR:

"We will try to do all we can for you. We will miss it very much if we do not get one every week." E. R. KRAUZE.

DEAR SIR:—I am sorry that you are compelled to go back to a monthly. I would much sooner pay more, and have it a weekly. Whatever way you fix it, consider me a subscriber.

GREEN BANK FARM.

J. W. HARTMAN.

MR. WADE:—

DEAR SIR:—Having seen in the *Journal* that it is going to be a monthly instead of a weekly, I must say that I feel sorry for the change. I would rather give \$4 for your weekly, than do without it. I am getting 3 different journals at present, and prefer the weekly before all the others, but I will continue it as a monthly, hoping it will become a weekly before long.

Yours truly,

JOHN BROWN.

A NEW NATURALISTS' DIRECTORY.

The work will be arranged according to subjects, will contain a list of all naturalists in North America, their special department of study, and remarks in regard to specimens they may have for exchange, or wish in return.

In addition to this we shall endeavor to give, after each subject a list of the standard literature devoted to that department of science. The work will be issued late in the fall, so that names can be inserted, and duplicate specimens collected the present season for exchanges next winter. Blank pages will be inserted for notes and memoranda.

Names should be sent in at once. Give (plainly written) name, town or city, county, state, department of science which you are interested in, and any necessary remarks about your duplicates, and specimens wanted in exchange. Names inserted free.

Mention whether you wish to become a subscriber to the work, and if you wish more than one copy, give the number, as the edition will be limited to the number subscribed for.

The price will not be over \$1.00 per copy. No money will be received until the book is ready to be sent out.

Our friends will aid us greatly by sending us the address of their Naturalist acquaintances with their own, at the earliest, date possible.

S. E. CASSINO, Salem, Mass.

MISSING NUMBERS.

DEAR SIR:

In December last (1875) I sent \$5.15, to Poultry Record for one year's subscription to each of the following poultry journals; American Poultry Journal and Record, World, Bulletin, Nation, Fanciers' Journal and Review. Not one of the journals have come regularly; one or more of each not having come at all. Of the Fanciers' Journal, I have not received numbers 3, 18, and 45, for 1876. Of the Review I have received but four numbers. Will you, please, send me those missing numbers of the Fanciers' Journal? If I contrive to live I will subscribe for a Poultry Journal for 1877, but I wish to subscribe for one of which I will receive all the numbers.

Think I sent you postal card week ago concerning the missing numbers.

J. D. THORLEY.

THE *JOURNAL* passing through so many hands before reaching our subscribers, we can only promise that the numbers shall be mailed regularly, and missing numbers replaced.

FROM AN OLD FRIEND.

FRIEND WADE:

Can you give me the address of any pigeon fancier in San Francisco? I don't know of one, but if you do and will send me their address you will greatly oblige. Yours truly,

SAN FRANCISCO.

H. F. WHITMAN.

Mr. J. H. Ringot, Cor. Scott and California streets, will doubtless welcome you to his loft, and introduce you to brother fanciers.

WHITE CARRIERS.

DEAR SIR;

Please answer through the columns of the *JOURNAL*. Should White Carriers' legs be feathered? I bought a pair, and the legs are heavily feathered, with feathers two and three inches long.

Answer in first *JOURNAL* if possible, and oblige,

YOUNG FANCIER.

The birds you describe are evidently crossed with Dutchess or Feather-legged Runts. Carriers should be clean legged *always*.

DEAR SIR:

I notice that there are lots of complaints against the express companies. I sent a small printing press with type, &c., weighed ten pounds, to Williamsport, Pa., and when it arrived there they charged \$4.50, and I got it from New York for \$1.50; it is outrageous.

A. A. W.

ONTARIO.

POULTRY AND PIGEONS.

SEASONABLE HINTS.

If from your poultry you desire eggs, more of heat external and internal (the latter by heat producing stimulating food) must be given *now*, than during the spring and summer season. Remembering always that the production of eggs in winter is unnatural, and unnatural means must be afforded to gain this end. Remember, also, if your birds are rare, choice specimens, and the eggs are for table use, you may pay dear for them. How? Consider for a moment. Egg-producing naturally is confined to two seasons, the spring and summer; if by forcing, the two seasons are lengthened to three, almost four, must it not be at the expense of vitality? May not shortness of life be the result? Nature is a unit; you cannot add to one quarter but at the expense of another. To the farmer whose poultry profits are when eggs are high, we would say, feed well, give good stimulating food, give warmth and protection, and you will be rewarded. But to the fancier—whose profits in eggs for hatching, whose pride is gratified by the showroom award—don't force your birds. Do not crowd them either for work or for room. Give just sufficient warmth for perfect health. Remember that nature cares for her own. If your birds are in heated quarters the feathering will be light and thin. If in cooler it will be heavy and perfect. The eggs, if the laying be delayed until nature herself favors, will produce stronger and healthier chicks, and the percentage be greater than if the result of a forcing, cramming, artificial feeding and care. Let your care and effort be for *perfect condition*, and the result will be, if your stock is good, perfect plumage and but few clear eggs when the hatching season arrives.

If you have flooring in your chicken house and use sawdust under the roosts for cleanliness, don't use it upon the feeding place. If during winter your feeding place is in the same pen with the roosts, nail a strip across the floor say two inches high, separating the parts, thus keeping the sawdust to its duty. Upon the feeding place throw sand or soil of any kind. Sawdust is injurious to fowls, it is an indigestible substance the gizzard can not act upon, and not only does it make the birds uncomfortable, but by causing unnatural thirst, very soon affects the birds' general condition. The gravel the birds will find and take from the sand or loam will prove beneficial to their health. In weather when the birds are confined indoors, cover the feed lightly with hay, straw or autumn leaves, as a promotive of health in affording exercise.

(For Fanciers' Journal.)

THE STANDARD AGAIN.

In discussing the merits and demerits of the *Standard of Excellence*, we should not make it accountable for the sins of Agricultural and Poultry Societies, as is often the case. An Agricultural society holds a fair, and has a Poultry class amongst its other attractions, and in its announcement it tells us that the Judges will be governed in their awards by the *American Standard of Excellence*. But when the Judges call on the executive committee for

instructions, they are told that as the different varieties are but poorly represented, and there are not more coops than premiums, they had better just give the best coop the first premium, and the next best the second premium, if indeed there are two coops—and that will be all that is required of them, as it is expected of the society to encourage all branches of agriculture, and it will not do to disqualify Squire So-and-so's birds, as it would do more harm to the society than the payment of the \$2 premium. So Mr. Judge finds he has to award premiums to *all* birds without regard to even the disqualifying features of the cases that may come up.

He is called upon to award a first premium to a cock mated with a pullet, or a cockerel mated with a hen. I know whereof I speak, as I have awarded premiums in such cases, and yet those to whom the premiums were awarded advertised their stock as first-premium stock, and were backed up by the advertised regulations of the Society that the stock was judged by the *Standard*.

And this kind of business is not done alone by Agricultural Societies, but also by regularly organized Poultry Societies who think more of the good will of some "Squire," or "Deacon" or "Judge," than they do of the reputation of the Judge who awards their premiums for them, or the character of the poultry business in general. And when a fancier who sees these first premium birds asks who the judge was, he is told that they were judged by the *Standard*, and they are consequently standard birds, and as such, he advertises them, and sells their progeny in eggs or chicks on an equal footing—when the real facts are unknown—with those who have spent years of time, experience and money. If that fancier who makes the inquiry and the judge are strangers, you can imagine the opinion he will form of such judgment, and he will forever be the enemy of a man who knew what he was doing, and yet did not use his *own* judgment, but only followed the instructions of the Executive Committee, or Superintendents of the Association. In this way discredit is thrown on the *Standard* when it is not to blame, and enemies are made for against whom it has no defense. Now how much better is the course being pursued by many of our societies this winter. Many of them are advertising the *number of points* required for a first, second, and third premium, thus guaranteeing the proper use of the *Standard* in deciding upon the merits of the stock it awards its premiums to. Were this course pursued by all Societies fewer mistakes would be made and the *Standard* would have many friends where it now has enemies. In this way justice is done to the *Standard*, to the exhibitor, and to the public, and until this is done by *all* societies, we will not be able to judge of the value of the *Standard*, nor of the value of a premium won. This is just what the *Standard* is for; to make values in fowls equal, and not to be made a screen behind which ignorance or knavery may hide itself. Yet when was there ever a law framed, no matter how wise and far-seeing its authors, but that knavery could find a hole in it in which to hide its evil doings. But these exceptions are not rules, nor are they good arguments against the *Standard*. For by the old method of judging by comparison, how many more ways have not these same rogues of hiding their deeds of darkness.

All a comparison judge has to do if he is criticised is to say in his opinion such is a better bird than the other because he chooses to think so. But if the *Standard* is used, and he marks down his score, and tacks it on to the coop for the criticism and inspection of the public, he will be very careful not to judge the man instead of the fowl, but will make his *marks* so as to be able to defend them. If, as the enemies of the *Standard* claim, all judges do not award alike by the *Standard*, how much nearer do they suppose judges will award by comparison, where a man can favor heavy leg feathering, long or short legs, blue or white under color, &c., just as his peculiar fancy may dictate. I have seen a bird awarded first premium in a class where by the *Standard*—or even a com-

mon sense or justice—would have given another bird *fifteen points* higher merit. And yet this judge could, and did say in his opinion the other was the best. And I may add just here, that I can—and so can you reader—name others who have done, and seen the same thing. But were the awards made by the *Standard*, could this thing occur? Certainly not, for in that case he would have been compelled to show where he found the superior merit—in other words, he could not have awarded the premium to his friend—he would have been obliged to award it to the fowl.

Now these are some of the points to be discussed by those who want a new *Standard*—no *Standard*—or Wright's Poultry Book for a *Standard*, and in that discussion let all personal and pecuniary motives be discarded, and let sober, honest and impartial motives prompt all criticism. The A. P. A. acted with a great deal of prudence in its discussion and action on the question of amending the *Standard*, brought before them at Chicago last winter, and we—the friends of the *Standard*—shall expect the same of them this winter at Boston. We have been shaping our ends so as to breed in conformity to its teachings, and now we must not have any radical changes that will derange our plans and calculations for the future. Besides it is the bond of unity that binds together the fanciers of the whole country, and by destroying its usefulness or radically changing it, we break that union of thought and feeling, and we are sent adrift again without either compass or rudder to guide us. Let it alone, gentlemen, except perhaps in a few important matters of phraseology or a few omissions that may be supplied to make the sense more complete. But let the "Supplement" be small, and let it not materially interfere with our present work, or you will inaugurate a warfare that will end in the destruction of the harmony which should prevail among the poultry fanciers of America.

ELIPHALET STOWELL.

YOUNG FOWLS FOR BREEDING,

Are not, in my experience, as good for mating to produce the best stock, any more than are the young of any animals. And chicks from the same broods, dogs from the same litters, rabbits from the same clutch, or pigeons from the same pair, bred together, very rarely give us progeny uniformly as thrifty, as healthy, or as promising; as those of any species more distantly related. I offer this general reply to an inquirer who asks "what is the better age to begin to breed from?"

With poultry, briefly, I would advise that *one* of the sexes at least be in the second year of its age. A vigorous young yearling cock mated to a few two-year-old hens, or an active two-years' cock to a clutch of one-year-old pullets, is a far better plan than mating all young birds for breeding.

A two-year-old dog is always best to line a young slut with, and for clean breeding, if both these animals are past their second year in age, the pups from them will be found in every way finer, in closeness to parental good qualities, in size, in subsequent hardihood, and thriftiness.

We are all too prone to hurry up these matters in breeding, and if we come into possession of a fine trio of promising chickens, they are put together at eight to ten months old for breeding, in the expectation that the pullets' eggs will produce their like, from the beginning. This is a mistaken notion, altogether.

I am aware that dealers send out their young fowls in trios—often at round prices—to novices who entertain "great expectations," from the beautiful young birds they so receive. The stock may be all that it is represented to be, and when it shall have attained the proper age, chicks from such a trio will be very satisfactory, no doubt.

But if I am asked (as in this instance) what is the better age to begin to breed at, I refer for answer, to the first paragraph of

this article. Don't hurry your young stock, for reproduction; and whenever you can do so, use either the male or the female, for breeding, that is one season older than the others you mate them with.

G. P. B.

MIDDLESEX ASSOCIATION FAIR.

The third exhibition of the "Middlesex Poultry Association," was held at Huntington Hall, Lowell, Dec. 5, 6, and 7, 1876. There were over six hundred entries, and remarkably fine specimens in nearly every class.

The following are the awards:—

ASIATICS.—*Light Brahmas*.—1st and 2d, Damon & Marshall, Cohituate; 3d, Geo. V. Fletcher, Belmont; 4th, Laurin Martin, Lowell. *Chicks*, 1st, J. E. Wilmarth, Taunton; 2d, W. F. Bacon, Lexington; 3d and 4th, Geo. V. Fletcher.

Dark Brahmas.—1st, 2d, 3d and 4th, Charles E. Perry, Wolloston. *Chicks*, 1st and 2d, C. W. Chamberlain, Arlington; 3d, J. N. Willman, Fisherville, N. H.; 4th, C. E. L. Hayward, Peterboro, N. H.

Buff Cochins.—1st and 4th, S. A. Jones, Lowell; 1d, Josiah Grover, Lowell; 3d, John H. Nichols. *Chicks*, 2d and 3d, Josiah Grover.

Partridge Cochins.—2d, S. A. Jones.

Black Cochins.—1st, Starks Whiton, Hingham Center. *Chicks*, 1st C. L. Parker, Winchester; 2d, C. E. L. Hayward; 3d, C. C. Chase, Manchester, N. H.

Dorking.—Chicks, 1st and 2d, C. E. L. Hayward.

Golden Penciled Hamburgs.—1st, Wm. E. Shedd, Waltham. *Chicks*, 1st and 2d, W. E. Shedd; 3d and 4th, C. E. L. Hayward.

Black Hamburgs.—1st, W. E. Shedd, 2d, C. E. L. Hayward. *Chicks*, 1st and 2d, W. E. Shedd.

Golden Penedels.—1st and 3d, Luther P. Eaton, W. Peterboro, N. H.; 2d, C. E. L. Hayward; 4th, John Lowell, Jr., Chestnut Hill. *Chicks*, 1st and 2d, L. P. Eaton; 3d, John Lowell, Jr.

Silver Spangled Hamburgs.—Chicks, 1st, G. S. Wheeler, New Ipswich, N. H.

White Hamburgs.—Chicks, 3d, C. E. L. Hayward.

SEASIDE.—*Brown Leghorns*.—1st, Geo. A. Parker, Reading; 2d, Laurin Martin, Lowell. *Chicks*, 1st and 3d, L. Martin; 2d, Ed. G. Rannells, Hopkinton, N. H.; 4th, E. A. Hurd, Lowell.

White Leghorns.—1st, C. E. Sanger, Watertown; 2d, F. W. Worthen, Chelmsford Center; 3d, G. Blanchard, Wilton, N. H. *Chicks*, 1st, D. H. Hayward, N. Cambridge; 2d, C. E. Sanger, Watertown; 3d, F. W. Worthen; 4th, John H. Nichols, Lowell.

Dominique Leghorns.—1st, Andrew J. Tuck, Nashua, N. H. *Chicks*, 2d and 4th, A. J. Tuck; 1st and 3d, C. E. L. Hayward. *Black Leghorns*.—1st, D. H. Hayward. *Chicks*, 1st and 3d, D. H. Hayward; 2d, G. S. Wheeler; 4th, C. E. L. Hayward.

Black Spanish.—2d, C. E. L. Hayward.

Andalusians.—1st, C. E. L. Hayward. *Chicks*, 2d and 3d, J. E. Wilmarth.

FRENCH.—1st and 2d, E. C. Aldrich, Hyde Park; 3d, W. J. Merrill, Lowell. *Chicks*, 1st, 2d and 4th, E. C. Aldrich; 3d, G. Blanchard.

Creve Coeur.—Chicks, 1st, J. H. Nichols.

La Fleche.—Chicks, 1st, C. E. L. Hayward.

POLISH.—*Silver Spangled*.—1st, C. E. L. Hayward; 2d, Wm. H. Sylvester, Brockton; 3d, Starks Whiton; 4th, S. A. Jones. *Chicks*, 1st and 4th, C. E. L. Hayward; 2d, S. Whiton; 3d, W. H. Sylvester.

Golden Spangled.—1st and 2d, C. E. L. Hayward; 3d, W. J. Merrill. *Chicks*, 1st and 2d, C. E. L. Hayward.

White Crested Black.—1st and 2d, D. Frank Ellis, N. Cambridge. *Chicks*, 1st and 2d, D. Frank Ellis.

White Polish.—2d, C. E. L. Hayward.

B. B. R. Game.—1st and 2d, D. B. Wallace, Lynnfield; 3d, G. E. Stanley, Lowell. *Chicks*, 1st and 2d, D. B. Wallace.

Brown Red.—1st, Geo. Volans, Newton; 2d, D. B. Wallace; 3d, A. H. Trowbridge, Winchester. *Chicks*, 3d, D. B. Wallace.

Ginger Red.—1st, D. B. Wallace.

Earl of Derby.—1st and 3d, Geo. Stanley; 2d, D. B. Wallace; 3d, A. H. Trowbridge. *Chicks*, 2d and 4th, D. B. Wallace.

Yellow Duckwing.—1st and 2d, Charles S. Lincoln, Warren; 3d, A. H. Trowbridge; 4th, A. J. Tuck. *Chicks*, 1st and 2d, C. S. Lincoln; 3d, D. B. Wallace.

White Pile.—1st, D. B. Wallace.

Red Pile.—1st, J. H. Fisher, Weston; 2d, D. B. Wallace.

Gray Pile.—2d, D. B. Wallace.

English White.—1st, D. B. Wallace.
White.—1st, C. S. Lincoln.
Blue Pile.—1st, D. B. Wallace.
B. B. R. Game Bantams.—1st, W. Frank Bacon, Lexington;
 2d, C. M. White, Worcester. Chicks, 1st, 2d and 3d, C. E. L. Hayward.
Red Pile.—1st, C. E. L. Hayward; 2d, C. M. White. Chicks, 1st and 2d, C. M. White.
Yellow Duckwing.—1st, D. B. Wallace; 2d, D. Frank Ellis.
Bantam other than Game—Black Rose Comb.—1st, D. F. Ellis; 2d, C. E. L. Hayward; 3d, L. Martin. Chicks, 1st and 2d, D. Frank Ellis; C. E. L. Hayward.
Golden Splits.—2d, C. E. L. Hayward.
White Rose Comb.—1st, W. G. Garmon, Manchester, N. H.

MISCELLANEOUS.

Sultans.—1st, E. A. Emerson, Waltham.
Creepers.—2d, J. L. Noyes, Lowell.
Plymouth Rocks.—1st, V. C. Gilman. Chicks, 1st, G. S. Wheeler, New Ipswich, N. H.; 2d and 3d, V. C. Gilman; 4th, F. A. Loughton.
Runpless.—3d, C. E. L. Hayward.
Friszles.—2d, C. E. L. Hayward.
Dominiques.—1st and 4th, Geo. F. Andrews, Nashua; 2d, C. N. Paige, Nashua. Chicks, 1st and 3d, C. N. Paige; 2d, D. Frank Ellis.

TURKEYS.

Bronze.—1st, G. S. Wheeler; 2d, John N. Nichols.
White.—2d, C. E. L. Hayward.
Black.—1st, C. E. L. Hayward.
Buff.—2d, C. E. L. Hayward.
Pea Fowls.—1st and 2d, Jona. Bowers, Lowell.
Pearl Guinea.—1st and 2d, W. B. Felch, Lowell.
White Guinea.—1st, C. E. L. Hayward.

GESE.

Bremen.—1st, C. L. Parker.
Gray China.—1st, C. L. Parker.
Wild.—1st, C. L. Parker.
Toulouse.—1st, C. E. L. Hayward.
African.—1st, C. E. L. Hayward.
Gray China.—2d, C. E. L. Hayward.
White.—2d, C. E. L. Hayward.
Wild.—2d, C. E. L. Hayward.
Egyptian.—1st, C. E. L. Hayward.
White China.—1st, C. E. L. Hayward.

DUCKS.

Pekin.—1st, Laurin Martin; 2d, 3d and 4th, C. E. L. Hayward.
Rouen.—1st, C. L. Parker; 2d and 3d, C. E. L. Hayward.
Aylesbury.—1st, C. E. L. Hayward; 2d, C. L. Parker.
Cayuga.—1st, C. L. Parker; 2d and 3d, C. E. L. Hayward.
White Crested.—1st, C. L. Parker; 2d and 3d, C. E. L. Hayward.
Muscovy.—1st and 2d, C. H. Parker.
Gray Call.—1st, C. E. L. Hayward.
White Call.—1st, C. E. L. Hayward.
Black Labrador.—1st, C. E. L. Hayward.
Wood.—1st and 2d, C. E. L. Hayward.
Rabbits.—W. H. Brackett won 7 first premiums, Charles A. Andrews, West Foxford, 1st and 5 second premiums, Geo. S. Wheeler, 2 second premiums.

SPECIAL PREMIUMS:

Best collection Light Brahmas, Geo. V. Fletcher. Best pair Lt. Brahma fowls, Damon & Marshall. Best Lt. Brahma cock, Damon & Marshall. Best Lt. Brahma hen, Damon & Marshall. Best pair Lt. Brahma chicks, J. E. Wilmarth. Best Lt. Brahma cockerel, Damon & Marshall. Best Lt. Brahma pullet, C. E. L. Hayward.
 Best collection Dark Brahmas, C. E. Perry. Best pair Dark Brahma fowls, C. E. Perry. Best pair Dark Brahma chicks, C. W. Chamberlain. Best Dark Brahma cockerel, C. W. Chamberlain. Best Dark Brahma pullet, C. W. Chamberlain.
 Best collection pea-comb Partridge Cochins, C. E. L. Hayward.
 Best Collection Buff Cochins, S. A. Jones. Best pair Buff Cochins, S. A. Jones.
 Best collection Golden Spangled Hamburgs, Luther P. Eaton.
 Best collection Golden Penciled Hamburgs, Wm. E. Shedd.
 Best collection Black Hamburgs, Wm. E. Shedd.
 Best collection White Leghorns, W. E. Sanger, also for best pair fowls, best cock and hen. Best pair White Leghorn chicks, D. H. Hayward. Also best cockerel and pullet.
 Best pair Brown Leghorn fowls, George A. Parker. Best col-

lection Brown Leghorns, Laurin Martin. Also for best pair chicks, best cockerel and pullet.
 Best collection Andalusians, J. E. Wilmarth.
 Best collection Black Leghorns, D. H. Hayward.
 Best pair Creve Cœur chicks, J. H. Nichols.
 Best collection Houdans, E. C. Aldrich. Also for best pair chicks.
 Best collection White Crested Black Polish, D. Frank Ellis.
 Best collection Black Breasted Red Games, D. B. Wallace.
 Best collection Games, D. B. Wallace.
 Best collection Black Breasted Red Game Bantams, W. F. Bacon.
 Best collection Red Pile Game Bantams, C. M. White.
 Best pair Black B. Red Game Bantam chicks, C. E. L. Hayward.
 Best collection P. Rocks, V. C. Gilman. Best pair P. Rock chicks, Geo. S. Wheeler.
 Best pair Turkeys, Geo. S. Wheeler.
 Best collection Pea Fowls, Jona. Bowers.
 Best collection Geese, C. E. L. Hayward.
 Best collection Ducks, C. L. Parker.
 Best collection Rabbits, W. H. Brackett.
 Best Canary, singer, Mrs. W. A. Safford.

DOMINIQUE.

Having read the different articles, pro and con, which have lately appeared in the columns of the JOURNAL, written by Messrs. Raub, Bicknell, and Darlington, I feel constrained to add my testimony to that of Mr. Darlington's in favor of this truly valuable fowl. Like Mr. D., I always had a strong liking for them, they being the first breed with which I entered the exhibition arena. So far as my experience extends I have found them to breed as true to form, feather, comb, etc., as any other breed with which I am acquainted. In fact the Dominique marking will prevail over any other variety with which it is crossed. A number of years ago I made several experiments in crossing with divers breeds, using a Dominique cock. When crossed with Light Brahma hens, the progeny were marked similar to the Dominiques, the pullets being lighter in color than the Dominique hens, but larger, good layers and sitters, and excellent for the table. The cockerels were fine large birds and also showed the Dominique marking quite plainly. I regard the produce of this cross well worth the attention of the farmer or market poultry man. The progeny of the Dominique cock when crossed upon Dark Brahma hens are magnificent birds, the plumage of the cockerels being exceedingly brilliant and showy, while the pullets, though less showily attired, are quite beautiful both in form and feather. Had I the time and space at command, I think by experimenting with the Dominique and one or two other breeds, I could produce a variety which for brilliancy of plumage would be unexcelled by any other breed extant. In conclusion, permit me to say that I do not own any Dominique fowls, neither am I interested in the sale of any.

W. E. FLOWER.

SHOEMAKERTOWN, Pa., Dec. 12, 1876.

MEAT FOR FOWLS.

Meat is essential, says an English writer, to promote egg-laying in winter. As a rule it should be cooked, although it is more stimulating given raw. Horse flesh cannot be surpassed for excellence, when it can be obtained, and even when given in quantity it does not impart the slightest flavor to the eggs.

Nothing but gross prejudice and ignorance prevents the more general use of horse-flesh for this purpose, thousands of horses being annually destroyed and buried, the flesh of which should realize £3 or £4 at 2d. per lb. A mincing or sausage machine is the best mode of preparing the meat when cooked.

There will be a grand trade sale of Poultry, Pigeons, and Pet-Stock at Boston during the week of the Massachusetts Poultry Exhibition. Catalogues can be had on and after Jan. 1st, by addressing W. F. Bacon, Lexington, Mass.

HIS NEIGHBOR'S CHICKENS.

Fritz has had more trouble with his neighbor. This time he determined to appeal to the majesty of the law, and accordingly consulted a legal gentleman.

"How vos dose tings," he said, "ven a valure's got a garden und der oder valure's got some chickens eat um up. Don't got some law for dot?"

"Some one's chickens been destroying your garden?" asked the lawyer.

"Straw in mine garden! Nine, it vos vegetables."

"And the chickens committed deprecations on them?"

"Ish dot so?" asked Fritz in astonishment.

"And you want to sue him for damages?" continued the lawyer.

"Yass. Gott for tamages, und der gabbages, und der let-euges."

"Did you notify him to keep his chickens up?"

"Yaas, I did notify him."

"And what did he say?"

"He notify me to go to haal, und to vipe mine shin down off mine vest."

"And he refused to comply with your just demand?"

"He allowed his chickens to run at large?"

"Yaas. Some vos large und some vos leedle valars; but dey dos scratch mine garden more as der seven dimes reech."

"Well, you want to sue him?" said the lawyer.

"Yaas, I want to sue him to make vone blank fence up sixteen feet his house all around, vot der tam chickens don't got over."

The lawyer informed him he could not compel the man to build such a fence, and Fritz left in a rage exclaiming:

"Next summer time I raise chickens too, you bate. I raise fighting chickens, by tam! Vipe off your vest down."

JACQUES INCUBATOR.

MR. JOS. M. WADE:

DEAR SIR,—My JOURNAL came to hand as usual, with the exception of being one-day late. The first thing I saw was an inquiry relating to me. It was headed like this, "Information Wanted." I will say to E. E. H., and all other inquirers, that if they will read on page 275, Vol. 3, No. 23, issued June 19, 1875, of THE FANCIERS' JOURNAL, they will find out all that I agreed to tell. The reason that I did not use it again was, that I had so much work that I could not give it proper attention. It is as good as ever, and if I do not dispose of it, I will heat it up again by and by. I have had quite a number of letters relating to my exchange in your JOURNAL. It is a "Jacques Incubator," and nothing else, and made in good shape, and will hatch good healthy chicks. I sold all I hatched with it, and got my money for them.

JOHN H. BISHOP.

"A HEN PARTY."—We often hear of masquerades, euche parties, sociables, bees, but we never before heard of a "hen party." One of this novel persuasion was given at the residence of J. B. Walch, at Wilson's Crossing. Mr. Walch had, unfortunately, lost all his poultry the previous week, by carelessly leaving some brine where the hens inhabited too freely, causing their immediate decease. There being a general sympathy felt by the neighbors, they proposed to give them a surprise in the form of a hen party, each one carrying with them one of the feathered tribe, and depositing it without ceremony in the cosy sitting-room. The result was favorable, despite the rain-storm, occasioning an agreeable and complete surprise, and causing an exhilaration of spirits unequalled by less novel occasions.

If our readers have never attended one of this kind of parties we would advise you to avail yourselves of the first opportunity.

C. J. N.

A MIDSUMMER RAMBLE.

(Concluded from p. 585.)

At New York I arrived the next morning. My first call was on Mr. Van Opstal. He was enthusiastic on the "fly." I did not see his birds. Next I called on Mr. Colell, a fancier who has a most wonderful collection of choice pigeons. Here I saw Trumpeters, with which the late cut in the JOURNAL cannot compete; the rose so immense, that it was in appearance not unlike a Polish fowl. Black Priests with white wing bars, and a fine rose, also Yellows with rose. Some very fine "China owls" with large breast frill, spreading like the letter Y. Mr. Colell says, most of his best birds he gets direct from Princess Charles of Prussia. His love for the choicest birds is such that a fabulous price does not hinder him from becoming their possessor. Inviting me to dine with him, I met at the appointed time, and at his solicitation Mr. A. M. Halsted and Mr. Burlingame joined us. The quartette was a lively one, the dinner excellent, and while we polished chicken bones, we discussed in a fowl manner also; pigeons likewise came in for their share—while the sable waiter—who perhaps had never before seen, four such "birds of a feather"

Come and dine there together,

with open countenance, suspiciously looked at us, as if we were not altogether right. In the evening Mr. Halsted invited me out to *Rye* (don't mean to imbibed) the *village*, where he resides, where I spent an agreeable evening. In the morning went through the place. I had expected to find some Brown Leghorns that would excell any I had ever seen—and I *did*. Excellent in all points. Steering clear of a splendid Newfoundland dog, chained near the henry, I took a stroll through his fine grounds, and found Mr. H. had a taste for fine grapes, pears, flowers, &c. Certainly a most charming place, and poultry yards, finely situated: He is manufacturing here quite enthusiastically his new incubator, which has proved such a decided success. Next, in company with Mr. H. we reached the Centennial. Here we saw so much that, like Hans Schneider, we almost got "confoused." What can we say about this *show* to fanciers?

In the Japanese department, we saw a pair of Japanese Bantams, made entirely of cloth—standard in plumage colors, very stylish and natural.

From Manila, Philippine Islands, some wonderful specimens of embroidery, which gave relief of from three to four inches, representing baskets, and bunches of fish, barrels, birds, &c. Some Aubrusson tapestry, by hand, that contained 3,000 different shades. One of the finest being a vine and scroll work centre, surrounded by a deep border, on which was seen fruit, vegetables, game, guns and fixings, rabbits, ducks, turkeys, fowls and chicks, hen's nest, a peacock, pigeon, monkey, and fish, and tackle, all wonderfully correct and fine. In this class of work, there was in the French department also two productions worthy of notice. In size, they were about fourteen feet square. The entire work by hand. One represented "The Queen of the Harem, 15th century" and had seven life size figures. The other, "The Fortunate-teller," containing eight figures. In this department were also several others, equally as large, and some with as many as sixteen figures, but to our idea, not so artistic in coloring as those mentioned. The above named, at a little distance, were almost equal to an oil painting. The coloring and shading harmoniously blending in the most artistic manner. In the *extreme* right end of this the main building, (as you enter,) we found a case that interested us. It is, "Game Cocks after the fight," and shows two birds captured in the descent on "Mulholland's cock-pit" in New York, Feb. 19, 1874, by the officers of the Society of Prevention of Cruelty to Animals. Thirty-two men (?) were arrested, tried in Court of Special Sessions, and each fined \$6.70. Both birds show severe punishment, each wearing steel gags. Here are also named pig-

eons—from shooting matches; hard looking specimens of bulldogs after "action;" results of abusing horses, &c. In the Agricultural Hall were two taxidermy specimens of chester white hogs. One 21 months old, weight 1307, the other weighed 1253, both were raised by L. P. Cooper, Croyden, N. H. *Chester White*—he is some on hogs.

Of the numerous collections of birds, (taxidermy,) there were many cases deserving of more than a passing notice. One particularly noticeable, was a case of Hawaiian birds, studiously grouped among natural moss, the effect novel and pleasing. A fine aquatic collection is shown from the Orange free states. Prof. Baird, Washington, D. C., had a case of nicely mounted birds. And Mr. C. H. Howlett, Hudson, O., six cases of birds finely arranged and grouped in a very characteristic manner. P. Aldrich, Milton, Mass., a splendid glass shade containing a collection of very rare and choice birds, with astonishingly brilliant plumage.

In the women's department, Ellen Roblin's (Boston,) decorated china—gives evidence of a clever artist. A pencil sketch on stone, of a wild turkey, by Mary Peart, (London,) proves her to be a *peart* Mary in this line. There were other specimens of artistic and commendable productions, that brought out with naturalness flowers, chickens, squirrels, dogs, &c. Here though, the *strangest* attraction is *Dreaming Iolanthe*, an artistic *piece* (of butter,) sculptured. A lady with butter-paddles, sticks, knife, small camel's hair brushes, and *genius*, has represented (in butter) dreaming "Iolanthe." It is a bust in *butter*, and no one *but her* could bust butter in such an artistic manner. "Iolanthe" reclined in her pure Orange County colors—a pretty face—the profile quite classic. It was truly the *boss* attraction in this department. As I stood and gazed upon "Iolanthe," and saw lean, hungry looking individuals look upon her, with the eye of a gourmand, I thought, "yes there are some of you, looking at this artistic novelty, that would be sacrilegious enough to cut poor "Iolanthe's" nose off, while she is thus dreaming, and comely spread it on a slice of stale bread, and others would bark her cheek or remove one of her dainty ears, in the same spirit, to use in buttering their Centennial lunch." And thanks to the *panes* they showed they had for her, the *glass case preserves but her*. But would these amputations really occur, wouldn't the fair sculptress have a time getting a nose and ear to *match in color*, and how suggestive of approaching winter would poor "Iolanthe" look with a *white* butter nose and ear. We shiver in imagination, look around and discover the fire has *gone out*, and our article is getting lengthy, so we will for the present stop.

BROOKLAND VILLE, MD.

G. O. BROWN.

GAPES IN POULTRY.

In a recent conversation with an experienced chicken grower, he informed us that he had been very successful in conquering that precarious disease in his young fowls by the application of air-slaked lime. As soon as a manifestation of gapes in his fowls appears, he confines his chickens in a box, one at a time, sufficiently large to contain the bird, and places a coarse piece of cotton or linen cloth over the top. Upon this he places the pulverized lime, and taps the screen sufficiently to cause the lime to fall through. This lime dust the fowl inhales and causes it to sneeze, and in a short time the cause of the gapes is thrown out in the form of a slimy mass or masses of worms, which had accumulated in the windpipe and smaller air vessels. This remedy he considers superior to any he has ever tried, and he seldom fails to effect a perfect cure. He has aljured all those mechanical means by which it is attempted to dislodge the Entozoans with instruments made of whalebone, hog's bristles, or fine wire, alleging that people are quite as certain to push the gape worms further down the throat of the fowls as to draw them out.—*Lancaster Farmer*.

PRESIDENT'S PRIZE.

Next month the Western Pennsylvania Poultry Society will hold its Sixth annual exhibition. We were shown to-day the President's prize medal to be awarded at this exhibition, for the best pair of Light Brahma chicks. This medal is of solid silver, three inches in diameter, and weighing sixteen ounces—one pound. It is valued intrinsically at \$35, and will be exhibited at E. P. Roberts & Son's jewelry store. The obverse bears the engraving of a Brahma cock, and on the reverse is inscribed "West Penn. Poultry Society, Pittsburgh, awarded to ———." Besides this fine medal, the awards will comprise twenty or thirty silver cups, of an average value of \$15. These will be awarded for best dogs, pet stock, &c. Silver mounted dog-whips, collars, &c., also find a place among the awards as special premiums. The society will distribute some \$3,000 in premiums alone, six of these being for the "Asiatic" class of fowls. There is every indication that the next exhibition will be a very attractive and interesting one.—*Pittsburgh Chronicle*.

DEAR WADE:—

Sorry you feel compelled to "throw up the sponge," or the *weekly* issue of FANCIERS' JOURNAL. But I have been expecting this for some time.

The fact is, there are not *enough* poultry men in this country, of the class who feel that they can afford a weekly poultry paper these exceptionally hard times—and they are satisfied with a monthly, (or none, some of 'em!)

We shall miss the weekly visits of the F. J. nevertheless.

Put me down for next year, any way; and I will pay for both subscriptions.

I will send you some articles for it, by and by. You have given us a *good* paper, and we have enjoyed it, for three years. There is no reason why you should attempt to run it weekly at a loss. I want a bound volume (3d) to preserve. I will send you my numbers for this purpose, at close of year.

Yours always truly,

G. P. B.

P. S.:—My new "Diseases" book has had, and is still having a very good sale. Third edition is printed this week, and most of them are besoken. A fourth (revised) edition will be printed by Jan. 1st. It has gone in goodly numbers into *every* State and Territory in the Union, and considerably into Canada.

The next Treatise, companion vol: "*Secrets in Fowl-Breeding*," will be out by Jan. 7. I have got a splendid cartoon frontispiece for this.

B.

BLACK-ROT IN FOWLS.

The complaint obscurely known as "black-rot," from the blackening of the comb, is a blood disease which affects the whole system. The lungs are seriously affected; indeed it may be that the disease originates there, and the blood is poisoned from want of perfect aeration. This however is not certain. When fowls are overfed, especially upon highly nitrogenous feed, as milk curd, or buckwheat or oats, and are not kept clean, or supplied with plenty of pure water, they are frequently attacked by this complaint. To prevent it, fowls should have wheat, crushed bones, corn, and no buckwheat except in winter. They should have the whole milk in place of curd; the whey contains a very important part of the milk, viz., the salts, which are more necessary to health than the curd alone. To cure the complaint, give a few drops of castor oil frequently, with a few drops of sulphuric acid in the water, and boiled wheat.—*Selected*.

Shoes have lately been manufactured in Gloucester, Mass., from the skin of the cusk fish, a member of the cod family.

THE TAMAQUA COLUMBARIAN SHOW

Seven o'clock A. M., December 12th, 1876.—I departed from Doylestown in company with my physician; (I always take my doctor with me, might be taken with roup or cholera, you know.) After a pleasant ride of one hundred miles in a warm car, the conductor shouted "Tamaqua," and I stepped upon the platform to find Messrs. Shriner and Moore with hands extended to greet me. Tamaqua is not the loveliest city of the plain, for the simple reason that there is no plain there. "Hills to the right, hills to the left." I was informed by a gentlemen of Tamaqua that the dead were taken up an inclined plain at Mauch Chunk; I presume by steam power, and I expect the same thing is done at Tamaqua. I had hoped to see a funeral while I was there, but was disappointed. Now, then, what of the exhibition? It was held in the same building as last year; if you were to ask me the name of the hall, my opinion would be that you were endeavoring to impose upon good nature. Mauch Chunk and Tamaqua have some very singular names, and it will not do to trifle with them. The Columbarian part of the show was a grand success. Over one hundred pair of pigeons were on exhibition, while last year only fifty pair were shown. Some of the kinds were very good, and some very poor. F. H. Schwartz, of Robesonia, Pa., had a fine show of Pouters, Black Pied, Blue Pied, and Yellow Pied; his Red Pied will not pass muster. One of his Black Pied measured nineteen inches, only one-half inch less than the largest Pouter at the centennial show. Come, friend Schwartz, when I judge your birds next year, I want you to have that extra half-inch, and I know you will have it. Mr. Schwartz received several first premiums on his Pouters, and well deserved them. Messrs. McKoen and Hulick of Easton, Pa., had on exhibition a fine collection of Antwerps, Blue Owls, and Tarbits, and some of them were remarkably fine birds. Mr. C. S. Trexler of Allentown, Pa., made a fine show of White Fans, Magpies, Carriers, Duchess, and Barbs, some of them showing very fine points. He received the ten dollar special for best display of birds. Mr. O. D. Schock of Hamburg, Pa., had very good White Jacobins, Yellow Fans, and other birds. Mr. Houser of Tamaqua had good Tumblers. Taken all in all, the show of pigeons was a good one. Mr. E. T. Fry invited me to spend an evening at his house, and partake of the good things of life. I do not like good things, never did. Some persons however have been heartless enough to say that I do. However I accepted the invitation, was introduced to his beautiful wife and his accomplished daughter. When supper was announced, my physician said to me in a side whisper, "Now my dear Tennent, do try and eat something, if only a cracker." Well, when I looked over the table and saw so many good things, I thought, for once in my life, I will partake of all. I did it, and my dear friend, Mr. F. will never never know what a moderate eater I am at home. The evening hours were spent in pleasant conversation, with music, sweet music by my host's daughter. Methinks I hear it still. Ten o'clock came and I took my departure, hoping I may be permitted to meet them again in the sweet by and by. On Thursday afternoon I took my departure from Tamaqua. When I held out my hand to Graff, the tears came into his eyes; good natured, (sometimes) whole-souled Graff, may you live a thousand years. Shaking hands with Wheatley, Moore, Shoemaker, Fry, and Houser, the train in waiting I was off for Doylestown.

TENNENT.

PIGEON PREMIUMS AT MIDDLESEX FAIR.

Pouters.—Red Pied, 1st, W. H. Perkins, Watertown. Black Pied, 1st, R. H. Justice, Lawrence; 2d and 3d, W. H. Perkins. Blue Pied, 1st, W. H. Perkins. White, 1st, H. Ramsdell, Natick; 2d, C. E. L. Hayward; 3d, L. C. Hunt, Sudbury.

Carriers.—Black, 1st, R. H. Justice; 2d, C. E. L. Hayward.

Blue, 1st, L. C. Hunt. Yellow, 1st, R. H. Justice. Red, 1st, R. H. Justice; 2d, H. Ramsdell. White, 1st, H. Ramsdell; 2d, C. E. L. Hayward.

Fantails.—White Crested, 1st and 3d, Laurin Martin, Lowell; 2d, L. C. Hunt. White Smooth Head, 1st, W. F. Bacon, Lexington; 2d, C. E. L. Hayward; 3d, L. C. Hunt. Black, 1st and 2d, E. H. Moore, Melrose; 3d, W. F. Bacon; 4th, D. Frank Ellis. Red, 1st, E. H. Moore. Yellow, 1st and 2d, C. E. L. Hayward. Blue, 1st, W. F. Bacon; 2d, C. E. L. Hayward.

Tumblers.—Almond, 1st, C. E. L. Hayward; 2d, R. H. Justice. Beard, 1st, C. E. L. Hayward; 2d, R. H. Justice; 3d, H. Ramsdell, 4th, D. Frank Ellis. Mottled, 1st, John H. Nichols; 2d, H. Ramsdell. Kite, 1st, Laurin Martin.

Jacobins.—Black, 1st, R. H. Justice; 2d, C. E. L. Hayward; 3d, H. Ramsdell. White, 1st and 2d, H. Ramsdell; 3d, C. E. L. Hayward. Red, 1st, R. H. Justice; 2d, L. C. Hunt.

Tarbits.—Black, 1st, C. E. L. Hayward. Red, 1st, R. H. Justice.

Nuns.—Black, 1st, Laurin Martin; 2d, C. E. L. Hayward.

Owls.—White, 1st and 2d, D. Frank Ellis; 3d, C. E. L. Hayward. Blue, 1st and 3d, Michael Stanton, Lowell; 2d, D. Frank Ellis. Red, 1st and 2d, D. Frank Ellis. Magpies, Black, 1st, J. H. Nichols; 2d, W. F. Bacon; 3d, C. E. L. Hayward. Blue, 1st, W. F. Bacon.

Barbs.—Black, 1st and 2d, E. H. Moore; 3d, R. H. Justice. Yellow, 1st, E. H. Moore; 2d, R. H. Justice; 3d, Laurin Martin.

Scallops.—1st, W. F. Bacon; 2d and 3d, C. E. L. Hayward.

Ring Doves.—1st, R. H. Justice; 2d, C. E. L. Hayward.

Spots.—1st and 2d, Michael Stanton; 3d, C. E. L. Hayward.

Trumpeters.—1st and 2d, W. F. Bacon.

SPECIAL PREMIUMS.

Best collection Pouters, W. H. Perkins. Best collection Carriers, R. H. Justice. Best collection Fantails, C. E. L. Hayward. Best collection Jacobins, Henry Ramsdell. Best collection Owls, D. Frank Ellis.

HOMING ANTWERPS AS OCEAN MESSENGERS.

I have read a great many articles on the Antwerp Carrier Pigeon but do not call to mind one advocating the use of these birds as messengers on our ocean steamers. Several steamers are now from three to six days overdue, and it must cause a great deal of anxiety to persons having friends on board of any of them. This anxiety could be relieved and in many cases danger averted by each Steamship Company having a stud of trained birds, both in America and Europe, and when a vessel sails she should have several of these birds from both ports, that in case she is disabled when within from five hundred to eight hundred miles of land on either side, the agent of the line can be notified and relief sent. Let us hear from some of our Antwerp fanciers.

BARB.

MR. WADE:

I am much pleased with your JOURNAL, and will try and get some subscribers for it.

It is just the thing for me. I have made some good exchanges through it. I disposed of all my canaries, with one insertion. Through it I received some fancy pigeons that I had wanted to get. I exchanged with a Mr. Green, of West Chester, Pa. He sent me a nice lot of pigeons. Mr. Cox, of the same place, also sent me some very good Pouters.

When friends call and see my pigeons, and ask where I got them, I tell them through THE FANCIER'S JOURNAL. I have lent them one or two copies, and think I may get some subscribers.

T. H. HAYDEN.

THE THIRTEENTH ANNUAL EXHIBITION

Of the New England Poultry club will be held at the City Hall, Fitchburg, Mass., December 27, 28, and 29, 1876. \$1,500 offered in cash premiums, payable at the close of the exhibition. All premiums will be awarded before the exhibition is opened to the public.

JOSEPH MASON, Sec'y,
Princeton, Mass.

TOYS vs. HOMING ANTWERPS.

MR. EDITOR:

I noticed in the present number (49) of your JOURNAL, a communication from G. W. A., in which he rather disparages our Toy birds. I wonder if he ever undertook to breed a perfect "frill," "skull," "gullet," or "ruffle." I hardly think so. If he had he would know the time, patience, and care it takes to get one of these points. How anxiously we look for a good skull in an Owl or Turbit, aye, as anxiously as G. W. A. ever looked for a returning Antwerp. And we are as willing to take that same perfect head to our breast, as he is to take his 100-mile aerial bird to his.

Let him once endeavor to breed a perfect Carrier, Pouter, or Barb, and he will find more trouble in doing it than he will in getting a bird of his to "do" 200 miles. Every man is his choice. G. W. A. prefers, and therefore keeps, Antwerps, but do not, my friend, sneer at a "frill" or "ruffle," for be assured that the owner of the "frill" has worked as hard, and even harder, to procure that frill, than you have to cover 100 or 150 miles. And we with our "Toys," have as much pleasure in seeing the gradual improvement of our pets as G. W. A. in his.

Apart from the above, there are many (I among the number) who have but a short period of each day to devote to their friends, for they are friends indeed, and who have not the time to go to railroad stations to send their birds off, nor the money to pay for their training. Such as these have to content (?) themselves with "Toys," and we are contented, aye even happy. And with a hearty wish for the success of G. W. A's pets, and the hope that he will not look down too much on our Toys,

I remain yours in the fancy,

R. E. JOICE.

THE BALDHEAD AND BEARD PIGEONS

We have this week the pleasure of placing before our readers, the portraits of two of the prettiest and most interesting varieties of our Fancy Pigeons—the Short faced Bald and Beard Tumblers, two varieties which we have no hesitation in saying have not of late years received that attention and consideration to which their beauty and merit deservedly entitle them. We very much question if there is any fancy which possesses greater attractions and interest for the breeder than the one in question. A prettier sight we are certain it is impossible to gaze upon, than a first-class loft of these charming and sprightly little pets, when the plumage is rich and clean, and the colors of the several varieties evenly represented. In a great measure we suppose this apparent neglect must be attributed not so much to want of appreciation, as it is to the one characteristic which they in common with all their Short faced brethren more or less participate in.

In answer to the question often put, "If you admire the varieties so much, why do you not keep them?" the invariable answer nearly always comes, "Oh! because they require so much attention and are so difficult to breed good, even if you can breed them at all." Now, this difficulty of rearing the progeny of all the Short-faces, as we remarked with regard to the Almond is more imaginary than real. The impression seems somehow to have got abroad amongst the fancy of the present day, and serves to turn in another direction the inclination of many a fancier, and in nearly every instance without a trial. We have only emphatically to repeat that this impression is entirely unfounded, and that if the right system is pursued, the breeding of Short-faces is, so far as our experience goes (and it is not inconsiderable), a far easier and more pleasing task than the rearing of high-class young Carriers and Pouters. Yet how many are there who persevere in that direction! We will, however, say a little more on this point further on, and in the meantime turn to the primary object of these notes.

In setting forth the points of the two varieties in question, their similarity, with one exception, will render only one description necessary. As color is in our opinion the most important property, we will commence by remarking that the standards are

THE BEARD.

red, yellow, black, blue, and silver, the latter two possessing the black bar common to all their brethren of these colors. Richness and depth of color are essential features, and more particularly is this so in reference to the three first-mentioned. To obtain this with the correct marking will be found a task of no easy accomplishment. The eye should be white, or what is termed the "pearl eye," bright and full. In structure the birds should be as small as possible, compact, and short in the body, flights, and tail; the legs short, and the feet small and neat.

Regarding the shape of the head we have a word or two to say, merely by way of suggestion. As in all Tumblers, it should be as round as possible, with a short, fine, and straight beak. We must confess, however, that it is a matter of surprise to us that no ardent enterprising lover of the Bald and Beard has endeavored to place upon them the broad and lofty skull of the Almond; That it would enhance their beauty and value we think no one will deny. In this direction we think there is ample scope for improvement; but fanciers of late years do not seem to hold this opinion, very little, if anything, having been done by them to improve the varieties in this particular, or, perhaps, we might also add in any other. Small and beautiful enough in color and marking we do frequently see them, but in every other respect they are merely their longer and larger *confrères* repeated. The answer may, and no doubt will be made, that all this is very fine, and very much more easily talked about than done. But has it not been done with the Almond by our fathers? Why cannot we repeat it in the Short faced Bald and Beard. Surely we must not conclude that there are not as much ability and zeal in the fancy now as there was fifty or one hundred years ago. Veterans tell us so, but we will not believe it, nor that the birds of their youth far excelled anything of the present day.

And now as to the markings. The body should be self-colored; the first ten flight feathers in each wing, together with the rump, tail, belly, and thighs, of a pure white, as shown in the portraits. And here the similarity in the two varieties terminates and the distinctive characteristic steps in which gives to each its name. The head of the *Baldhead*, as far down as the ear and just under the lower jaw, should be white; the line of demarcation being

clearly and evenly defined, or, as it is termed by fanciers, they must be "clean cut." The head of the *Beard* is the same color as the body, but it should have a crescent-shaped band, or beard like marking, of white feathers on the throat immediately under the lower mandible, as will also be seen in the admirable sketch, which we think fanciers generally will agree with us equals, if not exceeds, any former production from the pencil of our able and esteemed Secretary, Mr. J. W. Ludlow.

We have now, we think, said all that is necessary to lead to a right judgment in reference to the varieties before us, but by way of conclusion we think a few remarks in reference to Short-faced breeding will neither be unacceptable nor out of place. As far as regards the Bald and Beard in particular, there is no doubt but they are much better nurses than the Almond and other Short-faces, as in many instances we have known to them rear their own progeny strong and well. They are not, however, to be depended upon even in the most favorable weather—it is, in fact, the exception and not the rule; so that if any thing like success is to be achieved a staff of nurses is an essential requirement, as, in fact, it is to every breeder of high-class birds.

For this purpose none are better than the flying or common Baldheads. We do not allude to the excessively long-faced birds, but to a medium between them and the Short-faces, known as "pleasant-faced" birds.

All that is necessary in reference to nests, hatching, shifting, &c., was fully explained in our article upon the Almond; it is, therefore, unnecessary to repeat it here. What we more particularly wish to say at present is upon a most important and neglected feature in connection with Pigeon-breeding, the providing of proper accommodation for the nurses or feeders. The common notion is that any out-of-the-way hole or corner is quite good enough for them. Their requirements are generally the last to be attended to either as regards cleanliness or food, whereas common sense ought to make it apparent that the very opposite treatment

should be given to them by feeding in any other way, and no food is more wholesome or more suitable for Short-faces than tares. In our own lofts on this principle the death of a young one is a rare occurrence, and then it is from no neglect of the nurses; on the contrary, many of them are constantly raising three and even four young ones, and always in the kindest possible manner. But for the pens such a loft should be provided w.h. They should be 2 feet in height and length, 18 inches deep. Half the front, as shown in the diagram, is closed with a board or blind, and the other half with a wicket or wire gate. Inside from the blind to the back is fixed a shelf 1 foot from the floor and the same width, on to which opens through the blind a small door for the egress and ingress of the birds, with a ledge for them to alight upon. On the shelf is placed the nest-pan, and as soon as the old birds are ready to lay again, it should be shifted with the young to the floor

beneath, and a clean one substituted.

The advantage of the above plan must be apparent at a glance. The young birds cannot disturb the old birds while sitting, it puts them entirely out of danger when they begin to leave the nest, causes them to learn to feed themselves early, so that when they are able to ascend to the shelf they are ready for removal to the general loft. These pens have, among many other advantages, those of being readily and thoroughly cleaned, they give the loft a neat and uniform appearance, and in every way add to the pleasure of the fancier in ways unnecessary to detail.

Notwithstanding that we have never seen these pens in use in any other loft, we wish to claim nothing original or novel in their production. It is possible that they may be in use in many breeding establishments; but for those who have not adopted them, and want to be successful Pigeon breeders, especially of Short-faces, we have only to say, "Try them and you will not be disappointed in the result."—*Journal of Horticulture.*

PIGEONS.

Concluded from Page 536.

In 1825, the Society of Amateurs at Antwerp sent ninety Carriers to Paris, to fly for a prize. They were started from the French capital at seven in the morning, and by noon of the same day, thirteen of them had reached home. The first arrived at half past eleven o'clock. One of the Flemish breed, turned off after the fight for the championship, at Warwick, by Harry Eng-land, of the Green Man Inn, Kent Road, performed the ninety-two miles in three hours and thirty minutes. Mr. Atwood made a bet of one hundred sovereigns, that he would fly six pigeons from the high ground near Croxtwick, in Norfolk, one hundred and fourteen miles, and that one should arrive at his loft, in the Sanctuary, St. George's Fields, within four hours and a half. The other part of the match was, fifty pounds, that the second bird would not be at home in five hours and a half, and a like sum that the third would not in seven hours. The event proved as follows:—the first bird was at the end of his flight in twelve minutes within the given time, and the second bird arrived within five hours; but the others were not heard of during the day.

In July, 1828, fifty-six Carriers, brought to London from *Liege*, were flown in the neighborhood of Aldersgate-street, at thirty-four minutes past four o'clock, A. M. One of them, called *Napoleon*, reached its destination, a distance of three hundred miles, at about twenty-four minutes past ten o'clock the same morning,

The Baldhead.

should be their lot. The warmest, driest, and most comfortable portion of the loft should be set apart for them; and if convenient they should be allowed full liberty in the open air, the benefit of which will soon be perceptible in the manner in which the important functions allotted to them are discharged. A hopper of vetches and a constant supply of pure fresh water should always be at their command. Our experience is, that by keeping them to one kind of grain they feed better and keep their young better

having thus accomplished its journey in five hours and fifty minutes, which is somewhat beyond the speed of the eagle, (a heavy bird,) and is stated to be about forty-five miles per hour. The other pigeons followed in succession, and most of them reached *Liege* at noon. This is a large city in *Westphalia*, long famous for the pigeon fancy. In July, 1829, another prize flight took place, with forty-two pigeons, between *Maestricht* and *London*. The first bird lost by a few minutes, though it traveled at the rate of forty-five miles per hour.

By what kind of natural qualification birds are able to explore their way across such immense distances of land and sea, seems to mock all human powers of inquiry; and granting the accuracy of ancient relations in respect to the regular and successful use of pigeons as messengers, it appears to be one of those ancient arts said to be buried in the grave of time, which has not hitherto encountered resurrection. The price of a pair of Carriers was about six guineas.

The Carrier Pigeon fancy has never since been so attractive and prevalent in this country, as it was fifty or sixty years ago. It revived, but in a comparatively inconsiderable degree, a few years since, but at present seems to have suffered a total eclipse. Men's minds have assumed a direction entirely opposite to that of sportive amusement; political reform, and redress of ancient grievances, are now the popular substitute for pigeon flying; in course, both the breed and price of Carriers are proportionally reduced. It is true, pigeon-shooting up the Thames, at Battersea, has yet its annual term, but pigeon-shooters, and pigeon-flyers, have generally been distinct classes.

The following imperfect account of pigeons used and sold from a Berkshire dove-cote, in 1807, is extracted from the Survey:—147 used in the house, at 5s. per dozen, 3*l.* 1*s.* 3*d.*—Sold 550 for 10*l.* 15*s.* 10½*d.*=13*l.* 17*s.* 1½*d.* The DUNG estimated at one-fourth of their return per annum.

NEW GUINEA pigeons are said, in some Lady's Voyage to India, nearly to equal the turkey in size, of a slate color, with a crest of pause feathers some inches high, in the form of a fan; the iris of the eye bright vermillion.

By my memoranda, in 1801, I observe that sixty-five pairs of old pigeons, and one hundred and forty squeakers of all sizes, regularly fed, consumed in one week, five pecks of the smallest beans, and ten quarts of seeds. The above old stock, without any young, consumed about half the quantity.

From the same. FAN-TAILS or SHAKEERS, the head always in motion, are a beautiful stock, and good breeders, but so stupid and silly, as scarcely to be capable of taking care of themselves, or finding their home. RUNTS, although so much larger, breed as fast and equally forward as Tumblers. The duration of life in the pigeon is said to extend to about twenty years, and it is deemed full-aged when the wings are full of the quill feathers.

According to 7 and 8 Geo. 4, c. 29, Sect. 33, persons unlawfully killing, wounding, or taking any house-dove or pigeon, under such circumstances as do not amount to larceny, at common law, shall forfeit over and above the value of the bird, any sum not exceeding forty shillings. Occupiers of lands may lawfully kill pigeons destroying corn.

At the Westminster Court of Requests, in February 1829, a decision was made against TRAPPING pigeons, the defendant being amerced in the price of the pigeons and costs. There is, however, a by-law among the fancy, that a *great* shall redeem a trapped pigeon. But suppose the stray should be a valuable bird, worth many pounds?

The following singular detection of a thief occurred on a late examination at Queen's Square, Westminster:—Mr Bepy, in the Wandsworth Road, had his pigeon-house robbed. A known thief was stopped on the road with six fancy pigeons in his possession, by Sergeant Reardon of the police, and taken before the magis-

trates, but no evidence appearing against him, he was discharged, and suffered to take away the birds, which he claimed as having purchased them. Cooper, an officer of the court, being somewhat up to the pigeon fancy, and seeing them above the common sort, purchased them, and very commendably determined to find out the real owner, which he effected in the following ingenious mode. Selecting a fine bald-head, he attached a note to its foot, with his address, and then threw up the pigeon, which instantly flew to its own home, and was recovered by its owner, who returned it to Cooper, making him a present of the half-dozen as a reward for his sagacity.

On conclusion of the subjects of the feathered race, I have a few notes to make relative to the VERMIN which infest the country, and are unavoidably so destructive to the eggs and young of game, and occasionally to those of domestic poultry. These are too well known to need much attention here, as to their names or description, viz., the stoat, polecat, weasel, martin, cat; together with most birds of prey, and reptiles, the snake, adder and viper; for in various examinations in former days, it appeared to me, that there is a specific difference between the two latter, particularly in size and length, and the colors of the belly. Such animals, however, it would seem, there necessarily must be, for though wolves, in old time, were finally and completely exterminated in this country, a similar end appears not to be attainable with respect to the minor breeds of depredators. Our only resource then, and it ought to be established as a general rule, is to reduce their numbers by constant unceasing periodical attacks; for if these, however immediately effective (to refer particularly to the rat) should be, as is too usually the case, subsequently neglected, a temporary advantage only is obtained, and a too numerous breeding stock left. Such was the sound advice given in a Pamphlet published many years since, intitled, "Mulum in Parvo, or every man his own Vermin Killer." The best means to the above ends, are keeping vermin curs and ferrets, and when poison is used, arsenic is to be preferred as certain without deception. A few grains of this are mixed with any article known to be attractive to the vermin, intended to be destroyed. From its known danger, poison ought to be the ultimate remedy employed. Trapping is a sort of retail method, to be managed by the initiated in that practice. The best vermin dogs, those also watch-dogs, the tongues of which when alarmed, nothing could still, were those I had during my former residence on Sudbury Green, Harrow on the Hill, and at that period, a very distant one indeed, there was an extensive breed of them in the vicinity.

The RAT must certainly be looked upon to be the heaviest and most expensive depredator, as subsisting on corn, particularly on wheat. Should a farmer catch two or three rats, and board them during a week or two upon wheat, taking account of the quantity consumed, with the probability that it would be much more were the rats at large, he might gain intelligence worth knowing, granting he made good use of it, and would thence take the advice given in the New Farmers' Calendar, to have a perpetual periodical rat hunt, the periods never being too distant. The following example of the Proprietors of the St. Catherine's Docks, London, is indeed a shining and a radical one. I learnt from a well-informed person, who is often in the vicinity, that some hundreds of cats are kept in the Docks, to destroy the rats, which previously to this mode of insurance, made havoc amongst the sugars there deposited, to a vast annual amount. The annual expense of this plan is £104. The cats' meat is bought by contract, and two men are allowed to attend and feed them. They are fed in the morning at six, and in the evening at nine o'clock. A Proprietor, it seems, some time since, took a fancy to one of the cats, a great beauty and famous vermin-killer, and would have it, much against the inclination of the attendants. It was accordingly trapped; and the gentleman himself undertaking the perilous

attempt to lay hold and release it, the cat flew at him most ferociously, inflicting very severe wounds on his face, and then escaped.

PLANT FOOD—MEAGRIMS IN PIGEONS.

J. M. WADE:—Am sorry you are obliged to change the *Journal* into a monthly, for I always note its appearance with interest, and from it I have received a number of useful hints in pigeon culture.

While writing, if I don't occupy too much of your time, I may speak of the successful employment of a *Journal* recommendation, viz.: making a water solution of pigeon dung for potted plants. We have used it on the most delicate plants, ferns, exotics, &c. Two or three applications twice or thrice a year works wonders. Every one said "it's too strong, you'll kill your flowers!" We didn't. The quality is $1\frac{1}{2}$ spadefuls of pure dry pigeon dung to a bucket of water.

In the *Journal*, I have noticed inquiries as to the cause of "meagrim" in pigeons. I think I, or rather my brother and self being both Doctors, have found the cause. In my box there were two cases; we made dissections, and found a tumor on the brain. We know that such a tumor would produce symptoms similar to "meagrim." Understand we don't feel sure for we have not investigated cases enough. If I obtain more opportunities, and find the same tumor, I will feel sure, and will let you know.

To help you keep up a weekly, here is a new subscription, to commence Jan 1, '77. CHELTON.

MATING.

I have two cock Fans that lost their mates, they seemed to sympathize with each other, and went together as a pair. At last they took a female to their box, and the three kept together. I took one male and put with another female, confined them for awhile, but as soon as let loose, the three would get together again.

If I take the female away they get another, and all seem to agree; but they will not agree to a second female coming into their house. I have been a long time trying to have each male take a female, but do not succeed. I have turned one out loose, to find him a mate outside of the loft, and have turned the pair, or one male and the female out, and put in a female or two for the other. But to no purpose, they try to get together, they coo to each other, and will not settle down to nest.

T. H. H.

THE FANTAIL.

clip from the *Journal of Horticulture* the following, having to the Fantail article we published in No. 47. After enumerating the many points good birds of this breed ought to possess, the printer leaves out one of the most important, that of size. As regards this, they cannot be too small; and I disagree with the writer as to their being hardy birds, as the finer the quality the more tender they are. As we are referred to the illustration, it is full of errors. The head is far too round, it ought to be long, and the neck about half the thickness at the part where the head is set on. As the body is in profile, and the tail more than three quarter view, it is twisted—a grave fault in a Fantail. Taking it altogether, I should consider the bird figured exceedingly coarse, and of but little value. The number of feathers in the tail of a high-bred small Fantail seldom exceeds thirty-two. The shaking of the neck is a point, and is indispensable. Why should Blacks, Blues and Silvers have pearl eyes, and Yellows and Reds be doubtful? What is right for one is right for the other, at least so says—PRIZETAKER.

FAMILIAR SCIENCE.

Contributions to this department respectfully solicited from all.

For the *Fanciers' Journal*.

THE WOOD ROBIN.

Turdus mustelinus, Gmelin.

BY THOMAS G. GENTRY.

This rather homely but attractive species, seldom revisits the scenes of past association until spring has spread her mantle of verdure over Nature's form, and gemmed it with many a star of Flora's making. Unlike its nearest congener, the plain and Quaker-breasted robin, it is a rather late comer; scarcely daring to venture from the sunny South until the season has re-asserted her full supremacy. In the latitude of Philadelphia, the last week of April or the beginning of May marks its coming; when from the tallest tree-tops, long before the first approaching beams of light announce the advent of old Sol in the East, are heard his mellifluous, gushing, tinkling notes. As night approaches, the same delicious music is again begun, and continued for more than an hour, with scarce an intermission. It is the males who are thus occupied; doubtless with the view of attracting their sweethearts, in their arrival from their far-off southern home; for it must be remembered that the latter succeed the former by several days. After mating is accomplished, their song measurably diminishes.

Notwithstanding much has been said concerning the shy and retired nature of this Thrush by leading ornithologists, instances are recorded in the work entitled the "Birds of North America," where considerable confidence has been shown in man, as evidenced by breeding operations having been performed in close proximity to his habitation. I have noticed, during several years past, that there is a greater predilection for such localities than for more sequestered situations. With the progression of time, a pre-eminently more social and trustful disposition will be acquired; the current of events tending in this direction. This statement should not be accepted, however, without certain qualifications. A relapse into our former condition of inhumanity towards the feathered creation, and the falling into desuetude of wise and salutary laws, may, and surely will, alter this happy condition of affairs, and drive from our midst these joyful songsters in which we so much delight. In thickly-wooded regions where the species has not had a foretaste of man's association, and the pleasures arising therefrom, there still prevails the old feeling of shyness and distrust.

Besides the occupancy of man's domains, the depths of dense forests, the outskirts of thickets, and the borders of waste fields, are famous places of resort. I have never known individuals to build in "low damp forests, shaded by large trees," as affirmed by Dr. Brewer.

The movements of the Wood Robin, while on the wing, are decidedly more graceful, but less sustained than those of the Robin. When foraging for food, much of its time is spent upon the ground, where it destroys immense numbers of beetles and orthopters; some of which are very destructive to the roots of our grasses and other plants, as well as to the tops of the same. As the season advances, its habits become more arboreal. Divers caterpillars and berries are now eaten with a *gusto*. But did it confine its attention to such diet, verily would it be pronounced an *unmixed good*. But, alas! like its near cousin before-mentioned, it visits our orchards with their delicate blooming, not more for the "cattiff wretches" that lurk in the cherry and apple blossoms, than for the succulent ovaries and tender stamens themselves. Not satisfied with the wanton destruction thus committed, as if to detract still further from its good reputation, it

pillers the juicy cherry, which it richly esteems; and even dares to intrude its presence into forbidden grounds, to pluck the melting and delicately-flavored strawberry. This is not to be wondered at. In its wild native haunts, it doubtless acquired a passion for this favored berry; and who can, with a particle of sympathy in his bosom, justly censure a creature so low in the scale of reason and intelligence, when measured by the human standard, for obeying the irresistible instincts of its being? The berries of the wild Rubus, Red Cedar, and common Juniper, are dainty viands. When pressed by hunger, the seeds of many of our commonest weeds and grasses are greedily eaten. Besides relieving man of many of his most inveterate dipterous tormentors—the blood-thirsty *stomoxys* of our stables, and in the sharpening and piping mosquito—hosts of sugar-loving ants, and vegetable-eating caterpillars, meet at its hands an untimely death. I might instance the destructive Canker-worms which commit such untold ravages upon the fruits of the apple, gooseberry, and other plants; the cabbage-loving leolins, and the smooth, naked, and loathsome spindle-worm. For the manifold good which it thus accomplishes, we should willingly draw a veil over its evil traits, and not begrudge a juicy berry when we have enough, and some to spare.

Having devoted considerable space to a few of the many articles which constitute the bill of fare of this Thrush, I now approach that part of our sketch which will have more of interest to persons of delicate nerves and refined tastes; for, bear in mind, the barest mention of a worm or caterpillar, is apt to cause a thrill of horror to pervade the frames of such beings.

After a brief but eventful courtship, the male succeeds in regaining and strengthening the plighted love of by-gone days. With the partner of his choice by his side, and his spirits all aglow with hope and joy, he leads the way to a neighboring copse, or, maybe, to a beautiful lawn surrounding the palatial residence of opulence, where the happy pair, with a due degree of diligence, endeavor to discover a suitable place wherein to build a home. The wished-for spot being at length found, after a brief consultation, they immediately set themselves to work. The nest, according to my experience, is generally placed upon a horizontal branch; but not infrequently, within the crotch of certain species of *Pinus*, at a height of less than ten feet above the ground; very rarely at an elevation of fifteen feet.

The typical nest is said to be composed of decayed leaves, closely aggregated while in a moist state, which on drying, cause the fabric to become very firm and compact; thus presenting a semblance to pasteboard that has been soaked, and thoroughly compressed and desiccated. A few dried sticks intermingle therewith, and seem to strengthen it. The interior is lined with fine roots and grasses. A layer of mud occasionally replaces the dried unspasted leaves.

Several careful analyses which I have made, satisfy me that the above description which is substantially that given by Dr. Brewer, in the work above referred to, needs some modification, at least so far as this latitude is concerned. My dissections clearly show that a normal structure is composed of a basal layer of leaves, chiefly of the oak and beech, rather loosely aggregated, and increasing very gradually in compactness towards the center; these leaves are secured in a partially hemispherical position by small twigs, which serve to strengthen the structure. Surmounting this, is a superstructure of decaying plant-stems, decayed bits of pine-wood, and a modicum of mud; the whole is carefully lined with small roots, most intricately adjusted.

The surroundings of this Thrush sometimes determine a marked deviation from the typical structure. In a nest before me, which was placed upon a horizontal branch of a species of pine that grew by the side of a carriage-drive, which was the scene of much daily travel, the internal, parchment-like arrange-

ment is wanting. The outside is built of the dried leaves of the oak and beech, the inner bark of trees, and largely of the leaves of grasses; fragments of paper constitute an occasional feature. Within is a dense lining of small roots and grasses.

In building, the birds labor with a perseverance and a will, until the nest reaches completion, which requires a period ranging from five to six days. The period of incubation, which occurs not later than the 12th of May, continues for thirteen days. The brunt of the task devolves exclusively upon the female, while the male, like a faithful and devoted husband, meanwhile attends to her appetitive wants.

The young are the objects of the deepest parental solicitude. Both parents vie with each other in untiring and unremitting attentions. Their food consists of earth-worms, diptera, and various coleopterous and lepidopterous larvæ, which are substituted for beetles and moths, when such articles are adapted to their age and condition. The cherry, strawberry, and the several wild blackberries, are esteemed dainty luxuries. To enumerate the various articles, both vegetal and animal, that contribute to their subsistence, would be highly irrelevant to our present purpose.

When the nest is assailed by human or other foes, the parents exert themselves to the utmost to infuse a feeling of fear into the assailants, by vigorous cries and menacing gestures.

This species is single-brooded. Nests with eggs have been taken by the writer as late as the 15th of July, which were doubtless the labors of birds whose early efforts had been frustrated. The eggs are usually four in number. In some instances, but three have been observed. They are of a deep blue color, with sufficient yellow to impart a greenish tinge, and have an average measurement of .99 by .75 of an inch.

Its melody is one of its most pleasing characteristics, and possesses remarkable power and sweetness. No lover of sweet sounds can fail to appreciate it, and having ascertained whence it emanates, can fail to recognize it when heard again. It consists of several parts; each succeeding strain being more pleasing than the preceding. The conclusion may be likened to the tinkling of a small bell. The following syllables will give my readers a pretty accurate idea of its syllabic language: *ki-ki-ke-wil-ah-tse, ke-wil-ah-tse, twitiki-ke-wil-ah-tse, ke-wil-ah-tse, ke-wil-ah-tse, tur kwilla.* The ordinary call-note is *twit-kü-kü* pronounced very quickly and sharply.

This species remains with us, often as late as the 15th of November, when the season is remarkably propitious; when it returns to Central America, the home of its winter diversions. Its departure seems to be regulated by the scarcity or abundance of appropriate food-stuffs. For some time before it bids an adieu to its northern home, the woods and vales around are made to ring with its mellow tinkling notes, during the morning and evening twilight.

(For *Fanciers' Journal*.)

FIRST EXPERIENCE IN SAILING.

Those who have experienced the pleasure of sailing in a skiff, under favorable circumstances well know what a delightful and exhilarating enjoyment it is. How pleasant to go bounding over the waves, before a stiff breeze, watching the spray dashing over the gunwale, and sparkling in the sunlight like a myriad of diamonds; while a gay party of young ladies and gentlemen lounge back in the stern seat, laughing and joking, and adding life and pleasure to the scene.

I had enjoyed such excursions several times, but I was not satisfied; I wanted to be more than an ordinary passenger; I wanted to be captain myself. I wanted to be alone, where I could steer my own little craft, and joyously sing "A life on the Ocean Wave," and imagine myself on the briny deep, and have no one

to laugh at me. An opportunity soon offered itself. One day a gentleman was landed on the wharf near our house, and wished to get to his home on the opposite side of the river. I ventured to suggest that I would take him over, if we could obtain a boat. This we soon did, and in the space of half an hour, he was safely landed on his own shore, a distance of nearly two miles, he taking charge of the craft on the way over. It did not exactly correspond with my "beau ideal" of a boat, as it was a flat bottomed, rickety-looking, leaky affair, and carried one leg of mutton sail, which was a great deal too large for it, making it decidedly top-heavy, while the center board hadn't the least inclination to stay where it was put, but would continually rise, and allow the boat to make considerable leeway. The tiller was exceedingly long so that I was compelled either to get up and step over it, or crawl under it to the opposite side, whenever I tacked (which, I may mention, was very often). And to crown all, it commenced to rain, just as I left the shore; a disagreeable drizzle. As soon as the sail became wet it stretched to such an extent, that I had to lift the boom over the stern board every time I "went about." I jammed my hat over my ears, and sit down in the stern, taking the tiller in one hand, and the sheet in the other, feeling just a little concerned, as to whether I should succeed in reaching the other shore or not. When I judged it necessary to tack, the first thing to be done was to step over, or crawl under, the tiller, then to lift the end of the boom over my head, by which operation (tried only once) it became detached from the mast, and swung about as though it was distracted, placing me in imminent danger of being upset at any moment. Leaving the tiller and sheet to themselves, I rushed forward and fastened the boom back to the stern again, when the center-board "riz," and once more leaving the tiller, caught my foot in the sheet, stumbled and fell flat into the dirty water which covered the bottom of the boat. Smelling considerably fishy when I arose, I fixed the center-board, and discovered that the boat had swung around head to the wind, and was sailing *backward*. I was wet through to the skin, sailing backwards down stream, and for the last two hours had been jumping around like a madman, endeavoring to reach the opposite shore. I didn't sing "A life on the Ocean Wave," I didn't think of singing it. I only thought of the legend of the "Flying Dutchman," and of my dinner. This was getting monotonous. I would have unstepped the mast and rowed over, but was afraid I would drop it and capsize the "ship," and if I attempted to row with that sail up, a flaw of wind would have done the business surely. I sat down and wondered if anybody else had ever been in such a "fix," and felt as mad and hungry as I did.

Suddenly some one called, "Hello!" Looking up, I discovered a skiff approaching me, in which were a couple of friends. "Hello, yourself!" "What are you doing?" "Nothing." "Ha! ha! Wait till I come over to you." Coming alongside, one of them jumped in, and after I had told him of my troubles, laughed, and giving me directions, soon brought the boat to land. Suffice to say that it was a long time before I heard the last of that boat ride.

H. A. S.

NATURALISTS' DIRECTORY.

Mr. S. E. Cassino of Salem, Mass., is preparing for the press a Directory of Naturalists, and will be pleased to receive the name and address of every Naturalist who may see this notice. Give name and address distinctly, and what special line of study you are interested in.

AN IMMENSE EEL, measuring four feet eight inches in length, fifteen inches in diameter, and weighing seventeen pounds, was caught on Wednesday of last week, on the "Moss" fishing ground, about two and a half miles south of Fisher's Island.

WATERING WINDOW-PLANTS.

There is nothing that seems to bother more those who would grow window-flowers, than how often to water them. It is an exceedingly simple thing to those who have had experience; though so mysterious a thing to those who have had none. When the skilled gardener is asked for advice he says, "water only when the plants need it;" but this tells the inquirer nothing. There still remains to be understood how to tell when plants need water.

After all, this is a species of knowledge that cannot be well taught by another. It has to be learned from experience. The good plant cultivator tells from the color of the earth; but even this is a relative term. There is dark soil and there is light soil; but all soils are darker when they are wet than when dry. One can soon learn this by experimenting a little; and can soon tell whether the earth is dry or wet by the eye or finger alone. If it is wet of course wants no more water; if much lighter than its usual color, the earth is dry and needs some. It is an exceedingly simple matter to those who will try to learn; to those who cannot learn themselves it is a hopeless task.

There is one hint that we may give that may be of value. If the earth never gets dry, the plants are not in good condition, something is wrong. It is the active, growing, working roots that take the moisture out of the earth. It is a sign of good health for the plant to want frequent watering. As we have already said the color of the soil, as compared to what it is when wet, will tell whether it wants water or not.—*German town Telegraph*.

BEESWAX.—The uses for wax are numerous and important. Its property of preserving tissues and preventing mold or mildew was well known to the ancients, who used cerecloth for embalming, and wax for encaustic painting, as in the wall pictures of Pompeii. Wax candles and tapers play an important part in the processions and ceremonies of the Roman Catholic Church. Wax is used by the manufacturers of glazed, ornamental and wall papers, and on paper collars and cuffs for polishing the surfaces. It is used in varnishes and paints and for the "stuffing" of wood which is to be polished, as for pianos, coach work, fine furniture, and parquette floors. Electrotypers and plasterers use wax in forming their moulds. Wax is an important ingredient in preparations for covering surfaces of polished iron and steel to prevent rust. Combined with tallow, it forms the coating for canvases and cordage to prevent mildew, as in sails, awning, &c. Artificial flowers consume much wax, and, despite the introduction of paraffine, ceresin, and mineral wax, its use appears to be extending. One of the oldest of its applications is in the laundry, and in polishing wood-work.

The product of wax in the United States is stated to be 20,000,000 pounds annually, and increasing—worth in money at least \$6,000,000. Of this about \$700,000 worth are exported, and about \$1,200,000 worth of honey also goes abroad. The total product of honey and wax is worth at present in the United States nearly \$15,000,000.

The ingenious production of artificial combs, in a machine recently constructed, that turns out combs with cells rivaling, if not excelling, the natural product, is an important American improvement in apian culture, which will add largely to the economy of that industry, yet in its infancy. As the bee is said to consume three-fourths of its time in producing comb at the very time when the honey harvest is at its best, it is evident that the invention of artificial combs must be a great economy in collection and storing of honey; but it is not so clear how the stock is kept up unless man deceives the bee by using "mineral wax" in the formation of the artificial comb; and this wax is not true wax, but a natural paraffine.—*American Grocer*.

SMALL PET DEPARTMENT

(For Fanciers' Journal.)

ARRIVALS AT THE ZOOLOGICAL GARDEN,

Philadelphia, for the week ending Dec. 13, 1876.

- 1 Snowy Owl (*Nyctea niscia*). Presented by W. C. Farnsworth, Philadelphia.
- 1 Virginia Deer (*Cervus virginianus*). Presented by W. F. Whitner, Philadelphia.
- 1 Red-tailed hawk (*Buteo borealis*). Presented by J. Richardson, Rutland, Vt.
- 4 Goldfinch mules. Presented by A. W. Stevenson, Phila.
- 1 Bald Eagle (*Haliaeetus leucocephalus*), and 1 Caracara vulture (*Polyborus brasiliensis*). Purchased.

ARTHUR E. BROWN, Gen'l Supt.

PETS, AND THE FATE OF SOME OF THEM.

BY HUON.

NO. 5. THE PET COATIMONDI (*Nasua nasica*.)

"Alas! our young affectionate run to waste, or water, but the desert" —
—Byron.

Once upon a time a jolly Jack tar, on a return voyage from South America, brought home with him a little "animile," which he imposed upon a young gentleman, who was a great lover of all kinds of pets, though not too well posted in Natural History—as a regular ant-eater. It was about the size of a young cat; was covered with brownish fur on the back, which shaded off into orange and yellow underneath. It had a long tail, ornamented with a series of black and yellow rings; and such a nose! No one knows what such a nose is, until it has been seen! The sailors on the vessel in which it came, called it "Nosie," for want of any other name, but science had already named the animal "Nasua," which in a matter-of-fact way means just "nose," or the animal with a—nose.

The gentleman was soon informed that Nosie was no ant-eater at all, but a pretty little coatimondi of the female persuasion, nor was he long in discovering that she was well-named by both sailors and naturalists, for her nose was at once into everything, and she had not been in his house twenty-four hours, before the idea became general that "Nosie's nose knows too much." Insatiably inquisitive, she one day raised the lid of a pot which was full of boiling water, having just been lifted from the fire. The escape of hot steam made the attempt a sudden failure. The next moment her prehensile nose had pried up the lid of the knife-box, and she was handling the contents in happy ignorance of the warning, "beware of edge tools." Indeed, Nosie's curiosity was equal to that of the most inquisitive monkey. Everything hollow was particularly attractive; as for instance, a sleighbell; but being unable to get her nose or paws in its little aperture, the clatter within set her wild with excitement, and then would follow a most desperate attack upon the offending tintinnabulator with her teeth. When she found this was futile she gave it up and seized upon the dinner ringer, which in turn was abandoned in disgust, because she could not detach the clapper! Her attack next day was upon a bottle of ammonia, out of which she soon got the cork, and though some of the household were near being strangled by the powerful odor, Nosie did not seem to mind it a jot, and she played with the bottle as though her nose was proof against scents—of whatever power. One day a closed tobacco box was given her. Resting it on the floor between her two paws, she first gave it a general inspection, then nose, claws and teeth went to work with a will! Round,

over, under, every way was the box turned, but all in vain. She must have gotten a smell of the weed, so determined did she seem to have the box open, and at last, in pity at her distress in not having her curiosity satisfied, her master opened it for her, when Nosie was at once in a state of ecstatic enjoyment! In went her long nose among the "fine-cut," and very soon that wonderful smell of hers had separated every fiber of the tobacco, of which there now appeared to be about treble the actual quantity, so thoroughly did she stir it up! Another day Nosie got hold of a well-used briar-wood pipe, which was rank enough to "smell to heaven," but for all that, in to its bowl went the animal's flexible, velvety nose, clear to the bottom; and without offense! Of course it was not long after Nosie entered the house before she was, to a certain extent, mistress of it. Claiming the largest liberty, she "ran up stairs and down stairs, and in the lady's chamber." When the sun went down she retired to her cage, which was always open, and then how she would sleep! rolled up like a little ball of fur, with nothing on her mind, and a clear conscience, why should she not sleep? I wish, friends, we could all sleep like Nosie—Nosie could not have had a conscience at all, or she could not have slept in the manner in which she did!

Endless were the incidents of Nosie's curiosity, but sad to relate, her nose, like the fatal gift of beauty to woman, was her ultimate destruction, or like the pitcher to the well, it went once too often, and thus it was her destroyer. One morning the poor girl was found dead! A paper of strychnine, supposed to have been safely placed away, had been hunted out, as a matter of curiosity. Enough of the poison had been taken by poor Nosie to send her to the far beyond "where the surges cease to roll," even over coatimondis!

I have heard that the females of my friend's family were not very sorry at the sudden demise of Nosie! Indeed, some said that cook knew more about that paper of strychnine than she chose to tell, but at all events, thus ended the earthly career of Nosie.

—Sic transit gloria coati-mondi.

CANARY BIRDS.

Now that winter has closed about us and driven us with our plants in-doors, we would strongly recommend our readers to drop a few rape seed (which is the dark round seed in the canary mixture) in their flower pots every few days, when they will soon appear above the surface. When the plants are a few days old, take one or two each morning and give to your canary bird. Do this regularly and you will be surprised to see how much it will notice you; especially if you neglect your duty for even a few moments he will call, and talk to you, until he attracts your attention. At least this has been my experience for many years. Your pet will never make a mistake and call the wrong person. Should you go away from home for a few days, no member of your family will welcome your return so heartily as your pet canary. Yes, it is pure selfishness on the part of the bird, but nevertheless very gratifying.

WADE.

Which works on Angora or fancy cats are the most reliable and where can they be obtained? Yours truly,

I. W. SATPHIN.

"Cats, their points and characteristics," by Gordon Staples; and "The Cat," by Hon. Lady Cust. For sale by Dean & Row, London, England.

The latter work we intend to reproduce in the JOURNAL, beginning with No. 1, Vol. 4.

Whizzing in cage birds is not infectious.

YOUNG FOLKS' CORNER.

QUEEN CATASAUQUA AND THE GIANT HAN- DENDOCKQUA.

A LEGEND OF THE LEHIGH.

A STORY FOR THE YOUNG FOLKS.

Once upon a time, a long while ago, when the mountains of the Lehigh were young, there lived among them a huge giant named Handendockqua, who said he was king over them. Far down in one of the largest of the mountains, whose peaks pierced the sky, was his palace. There he dwelt surrounded by great fires which he kept burning to melt all the coal and iron which abounded there, to produce what he called "slag," with which he might cover all his mountains over, so that when the world should be on fire at the last day, they should not be destroyed; there, too, he himself would escape and be the owner of the whole world, as all but himself and his mountains of the Lehigh, would be burnt up! So King Handendockqua used to go about his fires, stirring them up, melting great loads of iron and then with his giant slaves he would carry tons and tons of it out as "slag," and cover with it all the mountain sides and tops until it was piled up hundreds of feet high, for miles and miles in extent, and thus they stand even unto this day. You should have seen this King Handendockqua! He was a terrible fellow, and carried a lighted lamp in his forehead, that he might see to come and go to and from his fiery home deep down in the mountains.

Now there lived at this time in the beautiful valley of the Lehigh a fairy, young and lovely, whose name was Catasaqua. Her husband, who was the Fairy-King, and named Tamaqua, ruled over a neighboring realm, called the Blue Juniata, and there he spent much of his time. They had two lovely daughters, the Princess Catawissa, and Catalpa, or as she was sometimes called Catawba.—You must know that Queen Catasaqua was very fond of cats—white cats in particular,—so much so that she called her two children by names which would remind her of them, and she would even have dwelt in the Catskills by the side of some roaring cat-aract, but that King Tamaqua desired she should be Queen of the Lehigh, and in that valley reside.

Now Queen Catasaqua loved the beautiful valley of the Lehigh, and every spring, taking her daughters, Catawissa and Catalpa with her, she went forth to decorate her beloved mountains from their bases to their summits with green, and dot them over with various colored flowers. It was Catawissa's duty, when her mother had put on the green to spread out the cat-nip blossoms and other beautiful hill-side blooms, while it was Catalpa's to hang on her namesake tree its showy sweet-scented white flowers, violet-tinged, with purple-dotted throats and its fine, pale green, heart-shaped leaves. Especially was it her duty to decorate her favorite tree on her birth-day which was the 21st of June.* Now when they all had done their work right—when the Fairy Queen had put on the green,—Catawissa, the flowers of various colors, and Catalpa had garlanded her namesakes with their gorgeous blossoms,—oh! but King Tamaqua was proud, for oh! the valley of the Lehigh (which means the Fairy's Nest), was a very Paradise, an Eden of loveliness.

Now all this was before the giant Handendockqua had made his appearance on the outside of the mountain with his melted slag, and one beautiful night, while the Queen, her daughters and her maidens were having a fairy dance

"All in the moonlight pale—"

The giant and his men, each with a fire burning in his forehead, came forth and began to throw the hot slag on the mountain-top,

in such abundance that it rolled down the sides cooling as it went, covering up all the beautiful verdure of Queen Catasaqua, the sweet-scented flowers of Catawissa, and even causing the blossoms of the Catalpa to wither and fall from her heart-leaved tree; thereby making a scene like unto Vesuvius after an eruption of fire, sand, and water! And still the giant and his Cyclopean band kept pouring their molten "slag" upon the mountain-top, until it ran down in red-hot streams, never cooling until it plunged hissing into the blue waters of the Lehigh. In vain Queen Catasaqua first commanded, then implored; in vain the beautiful Catawissa wrung her tiny hands; in vain the delicate Catalpa in sweetest tones begged that her namesake-blossoms might be spared; all in vain! the giant continued pouring out his red-hot iron which still rolled down hissing into the waters of the Lehigh.

Plunged into despair, Queen Catasaqua now determined to hold a council. King Tamaqua was away on Fairy-King duty in the land of the Appalachians,* and she had but to wave her fairy wand three times to call him home. Soon upon the wing of a Grand Emperor Butterfly, he came riding up, and when he had greeted his Queen with a fairy kiss, he enquired why he had in such earnest haste been summoned to her side, and why she was thus preparing to hold a council under a Polyanthus leaf instead of on the green, among the sweet blossoms, and under the Catalpas? Then the Queen rehearsed the doings of the giant Handendockqua, and how he was going to have the Lehigh valley with its sky-piercing mountains clothed in slag instead of green, flowers, and blossoms!

Very angry then was King Tamaqua, and in his fairy wrath he said: "When I was in the land of the Appalachians, I met with a brother Fairy-King, who rules among them and he gave me a charm which would circumvent and overthrow any giant who did not reverence and obey the GREAT CREATOR. Now this Handendockqua does not love the flowers which the Great Creator has made, nor does he keep His commandments, nor reverence or fear Him, or he would not undertake to make fire-proof a mountain, and thus defy the Supreme Being, like those who built the tower of Babel to prevent the world from being drowned, all of whom were punished for it by a confusion of tongues. Now this charm is very simple; it is but to say whenever I see an evil giant, doing anything wicked—as this gnome of our mountain is now, "Feet slip, knees shake, and body tremble, in the name of the Great Creator," and if the giant is doing wrong, which we know he is, his feet will slip, his knees will shake, his body will tremble, and he will die. So fear not my Fairy-Queen, we will watch for him to-night, and when he and his men come forth the spell shall be put upon him, and he shall perish! So fear not my Queen."

Now when the council was dissolved, and the night had come, King Tamaqua, Queen Catasaqua, and the Princesses went forth. It was a beautiful night, each star was shining on its throne of blue and gold. No moon was to be seen, for so high had the giant Handendockqua piled up the slag on the mountain-top, that Luna could not rise above it until far into the night. Soon came the giant and his attendants forth from their mountain home rolling before them a great ball of slag as tall as themselves, cold on the outside, but red-hot within, a great egg shell filled with melted slag, which he was going to break on the top-most height and send its fiery contents down the mountain side. Just then King Tamaqua appeared at the foot of the mountain, and three times waving his magic wand, he cried in his tiny but clear shrill voice: "Slip feet, shake knees, and body tremble if you love and reverence not the Great Father!" The giant had

* On June 21st, the Catalpa is always out in full foliage and flower.

* Alleghany Mountains.

† The Polyanthus bears the largest leaf of any tree in North America.

now raised his molten egg, holding it in both hands to a level with his head, ready to cast it down, when all at once his feet began to slip, his knees to shake, his body to tremble, causing the giant to fall upon him, and which bursting open as it fell, engulfed him in its molten contents, when all in one red-hot mass of slag, went crushing down the mountain side, never halting in its course until it hissing plunged into the middle of the river Lehigh, where in due time it cooled and there to this day it may be seen.

Then was there peace in the Fairyland of Lehigh. Again did the flowers bloom, set in their beds of green, again did the Catalpa blossoms gladden the eye and fill the air with their sweet perfume, and once again the fairies held their court and danced by the light of the moon, for the great Handendockqua lay cold in his watery bed, all the days of the year, except at each return of Christmas, when he seems to rise to his feet a giant of ice, formed by the hand of King Winter out of the dashing waters and spray which roll up from the obstruction of the huge boulder which forms his bed. When the spell of King Winter is broken by the warm hands of Spring, then down sinks the giant to be seen no more for another year. Then, as the hands and heart of Spring grow stronger and warmer, forth go Queen Catasauqua and her daughters Catawissa and Catalpa to perform their work of beauty and love as in times past, making the valley of Lehigh to appear in verdure clad, and blooming in all its former glory. Yet do the waters of the river roll and tumble, dash and roar against the great boulder of slag, once the mighty and presumptuous Giant Handendockqua.

GUY S. CUTTS.

THE FIRESIDE.

It is as the focus of home fellowship and intercourse that we speak of the fireside—as the spot consecrated to the freest action and utterance of family sympathies and affections—where conjugal, parental, fraternal and filial anxieties, hopes, fears, joys, sorrows, loves, resentments, confessions, forgiveness, are wont to be exchanged. There is no other place in which can be realized more thoroughly the weaving into one of several lives, each imparting and receiving something from the rest. No other is so sacred to the memory of those who have been summoned thence into the wide world, who are, perhaps, afar off, on the sea, or

doing their allotted work amongst strangers, or removed to those more inaccessible shores where “the wicked cease from troubling and the weary are at rest.” Elsewhere the absent may be forgotten, but seldom, for long together, at the fireside. It is crowned with associations which touch the heart at some point or other of its surface, and make it thrill with affectionate emotion, in which every member of the family gathered around the hearth can take an appropriate share. No lessons leave a more abiding impression than those which gently drop into the mind at the fireside. No fun is more tickling, or leaves behind it less regret. No history is purer, as a whole, than fireside history, and none lives longer or more lovingly in remembrance. He who cannot look forward with yearning desire to fireside enjoyment, as the staple enjoyment of life, is greatly to be pitied, and, if the cause be himself, is greatly to be blamed.

◆◆◆
BEGIN AT HOME.

“My daughter keeps my farm accounts, sir, and she is as particular as ever my son was, who kept them before he left home. I tell you it does girls” (and he might have added boys also) “good to give them some responsibility, and set them to watching things about the farm and household. They learn, I find, economy by it, and soon discover their father is not necessarily a crabbed old curmudgeon because he doesn’t loosen his purse-string whenever they see something they happen to fancy, for they discover the real reason why the purse should not be opened.”

Parents would prove themselves wise if they would oftener take their daughters into their counsels, and into the management of their finances. Let daughters learn economy, regularity, order, and the value of money (not so much as a medium of exchange, but as the foundation of home comfort, as a wage, an income under parental supervision,) and much of the misery, extravagance, and discouragement of young house-keepers and husbands, that is the breaking of the first bond of home love, will be avoided.

◆◆◆
“Do I believe in second love? Humph! If a man buys a pound of sugar, isn’t it sweet? And when it’s gone, don’t he want another pound? and isn’t that sweet, too? Troch, Murphy, I believe in second love.”

(For Fanciers' Journal.)

THE TUSCARORA.

BY T. G. G.

Calm was her course along the tide
To Mobile’s placid bay;
Bright flashed the gorgeous autumn sun
From drops of azure spray.
Hope beamed from each expectant face,
Joy thrilled each throbbing breast;
For naught arose to break the spell
That charmed the waves to rest.

Her hold with snowy cotton packed
From hills by zephyrs fanned,
Borne by the lusty breeze along,
She sped for Albion’s strand;
Her many thousand looms to feed
With light and leath’ry foam,
Plucked from the rich and fertile fields
Of freedom’s sunny home.

Far out upon the briny deep,
A prey to heavy sea;
Lashed by the pelting storm and wind
From caverns dark set free;
With rudder gone, upon the surf
She staggered to and fro,
Like one bereft of reason’s power
By an unkindly blow.

In this sad plight, from her mast-head
A signal was displayed;
Betokening to the passing ship
Her need of friendly aid.
At this dark hour when all seemed lost,
Some hope-gleams did appear;
For through the gloam and sullen gloom,
A vessel hovered near.

Alas, alas! Unlucky fate!
No aid could she bestow;
For wild and high the billows leaped,
And fierce the winds did blow.
Her captain now, a second sign
Flung out ‘mid tossing spray;
These pleading words inscribed therein,
“O stand by me, I pray.”

But all in vain; the noble ship
Spent by the with’ring blast,
Down to old Ocean’s rocky bed
She slowly sunk at last.
Her captain bold, and half a score
Of sturdy seamen brave,
Soon found beneath the wat’ry waste,
A cold and cheerless grave.

As many more of that sad crew
Were saved the tale to tell,
How through those bitter, bitter scenes,
They bore their fortunes well.

And when the final struggle came,
To part from kindred dear,
They yielded to their cruel fate
With scarce a pang of fear.

But one among that gallant band,
The captain—kind and true,—
Had left a young and loving spouse,
And tender infant, too;
An old and weather-beaten sire,
And many a faithful friend,
To mourn his dark and luckless fate,
His sad, untimely end.

Now nevermore around the hearth,
That graceful form shall stand,
To listen to her loving words,
To press her tender hand;
For in those dark and silent halls
Where sea-worms sport and glow,
His lifeless corpse, mayhap, shall sleep,
Till time shall cease to flow.

No marble slab hath he who lies
Beneath the sullen spray;
Inscribed within the heart, his name
Shall live an endless day;
For in its halls love’s magic wand
Shall rear a lasting bust,
Which shall survive when storied urn
Have crumbled into dust.

EXCHANGES.

Advertisements under this head of 5 lines or 40 words, describing and offering "for Exchange only," will be allowed at 25 cents for each and every insertion. For every line extra 10 cents will be charged.

Each and every advertisement must be written on a separate slip of paper, and on one side only.

No Exchange will be inserted unless accompanied with 25 cents.

BLACK LIST.

John C. Metcalf, Kingston, Ont., Canada.

C. BOGGS, Morton, Del., will exchange Dark Brahma Cockerels for Partridge Cochins Pullets, Pheasants, or Pigeons; also one Aylesbury Drake (Bicknell's eggs), for an Aylesbury Duck; also one fine Partridge Cochins Cockerel, for an Aylesbury Duck, or others. Stock all good. Postal cards answered.

ORLANDO SEELEY, Box 129, Ithaca, N. Y., will exchange B. B. R. Game Bantams, 3 P. C. Hens, Japanese Silver Hen, 1 Black Game Pullet, all bred from the best of stock, for German Canary Singers, Black or Blue Fantail Pigeons, or pets of any kind.

J. T. RELL, Franklin, Pa., has 1 Cock and 8 Hens, Silver Pencilled Hamburgs, all extra good birds; will give the lot for Wright's Illustrated Book of Poultry, in good condition, or Single Breech-loading Shot Gun, or others.

D. Z. EVANS, JR., Town Point, Cecil Co., Md., has for exchange one A. Liver and White Setter, which has been gunned over one season with the best results for Lop-eared Rabbits, L. Brahmas, W. C. B. Polish, Guinea Pigs, Pigeons, or others. Speak quickly.

LEERO GOODIN, Keaton, Ohio, has for exchange three Light Brahma and three Partridge Cochins Cockerels, for Partridge Cochins or Light Brahma Pheasants. Want nothing but first-class stock.

T. H. HAYDEN, West Stafford, Conn., will exchange 2 males, 1 female Shepherd and Newfoundland Pups, seven weeks old; also 1 female, 7 months old, and water fowls. Write soon. Letters preferred.

W. B. HARRIS, Dodgeville, Wis., will exchange 10 Houdans, Black Spanish, or Golden Poland, for a small well-bred English Breeze Hound Dog, from 8 months to 2 years old. Write, stating age, height, length of ears, stock, &c. Postals accepted.

S. O. CHASE, Killingly, Conn., will exchange one new Common Sewing Family Sewing Machine, one new German Concertina, twenty keys, and one pair White Crested Calcutta Fans, for Buffalo Robe, Black Fans, or others. Quick, or you lose it.

W. I. T., Bridgetown, Caroline Co., Md., to reduce stock, will exchange pair of Cashmere Goats for Alderney Heifer Calf, or others. Must be first-class, as Goats are; She Goat thought to be in kid. Full description and sample of dress sent on application. All communications answered.

I. W. HARTMAN, Westchester, Pa., will exchange Blue-winged Swallows, Flying Antwipers, Carriers, white, red, black, &c., Silver Pouter Cocks, Rite Dutch Cocks, Jacobins, Turbit Hens, wings and tail black, and about 100 others, for good Silver Watch, Commode, or others. Send along your postals.

A. J. TUCK, Nashua, N. H., offers two trigs G. P. Hamburgs for two trigs Brown or Dominique Leghorns; also 1 pair Silver Duckwing Game Bantams for Leghorns. Must be good. Mine are.

I. F. EMMONS, Keene, N. H., manufacturer of Custom Boots and Shoes, will exchange a few pairs of Mists for pure bred Poultry or Fancy Pigeons. Correspondence from breeders of fine stock solicited. "Dunghill fanciers need not apply."

CHAS. LIPPOD, 167 N. Queen St., Lancaster, Pa., will exchange 1 pair White Oels, 1 pair Solid Yellow, 1 pair solid Black Turbits, 2 pair Calcutta Fans, (bestor stock), for a solid Yellow Trumpeter Cocks, B. B. Games, (Warren's stock), or good Pards, or others.

FOX 368, North Attleboro, Mass., has for exchange The Poultry World, from No. 5, Vol. 3, up to Vol. 6; also The Fancier's Journal, from No. 22, Vol. 2, up to Vol. 4, for B. B. Game Hens, Canaries, Poultry Book, or others.

N. C. BACON, Potsdam, N. Y., will exchange 2 trigs White Leghorns, 2 trigs D. B. Bantams, 4 trigs Houdans, 2 pairs Rouen Ducks, for good Hunting Game Watch, Single Buggy Harness, Buffalo Robes, or pair Run Pigeons. My stock is good; shall expect same. State price.

W. GLADWIN, 5 Enos Place, Vine St., west of 23d St., Philadelphia, will exchange Blue Antwipers, Carriers, bred from imported stock, for Canaries or others. No other live stock wanted.

M. BOKEL, 307 N. Eden St., Baltimore, Md., will exchange, for Fancy Pigeons, a full set of Tailor's Patterns, consisting of Suit, Frock, Overcoat, Pants, Vests. These patterns are worth \$100 to any man that makes business.

DANIEL MILLS, Newfield, N. J., has one trio B. Hamburgs, 2 B. Hamburg Cockerels, 1 G. P. Hamburg Cockerel, 1 G. S. Hamburg Cockerel; all hatched in July last from eggs imported from James Long Island; also 2 Golden Poland Cockerels, to exchange for Brown Leghorn Pheasants. What offers.

BOX 43, Pillow, Pa., will exchange a store of about \$60, capital, situated in Zelknoten, Dauphin Co., Pa., with an established trade on cash basis, for a good farm that is suitable to raise Poultry.
